LIN. SYST. PENTADRIA, Digiñia. Margin of calyx 5-toothed, or rarely obsolete. Petals ovate, entire, involute or indented at the apex. Stylodium depressed, short, hardly distinct in the mature fruit. Fruit turigrid, the transverse section nearly tertate, or somewhat didymous; mericarps with 5 thick ribs, variable in the different sections. Commisurate nearly equal to the breadth of the mericarps. Seed constituting a free nucleus, covered with copious vitex, deeply involuted. Cotyledons of embryo diverging.—Perennial herbs. Leaves decumbent. Umbels numerous. Involucra and involucels of many leaves. Flowers yellow.

SECT. I. E. CACHRYS (from καθώς, well, and cachrys; this section contains what are supposed to be the true species of the genus). D. C. prod. 4. p. 236. Cachrys, Koch, umb. 1. c. Margin of calyx obsolete. Ribs of fruit broad, thick, obverse, sometimes so very broad at the base as hardly to be distinct. Prickles, bristles, or tubercles none.

1 C. Levigata (Lin. dam. 1. (1783) 256.) plant glabrous; leaves decumbent; leaflets multifid, linear-setaceous, divaricate; leaves of involucra and involucels few, entire; fruit globose, with very blunt, hardly distinct, smooth ribs. 2. H. Native of the south of France, in dry open places.—Moris. umb. t. 3. superior figure.—C. Ischanitis, Goun. ill. p. 12. but not of Lin. C. Morisini, All. pedem. auct. (1789) p. 29. Schultes, syst. 6. p. 441. exclusive of the synonyme of Desf. The oldest name is here admitted. Flowers yellow.

2 C. Macrocarpa (Ledebl. fl. ross. alt. ill. t. 312. fl. alt. 1. p. 365.) radical leaves ternate; leaflets bipinnate or tripinnate; pinnae ternate or pinnate: segments entire or 3-parted; lobes linear or oblong; involucra and involucels of many leaves; fruit oval; mericarps glabrous, 11-angled. 2. H. Native of Siberia, on hills in the Kirghisian steppe, at Ustakmenogorsk, and between Buckturnënke and Lake Noor-Saian. Root rather woody, supurse. Stems many from the same root, straitly furrowed, pubescent, branched at top. Leaves a foot long and more than a foot broad. Umbels of 5-10-rays, but usually of 8. Leaves of involucra ovate or lanceolate, short, membranaceous; of the involucels of unequal size. Flowers yellow, all hemaphroditic in the primordial umbels; but in the lateral ones they are polygamous, the outer ones fertile, and the inner ones for the most part sterile. Calyx very minute. Petals yellow, oblong, concave, reflexed, hardly keeled on the inside. Stylodium pubinate. Fruit large, compressed from the sides; mericarps with 5 thick keeled ribs. Carpophore bipartite, free.

Large-fruited Cachrys. Fl. 1 to 2 feet.

3 C. odonta-leca (Pall. itin. 3. p. 720. t. g. 1. 2. 3. ed. germ. 3. append. no. 75. t. 9. ed. goll. in sorto. append. no. 309. t. 76. f. 1.) leaves decumbent, clothed with hoary pubescence; leaflets linear, short, rather trifid; stem nacked; leaves of involucra and involucels few, divided; fruit oblong, having the mericarps somewhat compressed from the back, and hardly furrowed. 2. H. Native of Siberia, Taurio, and Cosaeus, in very arid muddy places. Biebl. fl. taun. 1. p. 217. suppl. 216. Hoffm. umb. 1. p. 176. t. 3. f. 2. and f. 4. d. e. Cachrys callosperma, Pall. itin. 3. p. 663. Involucrum none, ex Hoffm. 1-leaved, ex Vest; few-leaved, ex Pall. Fruit oblong, smooth, and ribless on the outside, as in C. levigata, but cylindrical, not
nearly globose. The Cossacks of the Jaik chew the seeds for pain in the teeth, and obtain relief by the copious salivation which follows their use.

Tooth-ache Cachrys. Pl. 1 foot.

4. *Paeonanthes* (Desf. fl. alt. 1. p. 250.) leaves decomposed; leaflets filiform, stiffish, rather pubescent; leaves of involucre pinnatifid; of the involucels undivided; fruit oval, with smooth obsolete ribs. 2. H. Native of Algeria, in corn fields. This species differs from *C. levigata* in the leaves of the involucrum being multifid, and in the leaves being pubescent.

*Paeonanthes*-like Cachrys. Pl. 1 foot.

5. *C. vaginata* (Led. fl. ross. alt. ill. t. 9. fl. alt. 1. p. 366.) radical leaves bipinnate; leaflets pinnate-parted; segments oblong-linear, acute; lower leaflets and segments approximating the rachis; sheaths of cauline leaves, ventricose; involucrum almost wanting; involucels of many leaves; fruit didymous; mericarps nearly globose. 2. H. Native of Siberia, on the mountains of Dolenkara, in the Kirghisian steppe. Stems rather flexuous, sulcatly strumulated. Umbels of 10-20, unequal, spreading rays. Leaves of involucels linear-lanceolate, with membranous margins. Margin of calyx obsolete denticulated. Petals whitish, nearly orbicular, emarginate, with an exfolled acumen, keeled inside.

Sheathed-petioled Cachrys. Pl. 1½ foot.

6. *C. alpinus* (Bieb. fl. taur. 1. p. 217. suppl. 216.) plant glabrous; leaves decomposed; leaflets linear, elongated; leaves of involucra and involucels very short, undivided; fruit oval, having the mericarps a little furrowed and strumated, the strie connate. 2. H. Native of Tauria, on the tops of mountains. Hoff. umb. 1. p. 176. C. Libanotis, Pall. ind. taur. Allied to *C. Libanotis* and *C. levigata*, but differs in the fruit not being perfectly smooth in *C. levigata*, nor deeply furrowed as in *C. Libanotis*. Perhaps this and the two preceding plants belong to the following sections.

Sect. II. *Elymum* (from αἰλήμος, aix aigos, a goat, and μακρόθυρον, marathron, fennel; goats' fennel). D. C. prod. 4. p. 237. = Hippomarathrum, Link, 1. c. and Koch, diss. but not of Riv. = Hippomarathrum, Koch, in litt. Margin of calyx 5-toothed. Ribs of fruit very thick, obtuse, almost filling the furrows, more or less tubercular, papillose, wrinkled, or tomentose, rarely smooth.

7. *C. Libanotis* (Linn. spec. p. 355.) plant glabrous; leaves decomposed; leaflets trifid, linear, rather pungent; superior ones opposite: upper ones trifid; leaves of involucra and involucels numerous, undivided; fruit ovate; mericarps very bluntly 5-ribbed. 2. H. Native of Mauritania, Sicily, but not in France. Schuh, hnhdb. t. 55. good. Hippomarathrum Libanotis, Koch, in litt. Hippom. Siculum, Boez. sic. t. 18.—M. ox. sect. 9. t. 1. f. 5. umb. t. 3. lower figure. C. vörös, Lob. icon. t. 782. f. 2. C. Scilla γ, Guss. prod. 1. p. 339. and perhaps C. sphaerospérmá, Ten. prod. xix. syn. 129. is also referable to this plant.

8. *Pterochlæa* (D. C. prod. 4. p. 237.) plant glabrous; leaves decomposed; leaflets trifid, keeled, stiff, divaricate, with the margins and keel scabrous; central umbels furnished with divided leaves of involucra, and the lateral ones with undivided leaves of involucra; leaves of involucels all undivided; fruit nearly globose; mericarps with 5 thick blunt ribs, which are granularly muricated on every side, having the furrows between the ribs deep and very narrow. 2. H. Native of Barbary, Italy, and Greece, ex Val. Salzin of Sicily, Spain, and the island of Cyprus, ex Sidthorp. C. Sicula, Linn. spec. p. 355. exclusive of Bocc. syn. Desf. fl. atl. 1. p. 240. Sibh. et Smith, fl. grcc. t. 278. Hippomarathrum Siculum, Link. cmm. 1. p. 271. Koch, l. c. Flowers yellow, as in the rest of the species.

10. *C. melilobi*a; leaves scabrous; pedioles 6 times divided, furrowed; leaflets triplicate: segments stiff, subulate, triangular, or somewhat pentagonal, channelled above; involucra and involucels of 5 short lanceolate leaves; mericarps granular, with rather prominent ribs, and distinct furrows. 2. H. Native of Caucasus, in the vicinity of Bakur and Klarji, Hippomarathrum anapolistis, Ledeb. in litt. Meyer, verz. pld. p. 131. Echinophora? Cassia, D. C. prod. 4. p. 235. Segments of leaves short, hardly 2 lines long, thick, and stiff, by which it is easily distinguished from *C. crispa*.

*Ample-leaved* Goat's-fennel. Pl. 2 to 3 feet.

11. *C. longifolia* (D. C. prod. 4. p. 237.) plant smooth; leaves multifid, trichotomous; leaflets linear, stiffish, elongated; leaves of involucra and involucels linear, short; fruit nearly globose, granular from papille; with thick ribs: which almost close the furrows. 2. H. Native of Persia, among rocks on the mountains about Seidkhodze, where it was collected by Szovits. Flowers and fruit like the Caucasian variety of *C. crispa*, but the ultimate lobes of the leaves are very slender, about 2 inches long, not 2 lines as in that plant.

12. *C. involucrata* (Pall. in Wildl. herb. ex Schultes, syst. 6. p. 447.) plant glabrous; leaves ternately tripinnate: leaflets cuneiform, jagged, acute; leaves of involucra and involucels lanceolate, membranous; fruit spongious, tubercular from papille all over. 2. H. Native of Persia. This species is hardly known, but from the character given it is nearly allied to the preceding species. Stem branched at the base. Leaves three times tripinnate.

Involucrated Goat's-fennel. Pl. 2 feet.

13. *C. erithrythra* (D. C. prod. 4. p. 238.) leaves multifid, and are, as well as the stems, quite glabrous; lobes or leaflets trichotomous: segments linear-subulate, stiffish; rays of umbell puberulous; umbelules crowded with flowers; calyx and fruit tomentose. 2. H. Native of Persia, in gravelly places at Badam. This is a very distinct species, from the fruit being nearly an inch long, and tomentose, with thick obtuse ribs, and very narrow furrows.

14. *C. acaulis* (D. C. prod. 4. p. 238.) radical leaves bipinnate; petioles and scapes clothed with short white hairs; leaves multifid, smoothish: lobes linear, soft, short; rays of umbel 4-5, puberulous, sometimes proliferous; leaves of involucra and involucels linear, with membranous margins; umbelules crowded with flowers; calyxes glabrous. 2. H. Native of Persia, on arid hills at the Lake Ormiah, in the province of Aderbeijan, where it was collected by Szovits. Herb small, with a flourous neck. This is a very distinct species, allied to the preceding, but the fruit is unknown.

Stemless Goat's-fennel. Pl. ½ foot.
UMBELLIFER.E. CLII. CACHYRS. CLIII. PRANGOS.

15 C. he'umis (Schouw. maroc. p. 118.) plant glabrous; leaves supra-decompound, fleshy; leaflets linear, trifid, mucronate; leaves of involucra and involucrenum, lanceolate, undivided; fruit furrowed, smoothish. 2. H. Native of Barbary, near Cape Spartel, mixed with Critthum maritimum. Perhaps belonging to a different section. Humble Goat's-fennel. Pl. 2 foot.

17 C. fungens (Jan. pl. exsic. Guss. prod. 1. append. p. 7.) plant glabrous; leaves decumbent; segments or leaflets filiform, linear, acute, somewhat pungent, elongated; leaves of involucra and involucres linear; fruit ovate, with distant somewhat winged crested ribs, and broad concave furrows. 2. H. Native of Calabria and Sicily, in the sand on the shore. C. Sicula fongoliformis, Guss. prod. fl. sic. 1. p. 360. Segments of the leaves elongated, 1-3 inches long.

Var. β, echinophora (D. C. prod. 4. p. 238.) leaves decumbent; leaflets trifid, lanceolate-linear, acute, rather scabrous from short scattered down, especially on the margins; leaves of involucra and involucres lanceolate-linear, acuminate, entire, of the involucres deflexed, of the involucres equal in length to the umbellules: fruit obscurely ribbed; ribs tubercular, somewhat echinately crested. 2. H. Native of Sicily, and in fields about Naples, and probably of Greece and Spain. C. Sicula, Ten. fl. neap. prod. 19. C. Sicula var. al, Guss. prod. fl. sic. 1. p. 329. There is sometimes a one branched leaf at the base of the rays of the umbel, which may be taken for an involucrum. It is perfectly distinct from C. petrochilhe'ana; the upper leaves are opposite as in it, but the segments are broader, and striated beneath by elevated nerves. Leaves of involucra broader at the base.

Dingent Goat's-fennel. Pl. 1 to 3 feet.

Colt. The species of Cachrys are only to be increased by seeds, which should be sown in autumn. A deep light soil suits them best.

Linn. syst. Pentad'ria, Digg'nia. Margin of calyx 5-toothed. Petals ovate, entire, involute at the apex. Stylodipus compressed, hardly prominent in the fruit. Transverse section of fruit nearly terete; commissure broad. Mericarps compressed from the back, with 5 smooth ribs, which are thick at the base, and ending each in a vertical membranous wing on the back. Seed girded by copious vitre. Albumen involute.—Perennial herbs, with terete stems. Leaves decomposed; leaflets or segments linear. Umbels numerous. Flowers yellow.

1 P. pabularia (Lindl. l. e. Wall. pl. rar. asiat. 3. t. 212.) plant glabrous; leaves supra-decompound; segments linear; leaves of involucra and involucres simple; fruit corky; mericarps with 5 ribs, which are expanded into crested wings. 2. H. Native of the temperate parts of the East Indies, about Imflal and Droz. This plant is called prangos at Imflal and Droz. It is employed in the form of hay as winter fodder for sheep and goats, and frequently for neat cattle, but its seed, when eaten by horses, is said to produce inflammation in the eyes, and temporary blindness. The properties of prangos, as a food, appear to be heating, producing flatness in a space of time singularly short, and also destructive to the Fasciola hepatica, or liver fluke, which in Britain, after a wet autumn, destroys thousands of sheep by the rot, a disease which has hitherto proved incurable. The last-mentioned properties of the plant, if they be retained in Britain, would render it especially valuable to our country. But this, taken along with its highly nutritious qualities, its vast yield, its easy culture, its great duration, its capability of flourishing on lands of the most inferior quality and wholly unadapted to tillage, is in part to it a general character of probable utility unrivalled in the history of agricultural productions. When once in possession of the ground, for which the preparation is easy, it requires no subsequent culture, save that of cutting and converting the foliage into hay. Of the duration of the plant there are several facts. Seeds having been transported westward along with thousands of yellow lucern above 40 years ago, and sown on the eastern frontier of Kashmir, where they vegetated, and of which the plants of the first growth still remain in a flourishing condition. In another instance, the seeds were transported eastward, and sown upon rocks near Molbe, where the plants flourished for about 40 years, but in consequence of a long period of drought the prangos perished along with the crops of that district in general. From various facts it is conceived not unreasonable to presume, that by the cultivation of this plant moors and wastes, hitherto uncultivated, and a source of disgrace to British agriculture, may be made to produce large quantities of winter fodder, and that the yield of the highlands, and of downs enjoying a considerable depth of soil, may be trebled. As the prangos has hitherto been of spontaneous growth alone, practices better adapted to the nature of the plant or of the country may be adopted at a future time; but from a view of its habitus, Mr. Moorcroft ventures to suggest that the seeds should be dibbled into holes singly, at an inch deep and a foot apart. Yellow lucern, which is also a spontaneous production of the country of the prangos, is of a constitution more hardy than that of the lucern of Europe, and requires no other culture than that necessary for sowing it, and lasts in vigour for a long series of years. It is submitted that, as it naturally grows along with the prangos, it would be well to imitate this habitude. The joint yield is vastly greater than that of the richest meadow land, and is produced on a surface of the most sterile nature, in regard to other herbage.

Fodder Prangos. Pl. 2 to 3 feet.

fruit than the Asiatic ones, but they are probably hardly varie-
ties. Flowers yellow, as in the rest of the species.

Giant-fennel-like Prangos. Clt. 1752. Pl. 1 to 2 feet.

3 P. cylindracea (D. C. prod. 4, p. 239.) leaves supra-
decompond, rather hairy; segments or leaflets linear, di-
ariate; leaves of involucra and involucres undivided, linear; fruit
chrysalid, expanded into membranous, entire, subundulated
wings; mericarps 5 times longer than their diameter. \( \varphi \). H.
Native of Calabria. Cârchius cylindraceus, Guss. in litt. 1829.

4 P. vlôtstera (D. C. prod. 4, p. 239.) leaves decompond,
glabrous, with the petioles trichotomous; segments or leaflets
linear; leaves of involucra and involucres linear, spreading; fruit
ovate, with very curled membranous wings. \( \varphi \). H. Native of
Persia, on rocks at Seidhodzi, in the province of Aderbeijjan,
where it was collected by Szovits. Allied to P. ferulacea, but
evidently distinct from it in the fruit being one-half smaller; in
the wings being much more curled and white, and in the umbel-
lules being more dense.

Curled-winged-fruited Prangos. Pl. 1 to 2 feet.

5 P. thaspoides (D. C. prod. 4, p. 340.) leaves supra-de-
compound, glabrous: leaflets or segments subulate, stiffish, shin-
ing; leaves of involucra and involucres 5-7, undivided, deflexed;
fruit ovate: having the ribs expanded into thick wings. \( \varphi \). H.
Native of Mount Atlas. Laserpitium thaspoides, Desf. fl. alt. 1.
Thapsia Lârserpâlî, Spreng. in Schultes, syst. 6, p. 613. It diff-
ers from Laserpitium in the petals being yellow, not white, ob-
long, not marinate. Ribs of fruit few.

Thapsia-formed Prangos. Pl. 2 to 3 feet.

6 P. anisoptéla (D. C. prod. 4, p. 240.) plant glabrous; leaves
decompound: lobes or segments linear, short; stem
nearly naked; leaves of involucra and involucres ovate-lanceo-
late, acute, entire; mericarps of fruit compressed from the back,
oblung: with the ribs expanded into wings, the 3 dorsal ribs
attenuated at the base, and somewhat concrete, the 2 lateral ones
marginating and broader than the rest. \( \varphi \). H. Native of
Syria, near Nazareth. It is allied to Cârchius odontáligus, but
diffs in being glabrous, and in the fruit being winged. Calyx
with 3 short teeth.

Unequal-petalled Prangos. Pl. 2 to 3 feet.

7 P. fœncîcula (Meyer, verz. pflanz. p. 131.) plant quite
glabrous; leaves supra-decompound; segments setaceous; leaves
of involucra and involucres lanceolate; wings of mericarps flat:
furrows naked. \( \varphi \). H. Native of Caucasus, among rocks or
in stony places, on the higher mountains of Tulaesch, at the ele-
vation of 2000 or 3000 feet.

Fennel-like Prangos. Pl. 2 to 3 feet.

Cult. The species of Prângos are of easy culture, but grow
best in a dry soil. They are only to be increased by seeds, which
should be sown in the autumn.

CLIV. COLLADONIA (dedicated in honour of F. Colla-
don, M. D. author of a monograph of Câsiaix). D. C. prod. 4,
and of Mart.—Laserpitium species, Vent.—Cârchius species, Spreng.

Petals oval, entire, involute at the apex. Stylodipodum depres-
sed, hardly prominent in the fruit. Transverse section of fruit
oval; mericarips compressed from the sides; commissure narrow,
abundant with 2 vitre. Mericarips expanded into 5 vertical
membranous wings on the back, with the furrows between the
wings broadish, and furnished with one vitta each. Albumen
involute.—Perennial glabrous herbs. Stems acutely triquetrous,
at length somewhat spirally twisted. Leaves pinnatifid; lobes
broadly oblong, toothed. Umbels and umbellules of many rays.
Leaves of involucra and involucres many, undivided. Flowers
golden yellow. This genus, according to Lagasca, in obs. apar.
p. 26. is easily distinguished by its character and habit. Perle-
bia is a name given to a genus by Martius, and is therefore
already preoccupied. Colladonia of Sprengel is a species of
Pâlcoirea.

1 C. triquetra (D. C. prod. 4, p. 240.) \( \varphi \). H. Native in
the neighbourhood of Constantinople, near the canal. Laserpitium
triquetrum, Vent. cels. t. 97. Cârchius triquetra, Spreng. in
Schultes, syst. 6, p. 443.

Pl. 3 to 4 feet.

Cult. See Prângos above for culture and propagation.

CLV. LECÔKIA (named after Henry Lecôq, author of an
[...]

Petals obcordate, with an inflexed point. \( \varphi \) ovate, villously
tomentose; mericarips with 5 thick, very blunt ribs, and narrow
furrows. Seed covered all over with numerous very fine vitræ,
covers on the outside, and with a deep involute furrow on the
inside. Perennial herbs, hoary from villous tomentum in every
part, referrible to Héctôs or Heroëcum in habit. Leaves pin-
nate; leaflets lobed; lobes ovate, toothed, decurrent. Umbels
and umbellules many-flowered, involucrate. Flowers white.
This genus is easily distinguished at once from Cârchius, in
the petals being white and obcordate.

1 M. tomentósa (Koch, in litt. 1828. D. C. prod. 4, p. 241.)
leaves pinnate, with 3-5 large, broadly ovate, toothed, cut leaf-
llets; ultimate leaflets confluent; all tomentose beneath, and
nearly glabrous above; leaves of involucra and involucres nu-
merous, elongated, linear, undivided; fruit ovate; mericarips
bluntly 5-ribbed, tomentose all over. \( \varphi \). H. Native of Bar-
brary and Sicily. Cârchius tomentósa, Desf. atl. 1, p. 249.
UMBELLIFERÆ. CLVI. MAGYARIS. CLVII. HERMAS. CLVIII. CONIUM.

Tomentoso Magyaris. Fl. June, July. Clt. 1823. Pl. 3 ft. 2 M. AMBROSA (D. C. prod. 4. p. 241.) leaves pinnate, with 5 oval-oblong crenulated leaflets, which are glabrous above, and scabrous on the nerves beneath, as well as on the petioles: ultimate ones distinct; leaves of involucra and involucells numerous, lanceolate-linear, undivided; fruit ovate, woolly. 2. G. Native of Mauritania, near Tangiers. Câchrys ambrosia, Salzm. pl. exsic. 1832. This species is intermediate between the preceding and following; to this the first in fruit, and to the last in the analogy of the leaves.

Ambiguoș Magyaris. Pl. 3 feet.

3 M. PANACINA (D. C. prod. 4. p. 241.) leaves on long petioles, some of them undivided, oval-oblong, and toothed: others are pinnate, with the ultimate segments confluent, all scabrous beneath the nerves, and on the petioles; leaves of involucra and involucells numerous, deflexed, undivided; fruit oblong, base with spreading villi, hardly furrowed. 2. G. Native of Spain. Câchrys panacina, Spreng. umb. spec. 1. p. 140.—Tuero, Chus. hist. 2. p. 192.

Cult. See Perângas, p. 375, for culture and propagation.

Lin. syst. Pentândria. Digyânia. Margin of calyx 5-parted, foliaceous, permanent. Petals oval-oblong, acute, keeled, entire, equal. Fruit ovate; mericarps rather inflated, compressed from the back, 5-ribbed, the dorsal rib exserted, the two middle ones larger, and the 2 marginal ones small, and placed under the commissure; vittae many in the furrows, which are broad. Seed elliptic, somewhat concave on the inside, and probably revolute, not adnate to the tegument.—Cape herbs, having the leaves clothed with soft white tomentum. Leaves undivided, hardly toothed. Umbels compound, nearly globose, of many rays. Involucrum of many leaves; involucells of 3 leaves. Rays of umbellules many; outer ones bearing sterile male flowers; the inner one or three bearing hermaphrodite flowers; the pedicels of the sterile or abortive flowers setaeous and permanent after the florescence, forming as it were an involucel to the fertile flowers. Lateral umbels sterile, male. Flowers white or purple.

1 H. GIÀNTICA (Lin. fil. suppl. 436.) radial leaves on long petioles, oval or oblong, somewhat serrated, clothed with dense soft tomentum on both surfaces. 2. G. Native of the Cape of Good Hope. Thumb. nov. act. petrop. 14. p. 529. t. 11. fl. cap. 249. Bupleurum giganteum, Thumb. prod. 50. Leaves from the dense tomentum usually entire. The upper part of the plant and umbels glabrous. Petals purple, ex Thumb. The wool scraped from the leaves is used for tinder at the Cape of Good Hope, as that from Artemisia is in China and Japan.

2 H. villosa (Thumb. nov. act. petrop. 14. p. 531. fl. cap. 249.) leaves ovate-oblong, acute, somewhat cordate at the base, stem-clasping, toothed, glabrous above, and clothed with white tomentum beneath. 2. G. Native of the Cape of Good Hope, on the Table Mountain. Burm. afr. t. 71. f. 2. Bupleurum villosum, Lin. spec. 343. Burm. fl. cap. p. 7. H. depauperata, Lam. dict. 3. p. 121. illust. t. 351. f. 1. Stem tomentose between the leaves, and glabrous above. There is also tomentum under the bracteas and involucra. Stems purple.

Tar. β, depauperata (D. C. prod. 4. p. 242.) leaves on short petioles, velvety beneath from short fuscous tomentum; involucra and bracteas glabrous at the base. 2. G. Native of the Cape of Good Hope, Hervas depauperata, Lin. mant. 299. Perhaps a proper species.

Terry-toothed-leaved Hermas. Pl. 1 foot.

Cult. A mixture of peat, sand, and loam is the best soil for the species of Hermas, and they may be either increased by seed or cuttings.

CLVIII. CONIUM (said by Linnaeus to be from corium, or corva, conis, or conia, dust or powder; but the application of the term is not evident). Lin. gen. no. 409. Hoffm. umb. p. 99. t. 1. f. 5. Lag. am. nat. 2. p. 103. Koch, umb. p. 135, f. 40.—Ciúta, Tourn. inst. t. 100. Gertin. fruct. 1. t. 22. Lam. dict. 2. p. 3.

Lin. syst. Pentândria. Digyânia. Margin of calyx obsolete. Petals obcordate, somewhat emarginate, with a short inflexed point. Fruit ovate, compressed from the sides; mericarps with 5 prominent equal undulately-crenulated ribs: lateral ones margining; furrows with many strize, but without vittae. Carpophore bifid at the apex. Seed with a deep narrow furrow, and as if it were complicate.—Biennial poisonous herbs, natives of Europe. Root fusiform. Stem terete, branched. Leaves decumbent. Involucra 3-5 leaves; involucells dimidiate. Flowers white, all fertile.

1 C. macelatum (Lin. spec. 349.) leaves of involucels lanceolate, shorter than the umbellules. 2. G. Native throughout the whole of Europe, in cultivated ground, among rubbish, and on dung hills; also of the eastern parts of Asia, North America, and Chili, where it has been introduced; plentiful in some parts of Britain. Schkuhr, handb. t. 62. Bull. herb. t. 63.
Hayn. arz. gew. 1. t. 31. Sowerby. engl. bot. t. 1191. Jacqu. austr. 2. t. 156. Woodyd. med. bot. t. 22. Plench. Icon. t. 183. Cieuta maculata, Lam. fl. fr. 3. p. 104. Cieuta majoy, Lam. dict. 2. p. 3. Coriandrum Cieuta, Crantz, austr. 24. Coriandrum maculatum, Roth, fl. germ. 1. p. 130. Cieuta, Hall. helv. no. 766. Riv. pent. rrr. 75. Blackburn. t. 451. Lob. Icon. 732. f. 1. Cieuta domestica, Mor. umb. 18. c. b. sect. 9. t. 6. f. 1. Cominum tenuifolium, Mill. dict. no. 2. Stem hollow, green, but often of a vivid colour, marked with dark spots. Hemlock is obviously distinguished from all other umbelliferous plants by its spurred stem, by the dark and shining green colour of the bottom leaves, and particularly by their disagreeable smell when bruised. According to Linnaeus, sheep eat the leaves, and horses, cows, and goats refuse it. Ray informs us, that the thres will feed upon the seeds even when corn is to be had. Hemlock has been stigmatised as one of the most noxious of vegetable poisons, has for many years been considered as a highly useful and powerful article of the Materia Medica, and it has been proved that though highly deleterious when imprudently used, yet in small doses it has been productive of considerable benefit in cases of which has resisted the usual methods. The first physician who endeavoured to bring hemlock into repute as a medicine was Baron Stoerck, of Vienna, who announced its extraordinary effects in the most invertebrate chronic disorders in 1760. The whole plant is a virulent poison, but varying very much in strength, according to circumstances. When taken in an over-dose, it produces vertigo, dimness of sight, difficulty of speech, nausea, fetid eruptions, anxiety, tremors, and paralysis of the limbs. But Dr. Stoerck found that in small doses it may be taken in great safety, and that, without at all disordering the constitution, or even producing any sensible operation, it sometimes proves a powerful remedy in many obstinate disorders. In scirrhus, the internal and external use of hemlock has been found useful, but mercury has been generally used at the same time. In open cancer it often abates the pain, and is free from the constipating effects of opium. It is likewise used in scrofulous tumours, and in other ill-conditioned ulcers. It is also recommended by some in chin-cough, and various other diseases. Its most common and best form is that of the powdered leaves, in the dose of first of 2 or 3 grains a day, which in some cases has been gradually increased to upwards of 2 ounces a day. An extract from the seeds is said to produce giddiness sooner than that from the leaves. Hemlock should not be gathered unless its peculiar smell be strong. The leaves should be collected in the month of June, when the plant is in flower. The leaflets should be picked off, and the footstalks thrown away. The leaflets are then to be dried quickly in a hot sun, or rather on tin plates before a fire, and preserved in bags of strong brown paper, or powdered and kept in close vessels, excluded from the light; for the light soon dissipates their green colour, and with it the virtues of the medicine. The narcotic seeds are most active and uniform when perfectly ripe. When the fresh root is wounded, it yields a bitter juice and a scent, by which Stoeerck found to excite in the tongue swelling, stiffness, violent pain, and transient paralysis. Paoli is of opinion, that the virtues of the hembock reside in a volatile principle, which, however, he was not able to obtain separate. Dr. Paris says, that the medicinal activity of the plant resides in a resinous element, which may be obtained in an insulatet form by evaporating an ethereal tincture made with the leaves on the surface of water. It has a rich dark green colour, and tastes of hemlock in perfection. A dose of half a grain will produce vertigo and headache. Var. 2. striatum (Tratt. arch. 1. t. 24.) stem diffuse, much branched, very straight; umbels and umbellules proliferous. 

377

CLIX. VICATIA. CLX. ARRACACHA.

CLIX. VICATIA (named after M. Vicat, who has wrote upon poisonous plants). D. C. prod. 4. p. 243.—Sison plants, Wall.

LIN. SYST. PENTANDRIA, DIGYNNIA. Margin of calyx entire. Petals unknown. Styles short, at length diverging. Fruit ovate-oblong. Mericarps almost semi-terete, with 5 filiform ribs: and broad flat furrows containing many small vitice each; commissure narrow. Carpophore thick, rather biferd at the apex. Alurnen furnished with a furrow in the commissure, convex on the outside,—A glabrous erect herb, native of Nipaul. Leaves petiolate, bipinnate; leaflets bifinnatid: lobes linear, acute, slender. Stems sparingly leafy at the base; the rest naked. Umbels terminal, without any involution, of many rays; rays unequal, umbellules of the shorter ones sterile. Involution remain, or very small, and of few leaves. Habit of Conium, but the character is near that of Arracacha. Fruit almost like that of the genus Pimpinella, but differs in the seed being curved.

Hemlock-covered Vicatia. Pl. 1½ foot. Cult. This plant will grow in any soil or situation, and will be easily propagated by seed.

LIN. SYST. PENTANDRIA, DIGYNNIA. Margin of calyx obsolete. Petals lancolate or ovate, entire, with an infiltrated point, curved above the middle nerve. Styllopodium conical, thick; styles diverging, at length reflexed. Fruit ovate-oblong, somewhat compressed from the sides; mericarps with 5 equal, not crenulated ribs: lateral ribs margining; vitice many in the furrows. Alurnen nearly semi-terete, furnished with a furrow in the commissure,—Perennial South American herbs, of a subluous quality. Roots tuberous, thick, edible. Leaves pinnate or bipinnate; leaflets deeply toothed, lower ones tripartite. Umbels opposable the leaves or terminal. Involution wanting or of one leaf; involucels of 3 leaves. Flowers polygamous; those of the rays hermaphrodite, and those of the disk male or imperfect. Petals white. This genus is nearly allied to Conium, but differs in the form of the petals, and in the ribs of the fruit being entire, not undulately crenulated.

1 A. esculenta (D. C. prod. 4. p. 244.) leaves pinnate: leaflets 5, broadly ovate, acuminate, deeply pinnatifid, profoundly serrated: the 2 lower leaflets petiolate, subulate; involucel wanting; ribs of fruit obtuse. 2. F. Native of 3 C
South America, at Santa Fe de Bogota, and of the Caraccas, where it is cultivated for culinary purposes under the name of Arracacha. Cónium Arracácha, Hook. exot. fl. bot. t. 152. Arracácha xanthorrhiza, Bancroft, l. c. who first published the history and uses of the plant in Alced. dict. geogr. amer. ex Vargas, in Koen. ann. 1. p. 400. Baner. in rev. brit. 1826.

Root forming large oblong tubers in cultivation. Stem \( \frac{1}{2} \) foot high. Petioles tubular.

The first account which reached our country of this interesting and valuable plant was published in the 1st volume of the Annales de Botany, about the year 1805, from a communication made to the editors of that excellent work by Mr. Vargas, a native of Santa Fe de Bogota, who at that period was residing in London. The arracacha is one of the most useful vegetables in that part of South America; in some parts of the country it is called apio, from its resemblance to celery. The roots immediately divide into 4 or 5 branches, and each of these, if the soil be light, and the season favourable, will grow to the size of a cow's horn. This root yields a food, which is prepared in the same manner as potatoes, is gentle to the palate, and so easy of digestion, that it constitutes the chief aliment of the sick; starch and pastry are made from its fecula; and the roots, reduced to pulp, are employed in the composition of certain fermented liquors, supposed to be efficacious as tonics. In the city of Santa Fe, and indeed wherever it can be procured, the arracacha is as universally used as the potatoe is with us. The cultivation of this plant requires a deep black soil, that will easily yield to the descent of the large vertical roots. It is propagated by planting pieces of the root, in each of which is an eye or shoot; these acquire in 3 or 4 months a size sufficient for culinary purposes, though if permitted to continue 6 months in the ground, they attain to immense dimensions, without any injury to their flavour. The colour of the root is white, yellow, or purple, but all the varieties have the same quality. Like the potatoe, the arracacha does not thrive in the hotter regions of America, for in such parts the roots acquire no size, and are indiffrent in flavour, and sometimes run altogether to stems. In the countries which are there called temperate, being less hot than those at the foot of the Cordilleras, this vegetable sometimes succeeds; but never so well as in the elevated region of those mountains, where the medium heat is between 58° and 60° of Fahrenheit. Here it is that these roots grow the most luxuriant, and acquire the most delicious taste. Before Vargas this plant was not mentioned by any other American writer, except by Alcedo, who notices it in a few words, at the end of his "Dizionario Geografico-historico delle Indie Occidentali O America." According to the late Baron de Schack, the arracacha is an essential article of food, not only to the poor, but to the rich, throughout Santa Fe and New Granada, and is every where cultivated as carrots are with us. It is also cultivated abundantly in the Caraccas and the adjacent mountainous country.

Plants of the arracacha have been introduced to this country, but have not succeed.d, although every situation, temperature, and soil have been tried; they have only produced at best a few leaves, and at the end of the year or less have perished altogether. Mr. Shepherd of Liverpool alone has been so fortunate as to have a few plants flowering in his garden.

Excitant Arracacha. Fl. Ju. Jul. 1823. Pl. 1 to 2 ft. 2 A. moschata (D. C. prod. 4. p. 244.) leaves bipinnate, or tripinnate; leaflets pinnatifid; lobes ovate, acutish, serrated; involucre of 1-3 jagged leaves; ribs of fruit acute. 2 P. F. Native of South America, in the province of de los Pastos, near Teindela, where it is called by the inhabitants Sacharachaca. Herb smelling of mus-k. Cónium moschátm, H. B. et Kuntth, nov. gen. amer. 5. p. 14. t. 420.

Musk Arracacha. Fl. June, July. Ct. 1824. Pl. 2 feet. Cult. These plants are of easy culture if kept from the frost; they may be either increased by seed or dividing at the root.

CLXI. Pleuroserpérmum. CLXII. Hyménoléna.

Austrian Pleuroserpérnum. Fl. June, July. Ct. 1597. Pl. 2 to 3 feet. 2 P. Ural'nsis (Hoffm. l. c.) vitae one in each furrow of the fruit; ribs very acute. 2 H. Native of Siberia, on the Ural Mountains. Ligústicum, Gmel. sib. 1. t. 45. This plant differs from Pleuroserpéraum Austriácum in the rays of the umbel being evidently velvety when examined by a lens; the colour of the leaves is more glaucous; the petals more obtuse at the apex, and flat.

Ural Pleuroserpérnum. Pl. 2 to 3 feet. 3 P. Kantschá'ticum (Hoffm. l. c.) vitae 2 in the furrows of the fruit; ribs somewhat dentilciliated; membranes almost cohering between themselves. 2 H. Native of Kamtschatka. Petals obvolute, with somewhat undulate margins, a little inflexed at the apex. A plant agreeing with this was found about Irkuck in Siberia, but differs in the leaves of the involucra being sometimes multifid, as is sometimes the case in P. Austriácum.

Kantschá'ta Pleuroserpémum. Pl. 2 to 3 feet. 4 P. Arcangélíca (Led. fl. alt. 1. p. 369.) 2 H. Native of Siberia. This plant is not well known. It has the habit exactly of Arcangélíca officínalis, and grows in the same places with it. The fruit is grey or dirty yellow.

Arcangélica-like Pleuroserpémum. Pl. 4 to 6 feet. Cult. Any common soil will suit these plants; and they may either be increased by dividing at the root or by seed.

CLXII. Hyménoléna (from hymen, a membrane, and chlauna, a cloak; in reference to the ribs of the fruit
Toothed-leaved Hymenolaena. Pl. 1 to 2 feet.

5 H. Candoli (D. C. L. c.) leaves pinnate; leaflets petiole, ovate, deeply pinnatifid; lobes deeply serrated at the apex; peduncles in fascicles; umbels and umbelules crowded; leaves of involucre and involucels many, oblong, obtuse, membranous, large, entire.

De Candolle's Hymenolaena. Pl. 1 foot.

7. H. Goyaniana (D. C. prod. 4. p. 246.) leaves pinnate; leaflets deeply pinnatifid; lobes oblong-linear, acute; leaves of involucre 5-7, multifid, much shorter than the rays of the umbels; leaves of involucels membranous at the base and margin, multifid at the apex, and exceeding the flowers. 2 H. Native of the Snowy Mountains of Sirmore. Ligusticum Goyaninquum, Wall. mas. Leaves like those of A. pikia. Rays of umbel 7-8, unequal. Stem striated.

Govan's Hymenolaena. Pl. 1 foot.

8. H. Benthami (D. C. L. c.) leaves pinnate; leaflets 5-7, ovate, cuneated at the base, coarsely toothed, trifid or triplicate; teeth mucronate; leaves of involucre foliaceous, oblong, deeply toothed, much shorter than the rays of the umbels; involucels about the length of the flowers.

9. H. Native of Nipaul, at Gosaingsth. Ligusticum Benthami, Wall. mas. Fruit ovate; mericarps somewhat compressed from the back, with broad furrows and narrow winged ribs. Seed convex on the back.

Bentham's Hymenolaena. Pl. 1 foot.

10. H. obtusiscula (D. C. L. c.) leaves pinnate; leaflets 5-7, ovate, deeply pinnatifid, bluntly toothed; leaves of involucre foliaceous, dilated at the base, and multifid at the apex, a little shorter than the rays of the umbel; leaves of involucels oblong, foliaceous, deeply toothed. 2 H. Native of Nipaul, at Gosaingsth. Ligusticum obtusissculum, Wall. mas. Fruit ovate; mericarps semi-ovate, with broad furrows, and undulate-toothed narrow winged ribs. Carpophore thick, bipartite. Seed semi-ovate, obtuse on the back.

Bluntish-seeded Hymenolaena. Pl. 1 foot.

Cult. See Pleurospermum, p. 375, for culture and propagation.
umbelliFerjE, CLXIII. Physospermum. CLXIV. Smyrnium.

sheaths. Leaves of involucra and involucels many. Flowers white. The ligule does not adhere to the fruit in the young state, but when ripe it does, whence the name is incongruous when the fruit is mature.

1 P. aqUElLjFÖLium (Koch, l. c.) lower leaves tridentate, glabrous; leaflets cuneate, deeply toothed; upper leaves many, reduced to the quite entire stipula-formed sheaths. 2 P. Fl. Native of Tauria, Italy, Spain, and Portugal, in woods and shady places. Danâa aquilegiföliâ, All. pedem. no. 1392. t. 63. Henselâ... Lusitanicum, Tourn. herb. Smyrnium medicâile, Bibl. fl. 1. p. 238. Spreng. umb. spec. t. 4. f. 7. Pimpinella Danâa, Bibl. cosp. p. 163. Coclême-leaved Physospermum. Fl. May, June. Clt. 1817. Pt. 3 feet.

2 P. CorNubisFÖLE (D. C. prod. 4. p. 246.) lower leaves tridentate, glabrous; leaflets cuneate-lanceolate, deeply toothed; uppermost ones reduced to the sheaths, each sheath bearing 5 linear, nearly entire leaflets. 2 P. Fl. Native only of Cornwall, in thickets, among bushes, and in hedges; in great plenty in the neighbourhood of Bodmin. Liguisticum Cornubiceum, Lin. spec. p. 359. Smith, engl. bot. t. 638. Smith, icon. pict. t. 11. Physospermum commutatum, Spreng. umb. spec. t. 4. f. 8. exclusive of many synonyms. Danâa aquilegiföliâ, Lag. am. nat. 2. p. 97. ex synonyme of Spreng. Cornwall Saxifraga, Petiv. herb. brit. t. 26. f. 9. Cattle are so fond of the plant that they eat it down to the ground. The root contains a yellow resinous juice.

4 P. ANgelcEleGFÖLium (Guss. ind. sem. 1825, prod. fl. sic. 1. p. 556.) stem furrowed, nearly naked; radical leaves bipartite, with the ramifications not divaricate; leaflets of the lower leaves ovate, of the superior ones oval-oblong, 2-3-parted, dentately serrated, glabrous above, and pubescent beneath. 2 P. Fl. Native of Sicily, on shady gravelly parts of mountains. Leaves like those of Angélica sylvestris.

Angelica-leaved Physospermum. Fl. 2 to 3 feet.

Cult. See Pleurôspèrûm, p. 378. For culture and propagation.

CLXIV. Smyrnium (from σμύρνη, Smyrna, a synonyme of μύρος; the odour of myrrh is common to many umbelliferous plants, among others the Myrîh... odorâta, for which reason it is so named). Lag. am. nat. 2. p. 101. Koch, umb. p. 153. f. 38, 39. D. C. prod. 4. p. 247. — Smyrnium species, Lin. and Spreng.

1 P. olusâ'trum (Lin. spec. 376.) stem terete; calyce leaves ternate; leaflets ovate, serrated; involucels very short. 2 P. Fl. Native of Middle and South Europe, in humid places; as in France, Spain, Italy, Belgium, and Britain. It is rather a maritime plant, and is found near our coast in various places, as about Scarborough Castle, and about Dover; it is common in Anglesea and in all the western counties, and in the flat parts of Gloucestershire, as also in many places of Dorsetshire. It occurs also among many inland towns, as Nottingham, York, Bury, Newmarket, and about Mackerell's Tower, Norwich. In several places of Cambridgeshire, Worcestershire, Kent, and Middlesex. In Scotland upon the coast of Dunglass, on the edge of Berwickshire. Lam. ill. 204. Smith, engl. bot. t. 230. S. Mathioli, Tourn. inst. 316. — Lob. icon. 705. f. 2. Moris. sect. 9. t. 4. The whole herb is of a pale bright green, in flavour something like celery. Lower leaves biternate; upper ones ternate. Petioles inflated. Umbels globular. Flowers greenish white. The plant was formerly eaten in various parts of Europe, either as a salad or pot-herb, whence, and from its blackness, the name olusatrum, from olus and alter. Ray says it was called Alexanders, because in Italy and Germany it had long been denominated herba alexandrina; having been supposed to have been brought from Alexandra. It flowers in May, and by the middle of July the stalks are dried up, but remain laden with large black seeds.

Olusatrum or Common Alexanders. Fl. May. Britain. Pt. 2 to 4 feet.

2 P. aqUElLj (Willd. spec. 1. p. 1468.) stem terete; calyce leaves cuneiform, obtuse, trifid, toothed: involucra and involucels wanting. 2 P. Fl. Native of Canadia. Schultes, syst. 6. p. 450. S. Crétium, Balb. Tourn. in Fl. so. 1825. p. 316. S. Crétium, Mill. dict. no. 4. Perhaps only a variety of the preceding. Stem angular, glabrous. The lower leaves of this plant are much smaller than those of the preceding, and more like those of smallage; the umbels are also smaller, and the seeds less are.

Smallage-leaved Alexanders. Fl. May. Clt. 1731. Pt. 2 to 3 feet.

3 P. rotundârifÖLium (Mill. dict. no. 2.) stem terete; calyce leaves stem-clasping, orbicular, quite entire, or hardly toothed. 2 P. Fl. Native of the islands in the Mediterranean, as in Corsica, Sicily, Cos, &c. on the mountains. Moretti, pl. ital. dec. 2. p. 9. S. Dodoneo's Spreng. umb. spec. 24. exclusive of many of the synonyms. S. Crétium, Math. ed. Valper. 1250. p. 255. S. Crétium, Mill. dict. no. 2. S. Mathioli, Presl. del. prag. p. 127. but not of Tourn. S. ramosum, D'Urville, emm. no. 278. S. perfoliatum a, Lam. dict. 3. p. 266. S. Egeriâcicum, Lin. ann. 4. p. 270. probably belongs to this species, which has often 2 single corollae, quite entire leaves on the floral branches, as in it. Root tuberously fusiform, black on the outside, with a sweet taste. Leaves pale green: lower ones ternate decomposed; leaflets ovate, deeply serrated, for the most part attenuated at the base. Lower calyce leaf 3-lobed.

Perfoliate-leaved Alexanders. Pl. May, June. Clt. 1½ foot. 5 S. Ecororidides (H. B. et Kunth, nov. gen. amer. 5. p. 16). leaves somewhat biternate; leaflets oblong, sharply serrated; umbels of 10-12 rays; involucra and involucelles of one leaf.  H. Native of Mexico, near Moran, at the height of about 4000 feet; and on the Cordilleras de Quialilapa. Sison agropodioidea, Spreng. syst. 1. p. 886. Flowers yellow. Fruit didymous, hardly compressed; vitte small; ribs filiform; furrows broad, reticulated; albumen involute.  Gout-need-like Alexanders. Pl. 1 foot.  

† A doubtful species.  

6 S. ? laterale (Thunb. fl. cap. 2. p. 290.) leaves pinnate and ternate; leaflets obovate, deeply lobed, mucronately toothed; umbels lateral, nearly sessile; involucrals few-leaved.  G. Native of the Cape of Good Hope. Petals white, inflexed. Fruit globose, pubescent. This plant evidently does not belong to the present genus, but to what genus it belongs is unknown.  

Lateral-umbelled Alexanders. Pl. 1 foot.  

Cult. The species will grow in any kind of soil in which the seeds may be sown.  

CLXV. EULOPHUS (from ev, eu, well, and λοφος, lophos, a crest; in reference to the stripes as well as the ribs of the fruit being rather pronounced). Nutt. in litt. 1855. D. C. coll. mem. v. p. 69. t. 2. f. M. prod. 4. p. 248.  

LIN. SYST. Pentandria, Digynia. Margin of calyx 5-toothed, at last falling off after flowering. Petals unknown. Fruit somewhat contracted from the sides, rather didymous; mericarps ovate, with 5 hardly prominent ribs: the furrows between the ribs furnished with 3 convex stripes each, which are more prominent than the ribs, they are hollow inside, and replete with oil, from containing oleiferous canals; commissure bearing 4 similar stripes or vitte. Seed seminiferum. Filling the mericarps; carpophore bipartite.—Glabrous herbs. Leaves multifo; lobes linear, elongated. Terminal umbels large, of 10 rays, fertile; the lateral ones opposite, and sterile. Involucra and involucelles of many linear acute leaves. Flowers many, abortive.  

This genus is very nearly allied to Physospermum, but differs in the fruit being covered with many vitte, as in Smyrniun.  

1 E. Americanus (Nutt. in litt.)—Native of North America, in the Arkansas Territory. Root composed of fascicles of oblong tubers. Stem terete, fistular.  

American Euophus. Pl.  

Cult. See Smyrniun above for culture and propagation.  

LIN. SYST. Pentandria, Digynia. Margin of calyx entire. Petals obcordate, with a short, inflexed, obtuse point. Stylodium thick, conically cylindrical, parallel; styles filiform, bent outwards. Fruit somewhat didymous; mericarps ovate, contracted at the raphe, scarcely compressed from the sides, with 5 filiform ribs, and flat-tish-convex furrows, each furrow containing 2-3 vitte. Commissure flatish, containing 4-6 vitte. Albumen furnished with a furrow inside.—Herb glabrous. Radical leaves on long petioles, which are hardly dilated at the base, ternate; leaflets pinnate: segments pinnatifid: lobes diverging, lanceolate, acute. Stem branched, rather dichotomous, terete. Upper leaves reduced to quite entire, or unidentate, elongated ligula. Umbels terminal, without involucra, of 9-10 rays; umbellules 12-15-flowered; involucelles of a few small, linear leaves. Flowers white.—This genus is allied to Euophus and Physospermum from habit and character, but differs from both in the calyx being toothless, in the form of the stylodium, and in the want of involucra. From habit and the somewhat didymous fruit it comes also very near Astoma.  

1 S. microcarpa (D. C. l. c.). Native of the Levant, near Seyde, at the foot of Mount Lebanon. Fruit small, blackish.  

Small-fruited Scaligeria. Pl. 1 foot.  

Cult. Sow the seeds in autumn, in the open ground; they will grow in any common soil.  

SUBORDER III. COELOSPERMAE (from κοιλός, koilos, hollow, and σπερμα, sperma, a seed; from the seeds being involutely curved from the base to the apex, and therefore forming a hollow on the inner side). D. C. prod. 4. p. 249. Albumen involutely curved from the base to the apex, excavated in front.  

TRIBE XVII.  

CORIAN'DRIFIE (this tribe contains plants agreeing with Coriandrum in important characters). Koch, umb. p. 82. D. C. prod. 4. p. 249. Fruit globose or didymous, with 2 subglobose mericarps. Mericarps with 5 primary, depressed, or flexuous ribs; the lateral ribs placed before the accessory margin; the 4 secondary ribs are more prominent than the primary ones; all wingless. Seeds involute, or curved from the base to the apex, hence they are excavated in front.  

LIN. SYST. Pentandria, Digynia. Margin of calyx obsolete. Petals obovate, emarginate, with an inflexed point; outer petals nearly equal, or radiating and bifid. Fruit didymous; mericarps somewhat globose ventricose, granularly wrinkled, marked with 5 impressed obsolete stripes: the 2 lateral stripes semicircular, and placed before the accessory margin. Vittae none. Commissure furnished with 2 holes. Seed involute from the base to the apex. Carpophore bipartite, adnate on both sides.—Petid herbs, with sulcate angular stems; and decomposed leaves; having five segments. Umbels of 2-3 rays. Involucra and involucelles wanting, or of one leaf. Flowers white. —B. testiculatum (Spreng. l. c.) umbels of 2-3 rays; involucra and involucelles of one leaf; flowers nearly equal; styles very short.  

Twin-fruited Bifora. Pl. June, Jul. Cilt. 1649. Pl. 1 to 2 ft. 2. B. radianus (Biob. suppl. 233.) umbels of 5 rays; involucra and involucelles of 1-2 leaves; outer flowers radiant; styles elongated after flowering.  

Cult. The seeds only require to be sown in the open border.  

CLXVIII. ASTOMA (from a priv. and στόμα, stoma, a mouth; this genus differs from Bifora in the want of the 2 holes in the commissure; hence the name). D. C. coll. mem. v. p. 71. t. 17. prod. 4. p. 249. but not of Gray.  

LIN. SYST. Pentandria, Digynia. All as in Bifora, but the
fruit is more evidently didymous; the commissure narrow, neither perforated nor dilated at the apex; and the styles rather divergent.—A glabrous herb, at first sight appearing like a species of *Seseli*. Stem terete, striated, erect, branched. Superior leaves bipinnatifid: with a few linear, nearly subulate, elongated, quite entire segments. Umbels by threes, pedunculate at the tops of the branches: the 2 lateral ones axillary and opposite, 6-8-rayed; but the central umbel is 10-12-rayed. Leaves of involucrum 5-6, lanceolate, entire, acuminated. Umbelles of 10-12 flowers, involucels of 4-5 leaves. Flowers white, all hermaphrodite. This is an intermediate genus between *Bifora* and *Atrema*: from the first it differs in the commissure being imperforated, in the fruit being smaller, and in the involucra and involucels being of many leaves; and from the last in the margin of the calyx being obsolete, in the fruit being without ribs, and exactly didymous.

1 A. *seseliformium* (D. C. l. c.). O. H. Native of Egypt, or rather of Syria, where it was gathered by Donati. Coriändrum seseliformium D. C. The fruit of this plant is 3 times smaller than in all the other genera of Coriándraceae, and exactly didymous. Mericarps nearly globose.

CLXIX. *ATREMA* (from a priv. and τρύμα, *tremu*, a hole; there are no holes in the commissure, as in the genus *Bifora*). D. C. coll. mem. v. p. 71. t. 18. prod. 4. p. 250.

Lin. syst. *Peniändria*, *Digynìa*. Teeth of calyx 5, acute, small, permanent. Petals obovate, emarginate, nearly equal, with an inferred segment. Fruit nearly didymous; mericarps nearly globose; ventricose: marked with 5 rather prominent small ribs. Vittae none. Commisure narrow, closed. Seed involute from the base to the apex.—An herb with a furrowed stem, having the angles acute and dentately mucrinated over the umbels. Leaves multifid, with linear segments. Umbels and umbellules of 5-8 rays. Involucra and involucels of many linear-setaceous, undivided leaves. This genus is intermediate between *Coriändrum* and *Bifora*. The flowers are equal and the fruit is didymous as in *Bifora*, and the fruit is spicid, 3-ribbed, and the calyx 5-toothed, as in *Coriändrum sativum*.

1 C. *Anethódes* (D. C. ex Meyer, verz. plantz. p. 132.)

O. H. Native of Caucasus, in stony places on the mountains of Taulisch, near Swant, about 2000 feet above the level of the sea.

*Fennel-like Cymbocarpace.* Pl. 1 foot. *Cult.* For culture and propagation see *Bifora*, p. 381.

N.B. The two species of *Coriändrum* cultivated in China and Cochín-china, are mentioned by Loreiro in his fl. cochin. p. 225. under the names of *C. sativum* and *C. testiculátum*; but the first differs from the true *C. sativum* in the involucres being of one leaf; and the second differs from the true *C. testiculátum* or *Bifora*, from the involucra and involucels being multifid, and in the fruit being sweet scented.

The tube of the calyx adnate to the ovary: with the limb entire or toothed. Petals 5-10, alternating with the calycine teeth, valvate in restivation, rarely wanting altogether. Stamens equal in number to the petals, rarely double that number, inserted beneath the margin of a large epigenous disk; anthers bilocular, peltate. Ovarium adnate to the calyx: with 2 or more cells, containing each only one ovulum. Styles many, simple, sometimes distinct and diverging, sometimes joined in one, rarely wanting; stigmas simple. Berry 2-15-celled, crowned by the entire or toothed limb of the calyx; having as many 1-seeded cells as there are styles. Seeds angular, erect, with a crustaceous testa, and a membranous endopleura. Embryo small, inverted, surrounded by copious fleshy albumen; having a superior radicle, which is twice the length of the cotyledons.—

Trees or shrubs, rarely herbs. Stems frutescent, often scandent, adhering by root-formed fibres to other substances, as in ivy. Leaves alternate, exstipulate, petiolate, simple or compound. Petioles long, always dilated and thickened at the base. Flowers axillary or terminal, umbellate or capitate; the umbels or heads often disposed in a racemose or paniculate manner: having involucres usually present.

The order Araliaceae approximates Umbelliferae, but differs from it in the inflorescence being often imperfectly umbellate; in the styles being usually many; in the fruit being baccate, and usually plurilocular, always without vitre; and in the parts of the fruit not being separable; in the albumen being fleshy, and in the embryo being nearly the length of the albumen. It also comes near Ampelidaceae, but differs in the stamens in Araliaceae alternating with the petals, not as in Ampelidaceae opposite them, in the leaves being exstipulate, and in the inflorescence never being opposite the leaves, as well as in the calyx adhering to the ovary, not free from it. The genus Hedera has often been confused with Caprifoliaceae, but agrees best with the present order, in the free petals and structure of the fruit.

The flowers have no beauty, but the foliage of many is extremely fine. The medicinal properties are much the same as those of Umbelliferae, except the fruit, which differs in virtues, as it does in botanical structure. The bark of many of the species exudes an aromatic gum-resin, as in Aralia umbellifera and others. The roots are tonic, with, in some cases, the flavour of parsnip. The famous Ginseng, which is produced by a species of Panax, is reputed to have powerful tonic, restorative, and even aphrodisiac qualities; but it is probable that these have been greatly exaggerated. The plant has perhaps some really invigorating power when fresh, which after the statements made by Father Jartoux cannot reasonably be doubted.

Synopsis of the genera.

5. Gelsemium. Margin of calyx entire, drawn out beyond the ovary. Petals 5-10. Stamens 5-10. Ovarium 5-10-celled, crowned by a broad disk. Style short, composed of 5-10 concrete ones, which at length diverge a little at the apex. Fruit fleshy, 5-10-celled.

6. Gastronia. Margin of calyx entire, drawn out beyond the ovary. Petals 5-16. Stamens double the number of the petals, 2 in front of each petal. Styles 8-12, short, rather concretes at the base. Fruit 8-12-celled, 8-12-ribbed, nearly dry.

10. Sciadaphium. All as in Aralia, but the petals are joined together into the form of a calyptra at the apex.

11. Hedera. Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex. Stamens 5-10. Styles 5-10, connivent, or joined in one. Berry 5-10-celled.

12. Parateopia. All as in Aralia or Hedera, but differs in the stigmas being sessile, at first approximate, and immersed in the epigenous disk.

I. Adoxa (from a priv. and coxa, doxa, glory; without any appearance. This plant covers the places where it grows, but the flowers are hardly to be seen, being of the same colour as the leaves). Lin. gen. no. 501. Gartn. fruit. 2. p. 111. t. 112. f. 9. Lam. ill. t. 320. D. C. prod. 4. p. 251.—Moschatellina, Tourn. inst. t. 68.

Lin. syst. Octandria, Tetragynia. Tube of calyx adnate to the ovary, with 2-3 deep segments. Corolla of one petal, wheel-shaped, in 4-5 (f. 66. a.) deep ovate, acute, spreading segments, longer than the calyx. Stamens 8 or 10; anthers roundish. Ovarium half superior. Styles 4-5 (f. 66. b.), short, united at their base, which is permanent. Berry globose, its lower half invested with the permanent calyx, whose segments surround the middle part, of one cell, pulpy inside. Seeds 4, ranged round the
central pulp, compressed, surrounded by a vertical membranous border. The terminal flower is only 1-cleft, with 8 stamens: the rest 5-cleft; hence according to the rule assumed by Lin- neus, this genus is placed in Octandria.—A smooth herb of humble growth, with twice ternate leaves, and terminal capitate green flowers. (f. 66. a.)

1 A. moschatellina (Lin. spec. p. 527.) 2 H. Native of Europe and Siberia, even to Dabaria, in groves, thickets, and under hedges; plentiful in Britain in like situations; in North America in the woods between lat. 54° and 64°, and the Rocky Mountains between lat. 42° and 46°. Smith, engl. bot. t. 453. Curt. fl. lond. t. 26. Fl. dan. 94. Moschatellina tetragona, Monch. meth. 476. —Lob. icon. 674. f. 2. —Corr. hist. 1722. f. Gerard. emac. 1301. Root of several white united crossing con- cave scales, producing fibres and runners from their interstices. Stem angular. Radical leaves twice ternate, on long stalks; cauline ones ternate, on long stalks. Flowers with a musk scent, when moist, forming a round head. (f. 66. c.)

Tubercous Moschatell. Fl. April, May. Britain. Pl. ½ f. Cult. The plant will grow freely under the shade of trees; and will be easily increased by the offsets.

II. PANAX (from παν, pan, all, and αοες, akos, a remedy; that is to say, a remedy for all diseases; in allusion to the mirac- ulous virtues which is attributed to P. quinquefolium, the ginseng of the shops). Lin. gen. no. 1166. Lam. ill. t. 860. D. C. prod. 4. p. 252.

Linn. syst. Polygaminia, Dieciea. Flowers polygamous. Margin of calyx very short, obliquely 5-toothed. Petals 5 (f. 67. a). Stamens 5, inserted along with the petals under the margin of the disk, alternating with them. Styles 2-3, short. Fruit fleshy, compressed, orbicular, or didymous (f. 67. c), 2-celled: cells coriaceous cartaceously, 1-seeded. —Herbs, shrubs, and trees, having the leaves and indorecence variable. The habit of the species is heterogeneous, but the characters of those that are perfectly known agree.

§ 1. Herbaceous plants, with tuberous roots; and verticillate, petiolate, palmately-compound leaves.—Aureliana, Cat. car. append. t. 16.—Araliastren, Vaill. serrm. p. 48.

1 P. quinquefolium (Lin. spec. 1512.) root tissiform, a little branched; leaves with 5 leaflets, which are stalked from the top of the common petiole; peduncle of umbel shorter than the petioles; styles and seeds 2. 2. H. Native of North America, in shady mountain woods, from Canada to Carolina; and of the north of Asia, as in Turania; and the north of China. Sims, bot. mag. 1333. Bigel. med. bot. 2. t. 29. Woody. med. bot. t. 99. Blackw. 513. —Lafit. gins. 51. t. 1. Catesh. car. 16.—Trew. chret. t. 6. f. 1. Jartoux, in phil. trans. 20. p. 237. Herb larger than the following species. Flowers yellowish. Berry globose, depressed, red. This plant is a native of Chinese Tartary, and also of North America. In the former country it has been gathered as an invaluable drug from time immemorial. In 1709 the Emperor of China gave orders to 10,000 Tartars to go in quest of the root, and to bring as much as they could find; every one was to give two pounds of the best to the emperor, and to sell the rest for the same weight of fine silver. The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese. Osbeck says that he never looked into the apothecaries’ shops but they were always selling ginseng, that both poor people and those of the highest rank made use of it, and that they boil half an ounce in their tea or soup every morning, as a remedy for consumption and other diseases. Jartoux relates that the most eminent physicians of China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves petrifying humours, and renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hyste- risis, hypochondriacal, and all nervous affections, giving a cure in two or three times the same age. The French in Canada use the root for curing the asthma, and as a stomachic. After all, our physicians say that we have no proof of the effi- cacy of ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine. The Chinese name of yamnsan or yanson, and the American one garangtonges or garangtologing are both derived from the fancied resemblance in the root.

Three-leaved Ginseng. Fl. May, June. Ct. 1759. Pl. 52 f. 3 P. sussgiseng (Wall. in act. soc. med. et phys. cale. 4. p. 117. pl. rar. asiat. 2. p. 30. t. 137.) tubers of roots in fascicles; leaves in threes or fours, quinate or ternate; leaflets lanceolate, ending in a long taper point, petiolate, much attenuated at both ends, doubly and euspidately serrated, sometimes deeply serrated, beset with hoary bristles along the nerves and midrib; peduncles terminal, usually trifid, about equal in length to the petioles; flowers hermaphrodite; berries 2-3-seeded.

2. H. Native of Nipaul, on the top of Mount Shepore. Flowers whiteish. Styles 2-3. Berry 2-3-celled, red. This species comes very near to P. quinquefolium or Ginseng, but is not known to possess any medicinal qualities.

False Ginseng. Fl. June. Pl. 1 to 2 feet. 4 P. trifinumatum (Wall. cat. no. 4934.) herbaceous, unarmed; leaves trinerved; leaflets ovate, acuminate, mucron- ately serrated, pale beneath, rather downy; panicle long, pubescent; umbellules many-flowered. 2. H. Native of Nipaul, at Gossingathan. P. decompositum, Wall. but not of D. C.

Tripinimata-leaved Panax. Pl. 2 to 3 feet.

§ 2. Prickly shrubs. Leaves ternate, or palmately lobed.

5 P. aculeatum (Ait. hort. kew. 3. p. 448.) stem shrubby;

**Prickly Panax.** Pl. Nov. Chi. 1773. Shrub 3 to 5 feet.

6 P. **LOUREI** (D. C. prod. 4. p. 232.) stem shrubby; branches prickly; leaves of 3 broad, lanceolate leaflets; umbels terminal, dense; petals 4. G. Native of China, in the province of Canton. Electrónia Chínensís, Lour. cooh. p. 162. This is a true species of *Panax*, and probably nothing but *P. pseudoatum*. Flowers white, Stevens 5. Berry 2-seeded.

Loureiro's Panax. Shrub 5 feet.

7 P. **no** (Smith, in Rees' cyc. 26. no. 10.) shrub bushy and very prickly; leaves simple, palmately lobed, deeply serrated, cordate; with prickly veins; umbels capitiate, racemose; styles and seeds 2. G. Native of the west coast of North America, at Nootka Sound. Abundant on the west side of the Rocky Mountains, from the head-springs of the Columbia to the coast; and of North California, ex Smith; and of the islands of Katiak and Sitka, according to Stevens. Styles 2, short. Fruit orbicular, pulpy. Racemes hispid. Flowers polygamous. Arálica occidentalis. Willd. herb. ex Stev. The entangled stems of this remarkable plant are described as a great impediment to travellers in the woods of North America.

**Hook. fl. bor. amer.** 1. p. 273. t. 98. (f. 68.)

**Horrtd Panax.** Shrub straggling.

**Hainia Panax.** Tree.

**§ 3. Shrubbery, unarméd. Leaves simple, undivided.**

**Shell-leaved Panax.** Chi. 1820. Shrub 10 to 12 feet.

10 P. **HEYNEX** (Wall. cat. no. 4927.) shrubby, unarmed; leaves broad, roundish-cordate, petiolate, quite entire, coriaceous, glabrous; branches of panicle in clusters; umbellules few-flowered. G. Native of the East Indies.

**Heyne's Panax.** Tree.

11 P. **simplicefolium** (Forst. prod. no. 399.) stem fruticosum; leaves lanceolate, serrated; umbels compound. G. Native of New Zealand. Perhaps the same as *P. simplicifolium*, Dietr. goetr. lex. 6. p. 633.

**Simple-leaved Panax.** Shrub.

**§ 4. Unarmed shrubs, with digitate leaves.**

12 P. **ATTENUATUM** (Swartz, prod. p. 54. fl. ind. occ. 1. p. 562.) stem shrubby, unarmed; leaves petiolate, digitate; stipulas intrapetiolar, membraneous; leaflets 5, rarely 3, petiolate, ovate, narrowly acuminate, crenated, glabrous; umbels terminal; branches racemiferous. G. Native of Guadalupe and St. Christopher. Racemes shorter than the leaves. Fruit compressed, indehiscent, oblong, hardish, 2-seeded, rarely 3-seeded. Flowers hermaphroditic, all fertile. Style bifid, rarely trident.

**Attenuated-leaved Panax.** Chi. 1823. Shrub 10 to 12 feet.

13 P. **ARBOREUM** (Forst. prod. 398.) stem arborescent, unarmed; leaves digitate, petiolate; leaflets 5, oblanceolate, serratetoothed; umbels compound; rays of umbel elongated. G. Native of New Zealand. Linn. fil. suppl. 441.

**Arborescent Panax.** Tree.

14 P. **GAUDICHAYDI** (D. C. prod. 4. p. 253.) Hook. and Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arborescent, glabrous, unarmed; leaves petiolate, digitate; superior ones opposite; leaflets 3, on long petioles, oval-elliptic, obtuse, remotely and sharply serrated, coriaceous; peduncles terminal, bearing umbels which are disposed in panicles; pedicels very short; styles 3; fruit globose-trigonal, 3-seeded. G. Native of the Sandwich Islands, in temperate places. Arálica trigna, Gaud. voy. p. 474. t. 98. This species is very nearly allied to *P. Lessoniíi*, and will perhaps, along with it, form a separate genus.

**Gaudichay's Panax.** Tree.

15 P. **LESSONII** (D. C. prod. 4. p. 253.) shrub glabrous, unarmed; leaves digitate, petiolate; leaflets 3-5, oblanceolate, cuneate at the base, acute, and quite entire at the apex, or bluntly somewhat toothed; umbels panicked, arising from the upper axis of the leaves, length of leaves. G. Native of New Zealand, where it was gathered by Lesson. Petioles not dilated at the base. Peduncles having the branches umbellically disposed at the apex, the rest scattered. Leaves scattered along the branches. Styles 3, very short, almost entire.

**Lesson's Panax.** Tree.

16 P. **OVATUM** (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arborescent, glabrous, unarmed; leaves petiolate; superior ones opposite; leaflets 3, on long petioles, ovate, quite entire, coriaceous. G. Native of the Sandwich Islands. Flowers and fruit unknown.

**Ovate-leaved Panax.** Tree.

17 P. **PLATYPHYLLUM** (Hook. et Arn. in Beech. voy. pt. bot. 1. p. 84.) stem arborescent, glabrous, unarmed; leaves petiolate; upper ones opposite; leaflets 3, on long petioles, oval, quite entire, coriaceous; peduncles terminal, bearing umbels of flowers, which are disposed in panicles.

18 P. **GLABRATUM** (H. B. et Kunth, nov. gen. amer. 5. p. 10.) stem arborescent, unarmed; leaves petiolate, digitate; leaflets 5, petiolulate, elliptic-oblong, acute at the base, quite entire, glabrous; panicle terminal; umbellules few-flowered. G. Native of South America, near La Vente Grande de Caracac.

**Smooth Panax.** Tree 20 feet.

19 P. **LONGIPETIOLATUM** (Pohl, in litt. ex D. C. prod. 4. p. 553.) stem arborescent, unarmed; leaves on long petioles, digitate, glabrous; leaflets 5-9, oblanceolate, acuminate, acute at the base, entire, or acutely toothed, membranous, on long petioles; adult ones glabrous, but when young clothed with rusty tomentum beneath. G. Native of Brazil.

**Long-petioled Panax.** Tree.
20. P. splendens (H. B. et K.) stem arborescent, unarmed; leaves digitate, on long petioles; leaflets 9, petiolate, somewhat oblanceolate, acuminate, rounded at the base, or somewhat cordate, sharply and doubly toothed, rather hispid above and silky beneath.  \( \sqrt { 7 } \). S. Native of South America, in the temperate parts of Popayan. Aralí a mics, Willd. mss. in Schultes, syst. 6. p. 701. Flowers and fruit unknown.

Splendid-leaved Panax. Tree 20 feet?

21. P. serratifolium (Wall. in herb. Moricand, ex D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves on long petioles; digitate; leaflets 5?, petiolate, oblanceolate, rather acuminate, somewhat attenuated at the base, rather glabrous above, and tomentose beneath.  \( \sqrt { 7 } \). G. Native of Nipal. Umbels many, disposed in a racemose manner.

Serrate-leaved Panax. Shrub.

22. P. tomentosum (Wall. in herb. Moricand, ex D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves on long petioles, digitate; leaflets 7-10, petiolate, ovate-oblong, rounded at the base, acute and quite entire at the apex, flat, covered with silky tomentum beneath; panicles terminal, crowded; umbels of 12-15 flowers.  \( \sqrt { 7 } \). S. Native of Caracas and Porto-Rico, on sterile hills. P. spinosa, Poir. suppl. 2. p. 778. P. undulatus, H. B. et Kuntz, nov. gen. amer. 5. p. 11. p. 417. f. 2. Panicle very showy, rather spiny. Petioles 3 feet long; leaflets nearly a foot long.

Showy Panax. Tree large.

23. P. speciosum (Willd. spec. 4. p. 1126.) stem arborescent, unarmed; leaves petiolate, digitate; leaflets 7-10, petiolate, ovate-oblong, rounded at the base, acute and quite entire at the apex, flat, covered with silky tomentum beneath; panicles terminal, crowded; umbels of 12-15 flowers.  \( \sqrt { 7 } \). S. Native of Caracas and Porto-Rico, on sterile hills. P. spinosa, Poir.

Silky Panax. Tree.

24. P. Morototoni (Aubl. guian. 2. p. 949. t. 360.) stem arborescent, unarmed; leaves petiolate, digitate; leaflets 7-9, oblong-lanceolate, attenuated at both ends, quite entire, undulated, clothed with golden tomentum beneath; panicle terminal, diffuse; umbellets of 8-13 rays.  \( \sqrt { 7 } \). S. Native of Cayenne, and the Island of Trinidad. P. chrysophyllum, Vahl. edag. 1. p. 33. P. undulata, Pers. ench. 1. p. 298, but not of Kuntz. Fruit compressed, pubescent. Leaflets like the leaves of Chrysophyllum Cuinito. M. rototoni is the Guiana name of the tree.

Morototoni Panax. Cl. 1822. Tree 100 feet.

25. P. serratum (Pohl, in litt. ex D. C. prod. 4. p. 254.) stem arborescent, unarmed; leaves digitate; leaflets 6-7, nearly sessile, oblong, obtuse, eunciated, with a revolute entire margin, coriaceous, silky from very finely rusty down beneath; racemes umbelliferous, panicled, clothed with silky rusty down.  \( \sqrt { 7 } \). S. Native of Brazil. P. vinousus, Schlcht. ex Pohl.

Silky Panax. Tree.

26. P. ? Anisum (D. C. prod. 4. p. 254.) stem shrubby, unarmed; branches very hispid; leaves impari-pinnate: with 5-7 oval, quite entire leaflets, which are acute at both ends; umbels terminal, compound.  \( \sqrt { 7 } \). S. Native of the Moluccas, and other Indian islands. Anisum Moluccanum, Rumpl. am. 2. p. 132. t. 43. Fruit rather didymous, with the scent of anise-seed.

Anise-scented-seeded Panax. Shrub 10 feet.

27. P. Leschenaultii (D. C. prod. 4. p. 254.) stem shrubby, unarmed; leaves pinnate: with 5 petiolate, broadly ovate, narrowly acuminate, acutely serrated, glabrous leaflets; umbels compound, bracteate.  \( \sqrt { 7 } \). F. Native of the East Indies, on the Nelligerry mountains, where it was gathered under the name of Solé maltanet. Califly bluntly 5-toothed.

Leschenault’s Panax. Tree.

28. P. diurum (Wall. cat. 4937.) unarmed; leaves pinnate; leaflets 5, broad-ovate, acuminate, smooth, spinulose serrated, rather oblique at the base; panicle umbellate, compound, spreading; umbellules of many flowers.  \( \sqrt { 7 } \). G. Native of Nipal.

Two-paired-leafletted Panax. Tree.

29. P. visnatum (Lam. dict. 2. p. 715.) stem shrubby, unarmed; leaves impari-pinnate; leaflets oval-lanceolate, acuminate, nearly entire, glabrous; panicle terminal; umbels few-flowered.  \( \sqrt { 7 } \). S. Native of the Moluccas. Scutellaria seceda, Rumph. amb. 4. p. 76 t. 32. Panax seceda, Schultes, syst. 6. p. 215. Berry somewhat compressed.

Pinnate-leaved Panax. Shrub 10 to 12 feet.

30. P. armatum (Wall. cat. no. 4933.) stem shrubby, prickly; racis of leaves jointed, furnished with hooked prickles, particularly at the joints; leaflets ovate, acuminate, serrated, beset with bristly hairs on both surfaces, but particularly on the nerves; panicle long, downy; umbellules many-flowered.  \( \sqrt { 7 } \). S. Native of the East Indies.

Armed Panax. Shrub.

31. P. finlaysonii (Wall. cat. no. 4936.) shrub furnished with hooked prickles on the stems, and racis of leaves; leaves pinnate and bipinnate; leaflets ovate, acuminate, membranous, coarsely serrated, beset with bristly hairs on both surfaces; panicle large; umbellules many-flowered.  \( \sqrt { 7 } \). S. Native of the East Indies.

Finlayson’s Panax. Cl. 1816. Shrub.

32. P. fragrans (Robx. hort. beng. p. 21.) stem shrubby, unarmed; leaves decussate; having the petiole many times oppositely branched: the ultimate branches of the petiole trifoliate; leaflets ovate, acuminate, entire, petiolate, the middle one the longest; panicles loose; ultimate branches short, bearing few-flowered umbellules.  \( \sqrt { 7 } \). G. Native of Nipal. Hiedera fragrans, D. Don, prod. fl. nep. 137.? but the leaves are not truly ternate, nor the margins segmentally serrated, nor any way glaucous beneath.

Fragrant Panax. Cl. 1816. Shrub.

33. P. fercicosum (Lin. spec. 1513.) stem shrubby, unarmed; leaves pinnately decussate; leaflets petiolate, oval-oblong, acuminate, coarsely and dentately serrated; ultimate ones deeply tridif; panicle corymbose; with the branches umbelliferous at the apex.  \( \sqrt { 7 } \). S. Native of the islands of Ternate, Java, and Ambonaya. Andr. bot. rep. t. 295. Blum. bijdr. p. 880. Scutellaria tertia, Rumph. amb. 4. p. 78. t. 33. Styles 3. Berry 2-3-seeded. Leaves bipinnate or tripinnate.

34. P. obtusum (Blum. bijdr. p. 880.) stem shrubby, unarmed; leaves supra-decussate; leaflets oblong-roundish, entire, or deeply parted, repandly and cuspicate serrated; umbels compound, terminal.  \( \sqrt { 7 } \). S. Native of Java, where it is called Kodong-dong.

Obtuse-leafletted Panax. Shrub.

35. P. samucfolium (Sieb. pl. exsic. nov. holl. 2. no. 256.) stem shrubby, unarmed; leaves pinnate, and somewhat bipinnate; leaflets petiolate, distant, oblong, acuminate, remotely serrated; panicle terminal; umbels 10-12-flowered.  \( \sqrt { 7 } \). G. Native of New Holland. Styles 2, acute.

Elder-leaved Panax. Shrub.

36. P. decompositum (Wall. in herb. Moricand, ex D. C. prod. 4. p. 255.) stem herbaceous; unarmed; leaves impari-pinnate of 2-4 pairs of petiolate, ovate, acuminate, sharply serrated, glabrous, or rather scabrous leaflets; umbels compound.—Native of Nipal. Umbellules many-flowered; pedicels 1-5 lines long.
Decomposed-umbellled Panax. Pl. 2 to 3 feet.

Cult. The hardy species of this genus grow best in peat, and are increased by dividing at the root. The other species grow well in a mixture of loam and sand: and are increased by cuttings which should be planted in sand, with a hand-glass placed over them.

Lin. syst. Pent-Heptandra, Di-Trigynia. Margin of calyx short, entire or with 5-7 acute teeth. Petals 5-7. Stamens 5-7, alternating with the petals. Ovarium turbinate, crowned by a broad disk. Styles 2-3, short, erect, distinct, approximate. Fruit 2-3-celled, roundish, nearly dry.—Cape shrubs; with rather succulent, thick trunks. Leaves glabrous, petiolate, palmate; leaflets 5-7, 1-nerved, entire, or lobed. Flowers greenish.

1 C.スピカータ (Thunb. nov. act. usps. 3. p. 212. t. 13.) leaves palmate; leaflets petioloate, variously and acutely cut, often trifid at the apex; flowers spicicata, exactly sessile along the rachis. G. Native of the Cape of Good Hope, Thunb. fl. cap. 247. Ait. hort. kew. 2. p. 115. Shrub glabrous, 8-10 feet high. Leaflets usually 7, rarely 5, lower ones 3, variously pinchate, ternate at the apex; lobes angularly toothed, very acute. Calyx entire. Flower bud globose. Styles 2-3. Flowers spirally disposed along the rachis of the spike in 5-6 series.

Spiked-flowered Cussonia. Clt. 1789. Shrub 6 to 10 feet.

2 C. THYSFILOSA (Thunb. act. usps. 3. t. 12.) leaves palmate; leaflets sessile, cuneiform, obtuse, truncate, truncate; flowers racemose, pedicellate along the rachis. G. Native of the Cape of Good Hope. Jacq. fil. eclog. 1. p. 85. t. 61. C. thysifoila, Thunb. nov. gen. 1. p. 11. Pers. ench. 1. p. 298. Leaflets some of them entire, and a little toothed: others are ternate, varying in number from 3 to 5. Calyx acutely 5-toothed. Styles 3. There is a variety of this with jointed leaflets, the lowest joints dilated at end into smaller lobes.

Thysa-flowered Cussonia. Clt. 1785. Tree 6 to 12 feet.

3 C. TRICHTERA (Colla, hort. ripul. 43. t. 26.) leaves palmate, leaflets sessile, variously and deeply pinnatifid, trifid at the apex. G. Native of the Cape of Good Hope. The leaflets are the number and form of those of C.スピカータ, but they are sessile, as in C. thysifoila. Flowers unknown.

Three-winged Cussonia. Shrub.

Cult. A mixture of peat, loam, and sand is a good soil for the species; and cuttings root readily if planted under a hand-glass.

Madagascar Maralia. Shrub.

Cult. See Cussonia above for culture and propagation.

Lin. syst. Pent-Decandria, Monogyne. Margin of calyx entire, drawn out beyond the ovarium. Petals 5-10. Stamens the same number as there are petals, and alternating with them. Ovarium 5-10-celled, crowned by a broad disk above. Style short, thick, conical or pyramidal, composed of 5-10 jointed ones, which are erectly connivent at the apex at first, but at length diverging a little. Fruit fleshy.—Shrubs or small trees. Leaves variable. Flowers umbellate, disposed in racemose panicles. This genus differs from Gastônia in the stamens being equal in number to the petals, not double that number as in that genus; and in the style being thick and pyramidal, hardly divided at the apex, not parted to the base, and stellate.

1 G. UMBELATA (Ruiz et Pav. fl. per. 3. p. 75. t. 312.) leaves simple; petals imbricate; limb ovate-oblong, obsolescently dentilicate, glabrous; umbels terminal, compound. G. Native of Peru, in the groves of Muna. Calyx 7-toothed. Petals 7. Style thick, conical; stigmas 7, at length spreading a little. Fruit 7-celled. Wangenheimia umbellata and Gunni'ma umbellata, Dietr. ex Steud.

Umbellate-flowered Gilbertia. Tree.

2 G. PALMA (D. C. prod. 4. p. 256.) leaves simple, glabrous above, and clothed with rusty pubescence beneath, corolate, palmately lobed; lobes lanceolate, acute, serrate; petals long, prickly; flowers umbellate. G. Native of the East Indies, at Chittagon. Gabiloria palmata, Roxb. hort. beng. 33. Ländl. bot. reg. 894. Calyx plicate. Petals white, nearly ovate, 5-9. Perhaps G. palmera, Mess. se. 1825. in Fernus. bull. 1825. oct. 326. From the description the leaves are said to be nearly peltate; the leaflets petiolate, and the petals wanting. Flowers white.

3 G. REPANDA (D. C. l. c.) leaves or leaflets broadly ovate, feather-nerved, coriaceous, glabrous on both surfaces, bluntly somewhat attenuated at the base, on short petioles, with repand-toothed margins; flowers umbellate. G. Native of the Mauritius. Margin of calyx short, entire. Ovarium sulate, conical in the superior part. Style hardly any; stigmas 5-7, very short, nearly stellate. The leaves or leaflets being detached from the specimen examined, it is doubtful whether the leaves are simple or compound; but from analogy we would rather consider them as compound.

Repa-doothed-leaved Gilbertia. Shrub.

Nalugu Gilbertia. Shrub 8 to 10 feet.

5 G. FANNUKATA (D. C. l. c.) leaves or leaflets broadly obvate, obtuse, feather-nerved, quite entire, coriaceous, glabrous; flowers panicked, disposed in racemes along the branches of the panicle. G. Native of the Mauritius and Bourbon. The leaves or the leaflets, whichever they may be, are about a foot long, and 6 inches broad. Panicle 6-8 inches long. Flowers on short pedicels. Margin of calyx entire; flower-bud conical, obtuse, 10-angled. Petals 10, valvate. Stamens 10, alternating with the petals. Style thick, conical, hardly 8-10-lobed at the apex. Ovarium 8, rarely 9-10-celled.

Panicled Gilbertia. Trec.
ARALIACEÆ. VI. GASTONIA. VII. POLYSCIAS. VIII. TORICELLIA. IX. ARALIA.

† A species not described.

6 G. saururoideæ (D. C. l. c.) ¾ S. Native of the Moluccas. Gastonia saururoideæ, Roxb. hort. beng. p. 90. Saururoideæ, Saururoideæ. Tree. — Shrubs and trees, having handsome foliage. The soil best adapted to grow these is a mixture of sand, loam, and peat; and cuttings are readily rooted, if planted in sand under a hand-glass in heat.

Lin. syst. Pentándria, Digínya. Margin of calyx entire, drawn out beyond the ovarium. Petals 5-16. Stamens double the number of the petals, 2 of which are opposite each petal. Ovarium 8-12-celled. Styles 8-12, short, concrete at the base. Fruit 8-12-celled, 8-12-ribbed, nearly dry, ex Juss. capsular. — A tree, native of the Mauritius. Leaves impari-pinnate. Flowers umbellate; umbels exinovalvate, disposed in panicles. — 1 G. cutispóngia (Lam. dict. 2. p. 610.) ¾ S. Native of Bourbon, where it is called by the inhabitants bois d'éponge or sponge-wood. G. spongiosa, Pers. ench. 2. p. 20. Araliaceæ, Sibb. fl. maur. excis. 2. p. 197. A tall smooth tree, covered with spongy bark. Leaves at the tops of the branches impari-pinnate: with 5 coriaceous, ovate, obtuse, quite entire leaflets. Racemes rising under the leaves, bearing umbels, containing about 20 flowers each. Spongy-barked Gastonia. Tree tall.

Cult. See Gastonia above for culture and propagation.

VII. POLYSCIAS (from πολυ, poly, many, and σκιά, skia, a shadow; in reference to the numerous umbels). Forst. gen. p. 63. t. 32. Lam. dict. 5. p. 559. ill. t. 320. with a figure. D. C. prod. 4. p. 257.

Lin. syst. Pent-Octándria, Tri-Pentágynia. Margin of calyx short, dentilicate. Petals 5-7, but usually 8, lanceolate, spreading. Stamens equal in number to the petals, and alternating with them. Style wanting; stigmas 3-5, short, exertly spreading. Berry globose, crowned by the margin of the calyx and stigmas, 4-celled, 4-seeded. Leaves pinnate. Umbels compound or verticillately proliferous; umbellules of many rays, flat. The rest unknown. A very doubtful genus, but probably only a species of Aralía.

1 P. pinnata (Forst. l. c.) ¾ B. Native of the islands in the Southern ocean. P. umbellata, Spreng. ex Steud. nom. 546. A plant has been sent by La Billardière from New Zealand, under the name of Polysciæas, which rather disagrees with the description given by Forster of his plant in the panicle being verticillate, and in the umbellules being 5-7-flowered. Margin of calyx nearly entire. Diak fleshy, covering the ovarium. Styles 2-5, erect, approximate, acute. Leaflets oblong, obtuse at the base, and acuminate at the apex, with somewhat dentilicate margins.

Pinnate-leaved Polysciæ. Tree or shrub.

Cult. See Cussónia, p. 387. for culture and propagation.

VIII. TORICELLIA (in honour of Dr. Toricelli, who prepared a barometer for the measurement of mountains, and therefore has done something towards the geography of botany). D. C. prod. 4. p. 257.

Lin. syst. Pentándria, Tetragynia. Margin of calyx acutely 5-toothed. Petals 5, oblong, attenuated at the base, and unequally incurved at the apex. Stamens 5; filaments very short; anthers ovate. Styles 4, straight, short. Berry nearly dry, ovate, crowned by the calyx, 4-celled. Seed unknown.—A small mountain shrub: with terete white glabrous branches, ringed with cicatrices. Leaves alternate, exstipitate, simple, cordate, roundish, membranous, palmately 5-nerved, coarsely and acutely toothed, somewhat 5-lobed, pubescent along the nerves and nervules; petioles rather dilated at the base. Panicle terminal, many flowered. Flowers abortive or polygonous, or all parts of the parts are rather variable. This genus is nearly allied to Polyclæas.

Cult. This shrub will grow very well in the open ground, and it may be increased by cuttings or seeds.

IX. ARALIA (a name of unknown meaning, under which one species was sent to Fagon from Quebec, in 1764, by one Sarrazin, a French physician). D. Don, prod. fl. nep. 185. in a note. Kunth, nov. gen. amer. 5. p. 8. in a note. D. C. prod. 4. p. 257.—Aralia species of Lin. and other authors.—Aralia vere, Blum. biijdr. 869.

Lin. syst. Pentándria, Pentágynia. Margin of calyx very short, entire or toothed. Petals 5, free, and expanded at the apex. Stamens 5. Styles 5, expanded, spreading divericately. Berry 5-celled, usually torose. Pyrænae charnaceæ.—Herbs and shrubs, indigenous to North America, with compound leaves; and umbellate white flowers, which are usually disposed in panicles.

§ 1. Unarmed species.

1 A. medicuális (Lin. spec. 293.) plant stemless; radical leaf one, with a trifid petiole; impari-pinnate divisions, bearing each 5 ovate acute serrated leaflets; scape trifid at the apex, shorter than the leaf: each division bearing a many-flowered umbel, without any involucrum. ¾ H. Native of North America, from Canada to Carolina, and from Lake Huron throughout the woody country to lat 64°, and the Rocky Mountains; and of Newfoundland. Lam. dict. 1. p. 224. Torr. fl. un. st. 1. p. 327. Big. fl. bost. ed. 2. p. 122. Rafin. med. bot. 1. t. 8.—Pluks. aln. t. 238. f. 5. Petals white, reflexed. Stamens exserted. Styles 3-5, short, erect, distinct. The Crees use the root of this plant as a remedy against the venereal disease, under the name of sumpus-cokpeh, i.e. rabbit-root; and also they apply the bruised bark of its root to recent wounds.—Richardson. The roots were formerly brought over and sold for sarraparilla, and some of the inhabitants of Canada make use of it as such, but it is very different from the true sort. A. medicuális, Blum. biijdr. p. 870. introduced into Java from Japan, is distinct from our plant.

2 A. racémosa (Lin. spec. 393.) stem herbaceous, smooth, divericately branched; petioles triplicate, the partitions bearing each 3-5, ovate or cordate, acuminated, serrated, smoothish leaflets; peduncles axillary, and disposed in a terminal raceme, umbelliferous; involucrum small, of few leaves. ¾ H. Native of North America, from Canada to Virginia, in rocky shady situations: throughout Canada, &c. from Lake Huron to the Saskatchewan. Schkuhr, haud. 1. t. 86. Hayn. term. bot. t. 38. f. 5.—Corn. can. t. 75.—Moris. hist. sect. 1. t. 2. f. 9. Petals greenish-white, spreading. Styles 5, short, erect, hardly recurved at the apex. Fruit 5-ribbed. Stamens equal in length to the petals. The plant is called spikenard in North America, and is highly esteemed as a medicine. Axillary branches leafy.
ARALIACEAE.

3 A. hu'milis (Cav. icon. 4. p. 7. t. 313.) stem herbaceous, glabrous, a little branched; leaves impari-pinnate, pubescent; leaflets cordate, acute, serrated; umbels disposed in terminal racemes; involucra very short, of many leaves. 3, G. Native of New Spain. The fruit, according to Cav. icon. is nearly glabrous. Styles 5, erect, rather distant. Stem variegated with brown tubercles. Petals green.

Humble Aralia. Pl. 1/2 foot.

4 A. Pw'excens (D. C. cat. hort. monsp. 1813. p. 80.) stem woody, unarmed, glabrous, branched; leaves impari-pinnate, pubescent; leaflets ovate-lanceolate, serrated, attenuated at the base, and acuminated at the apex; umbels numerous, disposed in a terminal raceme; involucra very short, of few leaves. 5, G. Native of New Spain. A. scabra, Presl, in herb. Hccke. Petioles not dilated into auricles at the base. Styles 5, divaricately recurved. Fruit glabrous, dark purple.

Pubescent Aralia. Ch. 1818. Shrub.

5 A. hisp'na (Michx. fl. bor. americ. 1. p. 185.) stem suffruticoso, very hispid at the base from bristles; leaves bipinnate; leaflets ovate, acute, deeply serrated, glabrous; petioles hispid; umbels on long peduncules; involucra of many short setaceous leaves. 3, H. Native of North America; in stony woods in New England, &c.; on high mountains in Pennsylvania and Virginia; in Canada, from Lake Huron to the Saskatchewan; Hudson's Bay, and of Newfoundland. Vent. hort. cels. t. 41. Sims, bot. mag. t. 1085. Lodde. bot. cab. 1306. A. Muhlenbergià, Schultes, syst. 6. p. 704. does not differ from this species. The shrub is called Old-elder. Stem paniclebranched at top. Hispid Aralia. Fl. June, July. Ch. 1799. Shrub 1 foot.

+ Unarmed species, which are not sufficiently known.

6 A. corda'ta (Thumb. jap. p. 127.) stem almost herbaceous, angular, unarmed, a little branched; leaves cordate-ovate, serrate-toothed, searbovs on both surfaces; pedicels of umbels tomentose. 3, H. Native of Japan. Das Jen, Kömpf. amer. 5. p. 826. Styles 5, divaricate, ex Thumb.

Cordate-leaved Aralia. Pl. ?

7 A. jàtö'tica (Thumb. fl. jap. 128.) stem shrubby, unarmed; leaves petiolate, 7-nerved, 7-lobed: lobes ovate, serrated at the apex; panicles terminal; peduncles umbelliferous. 3, H. Native of Japan, near Nagasaki. Banks. Icon. Kömpf. t. 10. Styles 5, diverging. Berry striated. Petioles ovate, acute, reflexed (Thumb.). Leaves coriaceous, glabrous in the adult state, but when young woolly on both surfaces. (Blum. bijdr. p. 371.) Petals white.

Japan Aralia. Shrub 5 to 6 feet.

8 A. Schiff'leri (Spreng. pug. 1. p. 28.) stem shrubby, smooth; leaves on long petioles, digitate; leaflets 5, petiolate; lanceolate, attenuated at the base, serrated, glabrous on both surfaces. 3, H. Native of New Zealand. Schifflera digitata, Forst. gen. t. 23. Lam. ill. t. 221. Petals 5, nearly spatulate, erect, not as in the genus Scindaphyllum, cohering into a cyphyta at the apex. Styles 8-10, diverging, not erect, as in Hedera. Berry 8-10 angled.

Schiffler's Aralia. Shrub.

9 A.? octo'hry'lla (Lour. coch. p. 187.) stem almost arborescent, unarmed; leaves petiolate, digitate; leaflets 5, oblong, obtuse, quite entire, glabrous; panicule umbellate. 3, G. Native of Cochim-china. Flowers yellow, of 5 petals. Sigmas 5, sessile. Berry ovate, 5-seeded. Perhaps a species of Pol'ysias. Panicule large, ending in umbels, which are without involucra.

Eight-leafed Aralia. Shrub 10 feet.

10 A.? Pal'mata (Lam. dict. 1. p. 254. but not of Lour.) stem shrubby, unarmed; leaves petiolate, pinnately 9-nerved, 9-cleft; lobes lanceolate, serrated; berry subcylindric, angular, 6-8-celled. 3, S. Native of the Moluccas.—Rumph. amb. t. 43. Perhaps a species of Polysias or Hedera. Umbels crowded, terminal.

Palmate-leaved Aralia. Shrub.

11 A.? mic'ans (Wild. herb. ex Spreng. syst. 1. p. 953.) leaves digitate; leaflets or lobes 10, subcordate, oblong, acuminated, mucronately toothed, hispid above, and silky beneath; heads disposed in racemes. 3, S. Native country unknown. Perhaps a species of Hedera.

Glittering Aralia. Tree or shrub.

9 2. Prickly species.

12 A. spin'osa (Lin. spec. p. 392.) stem arborescent, and are, as well as the petioles, prickly; leaves doubly and triply pinate; leaflets ovate, acuminated, deeply serrated; panicle much branched, beset with velvety stellate down; umbels numerous; involucra small, of few leaves. 3, H. Native of North America, in fertile low woods; of Carolina and Virginia; likewise in the Illinois country. Wats. dendr. brit. t. 116. Comm. hort. amst. t. 47. Pink. aln. t. 26. Schmidt, arb. 102 and 103. A tree about 8-12 feet high, with a simple stem. Petals white, reflexed. Styles 5, divaricate, arched. Fruit 5-ribbed. Known under the name of angelica-tree. The berries used in an infusion of wine or spirits are a remarkable medicine for relieving rheumatic pains.

Tar. ß, inermis (Parsh. fl. amer. sept. 1. p. 209.) stem spinose, glaucous; petioles unarmed. 3, H. Native of South Carolina, near Charleston.

13 A. mont'a'nna (Blum. bijdr. p. 870.) stem arborescent, and are, as well as the petioles and base of the leaves, prickly; leaves decumpanied; leaflets ovate-oblong, acuminated, unequally rounded at the base, sharply serrated, villous; panicle branched; flowers glomerate. 3, S. Native of Java, on the mountains of Seribu, where it is called Kibahoya. Mountain Aralia. Shrub 8 to 10 feet.

14 A. chin'ensis (Lin. spec. 393.) Blum. bijdr. p. 870.) stem arborescent, and is, as well as the petioles, prickly; leaves bipinnate, decumpanied; leaflets ovate-oblong, acuminated, unequally rounded at the base, sharply serrated, villous; panicle branched; flowers glomerate. 3, S. Native of Java, on the mountains (Blum.), China (Lin.), Lour. cochr. 187. Styles diverging, revolute. Petioles villous, bearing a few straight prickles. The figure in Rumph. amb. t. 44. cited by Linnaeus for this plant, is a species of Lycìa. Lourucre describes the plant as very troublesome to travellers, with its numerous crooked prickles, as it climbs in the hedges. According to him the corolla is white. Styles scarcely any.

China Aralia. Tree 10 to 12 feet.

15 A. eri'nae'ca (Hook. in Brewst. edinb. journ. sc. 1827. p. 61.) stem very spiny; leaves nearly palmate, very acute; lobes cut; petioles and nerves of leaves spiny; umbellae globose, disposed in racemes. 3, H. Native of the west coast of North America, in Queen Charlotte's islands.

Eринaceous Aralia. Shrub.

Cult. The hardly herbaceous species of Aralia grow best in peat or vegetable mould, and are increased by dividing at the
root, or by seed. The hardy shrubby kinds also grow best in peat-earth, and are very ornamental and curious; they are increased by seeds brought from the places of their natural growth, which do not vegetate until the second year; or by slips of the roots. The other species being either green-house or stove plants, require to be grown in pots, in a mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass.

LIN. SYST. Pentándría, Pentagyntia. All as in Arália, but the petals cohere in the form of a calyptra at the apex, notwithstanding it ought perhaps still to be joined with Arália.

§ 1. Leaves simple, undivided.

1 S. ru'hlle (Blum. bijdr. p. 875.) shrub parasitical, diffuse; leaves simple, ovate-oblong, acuminate, distantly serrated, coriaceous, glabrous; racemes terminal; flowers umbellate, tetranthous. f. S. Native of Java, in woods on Mount Salak.

Humble Sciodaphyllum. Shrub diffuse.

§ 2. Leaves simple, palmate-labed.

2 S. FALMÁTUM (Blum. l. c. p. 875.) stem arborescent, prickly, leaves membranous, glabrous, palmately 5-9-parted: segments lanceolate, serrated from the middle to the apex; racemes axillary; flowers umbellate, with 9-11 stamens. f. S. Native of Java, in humid parts of woods on the mountains, where it is called tjukurau by the natives. Fruit hemispherical, 6 lines in diameter.

Palmate-leaved Sciodaphyllum. Tree.

§ 3. Leaves trifoliate.

3 S. scándens (Blum. bijdr. p. 878.) stem shrubby, scandent; leaves trifoliate; leaflets lanceolate, much acuminate, quite entire, coriaceous, glabrous; the middle one on a long petiole; racemes crowded, terminal, divaricate; flowers umbellate, pentandrous. f. S. Native of Java, in woods on Mount Tjermani.

Scandent Sciodaphyllum. Shrub scandent.

4 S. PARAßTRICUM (Blum. bijdr. p. 877.) stem shrubby, parasitical; leaves ternate: leaflets oblong, acuminate, obtuse at the base, remotely serrated, coriaceous, glabrous, nearly veinless; racemes axillary and terminal, solitary or twin; flowers umbellate, hexandrous. f. S. Native of Java, at the foot of Mount Salak, where it is called Ramo giling hunte.

Parasitic Sciodaphyllum. Shrub parasitical.

§ 4. Leaves digitate.

* East Indian species.

5 S. SUBRAVE'NE (Blum. bijdr. p. 876.) stem frutescent; leaves digitate: leaflets 3-5, oblong, acuminate at both ends, coriaceous, nearly veinless; racemes crowded, terminal, diverging; flowers umbellate, pentandrous. f. S. Native of Java, on Mount Salak, in woods, where it is called Ramo-hunte by the natives.

Nearly-veinless-leaved Sciodaphyllum. Shrub.

6 S. TOMENTOSUM (Blum. bijdr. p. 877.) stem pubescent; leaves digitate; leaflets 5-7, oblong, acuminate, rounded at the base, shining above, but clothed with stellate tomentum beneath; racemes panicked, axillary, and terminal; flowers umbellate, pentandrous. f. S. Native of Java, in woods on Mount Burungang.

Tar. f. farínæum (Blum. bijdr. p. 875.) leaflets 7, ending in a long taper-point each. f. S. Native of the west of Java, in mountain woods, where it is called Paungany tapok. Actinophyllum farínæum, Blum. cat. hort. bilt. p. 43.

Tomentose Sciodaphyllum. Shrub.

7 S. ELÉTRICUM (Blum. bijdr. p. 878.) stem arborescent, sometimes scandent; leaves digitate; leaflets 5-7, petiolulate, oblong, bluish at both ends, glabrous; racemes panicked, terminal; flowers umbellate, pentandrous. f. S. Native of Java, on the mountains in humid woods, in the province of Buitenzorg, where it is called Ramo-giling or Sangga-boonah. Actinophyllum Elétricum, Blum. cat. hort. bilt. p. 42. and in flora 1825. p. 147.

Dirivicate Sciodaphyllum. Shrub cl.

8 S. DIVIRICATUM (Blum. bijdr. p. 876.) stem arborescent; leaves digitate: leaflets 11-12, oblong, acuminate, rounded at the base, coriaceous, glabrous; racemes crowded, terminal, divaricate, glabrous; flowers umbellate, pentandrous. f. S. Native of Java, on the top of Mount Salak.

Shining Sciodaphyllum. Tree.

* * American species.

Brown's Sciodaphyllum. Cl. 1793. Tree 10 to 15 feet.

Conical-flowered Sciodaphyllum. Shrub 10 to 12 feet.

12 S. penta'r'drum (Poir. dict. 6. p. 747.) stem shrubby, somewhat arborescent; leaves digitate: leaflets 7-11, petiolulate, oblong, acuminate at the apex, coriaceous, glabrous above, but hirsut with stellate pili beneath; racemes 1-3, woolly; flowers capitulate, pentandrous; corollas conical, obtuse. f. S. Native of Peru. Actinophyllum pentádrum, Ruiz et Pav. fl. per. 3. p. 75. t. 311. Corollas of a whitish purple colour; anthers yellow. Berry white, almost the size of a cherry. Leaflets dark-brown beneath. Racemes pale-reddish.

Pentadrum Sciodaphyllum. Cl. 1820. Tree 18 to 20 ft.

13 S. ANGULA'TUM (Poir. dict. 6. p. 745. exclusive of Brown's synonyme,) stem arborescent; leaves digitate: leaflets 7-11, petiolulate, oblong, acuminate, concave at the base, shining above,
but clothed with powdery velvety rusty down beneath; racemes elongated, granular; flowers capitate, with 7-9 stamens; corollas obovate, angular, and truncate. h. G. Native of Peru and New Granada, on shady hills. Actinophyllum angulatum, Ruiz et Pav. fl. 5. p. 73. t. 307. H. B. et Kuntz, nov. gen. amer. 5. p. 9. Heads of flowers about the size of a walnut, yellowish. Berry dark purple, cuneiform, angular. Styles 4-6.

_angular Scidaphyllum._ Tree 20 to 80 feet.

14 S. pedicellatum (Poir. dict. 6. p. 746.) stems scendant; leaves digitate: leaflets 9-13, petiolulate, oblong, acuminate, somewhat sinuately undulated, and concave at the base, glabrous; racemes many; flowers pedicellate, umbellate on the branches; corollas hemispherical. h. G. Native of Peru, in groves at Munna. Actinophyllum pedicellatum, Ruiz et Pav. fl. per. 3. p. 73. t. 308. Stem rooting, filled with medullae; branches purplish. Racemes purplish, a foot long. Stamens 6-7. Berries angularly globose, greenish purple.

_Pedicellato-flowered Scidaphyllum._ Shrub or tree.

15 S. acumina tum (Poir. dict. 6. p. 746.) stems scendant; leaves digitate: leaflets 7-11, petiolulate, oblong, obliquely acuminate, coriaceous, glabrous, reticulately veined; racemes 2-5, tomentose; flowers pentandrous and oecandrous, capitulate; corollas hemispherical, apiculate. h. G. Native of Peru, in groves. Actinophyllum acuminatum, Ruiz et Pav. fl. per. 3. p. 74. t. 310. Corollas yellow, disposed in heads, which are a little larger than a pea. Styles 5.

_Acuminate-leaved Scidaphyllum._ Shrub or tree.

16 S. anomum (G. Don, in Loud. Hort. Brit. p. 112.) arborescent; leaves digitate: leaflets 7-9, oblong-lanceolate, acuminate at the apex, green and smooth on both surfaces: outer ones the smallest; umbels capitately panicled; branches green and smooth. h. G. Native of Trinidad, in woods. Carolina insignis, Hort. Fl. Flowers whitish yellow. Largest leaflets 1 foot long.

_Anomalous Scidaphyllum._ Cl. 1817. Tree 20 feet.

17 S. Quindiuensis (D. C. prod. 4. p. 261.) stem shrubby, scendant; leaves digitate: leaflets 7-8, oblong-acuminate, quite entire, glabrous; umbels 4-flowered, racemose; flowers with 8-10 stamens. h. G. Native of the Andes, about Quindin, at the height of 3300 feet above the level of the sea. Aralia Quindiuensis, H. B. et Kuntz, nov. gen. amer. 5. p. 8. t. 417. f. 1. Styles 3-10, spreading. Petals cohering at the apex. Fruit 8-10-ribbed. Perhaps a species of Aralia.

_Guadua._ Glume 2, awn 1, stamen 1. Shrub or tree.

_Cult._ All the species are worth cultivating in gardens for the sake of their fine handsome large foliage. A mixture of loam, peat, and sand is a good soil for them; and they are easily increased by cuttings under a hand-glass in sand, placed in a moderate heat.

XI. _HEDERA_ (a name for which many etymologies have been offered. The best explanation is, that it has been derived from _hera_, cord in Celtic, _lere_ in French. The English name of ivy is derived from the Celtic word _in_, green, from its being always green. The word is given to _Táxus_ by the French, hence _Táxus_ by Linnaeus, and comes from the genus. L.) Swartz, fl. ind. occ. p. 518. D. Don, prod. nep. p. 186. Gaertn. fruct. 1. t. 26. D. C. prod. 4. p. 261.—Aralia sect. Gymnapeoio, Blum. bijdr. p. 871.—Hédera and Aralia species Lin. and all other authors.

_Lin. syst._ Pent-Decándria, Pent-Decagynia. Margin of calyx elevated or toothed. Petals 5-10, not cohering at the apex in the form of a calyptra. Stamens 5-10. Styles 5-10, conniving, or joined in one. Stamens 5-10-celled.—Climbing or erect shrubs. Leaves simple or compound. Flowers umbellate or capituate.

§ 1. Leaves simple, undivided, or lobed.

1 H. _Helix_ (Lin. spec. 292.) stems climbing, throwing out roots from the side by which it is placed to any substance; leaves coriaceous, glabrous, shining, with 5 angular lobes; those on the old upright branches, which form the tops of the plants, ovate, acute, quite entire; umbels simple, pubescent. h. H. Native of Europe. Common ivy is a valuable ornamental evergreen climbing shrub. It is useful for covering walls and sides of houses, or training into fanciful shapes, as of human figures, &c. on skeletons of wire-work, or trained up to a stake, so as to form a standard; but when ivy has reached to the top of any support, the branches shorten, and become woody, forming themselves into large bushy heads, and the leaves become entire and more of an oval shape, and not divided into lobes like the lower ones, and in this state they produce flowers at the end of every shoot. The berries are black at maturity. The flowers are yellowish, and appear late in the season, and in consequence is much resorted to by bees and flies, when little other food is to be had. The berries increase during the winter, are full formed in February, and ripen in April; furnishing food for wild pigeons, blackbirds, thrushes, &c. in the spring. Blackbirds, and several other birds, build their nests in the stumps of ivy tufts. Sheep are fond of the leaves, especially during severe weather. The ancient held ivy in great esteem, and Bacchus is represented crowned with it to prevent intoxication; and Homer describes his heroes as drinking out of a cup made of the wood. Haller says, that the leaves are given in Germany as a specific in atrophies in children. Common people apply them to issues and corns. The berries are aperient and emetic. The wood is soft and porous, so as to transmit liquids if turned of a sufficient degree of thinness. The roots are used by leather-cutters to whet their knives upon. The whole plant is rather aromatic; and a very fragrant resin exudes from the old stems when bruised. The specific name _Helix_ is derived from _helix, elix_ to encompass or turn round; in reference to the twining stems.

_Var. a._ vulgaris (D. C. prod. 4. p. 261.) pedicels clothed with stellate down; floral leaves ovate; fruit black; leaves of the rooting branches 5-lobed, with white veins. h. H. Native of Europe, in woods, hedges, and on old buildings. _Hédera Helix._ Lin. spec. 292. Smith, engl. bot. t. 1357. Curtis, Lond. f. t. 1. 1824. Fl. dan. t. 1027. Bull. ir. t. 133. Drev. and Hayne, pl. europ. t. 66. There is a variegated-leaved variety of this in the gardens.

_Var. b._ Caucanidis (D. C. prod. 4. p. 261.) pedicels beset with lobepetalled pubescence; floral leaves subcordate: those of the creeping branches 5-lobed, larger than those of the common ivy; fruit red. h. H. Native of the Canary Islands. _Hédera Caucanis._ Willd. in Berlin. mag. 2. p. 176. t. 5. f. 1. Schultes, syst. 5. p. 508. In the gardens this is called Irish Ivy.

_Var. c._ chrysocarpum (D. C. prod. 4. p. 261.) pedicels lobepetalled: floral leaves elliptic, usually cuneate at the base; fruit yellow. h. H. Native of the north of India. _Hélix._ Wall. in Roxb. fl. ind. 2. p. 515. —D. Don, prod. fl. nep. 187. It differs from _var. a._ vulgaris in the stature being more granular, in the leaves being much more cuneate at the base, in the pedicels being lobepetalled, in the berries being yellow and usually 5-seeded. _Hélix._ Poética, C. B. pin. p. 305. H. chrysocarpum, Dalsech. ingl. H. Dionysias, J. Buth. hist. with a figure.

2 H. corymbosa (Choisy, ms. in herb. D. C. ex prod. 4. p. 262.) stem arborescent, bushy; leaves cordate, acute, bluntly 5-angled, when young velvety on the nerves beneath, but in the adult state glabrous on both surfaces; flowers corym-
Araliaceae.

Native of the Canary Islands, where it has been probably introduced, and is called Peplin de St. Augustin.

Corynabe-flowered IVV. Shrub "

3 H. POLYACANTHA (Wall, cat. no. 4907.) Stem beset with short, conical prickles; leaves glabrous, 5-lobed, cordate at the base: lobes serrated; panicle large, pedunculate; umbel's many-flowered, furnished with woolly scales at the base of the pedicels; flower buds white from pubescence.  

Native of Nipan.

Many-spired IVV. Tree

4 H. laroea (Swartz, fl. ind, occ. p. 518.) Stem arborescent, unarmed; leaves oval, acuminate; racemes terminal; umbels pedunculate; pedicels longer than the flowers.  

Bery hexagonal.

Tree IVV. Tree 10 to 12 feet.

7 H. PEDELULATA (Swartz, fl. ind, occ. 1. p. 512, icon. t. 9.) Stem arborescent, unarmed; leaves ovate, lanceolate, entire; umbels almost capitulate; peduncles very long, drooping.  

Pendulous-umbellate IVV. Chl. 1824. Tree 12 to 15 feet.

6 H. UMBELLIFERA (D. C. prod. 4. p. 262.) Stem frutescent, unarmed; leaves on long petioles, lanceolate, acuminate, rarely serrated; peduncles umbellate, trifid; umbels capitulate, nearly globose, S. Native of Ambouya, on the mountains.  

Pseduo-santanalium Aboainense, Kunpl. amb. 2. p. 54. t. 12. Aralia umbelliferata, Lam. dict. 1. p. 235. Schultz, syst. 6. p. 697. There is a yellow gum issues from this tree, which becomes blackish on drying, and is sweet scented, which is called Saruru in Ambouya. Flowers whitish.

Umbelliferous IVV. Tree.

7 H. CUNTA (D. C. prod. 4. p. 262.) Stem arborescent, unarmed; leaves petiolate, broadly oblong, acute, quite entire, cuneated at the base, membranous, glabrous, with pinnate nerves: the 2 lower nerves parallel with the margins, rising from an acute angle; umbels terminal, of many rays; heads half globose.  

S. Native of Brazil, where it was collected by Schott. Aralia umebullata, Polli. in litt. but not of Lam.

Cumact-leaved IVV. Tree small.

8 H. XANT (Swartz, fl. ind. occ. 1. p. 514.) Stem arborescent, unarmed; leaves elliptic, acute, entire, membranous, glabrous, hardly cuneated at the base, with pinnate nerves: the 2 lower nerves parallel to the margin, and rising from an acute angle; racemes few, rising from the old branches; umbels semi-globose.  

S. Native of the south of Jamaica, on the tops of the Blue Mountains. Very like H. pandula, but the peduncles are shorter, the petioles terete, and the petals reflexed. Style short, 5-angled.

Drooping-umbellate IVV. Tree 10 to 15 feet.

9 H. RAMIFERAPA (D. C. prod. 4. p. 262.) Stem arborescent, unarmed; leaves petiolate, acute, quite entire, membranous, glabrous, hardly cuneated at the base, with pinnate nerves: the 2 lower nerves parallel to the margin, and rising from an acute angle; racemes few, rising from the old branches; umbels semi-globose.  

S. Native of Brazil, where it was collected by Schott. Aralia ramifera, Polll. in litt. Flowers 15-16 in each umbel, pedicellate.

Branch-flowered IVV. Tree 10 to 15 feet.

10 H. CAPITATA (Smith, icon. pict. rar. 1. t. 4.) Stem arborescent, unarmed; leaves elliptic, acuminate, entire, with pinnate nerves: the 2 lower nerves rising from an acute angle; raceme terminal, compound; umbels capitulate, on long peduncles; flowers sessile.  

11 H. MULTIFLORA (D. C. prod. 4. p. 262.) Stem arborescent, unarmed; leaves on long petioles, oblong-elliptic, acuminate, somewhat cuneated at the base, quite entire, membranous, glabrous, with pinnate nerves: the 2 lower nerves remote from the rest, parallel with the margin, and rising from an acute angle; racemes panicled, diverging; heads globose.  

S. Native of Brazil, where it was collected by Schott. Aralia multiforma, Polli. in litt.

Many-flowered IVV. Tree 10 to 12 feet.

12 H. MUTISIANA (D. C. prod. 4. p. 262.) Stem arborescent, unarmed; leaves oblong, somewhat serratulate at the apex, acute, cuneated at the base, coriaceous, glabrous, shining; racemes solitary; flowers capitulate.  

Oate-leaved IVV. Shrub.

13 H. OVA (Wall. cat. no. 4911.) Stem unarmed; leaves ovate, elliptic, quite entire, coriaceous, ending in a short blunt point, rusty beneath; peduncles axillary, solitary, and terminal, umbellate; umbellae many-flowered.  

S. Native of Madras.

Acute-leaved IVV. Tree or shrub.

15 H. AVICENNIFOLIA (D. C. prod. 4. p. 263.) Arborescent, unarmed; leaves oblong-lanceolate, acute at the apex, and acutish at the base, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; corymbs branched; flowers capitulate.  

Acute-leaved IVV. Tree or shrub.

16 H. CUMANENSI S (D. C. L. c.) Stem arborescent, unarmed; leaves ovate, acuminate, cuneate at the base, quite entire, somewhat 3-nerved, membranous, glabrous, shining.  

S. Native of Cumana, in shady places at Mount Cocalar, at the elevation of 1200 feet. Aralia Cumanensis, H. B. et Kunth, nov. gen. amen. 5. p. 3. Flowers and fruit unknown.

Cumana IVV. Tree.

17 H. CATALPAEFOlia (D. C. L. c.) Stem arborescent; leaves ovate, subcordate, acuminate, quite entire, glabrous; racemes short, bracteate at the base; heads of flowers globose.  

Catalpa-leaved IVV. Tree or shrub.

18 H. SEPTENNIVIA (D. C. L. c.) Stem arborescent? unarmed; leaves ovate, acuminate, rounded at the base, 7-nerved, rather coriaceous, glabrous; racemes panicled; heads globose.  

S. Native of New Granada, at the altitude of 4000 feet. Aralia septennivia, H. B. et Kunth, nov. gen. amen. 5. p. 3. Said to be hardly distinct from H. capitata. Style 1.
ARALIACEÆ. XI. HEDERA.

Seven-nerved-leaved Ivy. Tree or shrub.
19. H. Turbacceus (D. C. l. c.) stem arboreous; leaves on long petioles, acute at the base, membranous, glabrous, of one colour; some of them are undivided, and others are trifid at the apex; with the lobes or segments entire and acuminate; having the recesses between the lobes rounded. ½. S. Native of New Granada, in hot places near Turboce, where it is called Arbol de Guaco. Arálie Turbacéensis, H. B. et Kunth, nov. gen. amer. 5. p. 3. Flower and fruit unknown.

Turbacce. Ivy. Tree 40 to 50 feet.
20. H. d'écolor (D. C. l. c.) stem arboreous? leaves petiolate, rather coriaceous, glabrous, rounded at the base, shining above, and of a rusty-purplish colour beneath: some of them undivided and 1-nerved, and others are 2-nerved and trifid at the apex; having the lobes somewhat acuminate, the intermediate one the longest; racemes panicked; heads globose. ½. S. Native of New Granada? Arâlie d'écolor, H. B. et Kunth, nov. gen. amer. 5. p. 4. Flowers and fruit not sufficiently known.

Discoloured-leaved Ivy. Tree or shrub.
21. H. Argentatus (D. C. l. c.) stem arboreous, unarmèd; leaves petiolate, coriaceous, glabrous and shining above; but marked by silvery hoary-white down beneath; which are undivided and 1-nerved, and others are 2-nerved and trifid at the apex; having the lobes or segments somewhat acuminate: the intermediate lobe remotely serrated; racemes panicked; heads of flowers globose. ½. S. Native of New Granada. Arâlie argentâtus, H. B. et Kunth, nov. gen. amer. 5. p. 4. t. 414. Styles 3, conniving. Petals white.

Silvery-dotted Ivy. Tree 15 to 20 feet.
22. H. Crassiméria (D. C. l. c.) stem arboreous? leaves petiolate, acute at the base, coriaceous, glabrous above and shining, densely beset with rusty dots beneath: some entire, ovate-oblong, and others 3-lobed and somewhat acuminate; racemes panicked; heads of flowers elliptico-globose. ½. G. Native of South America, along with H. argentâtus. Arâlie crassiméria, H. B. et Kunth, nov. gen. amer. 5. p. 5. Styles 5-6, conniving.

Thick-nerved-leaved Ivy. Tree.

Blunt-lobed-leaved Ivy. Tree or shrub.

Angular-leaved Ivy. Tree.
25. A. plataniifolia (D. C. l. c.) stem arboreous: leaves petiolate, coriaceous, glabrous above and shining, but clothed with rustyomentum beneath, truncate at the base, 7-nerved, 7-cleft at the apex: lobes or segments oblong, acuminate, quite entire; racemes panicked; heads of flowers globose. ½. G. Native of Peru, on the western declivity of the Andes. Arâlie plataniifolia, H. B. et Kunth, nov. gen. amer. 5. p. 6. t. 415. Willd. in Schultes, syst. 6. p. 699. Tree 15-20 feet. Styles 4-5. Petals white; otherwise the outside.

Platanus-leaved Ivy. Tree 15 to 20 feet.
26. H. acerifolia (D. C. prod. 4. p. 264.) stem arboreous; leaves 5-lobed, acuminate, quite entire, glabrous, shining loped-dotted and of a different colour beneath. ½. S. Native of South America, Humb. and Bonpl. Arâlie acerifolia, Willd. in Schultes, syst. 6. p. 699. The rest unknown. This is the same as H. argenteâta, according to Sprengel.

Maple-leaved Ivy. Tree.
27. H. jatrophaeifolia (D. C. l. c.) stem arboreous; leaves petiolar, coriaceous, glabrous above, but clothed with fuscous tomentum beneath, cordate at the base, 7-nerved, deeply 7-cleft: segments or lobes lanceolate-oblong, acuminate, narrowed at the base and quite entire. ½. S. Native of New Granada. Arâlie jatrophaeifolia, H. B. et Kunth, nov. gen. amer. 5. p. 6. Leaves almost like those of Mânikot. This species approaches very near H. plataniifolia.

Jatropha-leaved Ivy. Tree.

Reticulated-leaved Ivy. Tree.
29. H. chaerophylla (D. C. l. c.) stem unknown; leaves palmately 5-lobed, cream-coloured beneath: lobes or segments acuminate, toothed; heads of flowers disposed in racemes, clothed with villous tomentum. ½. S. Native of South America. Arâlie chaerophylla, Spreng. syst. 1. p. 593.

Hand-leaved Ivy. Tree or shrub.
30. H. floribunda (D. C. l. c.) stem arboreous; leaves petiolate, glabrous above, but clothed with canescent tomentum beneath, 7-9-parted: segments or lobes acuminate, remotely and sharply toothed; racemes panicked; heads elliptical-globose. ½. S. Native of New Granada, in temperate parts, at the altitude of 3600 feet. Arâlie floribundâ, H. B. et Kunth, nov. gen. amer. 5. p. 6. t. 416. Arâlie Humboldtiana, and A. inesia, Willd. in Schultes, syst. 6. p. 699. ex Kunth. Styles short, connivent, somewhat diverging after flowering. Leaves so deeply parted as nearly to be compound.

Buddle-flowered Ivy. Tree 15 to 20 feet.

Climbing Ivy. Shrub d.

§ 2 Leaves compound; leaflets divided to the top of the petiole, digeratly or palmately disposed.

32. H. ferruginea (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 7, petiolate, oblong, acuminate, cuspidate, rounded at the base, quite entire, coriaceous, glabrous above, but clothed with thin tomentum beneath: when young clothed with rusty wool; racemes panicked; heads somewhat elliptically globose. ½. S. Native of South America, in the province of Quito, between Paramo de Saraguro and Oza, at the altitude of 3600 feet. Arâlie ferruginea, H. B. et Kunth, nov. gen. amer. 5. p. 7. Wildl in Schultes, syst. 6. p. 701.

Rusty-leaved Ivy. Cit. 1826. Tree.
33. H. xalapensis (D. C. l. c.) stem arboreous; leaves on long petioles, digitate; leaflets 5-7, glabrous, shining above, but dotted beneath, lanceolate-oblong, acute, narrowed at the base, and quite entire, rather coriaceous; racemes panicked; heads of flowers nearly globose. ½. G. Native of Mexico, on the mountains near Xalapa, at the altitude of 2000 feet. Arâlie xalapensis, H. B. et Kunth, nov. gen. amer. 5. p. 8. Arâlie digitâta, Wildl. in Schultes, syst. 6. p. 701. ex Kunth. Petals glabrous. Styles joined in one.
ARALIACEÆ.  394

XI. HEDERA.

*Hedera* Ivy. Tree.

34 **H. Celniers** (Cham. et Schlecht. in Linnaea. 5. p. 174, under *Aralia*) leaves membraneous, smoothish above, except on the middle nerve, but clothed with lax stellate tomentum beneath; floral leaves entire and lobed; lower leaves compound, of 5 nearly cuneate-obovate, acuminate leaflets; heads of flowers globose. *H. G.* Native of Mexico, in woods near Hacienda de la Laguna. Middle leaflet a foot long and 5½ inches broad.

35 **H. elata** (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arborescent, unarmed; leaves digitate; leaflets 7, radiant, petiolate, elliptic-oblong, acuminate, coriaceous, quite entire, glabrous, glaucous beneath, rounded at the base; umbels glabrous, racemously panicked. *H. G.* Native of Nipal, at Na-rain-Hetty, where it is called *Cauliflora* by the natives.

*Tall* Ivy. Tree.

36 **H. Undulatum** (Wall. cat. no. 4916.) stem shrubby; leaves on long petioles, digitate; leaflets 3-5, petiolulate, smooth, oblong-lanceolate, acuminate, undulated; panicle diffuse; um- bellules few-flowered: lateral ones opposite: terminal one um- bellate. *H. G.* Native of Silhet. Fruit oblong. Style 1, crowned by a capitate stigma.

*Undulate-leaved* Ivy. Shrub or tree.

37 **H. Ascclimolia** (Wall. cat. no. 4913.) stem shrubby; leaves digitate; leaflets 7, obovate-oblong, acuminate, clothed with rusty pubescence beneath: outer ones the smallest, all serrated: racemes lateral; umbellules pedunculate, many-flowered. *H. H.* Native of Nipal.

*Horse-chestnut-leaved* Ivy. Shrub or tree.

38 **H. Tomopeda** (Hamilt. in D. Don, prod. fl. nep. p. 187.) stem arborescent, unarmed; leaves digitate; leaflets 7-9, petiolate, oblong-lanceolate, acuminate, coriaceous, quite entire, at the base, densely clothed with tormentum beneath, as well as the peduncles, petioles, and younger stems; umbellules rising in clusters, pedunculate. *H. F.* Native of Nipal.

*Tomentose* Ivy. Tree.

39 **H. suerodota** (Wall. cat. no. 4917.) stem shrubby; leaves on long petioles, trifoliolate; leaflets petiolate, membranous, ovate, somewhat cordate at the base and acuminate at the apex; panicles numerous; flowers disposed in long slender racemes. *H. G.* Native of Silhet. Flowers small, spreading.

*Subcordata-leaved* Ivy. Shrub or tree.

40 **H. Florescens** (Wall. cat. no. 4912.) stem beset with short, conical prickles; leaves digitate; leaflets 7, on long petioles, elliptic, acuminate, clothed with rusty tormentum beneath while young; racemes long; umbellules on long peduncles, rusty as well as the racis. *H. G.* Native of Silhet.

*Dulate-leaved* Ivy. Shrub or tree.

*Turpentine* Ivy. Tree.

43 **H. Robosa** (D. C. prod. 4. p. 265.) stem shrubby, parasitic; leaves digitate; leaflets 5-7, ovate, or oval-oblong, acuminate, obliquely attenuated at the base, quite entire, rugged, clothed with brown stellate tomentum beneath; panicle terminal, very long; flowers racemose. *H. S.* Native of Java, in woods on Mount Gede. Aralia rugosa, Blum. bibdjr. 871.

44 **H. simillima** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-6, elliptic-oblong, acuminate, rounded at the base, remotely serrulate, reticulate, wrinkled and rather downy from stellate pili beneath; panicule terminal, divaricate; flowers racemose. *H. S.* Native of Java, in woods on the mountains. Allied to *H. rugosa*. Aralia simillima, Blum. bibdjr. p. 171.

*Very similar* Ivy. Shrub.

45 **H. aromatica** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 5-7, elliptic-oblong, acuminated, for the most part obliquely rounded at the base, glabrous; panicles corymbose, lateral; flowers umbellate. *H. S.* Native of Java, on Mounts Salak and Gede, &c, where it is called *Panggang-pang*. Aralia aromatica, Blum. l. c. p. 871.

*Var. b.* leafless, longer, serrated. *H. S.* Native of Java, on Mounts Salak, where it is called *Kirengdang*. Blum. l. c.

*Aromatic* Ivy. Shrub.

46 **H. luteascens** (D. C. l. c.) stem shrubby; leaves digitate; leaflets 7-9, oblong-lanceolate, long-acuminated, nearly veinless, shining above; racemes crowded, terminal; flowers umbellate. *H. S.* Native of Java, in woods in the province of Bantam. Aralia luteascens, Blum. bibdjr. p. 872.

*Yellowish* Ivy. Shrub.

47 **H. dispensa** (D. C. prod. 4. p. 256.) stems shrubby, climbing; leaves digitate; leaflets 5-7, oblong, acuminated, rounded at the base, sharply serrated, glabrous; raceme terminal, scurfy; flowers umbellate; fruit 3-seeded. *H. S.* Native of Java, in the higher woods, on the mountains of Baran-grang and Tyrme. Aralia dispensa, Blum. l. c. p. 872. Perhaps a species of *Panax*.

*Two-seeded* Ivy. Shrub cl.

48 **H. gloroulata** (D. C. l. c.) stem arborescent, spinescent; leaves digitate; leaflets 5-7, rarely 3, oblong, acuminated, acu- tish at the base, serrulately toward the apex, smoothish; panicle terminal, very long; flowers glomerate; ovaries 2-seeded. *H. S.* Native of Java, on Mount Gede, where it is called *Panggang*. Aralia gloroulata, Blum. bibdjr. p. 872. Perhaps a species of *Panax*.

*Glomerate-flowered* Ivy. Tree.

49 **H. heterophylla** (Wall. cat. no. 4919.) stem shrubby; leaves digitately compound, with the divisions quinate or ter- nate; leaflets oval-oblong, acuminate, glabrous; umbellules disposed in racemes, many-flowered, with a woolly bract at the base of each peduncle; rachis woolly. *H. S.* Native of Penang. Fruit angular.

*Variable-leaved* Ivy. Tree or shrub.

§ 3. Leaves compound, pinnate.

50 **H. parachistica** (D. Don, prod. fl. nep. p. 188.) stems rooting, parasitical; leaves pinnate: with 5, elliptic, acute, quite entire, nearly sessile, coriaceous, glabrous leaflets, which are glaucous beneath; umbels glabrous, racemose. *H. G.* Native of Nipal, at Na-rain-Hetty. Aralia parachistica, Hamilt. mss.

*Parasitical* Ivy. Shrub climbing and rooting.

51 **H. glauca** (Wall. cat. no. 4921.) stem shrubby, much branched; leaves pinnate; leaflets 5, elliptic-lanceolate, acumi- nated, glaucous beneath, glabrous; umbellules terminal, soli- tary or twin, many-flowered. *H. G.* Native of Nipal, at Kamaon. Style simple.

*Glaucous-leaved* Ivy. Shrub.

52 **H. Jacki*a**; leaves pinnate: with many pairs of oppo- site, oblong-lanceolate, petiolate, quite entire, smooth leaflets, which are oblique at the base; rachis jointed; umbels com-

Cult. All the species of Ixy are of easy culture. The common ivy and its varieties only require to have slips of them planted where they are intended to remain; or to be grown in pots until they are the size required, and then finally planted out; the other hardy species should be treated in a similar manner. The greenleaved and stowe kinds will grow in almost any kind of soil, but the lighter the better; and cuttings of them are easily rooted under a hand-glass.

XII. PARATROPIA (παρατροπή, paratropo, a bending or crooking; the petioles are kneed and bent). D. C. prod. 4. p. 265.—Aralia, sect. 3. Paratropia, Blum. bijdr. p. 875.

Lin. syst. Pentändria, Monogynia. All as in Aralia or Hedera, but differs in the stigmas being sessile, at first approximate, and immersed in an epigynous disk.—Shrubs or trees. Leaves compound. Flowers panicled or racemose.

1 P. nodosa (D. C. prod. 4. p. 265.) stem arboreous; leaves impari-pinnate; with many pairs of leaflets; leaflets on short petioles, crenated, glabrous: lower ones roundish-ovate, the rest oblong; panicle terminal, very long. S. Native of Java, in woods on the mountains in the western provinces, where it is called Kicalgit. Aralia nodosa, Blum. l. c. Common petioles 5-6 feet long, bent, articulated when dried. Panicle 4-5 feet long. Flowers pentandrous.

Nodose-petiolated Paratropia. Tree.

2 P. pergamaceæ (D. C. prod. 4. p. 266.) stem shrubby, parasitcal; leaves digitate: leaflets 6-12, oval, acute, rounded at the base, in substance like parchment, glabrous; racemes crowded, terminal, scurfy; flowers subflabellate. S. Native of Java, on the higher declivities of Mount Gede. Aralia pergamaceæ, Blum. bijdr. p. 875.

Parchment-leaved Paratropia. Shrub.

3 P. rigida (D. C. l. c.) stem arboreous; leaves digitate: leaflets 6-15, oblong, acute, bluntish at the base, and acutish in the apex, in substance like parchment, glabrous; racemes crowded, terminal, divaricate, rather scurfy; flowers umbellate, ocreanous. S. Native of the western parts of Java, in woods on the mountains, where it is called Songo-Poana. Aralia rigida, Blum. l. c.

Var. ß; racemes incurved, densely clothed with scurf. S. Native of Java, in the province of Bantam, where it is called Tulak-Tangol. Blum. l. c.

Stiff Paratropia. Tree.

4 P. longifolia (D. C. l. c.) stem arboreous, scandent; leaves digitate: leaflets 9-11, rather large, oblong, acute, rounded at the base, glabrous; racemes crowded, densely clothed with tomentum: terminal, straight; flowers umbellate, with 7-9 stamens. S. Native of Java, in mountain woods, where it is called, along with many other Araliaceous plants, Ramo-gilig. Sciodaphyllum longifolium, Blum. bijdr. p. 876.

Long-leaved Paratropia. Shrub cl.

5 P. cantonensis (Hook. et Arn. in Beech. voy. pt. bot. 185.) stem arboreous; leaves on long petioles, digitate: leaflets 5-9, elliptic, acutish at the base, acuminate at the apex, rather coriaceous, glabrous; racemes terminal, furfuraceous; flowers in fascicles, decandrous; stigma sessile, 10-cleft. S. G. Native of China, about Canton. Aralia octophylla var. Cantoniensis, Lour. coch. p. 187. This species comes very near P. pergamaceæ.

Canton Paratropia. Tree. 10 feet.

Cult. Any light soil will suit the species of Paratropia; and cuttings of them will be easily rooted under a hand-glass in heat.

XIII. ARTHROPHYLLUM (from άρθρον, arthron, a joint, and φύλλον, phyllon, a leaf; in reference to the jointed petals). Blum. bijdr. p. 878. D. C. prod. 4. p. 266.

1 A. Java'sium (Blum. l. c.) leaves bipinnate: leaflets cuneate-obovate, bluntish at the apex, or the upper leaflets are rounded and coriaceous. S. Native of Java, in mountain woods.

Java Arthrophyllum. Shrub or tree.

2 A. diversifolium (Blum. l. c.) leaves impari-pinnate, terminal or bipinnate; leaflets oblong, some short acuminate, oblique at the base, membranous. S. Native of Java, in woods, on Mount Salak.

Diverse-leaved Arthrophyllum. Tree.

3 A. ellipticum (Blum. l. c.) leaves bipinnate: leaflets elliptic-oblong, acute, oblique at the base, coriaceous. S. Native of Java, in mountain woods.

Elliptic-leaffletted Arthrophyllum. Shrub or tree.

Cult. See Paratropia above for culture and propagation.

Tube of calyx adhering to the ovarium more or less, 4-lobed (f. 69. a. g.) or repandly toothed. Petals 4 (f. 69. e. i.), linear, elongated, inserted in the calyx, alternating with the calyceine lobes, involute usually valvate in aestivation: rarely wanting, but probably sometimes changed into stamina. Stamens inserted with the petals, and double their number (f. 69. b.); those alternating with the petals are fertile, and those opposite the petals are sterile and destitute of anthers (f. 69. g.); filaments all short. Fertile anthers inserted by the base, 2-celled, dehiscing in various ways. Ovarium adnate at the base, 2-celled: cells 1-seeded; ovula pendulous. Styles 2 (f. 69. l.), very rarely 3. Capsule adnate at the base to the permanent tube of the calyx, 2-celled, 2-valved; valves bifold at the apex. Seed pendulous, with a superior hyllum. Albumen corneous. Embryo straight, slender, with a superior radicle; and folioseus flat cotyledons, or having their margins rather involute.—Shrubs. Leaves alternate, bipinnate, petiolate, feather-nerved, entire or sinutately toothed. Flowers axillary, nearly sessile, in fascicles, usually bracteate, sometimes dioecious or polygamous.

Many of the genera of this order were formerly placed among the Berberidaceæ and Amurnaceæ, but were constituted a distinct order by R. Brown in 1818; but the place which it should hold in the natural system is still doubtful. According to R. Brown, it is intermediate between Bruniaceæ and Mårleæ *, (a genus which should have been placed in Alangiæ, vol. ii. p. 806. But according to Pet. Thouars, it comes nearest to Rhinodendron, and according to Juss. to Haloragidæ. But afterwards it was 3 e 2.
placed by R. Brown and Pet. Thouars near Araliaceae and Córnece. The order differs from Alangiéce in the fruit being capsular, not bacate; and from Bruniiéece in the parts of the flowers being quaternary, in the stamens being double the number of the petals, in the insertion and dehiscence of the anthers, and in the cells of the ovary being 1-seeded, &c.; it differs from Araliéce and Córnece in the fruit being capsular, in the number of the parts of the flower, and in the structure of the anthers; and from Auméntiéece in the flowers of the genera being complete; but the genus Fothergilées agrees with Auméntiéece in habit, and in the want of petals; but perhaps in this genus the outer series of the stamens represent the petals.

Lin. syst. Octádri'a, Monogónia. Tube of calyx adnate to the ovary: limb short, bluntly 6-8-toothed. Petals 6-8, linear, alternating with the teeth of the calyx. Stamens 3, adnate to the epigynous disk, and inserted at the top of the calyx; anthers long, linear. Ovary 2-celled, biovulate. Style short: stigma 4-toothed. Drupé oval, rather fleshy, umbilicate from the teeth of the calyx: containing a 2-celled nucleus. Seed compressed. Albumen fleshy. Embryo with a superior radicle and flat cotyledons.—A small Asiatic tree. Leaves alternate, exstipulate, petiolate, unequally cordate, acuminate, entire, glabrous, except the nerves on the under side. Flowers on axillary peduncles, somewhat coriaceous, whitish or yellowish.

1 M. Degenófólia (Roxb. l. c.) ½. G. Native of the East Indies, in Silhet and Nipau; and of China, near Canton, where it is called *Poutsau.* Stylidium Chinénu, Lour. l. c. Stylis Chinénsis, Poir. l. c. Leaves sometimes acutely bifid, or a little toothed.

Cult. This shrub is easily increased by cuttings in sand under a glass. The soil best adapted for it is a mixture of sand, loam, and peat.

Synopsis of the genera. 

 Tribe I.

**Hamamelis.** Petals 4 (f. 69, c.). Stamens 8, 4 fertile (f. 69, b.), and 4 sterile (f. 69, g.). Anthers dehiscing by a valve.

1 Hamamelis. Calyx 4-fold, furnished with 3-4 scales on the outside. Ovary ending in 2-3 styles at the apex (f. 69, l.). Capsule caro предоставимые, 2-целые (f. 69, c.).

2 Diocry'the. Calyx 4-fold. Styles 2. Fruit inclosed in the circumsised calyx, umbilicate at the apex, 2-horned, 2-seeded.

 Tribe II.

Fothergilées. Petals wanting. Stamens 24, all fertile. Anthers opening by a semicircular chink at the margin.

 Tribe I.

**Hamamelis.** (shrubs agreeing with the genus *Hamamelis* in important characters). D. C. prod. 4. p. 268. Petals 4. Stamens 8, 4 of which are sterile. Anthers dehiscing by a valve.

1 Hamamelis (from *Hamamélis*, a name under which Athenaeus speaks of a fruit resembling an apple; it comes from *ipam*, *amor*, like, and *pylos*, wellea, an apple-tree; but the present genus is not in any way analogous to the apple). Lin. gen. no. 169. Juss. gen. p. 238. Lam. ill. t. 88. f. 1. D. C. prod. 4. p. 268.—Trifolus, Mith. act. acad. nat. cur. 8. appendix.

Lin. syst. Tetrádródia, Digýnia. Calyx 4-lobed, adhering to the ovary at the base, furnished with 2-3 scales on the outside. Petals 4 (f. 69, a.), long, tongue-shaped, alternating with the teeth of the calyx (f. 69, c.). The 4 stamens alternating with the petals, fertile (f. 69, b.), with very short filaments: adnate 2-celled anthers; the cells opening by a vertical valve. The 4 sterile stamens (f. 69, g.) with very thick filaments and round anthers, one in front of each petal. Ovary free at the apex, ending in 2 (f. 69, l.), rarely in 3 styles. Capsule coriaceous, half free, 2-celled, 2-разрезной at the apex; valves bifid. Arils 2 in each capsule, coriaceous, 1-seeded, opening by 2 elastic valves above. Seed oblong, shining, with a superior hyolum; albumen fleshy. Embryo with a superior radicle and flat cotyledons.—Small American or Asiatic trees.

Leaves alternate, on short petioles, bipustulate, ovate or cut-uneated, feather-nerved, nearly entire. Flowers nearly sessile, disposed in clusters in the axes of the leaves, girded by a 3-leafed involucrem. Petals yellow.

1 H. Virginica (Lin. syst. nat. p. 335.) leaves obovate, acutely toothed, with a small cordate recess at the base. ½. H. Native of North America, from Canada to Florida, in stony and dry situations, but frequently near water. Mill. ill. t. 10. Duham. art. t. 114. Schkuhr. handb. t. 27. Lodd. bot. cab. 598. Guimp. abh. holzart. t. 75. Rafin. med. bot. t. 45.—Catesb. car. 3. t. 2. This singular shrub, which grows about 10 or 12 feet high, begins to show its yellow flowers in autumn, when all others have dropped their leaves, continues to flower all winter, and forms its fruit the spring following. The flowers are either polygyna, varying to dioecious, monocoeous, and androgyne; hence the names of *Hamamélis* dioica, monoeica, and androgyne; Wolt. car. 155. The Indians consider this tree as a valuable article in their Materia Medica. They apply the bark, which is sedative and diuretic, to painful tumours and external inflammations. A cataplasm of the inner rind is found to be very efficacious in removing painful inflammations of the eyes.

Tar. ½. paraffolia (Nutt. gen. amer. 1. p. 107.) leaves smaller, oblong-obovate, upper part undulated and greatly crenated: the under side pubescent, rather hairy: segments of the calyx oblong; stamens and perigynous filaments often nearly equal. ½. H. From the mountains of Pennsylvania.

2 H. Macrophyl'la (Pursh. fl. sept. amer. 1. p. 116.) leaves nearly orbicular, cordate, coarsely and bluntly toothed, secedious from dots beneath. ½. H. Native of North America, in the
western part of Georgia; and of North Carolina, on the Catabaw Mountains. The large leaves punctuated on their under side, with rough tuberules and other marks, give sufficient reason for considering it a distinct species.

**Large-leaved Witch-hazel.** Fl. May, Nov. Cirt. 1812. Shrub 10 to 12 feet.

3 H. PE'SECA (D. C. prod. 4. p. 268.) leaves oval, acumini,
ated, repandly toothed above, cuneated at the base, equal.  
*H.* Native of Persia, in the province of Lenkeran, where it was collected by Hansan. Adult leaves rather scabrous on the nerves and petioles; the rest glabrous. Flowers unknown. Fruit a little smaller than that of *H. Virginica*, but similar.

**Persian Witch-hazel.** Shrub 10 to 12 feet.

4 H. CHINESENIS (R. Br. descr. pl. chin. 1818. p. 4. with a figure,) leaves ovate, quite entire, unequal at the base, grey on both surfaces from stellate down.  
*H.* Native of China, near Nankin, and in the island of Cheusan.—Pl. amath. 32. t. 308. f. 2. Petals linear, 3-nerved, very much elongated. Anthers with deciduous valves; hence it is proposed by R. Br. to form it into a distinct section under the name of *Loropetalum*.  
Citr. the Witch-hazel. Shrub 6 to 10 feet.

**Cult.** The species of Witch-hazel are well adapted for shruberies; they will grow in any common soil, and are increased by layers or suckers.

**Lin. syst. Tetrandria, Digitina.** Tube of calyx oblong, hairy, adhering to the ovary; limb 4-lobed, circumcised after flowering. Petals 4, inserted in the upper part of the tube of the calyx, joined to the filaments at the base. Stamens 4, fertile, alternating with the petals; filaments broad at the base; anthers oblong, adnate, erect, dehiscing at the side; and 4 sterile smaller stamens alternating with the first named ones. Styles 2. Pericarp inclosed in the circumcised calyx, umbilicate at the apex, and 2-horned, inclosing 2 1-seeded coriaceous coccula, which open at the apex. Seed ovate, hanging from the top. Albumen fleshy. Embryo with a superior radicle: and flat cotyledons, having revolute edges.—A small shrub, with twiggy weak branches. Leaves alternate, on short petioles, oblong, feather-nerved, entire, furnished with 2 unequal broad foliaceous stipules at the base. Cormys terminal, somewhat fasciculate, 7-8-flowered.

1 D. DIFUL'TA (Jaum. exp. fam. 2. p. 318.)  

**Stipulate-leaved Dicoryphe.** Shrub.

**Cult.** A mixture of sand, loam, and peat will be a good soil for this plant; and young cuttings will strike root in sand under a hand-glass, in heat.

III. **TRICHOCLOUDUS** (from *thrix, thrice, thrix trichos, a hair, and *klados, klados, a branch; the branches are clothed with stellate hairs). Pers. ench. 2. p. 597. D. C. prod. 4. p. 269.—Dahilla, Thunb. diss. (1792) and in edit. greet. 1. p. 108. act. soc. hist. nat. hafn. 2. vol. 1. p. 133. t. 4. but not of Cav. 1791.

**Lin. syst. Dióeia, Menasdría.** Flowers dioecious. Scales paler, distinguished from those of capitulate flowers. Male flowers. Calyx unknown. Petal 1, convolute. Stamens 1, near the scale and the petal; anthers ovate, double celled from the connate filaments (Thunb.), valves dehiscent (Burch.). Female flowers. Calyx unknown. Petals wanting. Ovarium villous.

Style 1. Capsule ovate, 4-valved, 4-celled. Arillus (seed, Thunb.) ovate, glabrous, villous from stellate dots. Leaves opposite, petiolate, oval, acuminate, entire. Flowers in terminal heads, crowded on a common receptacle. The character is taken from the description of the tree by Thunberg.

1 T. CRASSUS (Pers. 1. c.)  
2 G. Native of the Cape of Good Hope, in the woods of Houtniqs. Dállia cristina, Thunb. Il. ec. and fl. cap. 1. The shrub has the resemblance of a species of *Cróton*.

**Hairy Trichocloudus.** Cirt. 1823. Shrub 4 to 8 feet.

**Cult.** A mixture of loam and sand is a good soil for this shrub; and young cuttings will root readily in sand under a hand-glass.

**Tribe II.**

**FOETHERGILLA** (this tribe only contains the genus *Foethergilla*). D. C. prod. 4. p. 269. Petals wanting. Stamens 24, all fertile; anthers dehiscing by a chink. This tribe is intermediate between *Hamamelideæ* and *Aneleacea* from habit.

**Lin. syst. Icosandra, Digitina.** Calyx campanulate, adhering to the ovary at the base, somewhat truncate, with 5-7 callosous subepend teeth. Petals wanting. Stamens about 25, inserted in the calyx, club-shaped, exserted; anthers terminal, of the form of a horse shoe, opening by a semi-circular chink at the margin. Ovarium 2-celled, 2-ovulate. Styles 2, filiform. Capsule adnate to the base of the calyx, 2-lobed, 2-celled; cells 2-valved at the apex, 1-seeded. Seed bony, pericarpous, with a superior hyllum.—A shrub, with alternate, obovate, feather-nerved, bitispulate leaves, clothed with soft starry down; and terminal ovate spikes of flowers, having a solitary bractea under each flower; those bracteas of the apex of the spike are trifid, and those at its apex are nearly entire. Flowers white, sweet-scented, sessile. Anthers yellow.

1 F. ALNIFOLIA (Lin. fil. suppl. 267.)  

**Var. a, oblastra (Sims, bot. mag. 1341. Mill. fig. t. 1.) leaves obovate, crenate at the top, when young clothed with fascicles of down beneath. F. major, Loddi. bot. cab. t. 1520. (f. 70.)

**Var. b, acuta (Sims, l. c.) leaves narrow, ovate, acute, nearly entire, white from beneath. T. Gardén, Jacq. icon. rar. t. 100.

**Var. ç, maior (Sims, bot. mag. t. 1342.) leaves ovate-oblong, somewhat cordate at the base, very blunt and serrated at the apex, sometimes with an acumen; when young tomentose beneath.

**Var. ç, serotina (Sims, l. c.) leaves oblong, acute, crenately toothed at the top, green beneath.**

**Alder-leaved Foethergilla.** Fl. April, May. Cirt. 1765. Shrub 3 to 6 feet.
CULT. All the varieties of this shrub are very handsome while in flower and leaf, and are therefore proper for shrubberies. A peat or vegetable soil answers them best; and they may either be increased by layers put down in spring or autumn, or by seed, which is annually received from America.

Order CXXVI. CORNEæ. This order contains plants agreeing with CORNEUS in important characters. D. C. prod. 4. p. 271. —Caprifoliaceæ Cörnæe, Kuth. nov. gen. amer. 3. p. 430. —Genera of Caprifoliææ, Juss.

Calyx having the tube adnate to the ovary; and the limb superior and 4-lobed (fig. 71 c). Petals 4, oblong, broad at the base, inserted in the upper part of the tube of the calyx, regular, valvate in restitution. Stamens 4, inserted with the petals, and alternating with them; anthers ovate-oblong, 2-celled. Style filiform; stigma simple. Drupe baccate, crowned by the vestiges of the calyx, containing a 2-celled nucleus. Seed pendulous, solitary in the cells. Albumen fleshy. Berry with a superior radicle, which is shorter than the two oblong cotyledons.—Trees and shrubs, rarely herbs. Leaves of all opposite, except in one species of the genus CÖRNUS, entire or toothed, feather-nerved. Flowers capitate, umbilicate or corymbose, naked or involucrated, rarely dioecious from abortion. Flesh or pulp of fruit edible.

This order agrees with Hamamelidææ, and Caprifoliææ, tribe Sambuceæ; but differs from the first in the restitution of the petals being truly valvate; in the stamens not being double the number of the petals; in the style being simple, not double; in the fruit being drupaceous, not capsular; and in the albumen being fleshy, not horny, &c. From Sambuceæ it differs in the corolla being polypetalous, not gamopetalous; in the parts of the flower being quaternary, not quinary; in the style being exserted, not wanting; in the stigmas being 2, not 3, and in the fruit being drupaceous, not baccate, &c. Cörnæe differs from Loranthææ in the stamens alternating with the petals, not opposite them.

All the genera of this order have more or less anstringent bark; that of CÖRNUS flórida is used in North America in intermittent fevers, as is also that of CÖRNUS sericeæ, which, according to Barton, is scarcely inferior to quinquina.

Synopsis of the genera.

1 CÖRNUS. Limb of calyx 4-toothed (fig. 71 c). Drupe baccate, marked by the vestiges of the calyx, containing a 2-celled, rarely 3-celled nucleus.

2 Votomi'ta. Tube of calyx turbinate; limb 4-toothed. Anthers approximating into a tube, and terminated by a thin membrane. Stigmas 4, oblong. Drupe crowned by the calyx, 1-celled.

3 Mastixia. Limb of calyx 4-5-toothed. Stamens 4-5; anthers didymous. Style short, girdled by a disk; stigma obtuse. Drupe umbilicate, containing a 1-seeded nucleus.

I. CÖRNUS (from corum, a horn: the wood being thought to be as hard and as durable as horn. Its value as a material for warlike instruments has been celebrated by Virgil.—Loca helly corum). Tourn. inst. 641. t. 410. Lin. gen. no. 149. Gaertn. fruct. t. 26. D. C. prod. 4. p. 271.

§ 1. Nutdiffére (from nudus, naked, and flos, a flower; in allusion to the flowers being exinnovulate). D. C. prod. 4. p. 271. Flowers corymbose or paniced, exinnovulate.

- Leaves alternate.

Alternate-leaved Dogwood. Fl. May, July. Ch. 1760. Tree 15 to 20 feet.

* Leaves opposite.

2 C. panículata (Linn. hor. no. 10. t. 5.) branches erect; leaves ovate, acuminate, glabrous, hoary beneath; corymbs thyroid; ovarium silky. h. H. Native of North America, from Canada to Carolina, rare, in swamps and near rivulets among other bushes. Schmidt, arb. 2. t. 68. C. racemosæ, Lam. dict. 2. p. 116. C. fëminea, Mill. dict. no. 4. C. citrifólia, Hort. par. Branches pale-purplish. Berries roundish, depressed, watery, white, 3 lines in diameter. The dots on the under side of the leaves, which are only seen through a lens, bear bicuspitate short adpressed hairs. Tube of calyx pubescent.

ar. β, albida (Ehrh. beitr. 4. p. 16.) leaves elliptic- lanceolate.

Var. γ, radiata (Pursh. fl. amer. sept. 1. p. 109.) racemes sterile, foliiforous.

3 C. Tolucæææ (H. B. et Kuth. nov. gen. amer. 3. p. 430.) branches dichotomous, spreading; leaves ovate-oblong, narrowly acuminate, puberulous on both surfaces, paler beneath; cymes lateral, naked. h. H. Native of Mexico, on the higher plains about the city of Tołucca. Very like C. panículata. Compare Cham. et Schlécht, in Linnéa. 5. p. 171. in which place there is a species described which was found about Jalapa, and which is probably referrible to the present plant.

Toluccæææ Dogwood. Tree or shrub.

4 C. oélongæææ (Wall. in Roxb. fl. ind. 1. p. 432.) leaves oblong, acuminate, acute at the base, glaucous and rather scabrous beneath, with many excavated glands along the axils of the ribs and nerves; corymbs spreading, paniced. h. H. Native of Nipaul, about Narainbetty, Katmandu, and the valley of Dhoon. C. paniculata, Hamilt. ex D. Don, prod. fl. nep. p. 140. Young shoots clothed with short adpressed hair. Leaves 4-6 inches
long, and 1 to 1½ inch broad; petioles about an inch long. Flowers white or pale-purplish, fragrant. Calyxelyches with adpressed silky hairs, as well as the pedicels and petals. Drupe ovate-oblong. Ovarium 3-celled.

_lobular-leaved Dogwood_. Clt. 1818. Tree 10 to 15 feet.

5 _C. stricta_ (Lam. dict. 3. p. 116.) branches straight, fastigiate; leaves ovate, acuminate, glabrous, green on both surfaces, when young hardly pubescent beneath; corymbes convex, somewhat panicked. H. Native of North America, from Carolina to Canada, on the banks of rivers, frequent; also of Mexico, between Tampico and Real del Monte. Lher. corr. no. 9. t. 4. Schmidt, arb. 2. t. 67. C. fastigiata, Michx. fl. bor. amer. 1. p. 92. C. sanguinea, Walt. but not of Lin. C. cyanocarpus, Gmel. syst. veg. 1. p. 257. C. Canadensis, Hort. par. C. carúlea, Meerb. Icon. 3. but not of Lam. Branches reddish-brown. Anthers blue. Berries globose, soft, blue on the outside, but white inside.

Var. _β._ variegata; leaves variegated with white or yellow.

6 _C. sanguinea_ (Lin. spec. p. 171.) branches straight; leaves ovate, acute, smooth and green on both surfaces; corymbes glabrous. H. Native of Europe and the north of Africa, in hedges and thickets, especially on a chalk and limestone soil, common; plentiful in Britain in like situations. It is also said to grow in North America near the Lakes of Canada and New York, but has probably been introduced there. Smith, engl. bot. t. 249. Fl. dan. 431.—Duham. arb. 1. t. 75.—C. femina, Raill, syn. 460. Ger. emac. 1467. with a figure. Virga sanguinea, var. calva, vol. 1. p. 236 with a figure. Cam. epist. 159. with a figure. Branches of a dark-red when fully grown. Leaves 2½ inches long. Flowers greenish-white, unpleasantly scented; petals revolute at the sides. Fruit dark-purple, very bitter. Matthioli records that an oil is obtained from the berries by pressure, after they have been first boiled, which is used for lamp in the country near Trent. The shrub, after a smothered combustion, affords a charcoal, esteemed the best for entering into the composition of gunpowder. It has a variety of names in different parts of the kingdom, as _femina cornel_, _dogberry-tree_, _hounds-tree_, _pickweed_, from its use in making skewers, _gaten_ or _gaten-tree_, _gater_ or _gater-tree_. The wood was formerly made use of for cart timber and rustic instruments, &c. Mr. Miller informs us, that in his time the fruit was often brought to the markets, and sold for those of _buckthorn_.

_Bloody-branch Dogwood_ or _Wild Cornelian._ Fl. June, Britain. Shrub 4 to 5 feet.

7 _C. Pu'sinia_; branches straight; leaves ovate, green on both surfaces, and pubescent; corymb spreading. H. Native of North America, near the lakes of Canada and New York. C. sanguinea, Pursh, fl. amer. sept. 1. p. 109. Schmidt, arb. 2. t. 66. Flowers with yellowanthers. Berries dark-brown. This differs from the _C. sanguinea_ of Europe in the leaves being pubescent, and in stature.

_Pursh's Dogwood_ or _Cornel_. Fl. June, July. Sh. 8 to 12 ft.

8 _C. excélsa_ (H. B. et Kunth, nov. gen. amer. 3. p. 430.) branches spreading; branchlets pubescent; leaves ovate, acuminate, pubescent and paler beneath, and with minute scattered pili above; cymes naked, spreading. H. Native about the city of Mexico. Allied to _C. sanguinea_.

_Tall Dogwood_. Tree.

9 _C. x'iba_ (Lin. marr. p. 40.) branches recurved; branchlets glabrous; leaves ovate, acute, pubescent, hoary beneath; corymbes depressed. H. Native of Siberia, at the rivers Oul's and Amur, to the north of Kamtschatka, &c. &c. Native of North America, from Virginia to Canada, on the banks of rivers and lakes; and of North California. Pall. fl. ross. 1. t. 34. C. stolonifera, Michx. fl. bor. amer. 1. p. 109. C. sibírica, Loddi. C. Tatárica, Mill. fig. 104.—Amm. ruth. t. 32. Branches of a fine red colour. Berries white or bluish-white.

Var. _β._ _circinata_; leaves larger, more hairy beneath. H. Native throughout Canada, and from Lake Huron to north lat. 69°, Newfoundland, and the north-west coast of America. C. circinata, Cham. et Schlecht. in Linn. 3. p. 139. The berries are lead-coloured according to Dr. Richardson, who further says, they are named by the Cree _wasquaumeena_, because the bears fatten upon them; and _acucluan-pemcinnackie_, and _meckinan_ (red stick berry), and that pigeons are fond of them.

11 _C. circináta_ (L. Her. corn. p. 7. no. 8. t. 3.) branches warty; leaves broadly oval, acuminate, clothed with hoary tomentum beneath; corymb spreading, hoary. H. Native of North America, from Canada to Virginia, on the banks of rivers, and probably of California, ex Cham. and Schlecht. in Linn. 3. p. 159. Schmidt, arb. 2. t. 69. C. tumécula, Michx. fl. bor. amer. 1. p. 91. C. rugósa, Lam. dict. 2. p. 115. C. Virginiána, Hort. par. Branches slightly tinged with red. Leaves broad, waved on their edges. Flowers white as in most of the species. Berries globose, at first blue, but at length becoming white.

12 _C. macrophýlla_ (Wall. in Roxb. fl. ind. 1. p. 433.) branches smooth; leaves broad-ovate, acuminate, rounded at the base, smooth, glaucous and soft beneath, with the axils slightly glandular; corymbes umbellate; flowers racemose along the branches of the corymb, and secund. H. Native of Nipal, near Saharanpore and Sirinagar, and at Kamaon. Leaves with adpressed bristles, 6 inches long, and 4 inches broad, pale beneath; the bristles fixed by the centre, and therefore bicispulate, but are only to be seen through a lens. Ovarium hairy. Berries round, smooth, about the size of a grain of black pepper.

_Long-leaved Dogwood_. Shrub.

§ 2. _Involutáceae_ (from _involvere_, an involucrum; the heads of flowers are surrounded by an involucreum). D. C. prod. 4. p. 275. Flowers disposed in heads (t. 71. b.) or umbels, surrounded by coloured involucreum, which are usually composed of 4 leaves (t. 71. a.).

*Trees, with white capitulate flowers.

13 _C. capitáta_ (Wall. in Roxb. fl. ind. 1. p. 434.) branches
spreading, smooth; leaves lanceolate, acuminate at both ends, on short petioles, rather rough from small adpressed down; flowers sessile, densely aggregate, forming a round head, girded by a 4-leaved scabrous involucrem. \( \text{\textit{H}} \). Native of Nipaan, in Gosangthan, where the tree is called \textit{eungrag}; and about Scarampore, where it is called \textit{Bhumoro}.; and between Satluy and Jumna. D. Don, prod. fl. nep. 141. Leaves coriaceous, 2 inches long, glossy and pale beneath; with sometimes pink-coloured nerves, having each a minute gland in their axils. Heads of flowers about the size of a moderate-sized cherry, supported by a club-shaped peduncle, which widens at the upper end into a convex ligneous receptacle for the reception of the flowers. Involucre yellow, of 4 obovate leaves.

\textit{Capitate-flowered Dogwood.} Tree 10 to 15 feet.

14 C. \textit{disciflora} (Moc. et Sesse, fl. mex. icon. med. D. C. prod. 4. p. 273.) branches smooth; leaves lanceolate, acuminate at both ends, on short petioles; flowers nearly sessile, disposed in capitate umbels; leaves of involucrum joined together into a roundish 4-lobed disk. \( \text{\textit{H}} \). Native of Mexico, near Jalapa, where it was collected by Berlandier, Deppe, and Schiede. C. grándis, Chann. et Schlecht. in Linnaea. 5. p. 171. Flowers white, many sterile. Fruit ovate. Perhaps C. \textit{polygama}, Rafin. fl. ind. p. 78 ?

\textit{Disk-flowered Dogwood.} Tree.

\textit{Japan Dogwood.} Shrub 5 to 6 feet.

** Trees, with yellow umbellate flowers.

16 C. \textit{ma's} (Lin. spec. 171.) branches smoothish; leaves oval, acuminate, rather pubescent on both surfaces; flowers rising before the leaves; umbels about equal in length to the 4-leaved involucrum; fruit elliptic. \( \text{\textit{H}} \). Native throughout Europe, Britain excepted, and in the north of Asia, in hedges, and among bushes; as in France, Russia, Germany, Switzerland, Austria, Carniols, Piedmont, &c. Blackw. t. 121. Plenex. icon. t. 94. C. mascula, L'Her. corn. no. 4. Guimpp. abb. t. 2. Hayne, term. bot. t. 55. Fl. græc. t. 151. Schmidt, arb. 2. t. 63. Lomi. fl. t. 74. f. 1. Klap. cent. t. 1. 18. Flowers yellow. Fruit elliptic, of a high shining scarlet colour, the size and form of a small olive or acorn, very stumpy in its immature state. The Cornelian cherry is very common in plantations of shrubs. If the season be mild, the flowers will come out in the beginning of February; and though there be no great beauty in them, yet they are produced in plenty at a season when few other flowers appear. Formerly it was cultivated for the fruit, which was used to make tarts, and a rob de cornis was kept in the shops. The fruit is gratefully acid, and is called sorbet by the Turks. Cornel, says Evelyn, grows with us of a good bulk and stature, and is exceedingly commended for its durableness in wheel-work, piles, and wedges, in which it lasts like the hardest iron.

\textit{Corylus} \( \beta \); fruit yellow or yellowish. Duhum. arb. 1. p. 182. This variety is very found but very rare in the gardens.

\textit{Var. glabra}; leaves edged with white or yellow.

17 C. \textit{florida} (Lin. spec. 1661.) branches shining; leaves ovate, acuminate, pale beneath, beset with adpressed pili on both surfaces; flowers umbellate, rising after the leaves; leaves of involucrum large, roundish, retuse or nearly obcordate; drupes ovate. \( \text{\textit{H}} \). Native of North America, from Carolina to Canada, in woods, common; and on the banks of the Columbia near its confluence with the sea. L'Hére. corn. no. 3. Curt. bot. mag. t. 536. Catesb. car. t. 27. Bigel. med. bot. 2. t. 28. Guimpp. abb. holz. t. 19. Rafin. med. bot. t. 28. Schmidt, arb. 2. t. 52. Wang. beyr. 1. t. 17. f. 41. This is a beautiful small tree. Leaves of involucrum white. Flowers greenish-yellow. Berries scarlet, about half the size of those of \textit{C. mäs-cula}, ripe in August. The wood is extremely hard, and of a very fine texture. The bark is extremely bitter, and is used in North America for the cure of remittent and intermittent fevers; and is considered not inferior to Peruvian bark. The young branches stripped of their bark, and rubbed with their ends against the teeth, render them extremely white. (Baron. 1. p. 51.) From the bark of the more fibrous roots the Indians obtain a good scarlet colour.

\textit{Flowering Dogwood.} Fl. April, May. Clt. 1731. Tree 20 to 30 feet.

*** Herbaceous plants, with subterranseous creeping roots. Stems simple, herbaceous. Flowers white, in umbels.

18 C. \textit{canadensis} (Lin. spec. 172.) stems simple, herbaceous; upper leaves in whorles, ovate, acuminate, veiny, on short petioles; flowers umbellate, much shorter than the leaves of the involucrum, which are ovate, and acuminate; drupes globose. \( \text{\textit{H}} \). Native of North America, on the high mountains, in boggy ground (from New England to Carolina; also of Newfoundland, and the island of Unalaska; throughout Canada nearly to the Arctic coast, everywhere where as far as pine woods extend, &c.) L'Her. corn. no. 2. t. 1. Curt. bot. mag. 589. Begel. fl. bot. ed. 1. p. 37. Cham. and Schlecht. in Linnaea. 3. p. 159. Kern. t. 636. ex Roem. et Schultes, syst. 3. p. 319. Flowers purplish-white; involucrum white. Berries red, ripe in July, Habit of \textit{Paris quadrifolia}.

\textit{Canadian Dogwood.} Fl. May, June. Clt. 1774. Pl. 1/2 ft. 19 C. \textit{Cercépia} (Lin. spec. 172.) stem herbaceous; umbel between two branches, stalked, surrounded by 4 unequal white involucral leaves, tinged with red; leaves ovate, nearly a deal from the base; drupe globose. \( \text{\textit{H}} \). Native of Europe and the north of Asia, Camischakta, Aleutian Islands, Greenland, Lapland, Canada, Newfoundland, and Labrador, in moist alpine pastures. In Britain in like situations; on the Cheviot hills of Northumberland, abundantly. In the highlands of Scotland, frequent in boggy spots about rivulets. In the Hole of Horcum, near Scarborough. Lin. fl. lapp. ed. 2. p. 28. t. 3. f. 3. Svensk. bot. t. 201. Penn. tour. scott. p. 39. Smith, enj. bot. t. 310.—Oeder, fl. dan. t. 5. Strum. deutscl. fl. with a figure. C. herbacea, Huds. angl. 71.—Dill. clth. 108. t. 91.—Bail. syn. 261. Park. theatré. 1461. f. 1. The involucral leaves finally turn green. Flowers dark purple. The berries are red and sweetish, containing a 2-celled nucleus, having the disseminum between the cells furnished with a large hole; they are supposed by the Highlanders to create an appetite, and hence the Gaelie name, \textit{Liu-a-echras}, plant of glutony.\( \text{\textit{Var. \beta}} \); nearly twice the size of the species. \( \text{\textit{H}} \). Native of North America, at Fort Vancouver, on the Columbia.
Swedish Dogwood or Dwarf-cornel. Fl. June, July. Britain. Pl. ½ to ½ foot.

† Species not sufficiently known.

29 C. ferulae (Jacq. ex Steud. nom. 227.) or C. ferulifolia, Nocca, syn. pl. 38, but is undescribed. Compare Róem. et Schultes, syst. 3. p. 323.

Fenssel-bark Dogwood. Shrub.

21 C. latifolia (Bray. in Steud. nom. phan. 227.) this species is undescribed as far as we know.

Broad-leaved Dogwood. Shrub.

Polygamous Dogwood. Shrub. 15 feet.

Cult. All the woody species are desirable for shrubberies; and many of the kinds will grow under the drip of trees, which renders them valuable for thickening strips of plantations which have become naked below. They are easily increased by cuttings, layering, or by suckers. The C. Suècica and C. Canadensis should be grown in a border of peat, in a rather shady situation; they are to be increased by dividing when the plants have run considerably at the roots; or they may be planted in pots filled with peat earth, and cultivated as alpines.

II. VOTOMITA (Votomita is the name of the tree in Guiana). Aubl. guian. 1. p. 90. t. 35. D. C. prod. 4. p. 275.—Glossosma, Schrèb. gen. 1728.—Guillemina, Neckl. elem. no. 813, but not of Knuth.

Lin. syst. Pentáandra, Monogynia. Tube of calyx turbinate, adnate to the ovary; limb 4-toothed. Petals 4, oblong, acuminate, spreadingly reflexed. Stamens 4, with very short filaments; anthers oblong, approximate into a tube, terminated by a thin membrane. Style filiform, perforating the tube of the anthers; stigmas 4, oblong. Drupe crowned by the calyx, 1-celled. Seed one striated. — A glabrous shrub, having the branches somewhat quadrangular at the apex. Leaves opposite, sessile, ovate, acuminate, stiff, quite entire, furnished within the base of the petioles with 2 deciduous stipulas. Flowers corymbose; coryms axillary, few-flowered. Corolla white. This genus is not sufficiently known, but is allied to Côrnus from the description.

Guiana Votomita. Shrub 5 to 6 feet.

Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root readily in sand-under-a-hand-glass in heat.

Lin. syst. Tetra-Pentáandra, Monogynia. Tube of calyx adnate to the ovary; limb superior, 4-5-toothed. Petals 4-5, ovate, broadest at the base. Stamens 4-5, opposite the calyx teeth. Anthers didymous, bursting inwards. Ovary containing a pendulous ovulum. Style short, girded by a disk; stigma obtuse. Drupe baccate, umbilicate, containing a 1-seeded nut. Embryo inverted in the albumen.—Tall trees, natives of Java, with oblong acuminate leaves, and corymbose flowers.

1 M. fentaëandra (Blum. l. c.) leaves alternate, oblong, quite glabrous; coryms terminal; flowers pentandrous. ÷. S. Native of Java, on the more elevated woods on Mountains Salak and Burangrang, where it is called by the natives Huru-Litin.

Pentandra Mia. Fl. July, Dec. Tree 30 to 50 feet. 2 M. trichóforma (Blum. l. c.) leaves opposite, oblong, puberulous on the under side, as well as the petioles, and the coryms which are terminal and trichotomous; flowers with a 4-toothed calyx, 4 petals, and 4 stamens. ÷. S. Native of Java, in woods on the mountains along with the preceding species, where it is called Padaglar barriet or Tenjob.

Tetra-ovariata-corymbia Mia. Tree 50 to 60 feet.

Cult. For culture and propagation see Votomita above.

Lin. syst. Tetraándria, Monogynia. Tube of calyx adnate to the ovary; limb superior, 4-toothed, permanent. Petals 4, sometimes joined at the base. Stamens 4, free, alternating with the petals; filaments linear, rather membranous; anthers bursting lengthwise inwardly, adnate, 2-celled. Ovary incompletely 2-celled, many-seeded. Style filiform; stigma truncate, simple. Drupe somewhat baccate, containing a 1-seeded nucleus. Albumen rather horny. Embryo inverted.—Trees and shrubs, native of Java, with opposite exstipulate leaves; and axillary terminal racemes of whitish, very sweet-scented flowers, furnished with 3 bracteoles under each.

1 P. liço'formium (Blum. l. c.) stem arborescent; leaves oblong, coarsely and deeply serrated at the top. ÷. S. Native of Java, on the tops of the higher mountains.

Holly-leaved Polyosma. Tree 20 to 30 feet.

2 P. serrulatórum (Blum. l. c.) stem shrubby; leaves oblong, slightly serrated. ÷. S. Native of Java, in woods on Mounts Gede and Pangurango.

Serrulate-leaved Polyosma. Shrub 5 to 6 feet.

3 P. integrófíllum (Blum. l. c.) stem arborescent; leaves oblong, quite entire. ÷. S. Native of Java, in the higher woods on Mount Barrangrang.

Entire-leaved Polyosma. Tree 60 feet.

Cult. See Votomita above for culture and propagation.

Flowers hermaphrodite, or of different sexes (f. 73. a. d.). Tube of calyx girded at the base by a calyculous, which is adnate to the ovary; limb short, entire, or lobed. Petals 4-8 (f. 73. c.), sometimes distinct from each other, sometimes cerning more or less together, valvate in activation. Stamens equal in number to the petals, and opposite them; filaments adnate to the corolla, more or less, or wanting; anthers oscillatory, or erect on the tops of the filaments; or when the filaments are deficient or wanting, they are adnate to the lobes of the corolla. Ovary ovate or turbinate, adnate to the calyx. Style filiform or wanting; stigma capitate. Berry 1-celled (f. 73. a. f.), 1-seeded (f. 73. c.), crowned or umbilicate by the calyx (f. 73. b.). Segments membranous, involving the seed. Albumen fleshy. Embryo with a superior radicle, which is thickened or truncate at the apex.—The shrubs contained in this order are almost all parasitical, that is, growing on and deriving their nourishment from other trees: very few of them grow in earth. Leaves opposite, rarely alternate or wanting, coriaceous or more or less fleshy, and always entire. The disposition of the flowers and
the habit of the plants are very variable.—Very few of the plants belonging to this order are cultivable; they being nearly all genuine parasites, fixed in the bark and wood of trees, on which they grow, and deriving from their juices the whole of their nutriment. The Viscums have little or no beauty, but the other parasitical genera are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the trunks and branches of trees in the tropics, which they often clothe with a beauty not their own. The Mistletoe of the Druids is supposed to have been the Loranthus Europæus, the common Viscum never having been seen upon the oak, while the Loranthus Europæus inhabits no other tree. If this be correct, the latter must have once existed in this country, although now extinct. It has been suggested, that all vestiges of their religion were extinguished with the Druids, which will perhaps account for the Loranthus having disappeared wherever that religion formerly held its sway.

This order is very nearly allied to CephaloÆaceæ, from which it is easily distinguished by the anthers being opposite the lobes of the corolla. A connection is established between this order and Araliaceæ by means of Aiswia. Mr. Brown suggests their relation to Proteaceæ. The germination of Viscum is exceedingly remarkable; it has afforded a subject of some curious experiments upon the vital energies of vegetables. See Du Trochet sur la Motilité, p. 114.

**Synopsis of the genera.**

**Tribe I. Parasitical shrubs.**

1. **Viscum.** Flowers dioecious (f. 73. b. c.), or monoecious. Margin of calyx obsolete, but in the male flowers wanting. Petals usually 4 (f. 73. c.), connected at the base in the male flowers, but free in the female. Stamens 4. Stigma obtuse, sessile.

2. **Arceuthium.** Flowers dioecious. Male flowers sessile, without a calyx, but with a monopetalous 2-3-4-parted corolla, and the same number of sessile 1-celled anthers, and a gland in place of an ovary. Female flowers pedicellate, with an ovate, fleshy, bidentate calyx, adnate to the ovary, without any corolla, stamens, or style, but with a small obscurely-lobed stigma. Berry ovate or globose. 3. **Misolea.** Flowers dioecious: male ones unknown; female ones having a small truncate limb. Capsule oblong, trigonal.

4. **Loranthus.** Flowers dioecious or hermaphrodite. Margin of calyx entire. Petals 5-6, linear, reflexed. Stamens inserted into the middle of the petals; filaments very short. Berry globose, umbilicate by the calyx, immersed in the rachis.

5. **Symphoricarpus.** Flowers hermaphrodite, nearly all hexameric. Margin of calyx truncate. Petals linear, at length revolute. Anthers ovate, fixed near the base or beneath the middle of the petals; filaments very short. Berry ovate-elliptic.

6. **Pittacanthus.** Flowers hermaphrodite, for the most part hexameric. Margin of calyx entire, obliquely 5-6-toothed or repand. Petals linear-spatulate, erect, spreading, for the most part free to the middle. Filaments filiform from the middle of the petals; anthers fixed by the base or back. Berry ovate.

7. **Tristerix.** Flowers hermaphrodite; each furnished with 3 bracteas. Margin of calyx entire. Petals linear-spatulate, or linear, bearing the stamens in the middle; anthers fixed by the back, incumbent. Berry ovate or elliptic.

8. **Dendrophthoe.** Flowers hermaphrodite; each furnished with 1 bractea. Margin of calyx entire or toothed. Petals linear-spatulate, bearing the stamens in the middle; anthers fixed by the base. Berry ovate or elliptic.

9. **Pithirus.** Flowers hermaphrodite, perhaps always 4-petalled; each furnished with 3 or more bracteas. Anthers fixed by the back, ovate. Berry ovate.

10. **Scurcula.** Flowers hermaphrodite, tubular, divided into 4-5 short lobes, usually gibbous at the base, and bursting by a longitudinal fissure as in Lobelia. Filaments 4-5, adhering a long way to the corolla; anthers fixed by the base, erect. Style filiform; stigma capitulate.

11. **Elephantum.** Flowers hermaphrodite; petals 4-6-8, joined to the middle, forming a regular 4-6-8-cleft limb. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the base, erect. Style filiform. Stigma capitulate.

12. **Notandria.** Flowers hermaphrodite. Petals 5-6-8, but usually 6, sometimes almost free, and sometimes joined at the base. Filaments adnate to the petals at the base, but free at the apex; anthers fixed by the back, versatile or incumbent. Bracteas concave, 1 under each ovary, but often wanting.

13. **Loxanta.** Flowers hermaphrodite. Tube of corolla elongated, kn ked at the base, but somewhat clavate and oblique at the apex, and 6-lobed; the lobes somewhat spirally twisted. Filaments stiff and curved at the apex, not attenuated but rather dilated, and the anthers are fixed by the back. Style filiform. Stigma clavate.

**Tribe II. Terrestrial shrubs.**

14. **Scholppia.** Flowers hermaphrodite. Margin of calyx entire. Limb of corolla 5-cleft, rarely 4-6-cleft. Filaments adnate to the tube; anthers ovate-roundish. Drupe containing a 3-celled, 3-seeded nucleus.

**Tribe I. Parasitical shrubs.**

1. **Viscum** (viscus, birdlime, on account of the sticky nature of the berries; called gui, in French; misel in German; visco in Italian; and mistletoe in English). Tourn. inst. p. 609. t. fruct. 1. p. 151. t. 27. Lam. ill. t. 807. D. C. prod. 3. p. 277. 386. Lin. gen. no. 1103. D. C. coll. mem. 6. no. 1. Girter. 

**Lin. syst.** Monocotia or Dioecia, Tetrándria. Flowers monoecious or dioecious. Calyx a slight border in the male flowers, but rather a more evident border in the female flowers. Corolla in the male flowers gamopetalous, in 4 deep, ovate, acute equal divisions; in the female flower of 4 ovate, equal, deciduous petals, which are dilated at the base. Anthers in the female flowers none, but in the male flower there are 4 compressed, sessile ones, one on the base of each corolline segment, all over pitted or cellular. Ovary in the female flower inferior, ovate, adnate to the calyx, and crowned by its border. Stigma sessile, obtuse, undivided. Berry globular, smooth, juicy, viscid, of
Plants, leaves, branchlets, flowers, native.

**FIG.**

Native branches, involucels, leaves, fascicles, peduncles, etc.

**§ 1.** *Plants with true leaves.* *Flowers in fascicles or umbels.*

1 V. *album* (Lin. spec. 1451.) Stem much branched, forked; with sessile, intermediate heads, of about 5 flowers; branches terete; leaves obovate-lanceolate, obtuse, nerveless. \( n \), P. H. Native of Europe, parasitical on trees, especially on the apple-tree and hawthorn; but it is said also to have been found growing on the lime-tree, oak, American locust-tree, elm, fir, pear-tree, service, almon, white willow, walnut, &c. V. *album*, Engl. bot. t. 1470. Mill. fig. 87. Woodly, suppl. t. 270.—Duham. arb. 2. t. 104. Rich. ann. mus. 12. t. 27.—Fuchs. hist. 329. t. 1817. Cam. epít. 555. with a figure. V. *album* of Thumb and Walt. are distinct from this. Root hard, incorpo rated deep with the wood of the tree on which it grows, without any radicles, as in all the other species of this genus, as well as of *Loranthus* and the allied genera. Leaves permanent, stiff, with parallel ribs. Flowers yellowish. Berries white, pellucid, the size of a currant, sweet, very glutinous internally, serving to make the best bird-lime, when boiled with a small portion of vegetable oil. *Loranthus Europæus* seems to be the original and most common mistletoe, *viscum* of the Greeks, which grows usually on some kind of fir-tree. But our *V. album* is sometimes found in Greece, though rarely, growing on the oak; and this has been preferred from the most remote antiquity. Hence, when the superstitions of the East travelled westward, our Druids adopted a notion of the mistletoe of the oak being more holy or efficacious in conjurations or medicine, than what any other tree afforded, the *Loranthus* or ordinary mistletoe not being known here. This superstition actually remains, and a plant of *Viscum* from an oak is preferred by those who rely on virtues, which perhaps never existed in any mistletoe whatever. The Druids sent round their attendant youths with branches of mistletoe to announce the entrance of the new year; and something like the same custom is still continued in France. In England branches of it are hung up in most houses at Christmas, along with other evergreens. The berries are devoured by several birds of the thrush kind, and especially by the mistletoe thrush. The common mistletoe is not difficult to propagate by sticking the berries on thorn or apple trees, after a little of the outer bark has been cut off, and tying a shred of mat over them, to protect them from the birds.

2 V. *stellatum* (Hamilt. in D. Don, prod. fl. nep. 142.) much branched; branches whorled, terete; leaves obovate, obtuse, attenuated at the base, 3-nerved beneath; flowers terminal, sessile, 2-5-together in a cluster. \( n \), P. H. Native of Upper Nipaul, at Suambo, parasitical on trees. Habit of *V. album*. Nerves of leaves acutely prominent on the upper surface, but line-formed on the under surface. The branches are more likely dichotomous or trichotomous than verticillate.

**Starry Mistletoe.** Shrub parasitical.

3 V. *orientale* (Willd. spec. 4. p. 737.) branches terete; leaves oblong, obtuse, attenuated at the base, 3-nerved; peduncles axillary, usually 3-flowered. \( n \), P. S. Native of the East Indies (ex Wall.), and of Java, on the mountains (ex Blum. bijdr. 666.), and of Palestine upon olive trees, ex Sieb. pl. exotic. pal. Leaves 15-18 lines long, but in the Palestine specimens 20-25 lines long. Berries purple, ex Wall. Perhaps the Indian plant is the same as the *Easte*. Mistletoe. Shrub parasitical.

4 V. *Heyneanum* (D. C. prod. 4. p. 278.) branches terete; branchlets rather compressed; leaves ovate, acute at both ends, quintuple-nerved; peduncles axillary, aggregate, 3-flowered. \( n \), P. S. Native of the East Indies, where it was collected by Heyne. V. orientale, Heyne, herb. ex Wall, and probably of Wild. The form of the leaves is truly different from the Palestine form of *V. orientale*, but more of the figure of those of *V. monoicum*.

**Heyne’s Mistletoe.** Shrub parasitical.

5 V. *moisicus* (Roeh. bort. beng. p. 105.) branches terete, jointed; branchlets striated; leaves elliptic-oblong, acuminate at both ends, 5-nerved; fascicles of flowers axillary, aggregate, sessile, usually with only 3 flowers in each cluster. \( n \), P. S. Native of the East Indies, on the Pundu mountains. Leaves 24-27 lines long, and 9-10 broad. Flowers very small.

**Falcate-leaved Mistletoe.** Shrub parasitical.

7 V. *ovalifolium* (Wall. cat. no. 489.) branches terete; leaves ovate, obtuse, 5-nerved, narrowed into the short petioles at the base; flowers some of them in axillary sessile fascicles, and others are opposite, and somewhat verticillate, along an axillary rachis, disposed in an interrupted spike. \( n \), P. S. Native of the East Indies, in the island of Penang. Leaves 3 inches long, and 1½ broad. Racis not articulated. Berry oval.

**Oval-leaved Mistletoe.** Shrub parasitical.

8 V. *ortenssum* (Wall. cat. no. 494.) branches terete; leaves ovate, obtuse, somewhat cuneate, 5-nerved; flowers axillary, 1-5-together, almost sessile. \( n \), P. S. Native of the East Indies, in the kingdom of Ava, on Mouni Taong-Dong. Leaves 30 lines long, and 15 lines broad. Flowers small. Berries oval. Lateral nerves of leaves slender.

**Bluntish-leaved Mistletoe.** Shrub parasitical.

9 V. *heteranthum* (Wall. cat. no. 488.) branches angular, at length terete; leaves elliptic, obtuse, cuneated at the base, 5-nerved beneath; peduncles axillary, 2-5-together, equal in length to the petioles, capitate at the apex, 5-6-flowered, bearing 3-5 involucreate bractae. \( n \), P. S. Native of Nipaul. Berries ovate-globose, solitary in each head, surrounded by the small permanent bracteas. Flowers 5-cleft, one central, the rest disposed in a whorl around the central one, all sessile on the top of the peduncle.

**Variable-flowered Mistletoe.** Shrub parasitical.

10 V. *platyphyllum* (Spreng. cur. post. 47.) branches alternate, angular; leaves alternate, ovate or obovate, petiolate, attenuated at the base, nerved beneath; umbellules usually of 4 flowers, dispersed, pedunculate, solitary or aggregate; involucels 5-cleft, permanent. \( n \), P. G. Native of Nipaul, at Beempid. V. *hispidum*, Hamilt. in D. Don, prod. fl. nep. p. 142, but not of others.
LORANTHACEÆ. I. VIScum.

Casuarina (D.C. prod. p. 279.) branches terete; leaves ovate-lanceolate, acuminate, 3-nerved, on very short petioles, thick; spikes axillary, solitary, 5 times shorter than the leaves; female flowers trilobed. Ψ. P. S. Native of Jamaica, on trees, V. latifolium, Swartz, fl. ind. occ. 1798, but not of Lam., nor Don. 

V. nevera-like Mistletoe. Shrub parasitical.

20. V. tereticaule (D. C. l. c.) branches terete, smooth; leaves ovate, acute, nerveless, veinless, on very short petioles; spikes axillary, twin or solitary, shorter than the leaves; female flowers trilobed. Ψ. P. S. Native of Jamaica, on trees, V. latifolium, Swartz, fl. ind. occ. 1798, but not of Lam., nor Don.

V. tereticaule (D. C. l. c.) leaves having the middle nerved rather prominent, but with no axillary spikes; the margins rather undulated. Ψ. P. S. Native of Cuba. Lower spikes 2-3. Perhaps the same as the Jamaican plant.

5-6 inches long and 1½ broad. Spikes 2 inches long, erect, constant of 5 joints. Flowers in 6 rows, many of which are abortive. Immature berries nearly globose, half immersed.

**Perrottet's Mistletoe.** Shrub parasitical.

26. **V. brachystachyum** (D. C. l. c.) branches terete; leaves oblong, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary, opposite, sessile, ovate, few-flowered; berries ovate-globose. ½. P. S. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlandier. Leaves 12-15 lines long, and 3-4 broad. Spikes 3-4 lines long.

**Short-spiked Mistletoe.** Shrub parasitical.

27. **V. berberrum** (Linn. spec. 145), branches terete, simple; leaves oblong, obtuse, tapering into the petiole at the base; spikes axillary, one-half shorter than the leaves, somewhat interrupted; flowers tripartite; berries globose. ½. P. S. Native of the Bahamas Islands, parasitical upon mahogany and other trees. Berries red. Leaves opposite, of a shining green colour.

**Red-berried Mistletoe.** Shrub parasitical.

28. **V. Berteria'num** (D. C. prod. 4. p. 281.) branches terete, dichotomous; leaves oblong-lanceolate, attenuated at both ends, acute at the base, on very short petioles, having the middle nerve rather distinct, and with 2 rather oblique veins rising from the middle; spikes axillary, solitary, opposite, one-half shorter than the leaves, jointed, with bifid sheaths. ½. P. S. Native of St. Domingo. ½. dichotomum, Spreng. syst. 1. p. 448. exclusive of the synonyms, but not of D. Don. Leaves 3 inches long, and an inch broad. Spikes 1-2 inches long. Berries globose. Flowers disposed in 4 rows on the spikes.

**Bertera's Mistletoe.** Shrub parasitical.

29. **V. Schottii** (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves oblong-lanceolate, attenuated at both ends, and somewhat acuminate, having the middle nerve rather distinct, but the rest of the leaf veinless; racemes axillary, solitary or twin, opposite or verticillate, 2 or 3 times shorter than the leaves, articulated: with trident sheaths; berries ovate; flowers trifid. ½. P. S. Native of Brazil, where it was collected by Schott. Leaves 2½ inches long, and 8-9 lines broad. Spikes 9-12 lines long. Altered to F. Berterii.

**Schott's Mistletoe.** Shrub parasitical.

30. **V. macrostachyum** (Jacq. coll. 2. p. 109. t. 5. f. 3.) branches terete; leaves linear-lanceolate, nearly sessile, obtuse, veinless; spikes axillary, solitary, filiform, much longer than the leaves, articulated: with bowl-shaped sheaths; corolla tripartite. ½. P. S. Native of Martinique and Trinidad, on trees. Sieb. fl. trin. no. 337. Spikes 3-6 inches long; ultimate ones subpanicled. Flowers small. Leaves an inch long, and 3 lines broad.

**Long-spiked Mistletoe.** Shrub parasitical.

31. **V. fallicornis** (Hook. et Arn. in bot. misc. 3. p. 356.) branches terete, but when young compressed; leaves narrowly lanceolate, bluish, recurvedly falcate, tapering into the petiole at the base, obscurely 3-5 veined; spikes axillary, solitary, opposite, almost one-half shorter than the leaves; sheaths of spikes truncate. ½. P. S. Native of Brazil, upon laurels by the river Urugua. The sheaths of the spikes are here formed of 2 opposite and equal portions, which are truncate at the apex. In V. Liga they are keeled on the back, and acute at the extremity.

**Sickle-leaved Mistletoe.** Shrub parasitical.

32. **V. pyriformis** (D. C. prod. 4. p. 281.) plant pendulous, dichotomous, much branched; branches terete, articulated: joints bidentate at the apex; leaves eblong, narrowed at the apex, and obtuse, somewhat ensiform; spikes 2-3, axillary, articulate; flowers in 4 series, somewhat immersed in the racem. ½. P. S. Native of South America, near Carthagena and Po-

**Pepper-like Mistletoe.** Shrub parasitical.

33. **V. angustifolium** (D. C. prod. 4. p. 281.) much branched; branches terete, in whorles; leaves petiolate, linear-lanceolate, somewhat ensiform, narrowed at the apex and obtuse; spikes 1-3-together, axillary, articulated; flowers in 4 series, immersed in the racem. ½. P. S. Native of Peru, in the temperate regions of the Andes, between Ollera and Mount Aipate. Leaves 4-5 inches long, and half an inch broad; petioles 3-4 lines long. Spikes 12-18 inches long. Flowers unknown. V. stenophyl- lum, Spreng. syst. 1. p. 487. Loranthus piperoides, H. B. et Kunth, nov. gen. amer. 3. p. 442. Schultes, syst. 7. p. 155.

**Narrow-leaved Mistletoe.** Shrub parasitical.

34. **V. Affine** (Pohl, in litt. ex D. C. prod. 4. p. 281.) branchlets rather tetragonal; branches terete; leaves linear-lanceolate, obtuse, attenuated at the base, finely 5-nerved; spikes axillary, solitary or twin, twice or thrice longer than the leaves, articulated: with small sheaths; berries ovate, exserted. ½. P. S. Native of Brazil, where it was collected by Pohl. Leaves nearly 2 inches long, and 3-4 lines broad. Spikes 9-10 lines long.

**Allicd Mistletoe.** Shrub parasitical.

35. **V. ligia** (Gill. miss. ex Hook. bot. misc. 3. p. 355.) branches terete, while young compressed; leaves straight, linear-oblong, obtuse, hardly apiculate, attenuated at the base, 3-nerved, somewhat feather-veined in the middle; spikes solitary, axillary, opposite, 2 or 3 times shorter than the leaves; sheaths of spikes keeled, acute; berries ovate, exserted. ½. P. G. Native of Chili, on trees near Los Cerillos de San Juan, where it is called *Liga* by the natives. This species seems very nearly allied to V. affine, Pohl.

**Liga Mistletoe.** Shrub parasitical.

36. **V. ensifolium** (Pohl, in litt. ex D. C. prod. 4. p. 281.) branches terete; leaves linear-oblong, acuminate at both ends, petiolate, finely 3-5-nerved at the base; spikes axillary or terminal, many, verticillate, articulated, length of the petioles: with the sheaths bifid; flowers in 6 rows; berries globose. ½. P. S. Native of Brazil, where it was collected by Pohl. Leaves coriaceous, 6-7 inches long, and 8-9 lines broad; petals 8 lines long.

**Sword-leaved Mistletoe.** Shrub parasitical.

37. **V. veleutinum** (D. C. prod. 4. p. 281.) branches terete, velvety from short down; leaves linear-oblong, attenuated at both ends and acute, 3-5-nerved at the base, rather velvety when young, but glabrous in the adult state; spikes axillary, solitary or twin, 3 times shorter than the leaves, articulated: with bifid glabrous sheaths; berries in 4½ rows. ½. P. G. Native of Mexico, in the valley of Toluca, where it was collected by Berlandier. Leaves 4 inches long, and 6 lines broad. Spikes 9-15 lines long. The plate in Catesb. car. t. 81. lower figure, agrees pretty well with the present species.

**Velvety Mistletoe.** Shrub parasitical.

38. **V. tomentosum** (D. C. prod. 4. p. 670.) branches terete, while young rather compressed; leaves obovato, obtuse, a little attenuated at the base, clothed with velvety, somewhat deciduous tomentum on both surfaces, as well as the branchlets; spikes axillary, interruptedly articulated, solitary or twin, rather shorter than the leaves: with small nearly entire sheaths. ½. P. S. Native of Mexico, in the plains at Real de Rata, beyond the range of Michoacan, where it was collected by Berlandier.

**Toucanito Mistletoe.** Shrub parasitical.
39 V. interruptrum (D. C. prod. 4. p. 282.) branches compressed while young, but at length becoming terete; leaves oblong-lanceolate, obtuse, attenuated at the base, petiolate, almost nerveless, with 3-5 fine veins; spikes axillary, 1-2: with the sheaths rather truncate at the apex: joints naked at the base, and fruтиferous at the apex. 

**Branchlets 2-edged or compressed, but at length becoming terete.**

40 V. angustifolium (Spreng. sect. 1. p. 471.) branches 2-edged, but in the adult state they are nearly terete; leaves oblong-lanceolate, obtuse, attenuated at the base, having 3 veins rising from the base; spikes axillary, opposite, one-half or more shorter than the leaves. 

**Native** of Porto-Rico and Hispaniola, where it was collected by Bertero. Leaves 3-4 inches long, and 9 lines broad; petioles 4 lines long. Spikes an inch long or a little more.

41 V. hexastichum (D. C. prod. 4. p. 282.) branches 2-edged, but at length becoming nearly terete; leaves elliptic, tapering at both ends, bluish at the apex, and acute at the base, petiolate, feather-nerved; spikes axillary, solitary, opposite, articulated: with the sheaths truncate; berries globose depressed, disposed in 6 rows. 

**Native** of the island of Cuba, near Havannah. Leaves coriaceous, 3 inches long, and about 15-16 lines broad; petioles 4 lines long. This species is very like V. Perrottetii.

**Six-ranked Mistletoe.** Shrub parasitical.

42 V. undulatum (Pohl, in litt. ex D. C. prod. 4. p. 282.) branchlets 2-edged; branches terete; leaves oval or oblong, tapering at the base, and bluish at the apex, undulated, thickish, having the middle nerve rather tumbid, and the rest of the leaf veinless; spikes axillary, twin, articulated, 3 times shorter than the leaves; having the sheaths rather truncate, and the joints short. 

**Native** of Brazil, where it was collected by Pohl.

**Undulated-leaved Mistletoe.** Shrub parasitical.

43 V. macropulsum (Spreng. sect. 1. p. 488.) branches nearly terete; branchlets compressed at the apex; leaves broadly ovate or oval, petiolate, with the middle nerve rather thick, and the lateral veins perspicuous; spikes 2-4 from each axil, one-half shorter than the leaves, somewhat tetragonal; berries ovate, half immersed. 

**Native** of the West India Islands, as of St. Domingo (Plum. ed. Burm. t. 258. f. 4.), and Porto-Rico (Bertero). Leaves 6 inches long, and 2½ broad; petioles 6-8 lines long. Spikes 2½ inches long, interrupted. Fruit disposed in 4 rows on the spike, and each row composed of 4 berries. Sheaths of spike truncate.

**Long-leaved Mistletoe.** Shrub parasitical.

44 V. schiedeaeum (D. C. prod. 4. p. 670.) trunk terete; branches 2-edged, dilated under the forks; leaves fleshy, 3-5-nerved, falcate, ovate: female spikes 1-3-together, axillary; flowers 6 in a whorl. 

**Native** of Mexico, on trees near Jalapa. Fruit a little smaller than hemp seed. 

**Falcatum, Cham. et Schlecht. in Linnaee. 5. p. 172. but not of Wall. Schiede's Mistletoe.** Shrub parasitical.

45 V. flavens (Swaertz. fl. ind. occ. p. 266.) branches 2-edged, at length terete; leaves ovate, somewhat attenuated at the apex, obtuse, 5-nerved at the base, on very short petioles; spikes axillary, twi or tern, 3 times shorter than the leaves, articulated; berries ovate. 

**Native** of Jamaica (Swaertz) and Porto-Rico (Bertero), on the branches of trees. The figure of Plumier, cited for this plant by several authors, has here been omitted in consequence of the leaves in the figure being feather-nerved, and not 5-nerved at the base, as in this species.

**Yellowish Mistletoe.** Shrub parasitical.

46 V. tetragonum (D. C. prod. 4. p. 282.) branches opposite, and are, as well as the branchlets, tetragonal; leaves elliptic-lanceolate, attenuated at the base, and obtuse at the apex, 3-nerved or 5-nerved, the 2 lateral nerves being hardly evident; spikes axillary, solitary, 3 or 4 times shorter than the leaves. 

**Native** of Porto-Rico and Guadaloupe, on trees by the sea side. 

**V. undulatum, Spreng. sect. 1. p. 471.** 

**Yellowish Mistletoe.** Shrub parasitical.

47 V. maccellatum (D. C. l. c.) branches tetragonal, 2-edged while young, but nearly terete in the adult state; leaves oblong-lanceolate, attenuated at the base, obtuse, and mucronate at the apex, having the middle nerve and one on each side of it distinct; spikes axillary, solitary, 4 times shorter than the leaves. 

**Native** of St. Domingo. 

**V. myrtilloides, Spreng. in herb. Balb.** Leaves nearly an inch long, and 4 lines broad; petioles 1-2 lines long. Spikes 2½ lines long. 

**Mucronate-leaved Mistletoe.** Shrub parasitical.

48 V. penivsium (D. C. l. c.) branches tetragonal, nearly terete; leaves somewhat alternate, ovate on short petiole, obtuse: having the middle nerve rather prominent beneath, and with the lateral veins pinnate and branched, hardly persicuous above; spikes axillary, solitary, one half shorter than the leaves; berries oblong. 

**Native** of French Guiana.

**Feather-veined Mistletoe.** Shrub parasitical.

49 V. kuthanum (D. C. prod. 4. p. 283.) plant much branched; branches tetragonal, articulated; leaves nearly sessile, obliquely oblong, 3-5-nerved, rounded at the apex and cuneate at the base; spikes axillary, 2-3 together, articulated; berries globose, immersed in the rachis. 

**Native** of Quito, near Guayaquil, on trees. Leaves 18-24 lines long, and 2½-3½ lines broad. Spikes nearly an inch long. 

**Native** of the temperate parts of New Granada, parasitical on Guazuma. 

**V. rubrum.** 

**Tetragonal-leaved Mistletoe.** Shrub parasitical.

50 V. quadrangulariare (D. C. prod. 4. p. 283.) plant much branched; branches tetragonal, almost winged; leaves lanceolate-oblong, obtuse, almost ensiform, 5-nerved; spikes axillary, twin; articulated; berries globose, disposed in 4 series, sessile. 

**Native** of the temperate parts of New Granada, parasitical on Guazuma. 

**V. rubrum.** 

**Tetragonal-leaved Mistletoe.** Shrub parasitical.

51 V. oebonfolium (D. C. prod. 4. p. 283.) branches tetragonal; leaves oblong, obtuse, attenuated at the base, nearly nerveless, or somewhat 1-nerved at the base; spikes axillary, solitary, 2 or 3 times shorter than the leaves. 

**Native** of Guadaloupe, on the mountains. 

**Allied to V. tetragonum and V. mucronatum, but differs in the leaves being longer and nerveless.** Leaves 12-14 lines long and 3-4 broad. Fruit bearing spikes an inch and a half long.
Oblong-leaved Mistletoe. Shrub par.

59 V. elongatum (Wall. cat. no. 495. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, somewhat attenuated at the base, 7 times longer than their breadth; fascicles of flowers somewhat verticillate, sessile, containing 1-3 flowers each, placed at the tops of the joints. ꞌP. S. Native of the East Indies, on the Pandanus mountains. Wild. Specimens 20-22 lines long, and 3 lines broad. Branchlets usually opposite.

Elongated Mistletoe. Shrub parasitical.

60 V. fragile (Wall. cat. no. 498. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, striated a little, thickish in the middle, six times longer than their breadth; fascicles of flowers opposite, sessile, containing 1-3 flowers, placed at the tops of the branches. ꞌP. S. Native of the East Indies, at Martaban and Tavoy. Branchlets usually opposite. Perhaps sufficiently distinct from V. dichotomum.

Brittle Mistletoe. Shrub parasitical.

61 V. attenuatum (D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints gradually attenuated both at the base and apex, linear-euneate, somewhat striated, sometimes longer than their breadth; fascicles of flowers at the tops of the joints opposite, sessile, containing 1-3 flowers. ꞌP. S. Native of the East Indies, where it was collected by Heyne. V. opuntioides, Heyne. Herb. Branches usually in whorles, or somewhat dichotomous.

Attenuated-jointed Mistletoe. Shrub parasitical.

62 V. articulatum (Burn. fl. ind. p. 311.) plant leafless; branches compressed, articulated; joints elongated, striated a little, 10 times longer than broad; fascicles of flowers at the tops of the branches opposite, sessile, containing 1-3 flowers. ꞌP. S. Native of Java, parasitical upon some species of Asnônia. Joints of branches an inch long, and a line or a little more in breadth. Stems nearly terete at the base.

V. angularis (Comm. ex Pet. Th. mel. obs. p. 43.) plant leafless, much branched; stem and branches compressed, articulated, linear-oblong; sheaths truncate; flowers sessile, 2 opposite or 4 in a whorl, situated in the axils of the sheaths. ꞌP. S. Native of the Mauritius and Bourbon. Joints 3 lines long, and a line broad, but not striated. Flowers small. Plant becoming wholly black in drying. Habitat almost of Salicaginis.

Wreath Mistletoe. Shrub parasitical.

58 V. dichotomum (Hamilt. D. Don, prod. fl. nep. 147, but not of Spreng.) plant leafless; branches compressed, articulated; joints oval-oblong, striated lengthwise; 5 times longer than its breadth; flowers by threes, sessile at the tops of the joints or branches. ꞌP. S. Native of Nippon, about Narain-gutty, V. nepalense, Spreng. cur. post. Bracteae membranaceous, cuspidata, under the fruit, which is oval. Branches usually opposite, hence dichotomous.

Dichotomous Mistletoe. Shrub parasitical.

59 V. elongatum (Wall. cat. no. 495. D. C. prod. 4. p. 284.) plant leafless; branches compressed, articulated; joints linear-oblong, somewhat attenuated at the base, 7 times longer than their breadth; fascicles of flowers somewhat verticillate, sessile, containing 1-3 flowers each, placed at the tops of the joints. ꞌP. S. Native of the East Indies, on the Pandanus mountains. Wild. Specimens 20-22 lines long, and 3 lines broad. Branchlets usually opposite.
Berries oval-oblong; flowers 3-cleft. Perhaps the present variety is the female plant, and that called the species the male.

II. ARCEUTHOBII. III. MISODENDRUM.

LORANTHACEÆ. I. VISCUM.

Antarctic Mistletoe. Shrub par.

67 V. KEMPSEI (D. C. pro. 4. p. 285.) P. G. Native of Japan, at Mikawa, Kemp b. am. ex. 7/5. It is called Gami Matto. V. album,Thumb. p. 54, but it differs from V. album in the spikes being axillary, in the berries being reddish, and in the leaves being 1-nerved.

Kempse's Mistletoe. Shrub par.

N. B. V. rubrum, Burm. fl. ind. 311. is certainly not a species of Viscum, but perhaps one of Hederá. V. cau'plaire and V. ligula'tum, Blüm. biijdr. 667. are species of Psilotis. V. terres'tre, Lin. spec. 1452. is Lysimíchina stricta. V. flae'scens, Comm. in Misodendron punctato'tum. Cult. None of the species of Mistletoe are cultivable in gardens, except the common Mistletoe, whose culture and propagation are treated of under that species.

II. ARCEUTHOBII (from arceo'bo, arceuthos, the juniper, and a, bow, bue, to live; in reference to the plant being parasitic on Juniperus Ozyctédrus). Bieb. fl. taur. suppl. p. 629. Hook. fl. bor. amer. 1. p. 277—Viscum species, D. C. fl. ed. 3. no. 3400.

LIN. SYST. Dioicío, Di-Tetradría. Flowers dioecious. Male ones sessile; calyx none; corolla monopetalous, 2,3– rarely 4-parted, tough, and fleshy; segments ovate, concave, spreading; stamens 2–3–4; anthers sessile, fixed in the middle of the segments, free, nearly globose, 1-celled, membranous, dehiscing transversely; ovum none, but in its stead there is a small 2–3–4 lobed gland. Female flowers on short pedicels; calyx oval, compressed, fleshy, bidentate, almost covering the ovarium, which is one ovulate, and adnate to it; corolla, style, and stamens none; stigma small, obscurely lobed. Berries narrow, obovate, terete, 1-seeded, on short pedicels, on a viscous pulv. pulp, fixed to the upper part of the cell, pendant, obovately cylindrical, acuminate at the base; integument thin; albumen fleshy. Embryo immersed, slender, cylindrical, placed towards the base of the seed; radical turned to the hilum of the seed.—A small, leafless, rather fleshy, proliferous branched shrub, parasitical on resiniferous trees, in Middle Europe and North America; branches opposite, blantly tetragonal, articulated in the manner of Salix; seeds above, and somewhat polviform. Flowers terminal and lateral, usually three, small, and conspicuous.

1 A. Oxycé'dri (Bieb. fl. taur. suppl. p. 629. Hook. fl. bor. amer. 1. p. 278. t. 90.) P. H. Native from Spain, near Les'caria, and to the southward, in New Spain; also in Ecuador, Peru, at the base of the Cordillera del Andes, and in the mountains of the Cordillera, of the Pacific. III. MISODENDRUM (from mu'sos, misos, disad, and idé'cif, dundrion, a tree; trees with neither appearance nor beauty). Banks, ined. D. C. coll. mem. 6. no. 2. t. 11 and 12. pro. 4. p. 285.
LIN. SYST. DIÓCECA, TETRADÉRIA? Flowers dioecious; male ones unknown; female ones having the tube of the calyx adnate to the ovary, and furnished with 3 long plumose bristles on the outside, alternating with 3 bracteas, which are adnate to the calyx; limb of calyx minute, truncate. Fruit an oblong triquetrous indehiscent uriculus, crowned by the permanent limb of the calyx. Seed one; albumen fleshy.—Small smooth parasitical shrubs, with the habit of Viseum.

§ 1. Plant leafless.

§ 2. Plants furnished with leaves. Branches alternate, bearing one or articulated leaf at the apex.

2 M. Brachyphyllum (D. C. coll. mem. vi. t. 12. f. 1.) branches alternate, bearing each an obovate or oval obtuse leaf at the apex; spiklets few-flowered, bracteas, arising from the branchlets beneath the leaves; fruit ovate. Var. a. Native of the north-west coast of America, in Statenland. Leaves 3-5 lines long, and 3-6 broad, flat, nerveless. Flowers and fruit not sufficiently known, and therefore the genus is doubtful. Short-spiked Misdendron. Shrub par.

3 M. Quadrichilum (D. C. coll. mem. iv. t. 12. f. 2.) branchlets alternate, each bearing an oblong-obovate suberectuated leaf at the apex, and 4 sessile unilateral flowers on the upper side. Var. a. Native of North America, in Statenland. This is very like the preceding species in habit, but differs in the flowers and fruit being unilateral. Calyx triquetrous, dehiscing at the sides. Four-flowered Misdendron. Shrub par.

§ 3. Plants furnished with leaves. Leaves alternate. Branches floriferous at the apex.

4 M. Globochilum (D. C. prod. 4. p. 671.) branches clothed with fine velvety down; leaves oblong-lanceolate, cuneate at the base, 3-nerved, glabrous; spikes bearing each one leaf at the base, conforming to the others. Var. a. Native of Chili (Bertero), and of Chile (Cuming). Genus novum, no. 1. Poeppl. pl. exsic. no. 813. Flowers bracteas, with 8-10 distant ones in each spike. Oblong-leaved Misdendron. Shrub par.

5 M. linearechilum (D. C. prod. 4. p. 671.) plant glabrous; leaves linear, acute; flowers sessile, solitary at the axis of the leaves in the flowering branches. Var. a. Native of Chili, where it was collected by Poeppig. Genus novum, no. 2. Poeppl. pl. exsic. no. 806. Linear-leaved Misdendron. Shrub par.

6 M. Microphyllum (Hook. et Arn. in bot. misc. 3. p. 557.) leaves minute, linear; flowers sessile, solitary at the axis of the leaves; branches pubescent. Var. a. Native of Chili, in the province of Maule. Close allied, but apparently quite distinct from the preceding species. Small-leaved Misdendron. Shrub par.

Cult. These are singular shrubs, similar to the Mistletoe, but are not cultivable in gardens.

IV. LORANTHUS (from lorum, a leaf, and anthos, a flower; alluding to the long linear shape and leathery substance of the petals). Mart. in D. C. prod. 4. p. 671.—Loranthus species of Lin. and others.

LIN. SYST. Penta-hexárdia, Monogyniá. Flowers dioecious or hermaphrodite. Calyx cup-shaped, adnate, with an entire border. Petals 5-6 (f. 7–8. a. d.), linear, reflexed. Stamens inserted into the middle of the petals; filaments short; anthers globose, dindious, having the cells dehiscing in front towards the connecting part. Style thickish; stigma simple. Berry globose (f. 7–8. c.), umbilicate by the calyx, 1-seeded, 1-seeded as in the rest of the genus, broken off from the present.—Parasitical shrubs. Flowers immersed in the fleshy racis, each propped by a somewhat orbicular bracte at the base.

1 L. Europaeus (Lin. spec. 1672.) plant glabrous, much branched; branches terete; leaves opposite, petiolate, oval-oblong, obtuse, somewhat attenuated at the base; racemes terminal, simple; flowers dioecious, of 6 petals; anthers adnate in the male flowers. Var. a. Native of Austria, Hungary, Italy, and Upper Siberia, parasitical on oak and sweet-chestnut trees. Jacq. fl. austr. t. 30. Schkuhr, lamdb. t. 94. Sturm, fl. germ. with a figure. Plenck. icon. t. 248. Habit of Viseum alburn. Flowers greenish. Berries oval, white or yellowish. This is the Viseum or Mistletoe of the ancients.

Európea Loranthus. Shrub par.

2 L. oporatus (Wall. in Roxb. fl. ind. 2. p. 215.) glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, fleshy; spikes axillary, subtuscied, with a foetid slysh racis, and jointed sessile submersed spreading 6-petalled hexandrons flowers; anthers ovate, inserted by the base; style shorter than the petals. Var. a. Native of Nipanl, on the mountains of Chendiugri and Sheepore, parasitical on trees. D. Don, prod. fl. nep. p. 143. Schultes, syst. 7. p. 101. D. C. prod. 4. p. 291. Leaves pale green, at length becoming yellowish, from 4 to 6 inches long. Spikes shorter than the leaves, many flowered, almost sessile. Flowers small, nearly white, very sweet-scented, at first clavate, but at length spreading; petals cuneate, slightly concave at the apex. Ovarium supported by no other bractea than the acute margin of the foetida of the racis.

Sweet-scented-flowered Loranthus. Shrub par.

3 L. Lambertianus (Schultes, syst. 7. p. 118.) glabrous, dichotomously branched; leaves opposite, on very short petioles, ovate-lanceolate, narrowed at both ends, acute, nerved; spikes terminal, solitary; flowers half immersed in the foetid racis, 5-petalled; anthers fixed by the back. Var. a. Native of Nipanl. Habit of L. Europaeus. Lambert’s Loranthus. Shrub par.

Cult. The species have the habit of common mistletoe, but are not cultivable in gardens on account of their being parasitical.

V. STRUTHANTHUS (from struthos, struthos, a sparrow, and anthos, a flower; some of the species are called Erea de Passerinho and Herba dos Passerios, i.e. Sparrow-plant, in South America). Mart. in D. C. prod. 4. p. 671.—Loranthus species of authors.

LIN. SYST. Hexárdia, Monogyniá. Flowers hermaphrodite, almost always 6-parted (except in one species, which is 4-parted at the apex).
and dioecious, and in another 5-parted). Calyx angular, small, hemispherical, with an exstipulate truncate margin. Petals linear, distinct from each other a long way at the base, and at length revolute at the apex; anthers ovate, fixed by the back near the base or beneath the middle; filaments short, inserted beneath the middle of the petals. Ovarium ovate-globose. Style subulate. Berry ovate-elliptic.—Parasitical shrubs. Racemes terminal or lateral, solitary or aggregate in the axils, having the rachis for the most part angular or 2-edged. To this genus belongs the greater part of the sections Stachydranthus and Protostyles of Loranthus, D. C. prod. 4. p. 287 and 289, particularly the Brazilian species.

**Loranthaceae.**

**Stachya**nthus. (from σταχυς, a spike, and anthos, a flower; flowers sessile, disposed in spikes). Flowers sessile along the rachis, and sometimes immersed in pits on it, spicate, solitary or by threes, usually furnished with 3 bracteas each.

1 S. *alveolatus*; plant glabrous, much branched; branches terete; leaves petiolate, roundish-ovate, rather oblique, obtuse, somewhat coriaceous; spikes axillary, 1-3-together, without joints, somewhat tetragonal; flowers disposed in 4 rows on the spikes, immersed in pits in the rachis; petals linear-lanceolate.

2 S. *petrygopus*; plant glabrous; branches compressed at the apex; leaves opposite, on short petioles, ovate, acuminate, coriaceous; spikes axillary, solitary, longer than the leaves; peduncles compressed, winged; flowers by threes, sessile; petals 6, linear-lanceolate.

3 S. *ugaleatus*; plant glabrous, erect; branches terete; leaves alternate, oblong-lanceolate, cuneate at the point, attenuated into the petiole at the base; peduncles 1-2, filaments somewhat longer than the petals; anthers ovate, erect, stigma capitulate; berries egg-shaped.

4 S. *Porotheres*; plant glabrous, erect; branches terete, when young angularly compressed; leaves elliptic, attenuated at both ends, feather-nerved, reticulate above; spikes axillary and terminal, flexuous, pedunculate; flowers by threes, immersed in the rachis, which is winged; corolla 6-parted, with linear lobes; anthers inserted by the base; stigma capitulate.

5 S. *oblongus*; plant glabrous; branches terete; branchlets compressed; leaves oblong, nearly elliptic, obtuse, cuneate at the base, and 3-5-nerved; nerves slender, reticulately branched; spikes axillary, very short, few-flowered.

6 S. *occidentalis*; branches terete, scabrous; leaves ovate-roundish or elliptic, margined, glabrous, feather-nerved at the base, on very short petioles; spikes axillary, simple, shorter than the leaves, nearly terete; flowers almost sessile, furnished with a small very blunt bract each; petals 6, rather connate at the base; stamens 6, 3 fertile and 3 sterile.

7 S. *P. Native of Brazil. Loranthus oblongus, Schott. and Pohl, in litt. ex D. C. prod. 4. p. 287. Leaves 2 inches long, and 8 lines broad; petioles and spikes about 2-3 lines long. The nervation of the leaves is very distinct from the other species, but the young flowers are not described. It is probably a species of *Viscum*. Oblong-leaved Struthanthus. Shrub par.

8 S. *Polycauchcyus*; plant glabrous; branches terete, but compressed at the articulations; leaves petiolate, ovate-lanceolate, acute, thick, veiny; spikes axillary, by threes, one-half shorter than the leaves, diverging; flowers by threes, sessile, opposite; petals 6.

10 S. *P. Native of French Guiana, where it was collected by Patri. Loranthus Patrii, D. C. prod. 4. p. 288. Leaves 4-5 inches long, and 1-2 broad, rather glabrous above, and Rufescent beneath, on pedicels 2 lines long. Berries trigonally compressed while young, 3 lines long. Flowers unknown, therefore it is doubtful whether it belongs to this genus or not.

Loranthaceae.

V. Struthanthus.

ovate or oval, attenuated at the base, somewhat palmately veined, obtuse; spikes axillary, thick, tetragonal, shorter than the leaves, bearing flowers almost from the base; flowers deciduous; petals 6, concretes at the very base: berry ovate-oblong. \( P. \) P. S. Native of South America, amongst the bushes and woods of Carthagena. Loranthus spicatus, Jacq. amer. p. 97. t. 68. Flowers small, red. Berries green, red at the apex. Schultes, syst. 7. p. 151.

* var. \( \beta \). *atroanthus* (E. Meyer, nov. act. bonn. 12. p. 788.) lower spikes axillary, superior ones crowded in racemes, leafless. \( P. \) P. S.

* Spiked-flowered Struthanthus. Shrub par.

13 S. leptostachyus; plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminate, rounded at the base, rather coriaceous; spikes axillary, twin or tern, 2 or 3 times shorter than the leaves; flowers sessile, scattered, distant; racis compressed, rather quadrangular; petals 6, lanceolate-linear, spreading. \( P. \) P. S. Native of the Andes of Quindiu, between Carthagena and Buga. Loranthus leptostachyus, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 154. Leaves 5 inches long, and \( \frac{1}{2} \) broad. Spikes 1\( \frac{1}{2} \) to 2\( \frac{1}{2} \) inches long. Flowers hardly 2 lines long.

*S. slender-spiked Struthanthus. Shrub par.

13 S. ovalifolius; plant glabrous, herbaceous; stem terete, quite simple, erect; leaves ovate, thick, nearly veinless, on short petioles, obtuse or emarginate; spikes axillary, 1-2, twice the length of the petioles; flowers sessile, bractless; petals 6, linear, retroflected at the apex. \( P. \) P. S. Native of Peru, on the Andes in groves, upon trees and shrubs. Loranthus ovalifolius, Ruiz et Pav. flux. per. 3. p. 50. t. 277. f. b. Schultes, syst. 7. p. 151. Herb a foot high. Flowers much crowded, small, purple. Berry oval, of an obscure purple colour.

* Oval-leaved Struthanthus. Shrub par.

14 S. marginatus (Lam. dict. 3. p. 596.) plant glabrous; branches terete; leaves ovate-lanceolate, acuminate, petiolate, with scarious margins, having the middle nerve rather prominent, and the lateral ones wanting; spikes axillary, solitary, opposite, shorter than the leaves; flowers by threes in a fascicle along the rachis, bracteolate; corolla 6-parted, with linear segments; anthers very caducous; stigma capitulate. \( P. \) P. S. Native of Brazil. Loranthus marginatus, Lam. dict. 3. p. 596. Schultes, syst. 7. p. 137. L. avium, Pohl, in litt. Leaves 2 inches long, and 9-10 lines broad; petioles 2-3 lines long. Corolla 2-3 lines long.

15 S. concinnus; plant glabrous; branches slender, terete; leaves opposite, lanceolate, acuminate, membranous, shining above; spikes axillary and terminal, solitary, interrupted, shorter than the leaves; flowers by threes, opposite, sessile, somewhat verticillate, bracteate; petals 6, linear, reflexed. \( P. \) P. S. Native of Brazil, in the province of Rio Negro, in woods at Ega. Loranthus concinnus, Mart. in Schultes, syst. 7. p. 150. Flowers a line and a half long, elavate in the unexpanded state. Anthers ovate.

* Neat Struthanthus. Shrub par.

16 S. nitens; plant glabrous; branches terete, rooting on one side; leaves alternate, ovate-lanceolate, acuminate, shining, membranous; spikes racemose, interrupted, lower ones axillary, solitary; superior ones panicled; flowers by threes, sessile, bracteate; petals 6, linear-lanceolate. \( P. \) P. S. Native of Brazil, in the province of Rio Negro, in woods. Loranthus nitens, Mart. in Schultes. syst. 7. p. 150. Flowers a line long, ovate-club-shaped in the unexpanded state. Anthers ovate, excavated at the side of the filaments.

* Shining Struthanthus. Shrub par.

17 S. subcampestris; branches terete, beset with rusty dots at the apex, compressed; leaves opposite, ovate-elliptic, obtuse, coriaceous, nerved, glabrous; spikes 1-2, axillary, interrupted, one-half shorter than the leaves; flowers nearly opposite, by threes, sessile, bracteate, small; petals 6, linear-lanceolate. \( P. \) P. S. Native of Brazil, in the province of Minas Geraes. Flowers half a line long. Anthers ovate. Loranthus subcamppestris, Mart. in Schultes, syst. 7. p. 151.

Field Struthanthus. Shrub par.

18 S. affinis; branches terete, compressed at the apex, and beset with rusty dots; leaves nearly opposite, ovate-elliptic, acuminate, coriaceous, nerved, glabrous; spikes axillary, solitary, interrupted, not half so long as the leaves; flowers by threes, sessile, retrosellate, bracteate, small. \( P. \) P. S. Native of Brazil, in the woods of Japura, in the province of Rio Negro. Loranthus affinis, Mart. in Schultes, syst. 7. p. 151. Very like the preceding species.

* Allied Struthanthus. Shrub par.

19 S. accepis; branches compressed, 2-edged, green; leaves on short petioles, elongated, ovate-obtuse; spikes on short peduncles, solitary, axillary, much shorter than the leaves; flowers small, somewhat imbricate. \( P. \) P. S. Native of Guiana. Loranthus accepis, Desv. in Hamilt. prod. p. 33. Schultes, syst. 7. p. 153. The rest unknown.

* Two-edged-branched Struthanthus. Shrub par.

** Sect. II. PROTOSTELIDAE (meaning unknown to us). Loranthus, sect. 3. Protostelidæ, D. C. prod. 4. p. 289. Flowers of 6 petals, racemose or panicled; the branches of the panicles or racemes usually bearing 3 flowers and 3 bracteas at the apex. — Species all natives of South America.

20 S. rufulus; branches terete; leaves nearly opposite, on short petioles, ovate-oblong, long-acuminate, coriaceous; spikes terminal, panicled; racis beset with rufous dots; pedicels very short, bearing 3 flowers and 3 bracteas each; petals 6, linear; anthers roundish-ovate. \( P. \) P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loranthus rufulus, Mart. in Schultes, syst. 7. p. 150. Flowers a line and a half long, white.

* Rufous-branched Struthanthus. Shrub par.

21 S. aviculaîóus; plant glabrous; young branches tetragonal; leaves nearly opposite, ovate, rather acuminate, coriaceous; panicles axillary and terminal, solitary, diffuse, longer than the leaves; peduncles opposite, bracteate at the base; flowers by threes, sessile, 3 bracteate; petals 6, linear-lanceolate. \( P. \) P. S. Native of Brazil, frequent, where it is called Erva de Passerinho. Loranthus avicularius, Mart. in Schultes, syst. 7. p. 152. Flowers a line and a half long. Filaments of stamens excavated on the side at the apex.

* Knot-grass-like Struthanthus. Shrub par.

22 S. theobromæ; branches tetragonal, but at length becoming terete, rather radicant; leaves ovate, acuminate, on short petioles; panicles axillary and terminal, longer than the leaves; pedicels very short, 3-flowered at the apex. \( P. \) P. S. Native of Brazil, at Para, upon trees of Theobroma cacau, where it is called *Hera dos Passetura*. Loranthus Theobromæ, Willd. rel. ex Schultes, syst. 7. p. 152. According to Schultes, this is probably the same as the preceding species.

* Cacao Struthanthus. Shrub par.

23 S. virgatus; plant glabrous; branches radicant, tetragonal at the apex; leaves opposite, ovate, acuminate, complicate, rather coriaceous; panicles axillary, solitary, twiggy, 3 times longer than the leaves; having the branches tetragonal, and bracteate at the base, and the branchlets short and bearing 3 flowers at the apex, and 3 bracteas; petals 6, linear-lanceolate. \( P. \) P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loranthus virgatus, Mart. in Schultes, 3 G 2
syst. 7. p. 132. Flowers half a line long. Filaments of stamens excavated at the side at the apex.

**Twiggy Struthanthus.** Shrub par.

24 S. **Depeaéus**; glabrous; branches rather radicant; leaves almost opposite, petiolate, ovate-lanceolate, acuminate, sometimes 3-nerved; racemes 1-2, axillary; peduncles 3-flowered, bracteless; flowers pedicellate; anthers linear, fixed by the base. ½. P. S. Native of Mexico, near Jalapa. Loranthus Depéaéus, Cham. et Schlecht. in Linnaea. 5. p. 172. Style twisted in a circinate manner at the apex.

**Deppe’s Struthanthus.** Shrub par.

25 S. **erythrocárpus**; plant glabrous; branches terete; leaves nearly opposite, ovate-lanceolate, acuminate, attenuated at the base, coriaceous, veiny; racemes 1-3 together, rather spicate, interrupted, axillary, and terminal: having very short branchlets, which bear 3 flowers and 3 bracteas at the apex; petals 6, linear. ½. P. S. Native of Brazil, in the province of Rio Negro, on trees. Loranthus erythrocárpus, Mart. in Schultes, syst. 7. p. 138. Anthers ovate. Berries orange-coloured.

**Red-fruited Struthanthus.** Shrub par.

26 S. **citrícola**; plant glabrous; branches terete; leaves rather alternate, ovate, somewhat acuminate, and obtuse, sub-emarginate, veiny; racemes axillary and terminal, shorter than the leaves: superior ones solitary, but the lower ones are somewhat verricellate; branches of racemes short, opposite, bearing each 3 flowers at the apex and 3 bracteas. ½. P. S. Native of Brazil, near Rio Janeiro, on trees of the orange tribe, where it is called *Ieraca de Passerinho*. Loranthus citrícola, Mart. in Schultes, syst. 7. p. 137. Perhaps the same as S. *margiáditus*.

**Orange Struthanthus.** Shrub par.

27 S. **flexicaulis**; plant glabrous; branches sermentose, radicant; leaves almost alternate, oblanceolate, obtuse, with a mucronated, tapering at the base, flat, reflexed; racemes 1-2 together, axillary, erect, shorter than the leaves: having short, opposite, 3-flowered, tribracteate branchlets; petals 6, linear, spreading above the middle. ½. P. S. Native of Brazil, in the fields of Taboleira, in the province of Minas Geraes. Loranthus flexicaulis, Mart. in Schultes, syst. 7. p. 139. Flowers yellowish, a line long, clavate in the unexpanded state.

**Bent-stemmed Struthanthus.** Shrub par.

28 S. **polyrrhízus**; plant glabrous; branches scendent, root- ing; leaves subalternate, obovate, emarginate, flat, veiny; racemes axillary, solitary, compound, erect, one-half shorter than the leaves: having the branchlets tetragonal, and bearing 3 flowers at the apex and 3 bracteas; petals 6, reflexed from the middle. ½. P. S. Native of Brazil, in the province of Bahia, in the woods. Loranthus polyrrhízus, Mart. in Schultes, syst. 7. p. 139. Flowers 2 lines long, green. Anthers ovate.

**Many-rooted Struthanthus.** Shrub par.

29 S. **tetraquétér**; plant glabrous; branches compressedly tetragonal, scendent, rooting; leaves nearly opposite, ovate, obtuse, reflexed, rather coriaceous; racemes 2-3, axillary; having very short, nearly opposite 3-flowered tribracteate branchlets; petals 6, linear, hardly reflexed, spreading. ½. P. S. Native of Brazil, in the province of Minas Geraes, on trees. Loranthus tetraquétér, Mart. in Schultes, syst. 7. p. 140. Flowers hardly a line long, roundish in the unexpanded state.

**Four-side-d-branched Struthanthus.** Shrub par.

30 S. **staphyliínes**; plant glabrous; branches compressed at the apex; leaves nearly opposite, obovate or emarginate, attenuated at the base, flat, coriaceous, nerved; racemes axillary, solitary, longer than the leaves: having short bent branchlets, each bearing 3 flowers and 3 bracteas at the apex; petals 6, linear, reflexed spreading. ½. P. S. Native of Brazil, in the province of Rio Negro. Loranthus staphyllínes, Mart. in Schultes, syst. 7. p. 290. Flowers a line long. Anthers roundish-ovate. *Staphylea-like* Struthanthus. Shrub par.

31 S. **cuspíátus**; plant glabrous; branches rooting, terete; leaves nearly opposite, obovate, attenuated at the base, cuspidate at the apex, coriaceous, glaucous; racemes axillary, solitary; about equal in length to the leaves, few-flowered: having the branchlets 3-flowered at the apex, and tribracteate; petals 6, linear, reflexed from the middle. ½. P. S. Native of Brazil, in the woods, about Piaúbin. Loranthus cuspidátus, Mart. in Schultes, syst. 7. p. 140. Flowers 2 lines long, clavate in the unexpanded state. Anthers ovate.

**Cuspidate-leaved Struthanthus.** Shrub par.

32 S. **longipeudículus**; plant glabrous; branches terete; leaves opposite, oblong-ovate, acuminate, attenuated at the base, rather coriaceous, nerved; racemes axillary, solitary, longer than the leaves: with few branchlets, bearing each 3 flowers at the apex and 3 bracteas; petals 6, linear, spreading above the middle. ½. P. S. Native of Brazil, in the province of Bahia. Flowers 4 lines long, of a pale greenish colour. Anthers ovate. Loranthus longipeudículus, Mart. in Schultes, syst. 7. p. 141.

**Long-peduncled Struthanthus.** Shrub par.

33 S. **syringefólius**; plant glabrous; branches unknown; leaves opposite, petiolate, ovate, rather coriaceous, ending in a long taper point; racemes axillary, solitary, panicled, shorter than the leaves: peduncles compressedly tetragonal: with the branchlets short, thick, and bearing 3 flowers at the apex and 3 bracteas; petals 6, linear. ½. P. S. Native of Brazil, in the province of Rio Negro, in the woods. Loranthus syringefólius, Mart. in Schultes, syst. 7. p. 141. Racemes 1½ to 2 inches long. The unexpanded flowers dilated into a somewhat hexagonal club. Anthers erect, hastate at the base.

**Syringa-leaved Struthanthus.** Shrub par.

34 S. **páten**; plant glabrous; branches terete; leaves opposite, lanceolate, thin, ending in a long taper point; racemes axillary, solitary, spreading, exceeding the leaves a little; pedicels 3-flowered; flowers pedicellate; bracteas very minute, orbicular; petals 6, nearly linear, reflexed above the middle. ½. P. S. Native of Brazil, in the province of Minas Geraes. Loranthus páten, Mart. in Schultes, syst. 7. p. 142. Flowers 4½ lines long, tubularly club-shaped in the unexpanded state. Anthers ovate.

**Spreading Struthanthus.** Shrub par.

35 S. **elegantus**; plant glabrous; branches terete at the base, but compressed at the apex; leaves nearly opposite, somewhat ovate, rather coriaceous, terminating in a short reflexed acumen; racemes axillary, solitary, twice the length of the leaves: having the branchlets opposite, and bearing 3 flowers at the apex, without any bracteas; petals 6, linear-lanceolate. ½. P. S. Native of Brazil. Loranthus elegantus, Mart. in Schultes, syst. 7. p. 144. Flowers white, a line and a half long, of a roundish club-shaped form at the apex in the unexpanded state. Anthers ovate.

**Elegant Struthanthus.** Shrub par.

36 S. **rubens**; plant glabrous; branches terete, radicant; leaves opposite, somewhat reflexed, lanceolate, attenuated at both ends, nerved, somewhat undulated; racemes shorter than the leaves: and the peduncles are trifid: branchlets short, nearly opposite, bearing 3 flowers at the apex, and 3 bracteas. ½. P. S. Native of Brazil, in the province of Rio Negro, in the woods of Japura. Loranthus rhíbens, Mart. in Schultes, syst. 7. p. 144. Flowers unknown. Berries ovate-oblong, umbilicate, 3-4 lines long.

**Reddish Struthanthus.** Shrub par.

37 S. **polyántus**; plant glabrous; branches terete; leaves opposite, lanceolate, mucronately acuminate, flat, coriaceous;
racemes axillary, many-flowered, about equal in length to the leaves; branchlets 3-flowered at the apex, and tribrate; bracteas ovate, acute; petals linear, reflexed from the middle. ♂ P. S. Native of Brazil, in the province of Bahia, in the woods called Catingas. Loranthus polyanthus, Mart. in Schultes, syst. 7. p. 145. Flowers yellowish, 2 lines long. Anthers ovate.

**Many-flowered Struthanthus.** Shrub par.

38 S. PANICULATUS; plant glabrous; branches terete; floriferous branches tetragonal; leaves petiolate, ovate-elliptic, acute at both ends, rather coriaceous; panicules terminal, brachiate, diffuse; branchlets very short, bearing 3 flowers and 3 bracteas at the apex. ♂ P. S. Native of South America, on trees near Cumana, where it is called Pizarito. Loranthus paniculatus, H. B. et Kunth, nov. gen. amer. 3. p. 442. Flowers unknown. Berries oblong. Loranthus tetragonus, Willd. in Schultes, syst. 7. p. 131. Perhaps the same as S. Orinoscehis.

**Panicled Struthanthus.** Shrub par.

39 S. ORINOCOensis; plant glabrous; branches somewhat tetragonal; leaves petiolate, ovate-elliptic, acuminate, rounded at the base, and somewhat complicate, rather coriaceous; racemes axillary and terminal, exceeding the leaves, paniculately disposed, diffuse; branchlets short, bearing 3 bracteas and 3 flowers; flowers sessile; petals 6, linear-lanceolate, 3 of which are cohering; filaments broad; anthers adnate. ♂ P. S. Native on the banks of the Orinoco, parasitical on trees. Loranthus Orinocensis, Spreng. syst. 1. p. 129. Schultes, syst. 7. p. 136. Loranthus marginatus, H. B. et Kunth, nov. gen. amer. 3. p. 442. t. 299. exclusive of the syn. of Lam. Leaves ½ inches long and ½ broad; on petioles about 5 lines long. Flowers hardly 3 lines long.

**Orinoco Struthanthus.** Shrub par.

40 S. FYLHLLIREOIDES; plant glabrous; branches elongated, filiform; leaves oblong, acute, rather coriaceous, running into the short petiole at the base, velvety, with the middle nerve rather prominent beneath; peduncles axillary, rather dichotomous, 2-3 times shorter than the leaves; flowers sessile, usually by threes, tribracteate; petals 6, linear, spreading; anthers adnate, mucronate. ♂ P. S. Native of South America, parasitical on trees, near Cumana, where it is called by the natives Guat-Pizarito. Loranthus phylliraeoides, H. B. et Kunth, nov. gen. amer. 3. p. 439. Schultes, syst. 7. p. 122. Leaves 9-10 lines long, and 2-3 broad. Flowers small.

**Phylliraeoid-like Struthanthus.** Shrub par.

41 S. MICROPHYLLUS; plant clothed with hairy pubescence; branches terete; branchlets very short, bearing leaves and flowers at the apex; leaves oblong, obtuse, rather mucronate, sessile, thickish, canescent; flowers sessile, crowded, axillary, and terminal; petals 6-7, lanceolate-linear, rather acute at the base; filaments adnate to the petals, nearly to the apex; anthers adnate, mucronate. ♂ P. S. Native of Mexico, near Guanacava, on the mountains. Loranthus microphyllus, H. B. Kunth, nov. gen. amer. 4. p. 291. Flowers 4 lines long and ½½ broad. Flowers hardly 2 lines long, pubescent on the outside.

**Small-leaved Struthanthus.** Shrub par.

42 S. PARVIFOLIUS; plant glabrous; branches terete, while young angularly compressed; leaves attenuated at the base, on short petioles, obtuse at the apex, nerveless; peduncles axillary, opposite, trifid, 3-flowered, 3 times shorter than the leaves; petals 6, lanceolate-acute; stamens shorter than the petals. ♂ P. S. Native of the higher mountains of Jamaica, upon the branches of trees. Loranthus parvifolius, Swartz, prod. p. 58. fl. ind. occ. p. 638. Schultes, syst. 7. p. 126. Leaves 6 lines long, and 3 broad. Corolla 2 lines long. Berry oblong, black.

**Small-leaved Struthanthus.** Shrub par.

43 S. ROTUNDIFOLIUS; stems diffuse; leaves roundish, glabrous; flowers axillary, crowded, bracteate, hexadrous; peduncles short, many-flowered. ♂ P. S. Native of Brazil, among bushes about Rio Janeiro. Loranthus rotundifolius, St. Hil. pl. rem. bras. intr. p. 21. Schultes, syst. 7. p. 121.

**Round-leaved Struthanthus.** Shrub par.

44 S. PYRIFOLIUS; glabrous, pendulous; branches terete, compressed at the node; leaves petiolate, oblong, obtuse, acute at the base, rather membranous, complicated; racemes axillary and terminal; branchlets very short, nearly opposite, tribrate, 3-flowered; flowers sessile; petals 6, lanceolate. ♂ P. S. Native of South America, near Carthagena, growing on Crescentia Cujete. Loranthus pyrifolius, H. B. et Kunth, nov. gen. amer. 3. p. 441. Schultes, syst. 7. p. 139. Leaves 2-3 inches long, and 13-15 lines broad, on petioles 3 lines long. Racemes 3 inches long. Flowers small. Berries ovate.

**Pear-leaved Struthanthus.** Shrub par.

45 S. SUBROTUNDUS; plant glabrous, twining; branches terete; leaves alternate or opposite, petiolate, ovate-orbicular, ending in a short mucronate acumen, feather-nerved, shining above, coriaceous; racemes axillary, solitary, about equal in length to the leaves, or twin shorter than the other: branchlets opposite, bearing 3 sessile flowers and 3 bracteas at the apex; petals 6, linear, somewhat concrete at the base; filaments a little shorter than the petals, anthers ovate, erect. ♂ P. S. Native of Brazil, where it was collected by Schott. Loranthus subrotundus, Pohl, in litt. ex D. C. prod. 4. p. 292. Leaves 15-18 lines long, and 10-12 broad; petals 5-6 lines long. Corolla 3 lines long. Style filiform; stigma simple, not capitate.

**Roundish-leaved Struthanthus.** Shrub par.

46 S. GLOMERATUS; plant glabrous; branches terete, radiant; leaves opposite, on short petioles, ovate, ending in a short acumen, glaucous, coriaceous; peduncles very short, axillary, glomerate, bident; flowers by threes, sessile, tribrate; petals 6, linear, reflexed from the middle; anthers ovate; style equal in length to the petals. ♂ P. S. Native of Brazil, in the provinces of the Matos. Loranthus glomeratus, Mart. in Schultes, syst. 7. p. 121. Flowers yellowish green, 2 lines long. Glomerate-flowered Struthanthus. Shrub par.

47 S. CONFERTUS; plant glabrous; branches radical, terete; leaves opposite, ovate or roundish, obtuse, with a short acumen, coriaceous, nerves; peduncles axillary, crowded, dichotomous, simple; flowers by threes, sessile, tribrate; petals 6, spreadingly reflexed; linear; anthers ovate; style one half shorter than the petals. ♂ P. S. Native of Brazil, on trees of the orange tribe. Loranthus confertus, Mart. in Schultes, syst. 7. p. 121.

**Crowded-peduncled Struthanthus.** Shrub par.

48 S. PERRÒTTETRIT; plant glabrous; branches terete, but rather compressed in the young state; leaves petiolate, ovate, or oval, obtuse, coriaceous, feather-nerved; racemes twin, unequal, simple, axillary; with the branchlets bearing each 3 small concrete bracteas, and 3 sessile flowers; flower-buds ovate, small; berry ovate. ♂ P. S. Native of French Guiana. Loranthus Perrottettii, D. C. prod. 4. p. 292. Racemes, pediomas, and rachis of racemes rufous, appearing velvety at first sight. Flowers small. Leaves 2-3 inches long and ½½ broad. Racemes sometimes equal in length to the leaves, but sometimes twice the length.

**Perrottet's Struthanthus.** Shrub par.

49 S. INTERROGATUS; glabrous, pendulous; branches terete; leaves oblong, acute, running into the petiole at the base, rather coriaceous; racemes axillary and terminal; with short, nearly opposite, distant branchlets, bearing each 3 sessile flowers at the apex, without bracteas. ♂ P. S. Native of Mexico, near
Ario, on trees of Amnò narcissi. Loranthus interrumpitus, H. B. et Kunt, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 138. Flowers and fruit not sufficiently known. Leaves nearly 2 inches long and 9 lines broad; petioles 3-4 lines long.

Interrupted-spiked Struthanthus. Shrub par. 56 S. aduncus; plant glabrous; branches terete, knotted, scandent; branchlets angular; leaves opposite, oblong-rounded, apiculated by a hooked point, veiny, petiolate; racemes axillary, trichotomous, or simple; flowers sessile, 2-6 together, propped by a subtriangular bracteal; petals 6, linear; anthers oblong. ½. P. S. Native of Guiana, on trees. Loranthus aduncus, Meyer. prim. essq. p. 149. Schultes, syst. 7. p. 147. Perhaps the flowers are sessile on the tops of the branches, not on a rachis.

Hooked-leaved Struthanthus. Shrub par. 51 S. magdalenæ; plant glabrous; branches terete, rather sermantine; leaves petiolate, ovate, acute, complicate, feather-nerved, rather coriaceous; panicles axillary, longer than the leaves, spreadingly branched; peduncles distant, bearing 3 flowers and 3 bracts at the apex; petals 6, linear, anthers erect, inserted by the base, 3 of which are drawn out in a horn? ½. P. S. Native of South America, on the banks of the river Magdalenæ, where it was collected by Bertero. Loranthus Magdalenæ, Cham. et Schlecht. in Linnaea 3. p. 219. Wéíhea Magdalenæ, Spreng. in herb. Balb. but not of his sys. Leaves 20-22 lines long and 12-15 lines broad; petioles 4-5 lines long. Corolla 2 lines long.

Magdalenæ Struthanthus. Shrub par. 52 S. seselis; glabrous; leaves ovate; spikes simple, solitary; flowers sessile, by threes; pedicels thick, 3-flowered at the top. ½. P. S. Native of South America, in the woods of Carthagena. Loranthus sselis, Jacq. amer. 98. Berries of reddish dirty green colour. Perhaps Loranthus sesselis, Meyer. prim. essq. 4. p. 149. is the same as that of Jacquin.

Sesile-flowered Struthanthus. Shrub par. 53 S. stevis; glabrous; branches spreading; leaves ovate or oblong, coriaceous, nearly sessile; peduncles numerous, axillary, spreading, trigonal, bifid; having the branches bearing 3 equal, sessile, hexadromous flowers. ½. P. S. Native of Cupana, upon trees. Loranthus Stevis, Lin. spec. 331. Schultes, syst. 7. p. 147. Stevis, no. 1. Loebl. itin. 187. Plant not sufficiently known, and Stevis, no. 2. Loebl. is still more obscure.

Midthoe Struthanthus. Shrub par. 54 S. pedunculatus; glabrous; branches shining; leaves cordate-ovate, ending each in a short taper point, coriaceous, shining, petiolate, feather-veined; racemes axillary, solitary, shorter than the leaves; having the rachis compressed and the branchlets 3-flowered, and the flowers pedicellate; petals 6, obtuse; stamens some of them sterile. ½. P. S. Native of South America, in the woods of Carthagena, especially on the sea coast. Loranthus pedunculatus, Jacq. amer. p. 98. Schultes, syst. 7. p. 145. Leaves 2 inches long. Flowers small, white. Pedunculate-flowered Struthanthus. Shrub par. 55 S. psitobrytis; glabrous; branches terete; branchlets angularly compressed; leaves oblong, acutish, attenuated at the base, on short petioles, nerveless, except the middle nerve; racemes axillary, 4 times longer than the leaves, 2-edged, especially at the base; pedicels nearly opposite, 1-flowered; bracteæ 3, concrete, resembling a 3-cleft cupula under each flower. ½. P. S. Native of St. Domingo, where it was collected by Bertero. Loranthus psitobrytis, D. C. prod. 4. p. 293. Loranthus uniflorus, Spreng. in herb. Balb. but it is very different from the true L. uniflorus. Alabastra oval, a line long. Racemes 6-7 inches long. Leaves 15 lines long and 4 broad.

V. Struthanthus. Naked-racemed Struthanthus. Shrub par. 56 S. Dominoensis; branches 2 edged, green; leaves obovate-oblong, mucromulate, fleshy, running down the petiole at the base; racemes simple or tern; flowers remote. ½. P. S. Native of St. Domingo. Loranthus Dominensis, Desf. in Hamilt. prod. p. 33. Schultes, syst. 7. p. 147. The rest unknown.

St. Domingo Struthanthus. Shrub par. 57 S. laxiflorus; branches terete, brownish; leaves roundish-ovate, finely margined, running into the petiole at the base; racemes for the most part solitary, greyish, on long peduncles; flowers remote; pedicels elongated. ½. P. S. Native of Hispaniola. Loranthus laxiflorus, Desf. in Hamilt. prod. p. 33. The rest unknown.

Lax-flowered Struthanthus. Shrub par. 58 S. uniflorus; glabrous; branches terete; leaves obovate or oval, on short petioles, obtuse at the apex, emarginate, and rather mucronate, feather-veined, rather membranous; racemes axillary, solitary or twin, simple; pedicels 1-flowered, a little longer than the flowers, girded by a trilîd involucrum; petals 6, obtuse; alternate anthers sterile. ½. P. S. Native of St. Domingo, upon trees and bushes in the woods. Loranthus uniflorus, Jacq. amer. 98. t. 69. Schultes, syst. 7. p. 146. Loranthus parviflorus, Lam. dict. 3. p. 595. Leaves 1-2 inches long. Flowers purple, 2 lines long. Berries cylindrical, dark.

One-flowered Struthanthus. Shrub par. 59 S. Portoricensis; glabrous; stem terete, rooting, dichotomous; branchlets compressed; leaves petiolate, lanceolate, acute, glaucous, veinless, except the middle nerve, which is conspicuous at the base but hardly evident at the apex; corony dichotomous, few-flowered, terminal, one half shorter than the leaves; fruit oval, crowned by the teeth of the calyx. ½. P. S. Native of Porto Rico, parasitical upon trees, where it was collected by Bertero. Loranthus Portoricensis, D. C. prod. 4. p. 293. Loranthus Braziliensus, Spreng. in herb. Balb. Flowers smaller than in the rest of the species. Leaves 8 lines long and 3 lines broad.

Porto Rico Struthanthus. Shrub par. 60 S. pauciflorus; glabrous; branches terete, spreading; leaves obovate-roundish, veiny, on very short petioles; racemes axillary, solitary, tripartite, shorter than the leaves; flowers nearly sessile, decussate; bracteæ concave; petals 6, lanceolate, contiguous at the base; anthers 6, ovate. ½. P. S. Native of the interior of Jamaica, and of Cayenne, parasitical on trees. Loranthus pauciflorus, Swartz, prod. p. 58. fl. ind. occ. 677. Schultes, syst. 7. p. 147. Loranthus occidentalis, Aubl. guian. p. 310. ex Swartz. Allied to S. occidentalis, but differs in the raceme or spike being tripartite, not simple.

Few-flowered Struthanthus. Shrub par. 61 S. Guadalupensis; glabrous; branches terete; leaves ovate, rather cordate at the base, acuminated at the apex, on very short petioles, veinless except the middle nerve; peduncles terminal, trichotomous and corystome at the apex, about the length of the leaves; bracteæ small; calyx denticulated; berry oval. ½. P. S. Native of Guadaloupe, where it was collected by Bertero. Loranthus Guadalupensis, D. C. prod. 4. p. 294. Loranthus pedunculatus, Spreng. in herb. Balb.

Guadaloupe Struthanthus. Shrub par. 62 S. quercicolæ; glabrous; branches terete; leaves almost opposite, petiolate, ovate, acuminate, papery, reticulately veined; racemes 1-2, axillary; flowers almost sessile, by threes, opposite; anthers orbicular, fixed by the base. ½. P. S. Native of Mexico, near Jalapa, parasitical on oak and other trees. Flowers minutely bracteolate. Corolla a line and a half long. Loranthus quercicola, Cham. et Schlecht. in Linnaea 5. p. 173. Oak Struthanthus. Shrub par.
63 S. retroflexus; glabrous; branches terete; leaves ovate, acute, deflexed, rather coriaceous, on short petioles; panicles axillary and terminal: with an angular rachis: and retroflexed branchlets, bearing ovate, concave, deciduous bracteas, and 5-4 flowers, which stand on short pedicels; petals 6, linear, reflexed at the apex.  

1. P. S. Native of Peru, in groves on the Andes, upon trees. Loranthus retroflexus, Ruiz, et Pav. fl. per. 3. p. 49. t. 279. f. 4. Schultes, syst. 7. p. 128. Leaves usually an inch and a half long and 2 inches broad; on petioles 2-3 lines long. Flowers small, purple. Berries oval, of a yellowish glaucous colour.  

Retroflexed-petalled Struthanthus. Shrub par.  

Cult. All the species of this beautiful genus being parasitical, they are consequently not cultivable in gardens. They have something of the aspect of Lonicera or honeysuckle.

VI. PSITTACANTHUS (Psittaceæ, psittacos, a parrot, and arboc, anthos, a flower; perhaps from the bright colour of the flowers), Mart. in D. C. prod. 4. p. 671. Loranthus section Oscellaria Callanthæ. D. C. prod. 4. p. 308.—Loranthus species of authors.

Lin. syst. Hexandria, Monogynia. Flowers hermaphrodite, for the most part hexameros. Calyx cup-shaped, hemispherically cymiform, with a contracted mouth: having the border sometimes entire, and sometimes obliquely 5-6-toothed or re-pand. Petals 6, linear-spatulate, in most of the species distinct to the middle, erect, spreading, often furnished with a linear scale in the middle. Filaments filiform, rising from the middle of the petals; anthers linear or oblong, fixed by the base, therefore erect: or by the back, then they are incumbent. Ovarium ovate. Style filiform; stigma capitata. Berry ovate.—Panicules dichotomous or trichotomous, expanded or corymbose; peduncles articulate inserted, bracteate; pedicels extended into a cup-shaped bracteole each. Flowers large, thick, deeply coloured.

1. P. bamilekis; glabrous; branches terete; branchlets angular; leaves ovate, bluntish, attenuated at the base; peduncles opposite, trifid, 6-flowered, spreadingly deflexed, rising beneath the leaf-bearing branches: alabastra conical; petals lanceolate-linear, acuminate; anthers versatile.  

P. S. Native of Mexico, parasitical on trees, on the mountains of Mocanitza. Loranthus bamilekis, Moc. et Sesse, fl. mex. Icon. ined. ex D. C. prod. 4. p. 308. Leaves 1½ inch long, and 6-7 lines broad; on very short petioles. Corolla 10 lines long, conical.  

Branch-flowered Psittacanthus. Shrub par.

2. P. calyculatus; glabrous; branches nearly terete; leaves opposite, ovate, or lanceolate, hardly petiolate, coriaceous, veinless; coryms terminal, trichotomous, shorter than the leaves: having a cup-shaped bractea under each flower, as in all the rest of the species; petals 6, linear, acute; anthers versatile.  

P. S. Native of Mexico, about Cuacavara, where it was collected by Berlandier. Loranthus calyculatus, D. C. coll. mem. vi. t. 101. Larger leaves 2 inches long and 1½ broad, the rest rather smaller. Flowers of a yellowish scarlet colour, almost 2 inches long. There are 2 oblong floral leaves under each lateral branch of the corymb. Limb of calyx truncate.  

Allied to P. ceillus. Perhaps the same as Loranthus Quanzchiti of Moc. et Sesse, fl. mex.  

Calyculate Psittacanthus. Shrub par.

3. P. jacquinii; glabrous; branches terete; leaves obovate or oval, coriaceous, shining, on short petioles, veinless; peduncles axillary and terminal, cymose, shorter than the leaves; ultimate ones trifid; having an unicordate, small bractea under each flower; petals 6, contiguous at the base, linear, revolute at the apex; alabastra curved a little; anthers oblong, versatile.  

Var. 3, longifolius (D. C. prod. 4. p. 308.) leaves oblique, lanceolate, attenuated at the base.  

4. P. brasiliensis; glabrous; branches terete, compressed while young; leaves petiolate, lanceolate-ovate, obliquely nerves, thickish, shining above; peduncles trichotomous, terminal, and in the upper axis: branchlets 5-flowered; alabastra club-shaped; petals 6, linear; anthers versatile.  

P. S. Native of Brazil. Loranthus Brasilienïs, Desr. in Lam. dict. 3. p. 396. Schultes, syst. 7. p. 127. Habit of Aveécinia tonentosa, but is perfectly glabrous. Leaves 3 or 3½ inches long, and 12-15 lines broad, on petioles 3-4 lines long. Corolla an inch and a half long.  

Brazilian Psittacanthus. Shrub par.

5. P. coccus; branches terete; leaves opposite and alternate, on very short petioles, oblong-ovate, obtuse, thick, margined; racemes axillary and terminal, compound: peduncles nearly opposite, 2-flowered; bractea cup-shaped; flowers tormentose on the outside, clavate at the apex in the unexpanded state; petals 6, nearly linear, glandular at the base.  

P. S. Native of Brazil, in the province of Rio Negro, in the woods of Jupara. Loranthus coccus, Mart. in Schultes, syst. 7. p. 134. Corolla 1 or 1½ inch long, densely clothed with coloured tomentum. Anthers oblong. Style equal in length to the petals. Stigma capitata.

Girded Psittacanthus. Shrub par.

6. P. speciosus; glabrous; leaves oblong-elliptic, or lanceolate, blutish, cuneated at the base, coriaceous; having the middle nerve hardly conspicuous, and the lateral veins wanting; racemes unknown; alabastra cylindrical; petals 6, linear, hardly concrete at the base; anthers versatile; stigma not capitata.  

P. S. Native of Brazil. Loranthus speciosus. Pohl, in litt. but not Dietr. nor Wall. Leaves 3 inches long and an inch broad; pedioles hardly any. Corolla 3 inches long. It differs from P. Brasilienïs, Lam. in the alabastra not being clavate.  

Showy Psittacanthus. Shrub par.

7. P. dichroïdes; glabrous; branches terete; leaves opposite, obovate, emarginate, coriaceous, hardly veined; pedicelles solitary, axillary, dichotomous: the branches 2-3-flowered; bractea cup-shaped, shorter than the ovary, 1-toothed; petals 6, linear, spreadingly reflexed from the middle; anthers linear-oblong.  

P. S. Native of Brazil, in the province of Rio Janeiro. Loranthus dichroïdes, Mart. in Schultes, syst. 7. p. 122. Flowers 18-20 lines long, scarlet, but green at the apex.  

Two-coloured-flowered Psittacanthus. Shrub par.

8. P. grandiflorus; branches terete; leaves opposite, on short petioles, ovate-lanceolate, acuminate, thick; pedicelles dichotomous: terminal ones 3-4: axillary ones solitary; flowers pedicellate by threes, tormentose; bractea cup-shaped, unidentate; petals 6, linear, bearing each a scale on the inside at the base.  

Great-flowered Psittacanthus. Shrub par.

9. P. intermus; branches terete, rather velvety; leaves nearly opposite, petiolate, elliptic, obtuse, thick, glaucescent; peduncles axillary and terminal: lower ones solitary, dichotomous: superior ones sub-panicled; flowers pedicellate, pubescent;
bracteas ovate; petals 6, linear, bearing each a scale on the inside at the base; anthers oblong, versatile. \(\in\) P. S. Native of Brazil. Loranthus biternatus, Hoffmannseg, in Schultes, syst. 7. p. 124. Corolla 12-18 lines long. Three of the stamens are shorter than the rest. Style bent, with 2 knees; stigma capitate.

**Bicordate** Psittacanthus. Shrub par.
10 P. bicordatus; glabrous; branches tetragonal; leaves opposite, dentate, on short pedicles, oblong-obovate, obtuse, thick; peduncles terminal, and corymbose crowded in the axils of the upper leaves, 3-flowered; flowers erect, angular; bracteas nearly orbicular, short. \(\in\) P. S. Native of Brazil, in the province of Rio Negro, in woods about Japura. Loranthus robustus, Mart. in Schultes, syst. 7. p. 125. Corolla yellow, 2-3 inches long, glabrous on the outside. Style filiform; stigma capitate. Anthers linear.

**Robust** Psittacanthus. Shrub par.
11 P. forcatus; glabrous; branches tetragonal at the apex; leaves opposite, ovate-obtuse, emarginate or obtuse, coriaceous, almost nerveless; peduncles axillary and terminal, 1-3 together, those in the forks bearing 2-6 flowers; bracteas ovate, acutish; petals 6, linear, longer than the base, but spreadingly reflexed at the apex. \(\in\) P. S. Native of Brazil, in woods at the river St. Francisco. Loranthus forcatus, Mart. in Schultes, syst. 7. p. 126. Corolla 1 or 1½ inch long, scarlet at the base, but paler towards the apex, and yellow inside. Anthers oblong, probably versatile.

**Forked**-peduncled Psittacanthus. Shrub par.
12 P. bicordatus; glabrous; branches tetragonal; leaves opposite, ovate-cordate, obtuse, somewhat stem-clasping, thick, glaucous; panicel terminal, dichotomous, bracteate; peduncles 2-3-flowered, tomentose; bracteas cup-shaped, girding the ovarium; calyx 6-toothed; petals linear. \(\in\) P. S. Native of Brazil, in the province of Bahia, in woods. Loranthus bicordatus, Mart. in Schultes, syst. 7. p. 125. Corolla 14 lines long, tomentose on the outside, scarlet. Style longer than the stamens; stigma capitate.

**Bicordate**-flowered Psittacanthus. Shrub par.
13 P. cordatus; glabrous; branches terete; leaves opposite, cordate at the base, stem-clasping, coriaceous, ending in a long acumens, triple or quintuple-nerved; flowers racemously panicked on the tops of the branches, and in the axils of the upper leaves; peduncles 2-flowered; rather tomentose; bracteas cup-shaped; petals 6, linear, spreading above the middle. \(\in\) P. S. Native of Brazil. Loranthus cordatus, Hoffmannseg in Schultes, syst. 7. p. 128. Corolla 12-16 lines long. Anthers oblong. Stigma capitate.

**Cordate**-leaved Psittacanthus. Shrub par.
14 P. falcirostris; glabrous; branches terete; leaves opposite, sessile, oblong-lanceolate, rather falcate, triple or quintuple-nerved, coriaceous; panicles terminal and axillary, somewhat dichotomous; flowers by threes, glabrous; pedicels equal in length to the bracteas, which are drawn out into a cup, around the ovaria, and much longer than them; petals 6, linear. \(\in\) P. S. Native of Brazil. Loranthus falcirostris, Mart. in Schultes, syst. 7. p. 129. Corolla golden-yellow, 11-18 lines long. Anthers oblong, yellow.—There is a variety of this species having shorter, ovate-oblong, hardly falcate leaves.

**Sickle-leaved** Psittacanthus. Shrub par.
15 P. acinarius; glabrous; leaves lanceolate, acuminated, oblique; rather falcate; thick, hardly veined; cymes 5-parted, with the branchlets 3-flowered; flowers pedicellate; bracteas cup-shaped, large, truncate, nearly entire; calyx 6-toothed; petals 6, linear. \(\in\) P. S. Native of Brazil, in woods in the province of Piauí. Loranthus acinarius, Mart. in Schultes, syst. 7. p. 130. Corolla 1½ inch long, club-shaped at the apex in the unexpanded state. Anthers oblong. Stigma rather oblique.

**Actinarios** Psittacanthus. Shrub par.
16 P. cucullarum; glabrous; branches terete, nodose at the joints; leaves broad-lanceolate, falcate, 5-nerved, opposite, on short pedicles; peduncles axillary and terminal, bifid or subpaniculate, nearly one-half shorter than the leaves: with 1-5-flowered branches; bracteas large, concave, cordate, acuminated, flowers sessile; petals 6, linear; anthers versatile. \(\in\) P. S. Native of French Guiana. Loranthus cucullaris, Lam. journ. hist. nat. 1. p. 144. t. 23. Schultes, syst. 7. p. 130.

**Cuclular-bracted** Psittacanthus. Shrub par.
17 P. mexicanus; glabrous; leaves ovate-lanceolate, rather falcate, running down the short pediole in a cuneate manner at the base, 5-7-nerved, rather coriaceous; panicles axillary and terminal: with thick branchlets, bearing 3 flowers at the apex; pedicels shorter than the bracteas, which are drawn out into ovate cupula, much exceeding the ovaria; petals 6, linear, acute, velvety on the outside; anthers oblong. \(\in\) P. S. Native of Mexico, where it was collected by Haenke. Loranthus Mexicanus, Mart. in Schultes, syst. 7. p. 129. Leaves 5 inches long and 1½ broad. Flowers 18-20 lines long, golden yellow in the dried state. The leaves are very similar to those of *P. cucullaris*, but differs in the bracteas being much smaller.

**Mexican** Psittacanthus. Shrub par.
18 P. \(?\) destructor; glabrous; branches tetragonal, warted; leaves petiolate, oblong, acute, coriaceous, having the middle nerve rather prominent beneath, the rest of the leaf veinless; racemes terminal, having the branchlets 3-flowered, approximate, secund, and bracteas; flowers pedicellate; petals 6, linear; anthers incumbent. \(\in\) P. S. Native of Quito, on trees near Villa de Ibarra, where it is called *Mota pula*. Loranthus destrctor, H. B. et Kunth, nov. gen. amer. 3. p. 485. Schultes, syst. 7. p. 135. Leaves 2 inches long and 8-9 lines broad; petals 5 lines long. Flowers about an inch long, orange-coloured. Berries globose, black. It is very doubtful whether this is a species of the present genus from the want of bracteas.

**Destructive** Psittacanthus. Shrub par.
19 P. formosus; quite glabrous; branches compressedly angular at the nodi; leaves elliptic-lanceolate, obtuse, on short petioles, coriaceous, feather-veined; umbels 3, 1 terminal, and 2 axillary, pedunculate; bracteas irregular; calyx re pandly truncate; corolla 6-parted, with linear lobes; anthers versatile. \(\in\) P. S. Native of Brazil. Loranthus formosus, Cham. et Schlecht. in Linnaea. 3. p. 211. An intermediate species between *P. jacquinii* and *P. Matelisi*. Leaves almost alternate or opposite, 2-4 inches long, and 1-2 broad. Corolla 4 inches long, showy.

**Beautiful** Psittacanthus. Shrub.
20 P. cucullifolius; glabrous; branches terete; leaves nearly sessile, cuneiform, small, ending in a short acumen, fleshy, shiny; pedicules 1-3 together, axillary, 1-flowered, 3 times shorter than the leaves; bracteas cup-shaped, one under each flower; petals 6, linear-spatulate, concrete at the base; anthers versatile. \(\in\) P. S. Native of Brazil and Peru, on trees and shrubs; of Chili, in valleys in the Andes of Mendoza, Cordillera of Chili, on *Cavania Cavina* at Llalay, and upon willows at Banda Oriental. Loranthus cucullifolius, Ruiz et Pav. fl. par. 5. p. 46. t. 276. f. b. Cham. et Schlecht. in Linnaea. 3. p. 212. Schultes, syst. 2. p. 128. Loranthus montevideosis, Spring, syst. 2. p. 128. Leaves hardly an inch long, some of them emarginately retuse at the apex. Corolla scarlet, an inch and a half long. Berries roundish, black, crowned by the urceolate calyx. *Cuneiform-leaved* Psittacanthus. Shrub par.
21. *P. cupulifer*; glabrous; branches terete; leaves nearly sessile, obliquely ovate-oblong, narrowed at the apex and obtuse, reticulately many veined, somewhat membranous; pedun- 
cles axillary, 2-3-flowered, unbracteate; pedicels furnished with a 
large cup-shaped bractea under the flower; petals 6, linear, spreading, revolute at the apex; anthers incumbent. 
†. P. S. Native of Peru, near Loa. Loranthus cupulifer, 
120. Leaves 5 inches long and 2 inches broad, on very short 
pedicels. Flowers 1 or 1½ inch long, on very short pedicels. 
Berry elliptic, about the length of the cup-shaped bractea.

*Cup-bearing* Psittacanthus. Shrub par.

22. *P. Plumi*; glabrous; branches terete; leaves ovate 
(3-nerved ex Lam.) 5-7-nerved at the base, coriaceous; pedun-
cles axillary, trichotomously corymbose, shorter than the leaves; 
petals 5, linear, contiguous at the base; alabastra a little curved; 
anthers versatile. †. P. S. Native of the West India Islands, 
parasitical on trees. Loranthus Plumi, π. & Schlecht, in 
Linnea, 3. p. 311. Lonicera, Plum. nov. gen. 17. t. 37. pl. 
par. 1722. p. 201. Plumier says the flowers of his plant are 
composed of 6 petals, but the number of the parts of the flower is 
unknown.

*Plumier's* Psittacanthus. Shrub par.

23. *P. ecalyptiformis*; glabrous; branches terete; leaves 
petiolate, ovate, rounded at the apex, coriaceous, almost vein-
less; peduncles axillary, 3-flowered, shorter than the leaves; 
pedicels furnished with a cup-shaped bractea each under the 
flower; petals 6, linear, a little dilated at the apex, hardly 
cohering at the base; anthers incumbent. †. P. S. Native of 
South America, in the province of Caracas, at Villa de Cura. 
Loranthus ecalyptiformis, H. B. et Kunth, nov. gen. amer. 3. 
p. 433. Leaves 3 inches long, and nearly 2 broad. Flowers 
yellow, glabrous, about 1½ inch long. Schultes, syst. 7. p. 120.

*Ecalyptus-leaved* Psittacanthus. Shrub par.

24. *P. crassifolius*; branches terete, dotted with brown 
at the apex; leaves opposite, broad-ovate, obtuse, with subrevolute 
margins, coriaceous; peduncles axillary, 1-3-together, dichoto-
mous; flowers twain or tern, pedicellate, tubular; the tube ven-
tricose above the middle, and spreading at the apex, and having 
the throat constricted; bractees cup-shaped, one under each 
flower. †. P. S. Native of Brazil, in the province of Rio 
Grande, in woods about Japura. Loranthus crassifolius, Mart. 
in Schultes, syst. 7. p. 123. Corolla purplish, 2 and 2½ inches 
long. Anthers linear.

*Thick-leaved* Psittacanthus. Shrub par.

25. *P. dichotomus*; glabrous; branches terete, dichotomous, 
5 or 4 in a whorl; leaves usually in whorles, ovate-elliptic, 
rounded at the apex, coriaceous; peduncles axillary, twin, bifur-
cate, penioulous in the flower-bearing state, but erect in the 
fruit-bearing state; limb of calyx truncate; bractees cup-
shaped, one under each flower; petals 6, linear, concrete at the 
base, revolutely spreading at the apex; anthers incumbent. †. 
P. S. Native of Peru, on the Andes, in groves about Muna. 
Loranthus dichotomus, Ruiz et Pav. fl. per. 3. p. 45. t. 274. f. 
rel. ex Schultes, syst. l. c. Leaves 2 inches long, and a hand 
and a half broad. Corolla about a hand and a half long, scarlet 
at the base, and yellow at the top. Petioles very short.

*Var. β. Balthasaris* (D. C. prod. 4. p. 311.) petioles 8-9 
lines long; margins of leaves somewhat revolute, shining above, 
and rudder glaucous; flowers red, 3 inches long; petals a little 
dilated at the apex. †. P. S. Native of South America, 
on the branches of the Orchis, near Balthasar. Loranthus di-
chlorous, H. B. et Kunth, nov. gen. amer. 3. p. 433. Perhaps 
sufficiently distinct from the species.

Dichotomous-peduncled Psittacanthus. Shrub par.

26. *P. nodosus*; glabrous; branches terete, dichotomous, arti-
culated at the nodi; leaves opposite, petiolate, ovate-roundish, 
coriaceous, somewhat 7-nerved at the base; peduncles axillary, 
and in the forks of the branches, in fascicles, 1-2-flowered, nearly 
the length of the petioles; bractees semicircular; alabastra 
terete, acute; petals 6, linear-lanceolate; filaments adnate a 
long way to the petals. †. P. S. Native of Peru. Loranthus 
119. Leaves 3½ to 4 inches long, and 2½ to 3 inches broad. Corolla 
3 or 3½ inches long.

*Knotted*-branched Psittacanthus. Shrub par.

27. *P. Mutisi*; glabrous; branches terete; leaves 3 in a 
whorl, sessile, somewhat obliquely elliptic-oblong, or obovate, 
rounded at the apex, coriaceous; peduncles axillary, few-flowered, 
bractless; petals 6, linear, glabrous, concrete at the base? 
†. P. S. Native of South America, near Santa Fe de Bogota. 
Schultes, syst. 7. p. 124. Loranthus longifolius, Mutis, ined. 
ex Boulp. Leaves 2½ to 3 inches long, and 1½ broad. Flowers 
half a foot long.

*Mutisi's* Psittacanthus. Shrub par.

28. *P. diversicatus*; glabrous; branches terete, divaricate; 
leaves petiolate, oblong or elliptic, rounded at the apex, coria-
ceous, glaucous; peduncles panicked on the tops of the 
branches, 3-flowered, bractless; pedicels expanded into an entire 
cupula under each flower; petals 6, linear, glabrous; anthers 
incumbent. †. P. S. Native of South America, on the banks of 
the Orinoco. Loranthus diversicatius, H. B. et Kunth, nov. 
gen. amer. 3. p. 433. Schultes, syst. 7. p. 127. Flowers more 
than an inch long. Leaves 10-15 lines long, and 5-9 broad.

Peduncles axillary and terminal.

*Divaricate* Psittacanthus. Shrub par.

29. *P. acutiformis*; glabrous; branches terete; leaves petio-
late, lanceolate, very acute; racemes axillary, one-half shorter 
than the leaves, having the branches 1-3-flowered; flowers pe-
dicellate, furnished with a common acute bractea each; petals 6, 
linear, somewhat spatulate, erect to the middle, and convining. 
†. P. S. Native of Peru, parasitical on trees, and in hedges at 
Huanaco. Loranthus acutiformis, Ruiz et Pav. fl. per. 3. p. 
48. t. 274. f. b. Schultes, syst. 7. p. 142. Leaves 2-3 inches long, 
and nearly an inch broad; petioles 2-3 lines long. Corolla white, 
4-5 lines long. Berry oval, blackish.

*Var. β. Chiléensis* (D. C. prod. 4. p. 314.) racemes dense-
flowered, almost bractless; petals erect beneath the middle, and 
convining, linear and acute at the apex. †. P. G. Native of 
Chili, where it was collected by Hænke. Loranthus acutiformis, 
Presl, in herb. Hænke. Perhaps a distinct species.

Acute-leaved Psittacanthus. Shrub par.

30. *P. Eschscholtzianus*; branches terete, or a little angu-
lar, rough; leaves subalternate, on very short pedioles, rough, 
ovate or roundish, obtuse, glabrous, coriaceous; peduncles 
corymbose racemose, terminal and axillary, erect, for the most 
part 3-flowered; the middle flower sessile; bractes ovate, 
fringed at the apex, equal in length to the ovaria; corolla 
5-cleft, clavate; anthers fixed by the back. †. P. G. Native of 
Chili. Loranthus Eschscholtzianus, Mart. in Schultes, syst. 

Eschscholk's Psittacanthus. Shrub par.

31. *P. thyrsiflorus*; glabrous; branches dichotomous or 
trichotomous; leaves broad-lanceolate, acutish or acuminated, 
with pellucid cartilaginous margins; racemes terminal and axil-
ary; flowers 2-3, sessile at the tops of the branches; bractes 
ovate, acute, or; under each flower; corolla 6-parted, with linear 
lobes; anthers versatile. †. P. S. Native of Brazil. Loranthus 
thyrsiflorus, Chum. et Schlecht. in Linnea. 3. p. 214.
Leaves 2 inches long, and 8-9 lines broad; pediolos 6-9 lines long. Flowers 5 lines long. Limb of calyx very narrow, truncate.

_Tyrse-flowered_ Psittacanthus. Shrub par.

32. _P. flagellare:_ glabrous, tormentose; branches terete; leaves sessile, linear, acute, coriaceous, with the middle nerve hardly conspicuous; racemes terminal, naked, erect; lower pedicels 3-flowered, superior ones 1-flowered; bracteas deciduous, one under each flower; calyx lacerate, truncate; corolla 5-parted, having the lobes linear and dilated at the apex; anthers versatile. ʒ. P. S. Native of Chili; of _Chili_, near La Punta de San Luis, at El Aquadita, and on the banks of El Rio Chorillo. Loranthus flagellarius, Cham. et Schlecht. in Linnaea. 3. p. 213. Like _Loranthus cuneiformis_ and _sarmen- tus_, Ruiz et Pav. in fl. per. Corolla fine red, 6 lines long. Style attenuated at the apex. Leaves 20 lines long and ½ broad.

_Whip_ Psittacanthus. Shrub par.

33. _P. Berteroii:_ glabrous; branches terete; leaves alternate, broad, elliptic, obtuse, tapering into the short pediolos at the base, coriaceous, with somewhat revolute margins; peduncles terminal, in dense corymbose racemes; the partial peduncles 2-5-flowered; flowers tubular, with 6 linear-spatulate, nearly free sepals; filaments equal in length to the petals; anthers linear-oblong, ovaliatory; style filiform, angular, stigma hardly capitate; ovary ribbed, exceeding the unilateral bractea, which is roundish and dentilicate at the apex. ʒ. P. G. Native at Juan Fernandez, growing on _Myrtus Persicaria_. Hook. et Arn. Loranthus Berteroii, Hook. et Arn. in bot. misc. 3. p. 528. _Loranthus venetus_, Bertero, but not of Kunit. The partial peduncles are simple, and bear 2 flowers, or are forked, and then bear 3 or 5 flowers. The flowers are about an inch long. It is probably a species of _Struthanthus._

_Berteroii_ Psittacanthus. Shrub par.

34. _P. Schiedeaui:_ plant glabrous; branches subalate tetragonal, dilated at the nod; leaves nearly opposite, on short pediolos, ovate-lanceolate, obliquely falcate, feather-veined, and somewhat triple-ribbed; corymbs terminal; bracteas cup-obed, one under each flower; limb of calyx truncate. ʒ. P. S. Native of Mexico, near Jalapa. Loranthus Schiedeaeus, Cham. et Schlecht. in Linnaea. 5. p. 172. Allied to _P. Jacquini_, but differs in the flowers being more slender, and about 2 inches long. _Schiedeaui_ Psittacanthus. Shrub par.

_Cult._ The flowers of all the species of this genus are very showy, and comparatively large. The habit is that of honey-suckle. Being all parasitical shrubs, they are not cultivable.

VII. TRISTERIX (from τρις, three, and πτερις, a wing; in reference to the 3 bracteas to the flowers). Mart. in D. C. prod. 4. p. 671.—Loranthus species of authors.

_Lan. syst._ Tetra-Hexandria, Monogynia. Flowers hermaphrodit, each furnished with one bractea; bracteas sometimes lateral, and sometimes cupular and oblique. Calyx cup-shaped or campanulate, with an entire or toothed border. Petals linear-spatulate, bearing the stamens in the middle. Anthers fixed by the base, erect, linear. Style filiform; stigma capitate. Berry ovate or elliptic. Racemes for the most part lateral, subcorymbose.

§ 1. Flowers of 4-5 petals, having a ciliate bractea under each flower.

1. _D. ligusteri_: branches terete, when young, as well as the new leaves, peduncles, bracteas, and flowers pubescent; leaves petiolate, lanceolate, acuminate, coriaceous, at length glabrous; peduncles many, axillary, cymosely corymbose; bracteae lateral, ciliate under each flower: limb of calyx almost entire; corolla tetragonal; petals 4, linear, at length spreading; flowers pentandrous. ʒ. P. G. Native of _Nipal_, in woods in the great valley. Loranthus ligustrius, Wall. in Roxb. fl. ind. 2. p. 219. D. Don, prod. fl. nep. p. 143. Schultes, syst. 7. p. 101. Leaves 2 inches long, and 6-9 lines broad; pediolos 2 lines long. _Corolla_ 4-6 lines long, reddish.
LORANTHACEE.

VIII. Dendrophthoe.

Privet-like Dendrophthoe. Shrub par.

2 D. Wallachiæ: glabrous; branches terete; leaves rather alternate, ovate, obtuse, acute at the base; racemes axillary, 1-3-together, one-half shorter than the leaves, simple, in fascicles round the base of the branches; flowers small, pedicellate; bracteas lateral cuneate, one under each flower; petals 4, linear-cuneate; alabastra nearly terete; berry subglobose, reflexed; flowers tetraandrous.

3 P. S. Native of the East Indies, where it was detected by Heyne. Loranthus Wallachiæ, Schultes, syst. 7. p. 100. Loranthus polysepþhus, Wall. in Roxb. fl. ind. 2. p. 217. but not of Ruiz et Pav. Corolla deep purple, 4 lines long.

Wallich's Dendrophthoe. Shrub par.

4 D. púlcher: glabrous; branches terete; leaves opposite, petiolate, long-linear, acutish, coriaceous, with 5 subparallel veins, which are hardly conspicuous; corymb axillary, 1-2-together, pedunculate, trifid; branches 3-flowered; bracteas ovate-roundish, lateral, one at the outer side of each flower; limb of calyx truncate; alabastra terete, clavate; petals 5, linear, somewhat dilated at the apex; flowers pentandrous; anthers oblong, erect. 

Fair Dendrophthoe. Shrub par.

5 D. Pédelílis: glabrous; branches terete; leaves opposite, petiolar, long-linear, acutish, coriaceous, with 5 subparallel veins, which are hardly conspicuous; corymb axillary, 1-2-together, pedunculate, trifid; branches 3-flowered; bracteas ovate-roundish, lateral, one at the outer side of each flower; limb of calyx truncate; alabastra terete, clavate; petals 5, linear, somewhat dilated at the apex; flowers pentandrous; anthers oblong, erect. 

Pendulous Dendrophthoe. Shrub par.

6 D. con génér: glabrous; branches terete; leaves oblong, obtuse, attenuated at the base, on short petiolo; coriaceous, veined; racemes axillary, shorter than the leaves, subcoriaceous; peduncles 3-flowered; flowers pedicellate; bracteas ovate, acute, lateral, one under each flower; limb of calyx truncate; alabastra terete, somewhat club-shaped; petals 5, linear, acute; flowers pentandrous; anthers linear, inserted by the base. 

Congener Dendrophthoe. Shrub par.

7 D. Forstériæ: glabrous; branches terete; leaves opposite, petiolar, ovate, veiny, thin; cymes axillary, solitary, shorter than the leaves; peduncles 3-flowered; bracteas ovate, obtuse, lateral, one under each flower; calyx truncate; corolla pentagonal, subclavate in the young state. 

P. G. Native of the Society Islands. Loranthus Forstériæ, Schultes, syst. 7. p. 114. Loranthus stélis, Forst. prod. ex specimen in herb. Scherb. from Schultes obs. Perhaps this species does not belong to the present genus.

Forster's Dendrophthoe. Shrub par.

8 D. Gaudichaudi: glabrous; branches terete; leaves opposite, linear, obtuse, thickish, attenuated at the base; peduncles axillary, much shorter than the leaves, divaricately bifid at the apex, 2-4-flowered; parts of flowers equal; flowers tetraandrous; petals spatulate; anthers ovate, inserted by the base. 

P. G. Native of New Holland, where it was collected by Gaudichaud. Loranthus Gaudichaudi, D. C. prod. 4. p. 295. Leaves 10-12 lines long, and 2 lines broad. Flowers 5-6 lines long. Style filiform.

Gaudichaud's Dendrophthoe. Shrub par.

9 D. tetraphæ'talus: leaves opposite, nearly sessile, oblong, or elliptic, coriaceous; flowers tetraandrous, one on each side of each leaf, and therefore there are 4 at each joint, disposed in a short raceme; petals 4, linear. 

P. G. Native of New Zealand. Loranthus tetraphæ'talus, Lin. fl. suppl. 211. Forst. prod. no. 156. Schultes, syst. 7. p. 96. Calyx nearly entire. Style a little longer than the petals, filiform; stigma capitate. Bracteas probably wanting.

Four-petalled Dendrophthoe. Shrub par.

10 D. luzon'œnës: glabrous; branches terete, dichotomous or whorled, knotted at the joints: leaves opposite or verticillate, oval-oblong, coriaceous, sessile, almost veinless; peduncles terminal, cymose, cymose synflorescence at the apex, pubescence; bracteas ovate, acute, lateral, rather concave, one under each flower; limb of calyx truncate; corolla of 4 linear acute petals, which are somewhat concrete at the base (sometimes joined by pairs); style filiform. 

P. G. Native of Luzon, one of the Philippines. Loranthus Luzonëenës, Presl. in herb. Henck. and Schultes, syst. 7. p. 104. Leaves 11-15 lines long, and 6-7 broad. Corolla 15 lines long, hardly pubescent on the outside.

Luzon Dendrophthoe. Shrub par.

11 D. pentape'talus: glabrous, much branched; leaves opposite, petiolar, lanceolate-ovate or oval-cordate, obliquely attenuated, smooth; racemes 1-2, axillary, simple, stiff, length of the leaves; flowers very numerous, on short pedicels; bracteas oblique, oval, adpressed to the ovary; limb of calyx nearly entire; petals 5, swelled out at the base into a fleshy triquetrous body, recurved at the apex; stamens 5; anthers obovate; style angular; berry oblong. 

Five-petalled Dendrophthoe. Shrub par.

12 D. racemi'ferus: glabrous, clothed with rufous villi in the young stage, as well as the peduncles; leaves opposite or alternate, on short petioles, oblong-lanceolate, bluntish at the base, and acutish at the apex; glabrous; racemes axillary, spicate, simple, length of leaves; bracteas cuneate, lateral, one under each flower; petals 4, triquetrous at the base. 

P. G. Native of the East Indies, in the Burman empire, at Amherst and Tavoy. Loranthus racemi'ferus. Wall. mas. Very like D. pentape'talus, but differs in the flowers being tetraandrous.

Raceme-bearing Dendrophthoe. Shrub par.

13 D. coccineüs: glabrous; branches elongated; leaves alternate, on short petioles, oblong-ovate, obtuse, somewhat coriaceous at the base; spikes axillary, 1-2-together, erect, longer than the leaves; flowers sessile, with one bractea under each; limb of calyx nearly entire; corolla tubular; petals 4, linear, dilated at the base; anthers adnate; flowers tetraandrous. 

Scarlet-flowered Dendrophthoe. Shrub par.

§ 2. Flowers tubular, slender, 4-cleft, disposed in racemes, with one bractea under each flower. Many of the plants in this section are probably species of Scærnæ.
petioles, elliptic-lanceolate, at length glabrous; flowers in fascicles from the axils of the leaves, velvety from dense rufous pubescence, as well as the racemules and peduncles; bracteas lanceolate, thin, subuliform, under each flower 1-3 in a flat ring of calyx hardly any; corolla tubular, arched; lobes 4, oblong; anthers erect. ʃ. P. S. Native of the Burmese Empire, on Mount Taong-Dong, near Ava. Loranthus obtectus, Wall. mss. Leaves 2 inches long and an inch broad; petioles ½ inch long. Corolla 4-6-cleft, 10-11 lines long. Stigma hardly capitate.

Covered Dendrophthoe. Shrub par.

14 D. recurvus; branches terete, adult ones glabrous; leaves alternate, petiolate, elliptic, obtuse, acute at the base, smoothish; peduncles axillary and lateral, branched, 2-5-flowered, and are, as well as the flowers, velvety; flowers recurved; bracteas broad, obliquely capitulate, one under each flower; limb of calyx cup-shaped, toothed; alabastra terete; lobes 3, oblong; flowers tetradrous. ʃ. P. S. Native of the East Indies, on the Nelligerry mountains, where it was collected by Noton. Loranthus recurvus, Wall. mss. Leaves 2 inches long and 1½ lines broad; petioles 3-4 lines long. Alabastra 6 lines long. Anthers oblong, inserted by the base. Style filiform. Stigma hardly capitate.

Recurred-flowered Dendrophthoe. Shrub par.

15 D. lepta'mnthus; branches terete, while young as well as the leaves white from velvety down; leaves opposite, or rather alternate, petiolate, oval, obtuse at both ends, at length glabrous; racemes short, axillary, and are, as well as the flowers, velvety from white tomentum; tube of corolla long, terete, somewhat incurved; lobes 4, nearly equal, spreading; flowers tetradrous. ʃ. P. S. Native of the Burmese empire, at the river Irrawaddy, near Yenan. Loranthus leptanthus, Wall. mss. var. rotundifolia, D. C. coll. mem. vi t. 5. Corolla 4-cleft, 15-17 lines long. Anthers linear, erect. The species is allied to D. pulverulentus.

Dichotomous-flowered Dendrophthoe. Shrub par.

16 D. ferrugineus; branches long, pendulous, densely clothed with ferruginous down when young, as well as the under side of leaves, pedicels, calyxes, and corollas; leaves opposite, on short petioles, elliptic, obtuse, coriaceous, glabrous above; peduncles 1-4 together in the axils of the leaves, 2-6-flowered; bracteas small, adpressed to the ovaria, one to each; corolla tubular, deeply 4-parted; berry ovate; flowers tetradrous. ʃ. P. S. Native of the East Indies, in Pulo-Penang, Singapore, and Sumatra. Loranthus ferrugineus, Roxb. fl. ind. 2. p. 207, Jacq. mal. miss. 1 p. 5. Schultes, syst. 7. p. 98. Corolla densely clothed with rusty hairs, 7 lines long.

Rusty Dendrophthoe. Shrub par.

17 D. graciliflorus; branches compressed, at length terete, glabrous; leaves opposite, on short petioles, elliptic-oblong, acute at both ends, at length glabrous; racemules axillary, 5-7-flowered, somewhat umbellate; bracteas lateral, small, acute, one under each flower; corolla whitish from velvety down, slender, 4-lobe; lobes linear. ʃ. P. S. Native of the East Indies, in Siilhet. Loranthus graciliflorus, Schultes, syst. 7. p. 98. Leaves an inch and a half long, and 6-9 lines broad. Corolla 5 lines long, 4-cleft, with the tube tetragonal at the base. Anthers inserted by the base. Allied to D. ligustrinus.

Slender-flowered Dendrophthoe. Shrub par.

18 D. Heyne; branches terete, glabrous in the adult state; leaves opposite, on short petioles, oval, bluntish, rather velvety beneath from rufescent down; peduncles axillary, in fascicles, or branched, much shorter than the leaves, and are, as well as the flowers, clothed with rufous velvety down; bracteas lateral, small, one under each flower; corolla very slender, tubular, terete, 4-lobe; lobes oblong, short. ʃ. P. S. Native of the East Indies. Loranthus Heynei, Wall. mss.
peduncles axillary, 3-5-flowered; bracteas lateral, cuneulate, one to each flower; corolla cylindrical, truncate at the apex; style cleft. P. S. Native of the East Indies, at Munnar, on the banks of the Irriwaddy. Loranthus cuneatus, Wall. mas. Heyne, ex Roth, nov. spec. p. 198. Anthers probably 5, but in the younger flowers they are glued together, and with the stigmas. Corolla 6 lines long, velvety on the outside. This, with the preceding species, may hereafter form a distinct genus, or at least a separate section.

Cuneated-leaved Dendrophthoe. Shrub par.

Cult. Like the rest of the genera of this order, the species are not cultivable in gardens. They are showy plants, with the habit of honeysuckle.

IX. PITHIRUSA (from φίθιρος, φίθιρο, to destroy; the species destroy the trees on which they grow). Mart. in D. C. prod. 4. p. 672. Loranthus, sect. Claneastini, D. C. prod. 4. p. 287.

LIN. SYST. Tetrandria, Menogynia. Flowers hermaphroditic, 4-parted, furnished with 3 jagged bracteas each, some of them crowding in the axils of the leaves. Anthers fixed by the back, ovate. Styles short; stigma capitate. Berry ovate. Flowers small, axillary, sessile, or in axillary racemes.

1. P. Claneastini; glabrous; branches compressedly tetragonal while young; leaves opposite, obovate, coriaceous; flowers axillary, solitary, sessile, small; petals 4, concave; anthers ovate; berries oblong. P. S. Native of Brazil, in the province of Pará, in woods. Loranthus clandestinus, Mart. in Schultes, syst. 7. p. 96. Flowers hardly half a line long. Bracteas subcordiangular, jagged, one under each flower. Stamens shorter than the petals, but equal in length to the style. The anthers are said to be almost sessile.

Clandestine-flowered Pithirusa. Shrub par.

2. P. Salicifolius; branches compressedly tetragonal above; leaves opposite, lanceolate, acuminate, glaucous, coriaceous; racemes solitary, axillary, 3 times shorter than the leaves; pedicels 3-flowered, short, bearing 3 bracteas at the apex; petals 4, linear-lanceolate; anthers roundish-ovate. P. S. Native of Brazil, in the province of Minas Geraes. Loranthus salicifolius, Mart. in Schultes, syst. 7. p. 102. Flowers small, probably dioecious.

Willow-flowered Pithirusa. Shrub par.

3. P. Lucarqueensis; plant glabrous, much branched; branches terete; leaves petiolate, roundish-elliptic, acute, rounded at the base, somewhat membranous, veiny, with the middle nerve rather prominent; racemes axillary and terminal, few-flowered; flowers almost sessile, scattered, bracteal; petals 4, oblong, rather concave; anthers unknown. P. S. Native of Peru, in temperate parts near Lucarque. Loranthus Lucarqueensis, H. B. et Kunth, nov. gen. amer. 3. p. 440. Schultes, syst. 7. p. 102. Leaves an inch long, and 9-10 lines broad; petioles 4-5 lines long. Racemes 3 lines long. Flowers minute, of a whitish yellow colour.

Lucarque Pithirusa. Shrub par.

Cult. The species of this genus do not possess any beauty, and are not cultivable in the gardens.

X. SCRURULA (a diminutive of Scérra, a parasite; plants parasitical on trees). Loranthus, sect. iii. Scurrula, D. C. prod. 4. p. 301.

LIN. SYST. Tetra-Pentandria, Monogynia. Flowers hermaphroditic. Petals 4-5, joined together into a long tube, which is divided at the apex into 4 or 5 short unilateral lobes, usually gibbous at the base, opening by a longitudinal fissure as in Lobélia. Stamens 4-5; filaments adhering a long way to the corolla, but free at the apex; anthers fixed by the base, seldom by the back, to the top of the filaments, oblong, erect. Style filiform or cleft; stigma capitate. Peduncles axillary, few-flowered, or racemose, having a solitary bractea under each flower, which is usually pressed to the ovary.

§ 1. Flowers tetrandrous. Corolla 4-parted.

1. S. Roxbeíghi; branches terete, glabrous; leaves opposite, ovate, subcoriaceous, white from soft down beneath; peduncles crowded in the axils of the leaves, very short, simple or branched, 1 or few-flowered; bractea adpressed to the ovary, which is turbinate; alabastra cylindrical, 4-lobed at the apex, and having the tube cleft longitudinally. P. S. Native of Malabar, and probably of China, if the synonyme of Linnaeus does not appertain to S. Chinénsis. Loranthus Scurrula, Lin. spec. 472. Roxb. cor. 2. t. 140. Corolla of a rusty grey colour and mealy on the outside, but dark purple inside.

Roxburgh's Scurrula. Shrub par.

2. S. Chinénsis; branchlets and young leaves clothed with rusty villi; the rest glabrous; leaves opposite, ovate, on short petioles, coriaceous, obtuse, cuneated at the base; peduncles axillary, very short, bearing 2-5 umbellate pedicellate flowers; bractea ovate, small, under the ovary; limb of calyx truncate; corolla cleft, and curved in the bud, cleft longitudinally on one side; lobes of corolla 4, linear, short, reflexed. P. S. Native of China, where it was collected by Sir George Staunton. Loranthus Chinénsis, D. C. coll. mem. vi. t. 7.

Chinese Scurrula. Shrub par.

3. S. Fulvuleíenta; the younger parts of the plant are clothed with mealy stellateomentum; branches terete; leaves opposite, petiolate, broad-ovate, acute, at length glabrous; racemes lateral, tomentose, in fascicles; flowers pedicellate; tube of corolla long, terete, cleft at the apex into 4 short unilateral reflexed lobes. P. S. Native of Nipanul, on trees of Hetourou, and along the banks of the river Rapit. Loranthus fulvuleíentus, Wall. in Roxb. fl. ind. 2. p. 221. Schultes, syst. 7. p. 99. Petioles an inch long. Leaves 5-7 inches long. Corolla more than an inch long, mealy outside. Berry large, club-shaped, mealy.

Powdered Scurrula. Shrub par.

4. S. Fasciculata; glabrous; branches terete; leaves opposite, or somewhat verticillate, obovate, veiny above, but veinless beneath, coriaceous; fascicles lateral, few-flowered; lobes of corolla 4, reflexed, second; style longer than the exserted stamens. P. S. Native of Java, near Linga Jattie, in the province of Cheribon, on trees. Loranthus fasciculatus, Blum. bijdr. p. 661. Loranthus odoratus, Blum. bijdr. p. 663. This does not differ from this species according to the author.

Fasciculé-flowered Scurrula. Shrub par.

5. S. Fuscus; glabrous; branches terete, rather angular in the young state; leaves opposite, on short petioles, obovate, and oval, acute at the base, coriaceous, beset with rusty dots beneath while young; peduncules axillary, 1-2-flowered; corolla cleft on one side, having 4 erect lobes. P. S. Native of Java, on Mounts Salak and Gede, on trees. Loranthus fuscus, Blum. bijdr. p. 660. Genitals dark purple. Stigma capitate. See Blum. bat. verd. 1823. p. 190.

Fuscus Scurrula. Shrub par.

6. S. Umbellifer; glabrous; branches terete; leaves opposite, oblong-lanceolate, on short petioles, acute at the base; peduncles in fascicles, axillary, and lateral, pubescent, 3-flowered, subumbellate; corolla very long, slender, cleft into 4 linear reflexed segments at the apex; stigma cleft. P. S. Native of Nipanul, on Mount Sheeporou. Loranthus umbellifer, Schultes, syst. 7. p. 97. Loranthus umbellatus, Wall. in Roxb. fl. ind. 2. p. 222. but not of Roth. Corolla of a bright red colour, curved, pubescent. Peduncules clothed with ferruginous tomentum.

Umbel-bearing Scurrula. Shrub par.

7. S. Cordifolia; branches terete, villous, mealy while young;
leaves opposite, ovate-cordate, obtuse, villous on both surfaces, petiolate; racemes fascicled, villous, axillary; corolla tubular, clavate, villous, cleft at the apex into 4 short lanceolate lobes. 1. P. G. Native of the East Indies, at Shreemagur. Loranthus cordifolius, Wall. in Roxb. fl. ind. 2. p. 222. Schultes, syst. 7. p. 100. D. Don, prod. fl. nip. p. 143. New shoots, as well as all the tender parts of the plant, covered with pale or white stellate tomentum. Petioles an inch long. Corolla an inch long.  

Cordate-leaved Scurrula. Shrub par.  

8 S. DENDROIDES; branches terete, velvety when young; leaves usually opposite, ovate, on short petioles, glabrous above, and clothed with fine velvety down beneath; racemes of flowers axillary, on short peduncles, hardly longer than the petioles; bracteas ovate, small, one under each flower; tube of corolla arching, clothed with rusty velvety down, cleft into 4 linear-cuneated unequal lobes. ½. P. S. Native of the East Indies. S. buddeioides, Desr. in Linn. dict. 3. p. 600. Schultes, syst. 7. p. 97.  

Buddleia-like Scurrula. Shrub par.  

9 S. DENDRO; glabrous; branches terete; leaves petiolate, ovate-roundish, thickish; peduncles axillary, 1-2, bifid, a little shorter than the petioles; bractea ovate, girding the base of the ovarium; bud of corolla slender, somewhat clavate at the apex, arching, clothed with rusty velvety down. ½. P. S. Native of the East Indies. Loranthus bilobatus, Desr. in Linn. dict. 3. p. 600. Schultes, syst. 7. p. 119. Corolla 4-lobed.  

Two-flowered Scurrula. Shrub par.  

10 S. PHILIPPINESI; branches terete, velvety from short down when young, as well as the peduncles, bracteas, calyces, and corollas; leaves on short petioles, oval, rather pubescent, obtuse at both ends; flowers few, in fascicles, axillary, on short pedicels; bractea ovate, concave, small, under the ovarium; limb of calyx truncate; corolla cylindrical, cleft into 4 linear nearly equal lobes at the apex; style filiform. ½. P. S. Native of the Philippine Islands. Loranthus philippinensis, Cham. et Schlecht. in Linneea. 3. p. 204. Leaves 3 inches long and an inch broad. Corolla 7-8 lines long. Stigma small, capitate. Anthers linear, erect.  

Philippine Scurrula. Shrub par.  

11 S. VESTITA; branches terete, pedicels, under side of leaves, peduncles, bracteas, and flowers, clothed with rusty, mealy, velvety, stellate tomentum; leaves oblong-lanceolate, acute, shining above, and glabrous; fascicles of flowers numerous, on short peduncles in the axis of the fallen leaves; bractea concave, small under the ovarium; limb of calyx somewhat 4-toothed; corolla cylindrical, 4-cleft; lobes of corolla 4, linear, unilateral, reflexed. ½. P. G. Native of Nipaul, on the mountains of Chandagiri and Sheepeore. Loranthus vestitus, Wall. in Roxb. fl. ind. 2. p. 218. D. Don, prod. fl. nep. p. 143. Wall. pl. rar. asiat. 3. t. 250. Plant stout. Fascicles numerous, few-flowered, in the axis of the fallen leaves. Corolla cylindrical, with a subglobular apex before expansion, afterwards its limb bursts into 4 linear reflexed segments. On the outside the flower is rust or cinnamon coloured, and within purple and smooth. Berry oblong, tomentose.  

Clothed Scurrula. Shrub par.  

12 S. LEVIGATUM; branches terete, glabrous, when young compressed; leaves petiolate, opposite, elliptic-oblong, obtuse, glabrous, smooth; peduncles axillary, branched, 7-8-flowered, 4 times shorter than the leaves, and are, as well as the flowers, rather velvety from rusty down; bractea lateral, small; tube of corolla terete, cleft on one side: lobes 4, oblong. ½. P. S. Native of the East Indies, at Tavoy, in the Burmese Empire. Loranthus levigatissimus, Wall. mss. Flowerbud 7-8 lines long, regular while young. Anthers erect. Stigma rather capititate.  

Smooth Scurrula. Shrub par.  

13 S. HUTFULDA; branches terete, glabrous in the adult state, but when young angularly subcompressed; leaves opposite, petiolate, elliptic-oblong, acutish, glabrous, or clothed with rufous velvety down on the nerves beneath; bractea lateral, small, concave; corolla with a terete tube, and 4 oblong lobes. ½. P. S. Native of the East Indies, at Tavoy, in the Burmese Empire. Loranthus rigidulus, Wall. mss. This is hardly distinct from S. levigata.  

Small-rufous Scurrula. Shrub par.  

14 S. LEPIODOTA; branches terete, compressed while young, beset with velvety dots at first, but at length glabrous; leaves nearly opposite, oval, beset with rusty dots beneath; corolla 4-cleft, curved, elongated, covered with rusty dots; lobes reflexed, unilateral. ½. P. S. Native of the western parts of Java, on the higher ranges of mountains. Loranthus leptodetus, Blum. bijdr. p. 660. bat. verh. 1823. p. 192. but not of Schultes.  

Lepioidota Scurrula. Shrub par.  

15 S. RUFOLOSA; glabrous; branchlets rather compressed, but at length terete; leaves opposite, on rather short petioles, oblong-lanceolate, obtuse, glaucous, reticulately wrinkled, with smooth cartilaginous margins; racemes axillary, opposite, simple, shorter than the leaves; bractea concave, one at the side of each ovarium; corolla tubular, arching; limb of 4 lanceolate lobes. ½. P. S. Native of the East Indies. Loranthus rugulosus, Roth, nov. spec. p. 194. Schultes, syst. 7. p. 191. Corolla nearly an inch and a half long.  

Wrinkled-leaved Scurrula. Shrub par.  

Club-flowered Scurrula. Shrub par.  

17 S. ? OBOVATUS; leaves nearly opposite, obovate, glabrous; racemusescrowded, axillary; flowers tetrandrous; tube of corolla elongated. ½. P. S. Native of Java, about Linga Jattie, on trees. Loranthus obovatus, Blum. bijdr. p. 665.  

Obovate-leaved Scurrula. Shrub par.  

§ 2. Flowers pentandrous. Corolla 5-lobed.  

* Species natives of Africa.  

18 S. THONNINGII; branches terete, compressed at the apex; leaves petiolate, ovate, somewhat caduninmated, coriaceous, glabrous and dark green above, somewhat canescent beneath from almost imperfectly discernible down, as well as the branchlets; peduncles 1-3, axillary, short, bearing each 3-4 umbellate flowers on short pedicels; bracteas small, ovate, lateral, one under each pedicel; fruit ovate. ½. P. S. Native of Guinea, where it was collected by Thonning. Loranthus Thonninii, D. C. prod. 4. p. 303. Loranthus clavatus, Thonn. mss. but not of Lam. Flowers unknown.  

Thonninii Scurrula. Shrub par.  

19 S. KUTESESSIS; branches terete, rather compressed at the apex; young leaves, peduncles, and flowers clothed with rusty down; leaves petiolate, oval, obtuse at both ends, coriaceous; peduncles 1-3 together, shorter than the pedicels, bearing 2-3 1-flowered pedicels; bracteas lateral, oblong, 1 under each pedicel; flower-bud pentagonal at the apex; fruit ovate. ½. P. S. Native of Senegambia, near Nghianga, on trees. Loranthus rufescens, D. C. prod. 4. p. 303. Alabastra 3 lines long. Calyx truncately urceolate. Very nearly allied to S. Thonningii.  

Rufescens Scurrula. Shrub par.  

20 S. SENSILIFOLIA; glabrous; branches terete, simple; leaves sessile, opposite, ovate-roundish, cordate at the base; flowers
many in the axis, fascicled, sessile, deflexed; corolla tubid at the base, narrowed above, cleft longitudinally, hence it is expanded into a 5-lobed ligula on one side. 7. P. S. Native of Africa, at Koto or Keta. Loranthus sessilifolius, Beauv. fl. d'ow. 2. p. 8. t. 23. Schultes, syst. 7. p. 108. The anthers are delineated in the figure versatile.

**Sessile-leaved Scruulla.** Shrub par.

21. S. belvii; glabrous; branches simple, terete; leaves on short pedioles, rarely opposite and alternate, broad ovate-lanceolate, acute; peduncles very short, axillary, numerous, fascicled, 1-flowered, deflexed; corolla tubid at the base, narrowed above, cleft laterally, expanded into a 5-lobed ligula at the apex; anthers somewhat versatile. 7. P. S. Native of Africa, in the kingdom of Waree, at Chama or Sama. Loranthus belvii, D. C. pro. 4. p. 303. Loranthus lanceolatus, Beauv. fl. d'ow. 2. p. 8. t. 64. Schultes, syst. 7. p. 108, but not of Ruiz et Pav.

**Bela's Scruulla.** Shrub par.

22. S. pentagonia; glabrous; branches terete; leaves on short petioles, ovate or lanceolate, coriaceous, almost veinless, glaucous; flowers 4-5, in the axis of the leaves, sessile, crowded; bracteae calyxform under the ovarium; corolla tubid at the base, and narrowed above, cleft, expanded at the apex below, filaments and pentagonal at the apex before expansion, but at length expanded into a 5-lobed ligula; filaments inflexed; style tymid and pentagonal under the apex; stigma capitate. 7. P. S. Native of Senegal, on trees. Loranthus pentagonia, D. Coll. mem. vi. t. 8. This species is easily distinguished from the rest in the form of the style and flower-bud. It is very like S. Belviisi.

**Pentagonal-flowed Scruulla.** Shrub par.

23. S. dodoneae; glabrous; branches terete; leaves on short petioles, elongated, oblong-linear, obtuse, attenuated at the base, thick and coriaceous, glaucous, almost nerveless; flowers 2-3 together, sessile, crowded; bracteae cup-shaped, one under each ovarium; alabastra ciliard; corolla tubid at the base, but somewhat constricted above, expanded into a 5-lobed ligula at the apex; filaments inflexed; style tymid at the apex and pentagonal; stigma capitata. 7. P. S. Native of Senegal, on the trunks of tamarind trees. Loranthus dodoneae, D. Coll. mem. vi. t. 9. Allied to S. pentagonia.

**Dodonea-leaved Scruulla.** Shrub par.

24. S. glauce; glabrous; branches terete; leaves alternate, opposite, and 3 in a whorl, oblong or obv-oblong, obtuse, covered with a glaucous bloom; peduncles axillary, erect, bearing 3 or 5 flowers at the apex, on short pedicels; corolla rather tubid at the base, constricted in the middle, and divided at the apex into 5 linear revolute lobes; anthers linear, erect. 7. P. G. Native of the Cape of Good Hope. Loranthus glaucus,-Thumb. fl. cap. p. 293, but not Ruiz et Pav. Schultes, syst. 7. p. 104. Moquinia ribra, Spreng. ex Zeyh. in herb. Moricand. Habit almost of S. oleasfolia, but differs in the anthers being long and linear, not ovate, and in the stamens being free, not concretes.

**Glaucus Scruulla.** Shrub par.

25. S. oleasfolia; branches terete; leaves opposite, oblong, silky, bluish, feather-nerved; peduncles axillary, very short, bearing each 3 almost sessile flowers at the apex; corolla tubid at the base, and narrowed above, tubular, 5-lobed; lobes short, deflexed; stamens monadelphous; anthers oblong, fixed by the base. 7. P. G. Native of the Cape of Good Hope. Loranthus oleasfolia, Cham. et Schlcht. in Liouard, pl. 209. Lichtensteinia oleasfolia, Wendell. coll. 2. p. 4. t. 39. Loranthus speciosus, Dietr. Corolla red. Ovarium 1-celled; cell pentagonal, 1-seeded, ex Cham. et Schlcht. not 5-seeded.

**Olive-leaved Scruulla.** Shrub par.

26. S. canescens; every part of the plant is canescent; leaves ovate, obtuse, small. 7. P. S. Native of the Cape of Good Hope, in arid places on the branches of Lycium. Loranthus canescens, Burch. cat. geogr. 1119. trav. afr. 2. p. 90.

**Cancereiro Scruulla.** Shrub par.

27. S. clava-ta; glabrous; branches terete; leaves opposite, on short petioles, ovate, obtuse, coriaceous, almost veinless, rusty beneath; peduncles many, crowded, very short, in the axis of the leaves, dilated under the apex into a somewhat discoid bracteae; limb of calyx 5-toothed; alabastra cylindrical, clavate; corolla at length cleft laterally, 5-lobed; style striated angular. 7. P. S. Native of Madagascar. Loranthus clava-tus, Lam. dic. 3. p. 598. but not of Roxb. Schultes, syst. 7. p. 106. Filaments of stamens adnate a long way to the corolla; anthers oblong, erect, terminal.

**Clavate-flowed Scruulla.** Shrub par.

**Species natives of Asia.**

28. S. Henkea; glabrous; branches terete; leaves petiole, lanceolate-oblong, obtuse or acuminate, coriaceous, obsolescently veined; peduncles from the forks of the branches erect, bearing 3-flowered pedicels; bracteae ovate, concave, one under each ovarium; calyx pubescent, entire; corolla tubular, cleft laterally on one side: lobes 5, linear, reflexed. 7. P. S. Native of the island of Luzon. Loranthus Henkea, Presl, in herb. Henke, ex D. C. pro. 4. p. 304. Schultes, syst. 7. p. 113. Leaves 3-6 inches long, and 1½ to 2 inches broad, on petioles 8-10 lines long. Corolla 3-4 lines long, glabrous. Calyx reddish.

**Henke's Scruulla.** Shrub par.

29. S. malifo; glabrous; branches terete; leaves ovate, acute, petiolar, lanceolate-oblong, obtuse or acuminate, coriaceous, obsolescently veined; peduncles axillary, solitary, reflexed, bearing a dense umbel of flowers; pedicels and calyces clothed with rusty pubescence; limb of calyx nearly entire; corolla 5-cleft beyond the middle, and somewhat laterally cleft: lobes linear, reflexed. 7. P. S. Native of the island of Luzon. Loranthus malifo, Presl, in herb. Henke, ex D. C. pro. 4. p. 304. Schultes, syst. 7. p. 113. Perhaps sufficiently distinct from S. Henkea.

**Apple-leaved Scruulla.** Shrub par.

30. S. longifolii; glabrous; leaves oval-oblong, obtuse, veiny, coriaceous; upper ones rather cordate at the base; racemes axillary, simple, short, subcorbaceous; bracteae concave, one under each ovarium; limb of calyx entire; corolla long, clavate, contracted beneath the limb: lobes 5, unequal, cuneate. 7. P. S. Native of Malabar and Pondicherry. Loranthus longifolius, Desr. in Lam. dic. 3. p. 498. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 112. Walli-li-can, Rheed. mal. 10. p. 5. t. 4. Flowers purple, curved, 20 lines long. Anthers linear, inserted by the base.

**Long-flowered Scruulla.** Shrub par.

31. S. incarnata; plant while young beset with deciduous stellate down; leaves alternate, on short petioles, broad-ovate, acute, nerved; racemes rising beneath the leaves, hoary from wool; flowers nearly sessile, each furnished with 1 bracteae; limb of calyx 5-toothed; tube of corolla gibbous at the base, but constricted a little above the base: limb 5-parted: lobes reflexed; stigma clavate. 7. P. S. Native of the East Indies, in the island of Pulo Nias. Loranthus incarnatus, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 111. Leaves 9 inches long. Corolla above 2 inches long, slightly tomentose without, pale rose, with a greenish limb; tube gibbous below, contracted a little above the base, then widening upwards till it suffers a
second contraction before expansion into the limb, which is about a fourth the length of the tube, 5-parted, with reflexed segments. Berry mealy, ovate, 1-seeded. This is a beautiful species.

**Loranthaceae.**

32 S. *'elegans*; glabrous; branches terete; leaves opposite, or nearly alternate, oblong, obtuse, somewhat cuneate at the base, with undulated margins, almost veilless, coriaceous; racemes axillary, short, twin or tern, erect, 5-7-flowered; corolla terete, somewhat incurved, 5-tailed; lobes linear, spreadingly reflexed, nearly equal; style exerted beyond the anthers. *f.* P. S. Native of the East Indies, near Yennanag. Loranthus elegans, Wall. cat. no. 530. Leaves 2 inches long, and 9 lines broad. Corolla glabrous, an inch and a half long, red. Anthers linear, erect. Calyx truncate. Bracteas lateral, small, one under each ovary.

**Elegant Scruella.** Shrub par.

33 S. *cy^2^r^2^rdia*; glabrous; leaves alternate, petiolate, lanceolate, acute at both ends, smooth, nervled; racemes axillary, stiff, length of the leaves; flowers pedicellate, rather distant from each other, each girded at the base by a bracteae on the outer side; limb of calyx almost entire; limb of corolla much longer than the tube, which is cylinudcular, with reflexed segments. *f.* P. S. Native of Sumatra. Loranthus cylinudricus, Jack, in Roxb. fl. ind. 2. p. 213. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4-5 inches long; pedicels about an inch long. Corolla red, perfectly cylinudcular, before expansion, 5-petalled; limb reflexed, 3 times as long as the tube; petals linear, separating almost to the base. Ovary cylinudcular, 1-seeded. Flowers sometimes tetraudrous.

**Cylindrical-flowered Scruella.** Shrub par.

34 S. *i^2^n^2^dica*; glabrous; branches terete; leaves nearly opposite, ovate-oblong, on short pedicels, bluntish, feather-nerved; racemes axillary, or nearly terminal, solitary, simple, shorter than the leaves; flowers on short peduncles, each peduncle bearing 1-3 sessile flowers at the top, each flower propped by an ovate bracteae; petals 5, linear, acute, hardly concre at the base; the border reflexed; anthers linear, erect. *f.* P. S. Native of the island of Timor, and probably elsewhere in India. Loranthus Indicus, Desc. in Lam. dict. 5. p. 601. Schultes, syst. 7. p. 149. D. C. prod. 4. p. 305. Lionéica Zeyclanica, Gærtn. fruct. 1. p. 157. t. 27.? Corolla purple, glabrous, 7-8 lines long. Leaves 3 inches long, 1 or 1½ broad, on pedicels, which are 2-3 lines long. Berry ovate.

**Indian Scruella.** Shrub par.

35 S. *turbinata*; glabrous; branches terete; leaves sub-alternate, on short pedicels, oval or oblong, obtuse or acutish, thick; peduncles axillary, 2-3-cleft, much shorter than the leaves; bracteae ovate, one under each ovary, which is turbinate; limb of calyx unequally and bluntly 5-toothed. *f.* P. S. Native of the East Indies, on the Nelligerry mountains, where it is called Mandjil, along with other species, by the natives. Loranthus turbinatus, D. C. prod. 4. p. 305. Leaves 3 inches long, and 12-16 lines broad; pedicels 3-6 lines long. Corolla unknown, and is only judged to belong to the present section of the genus in the calyx being said to be 3-parted.

**Turbinate-fruited Scruella.** Shrub par.

36 S. *violaceus*; glabrous; leaves nearly opposite, on short pedicels, from oval to lanceolate, thick, unadulterated, hardly veined; racemes axillary, simple, solitary, many flowered; bracteas concave, cordate, small, one adpressed to each ovary on the outer side; calyx cup-shaped, with an entire border; corolla long, tubular, a little curved, swelling from the bottom to within a third of the mouth, then contracting a little, with a 5-parted border; upper fissure much the deepest; lobes linear, reflexed towards one side; stigma clavate; berry oblong, smooth, 1-celled, 1-seeded. *f.* P. S. Native of the East Indies, frequent on trees. Loranthus bicolor, Roxb. cor. 2. p. 19. t. 139. fl. ind. 2. p. 205. Schultes, syst. 7. p. 109. D. C. prod. 4. p. 305. Flowers the size and appearance, and much like those of a honeysuckle, red at the base, and green at the apex, nearly 1½ inch long. Anthers exerted, linear, fixed by the base. Leaves from 3-5 inches long, and from ½ to 1 inch in breadth.

**Two-coloured-flowered Scruella.** Shrub par.

37 S. *falcata*; glabrous; branches terete; leaves opposite, on short petioles, linear, glaucous, coriaceous, obtuse, laterally falcate; racemes axillary, few-flowered; bracteae short, one under each ovary on one side; alabastra falcate, cylinudcular, pentagonal at the apex; lobes of corolla 5; anthers linear-oblong, inserted by the base. *f.* P. S. Native of Madras. Loranthus falcatus, Lin. fil. suppl. 211. Schultes, syst. 7. p. 150. The flowers are fulvous according to Linnaeus.

**Falcate-flowered Scruella.** Shrub par.

38 S. *venosa*; glabrous; branches terete; leaves subalternate or opposite, oval, attenuated at both ends, coriaceous, having the veins blood-coloured beneath; racemes axillary, much shorter than the leaves, rather conicent; limb of calyx somewhat 5-toothed; tube of corolla more or less cleft on one side; lobes 5, reflexed, umbraculifer; berries oblong-conical. *f.* P. S. Native of Java, at Buitenzorg, upon trees. Loranthus venosus, Blum. bijdr. p. 668. bat. verhund. 1823. p. 188. Corolla 4-5 lines long. Leaves variable in form. Style a little longer than the stamens; stigma capitate. Anthers linear, adnate. Blum. l.c.

**Veiny Scruella.** Shrub par.

39 S. *pentaedra* (Lin. mant. p. 63.) glabrous; branches terete; leaves alternate, on short petioles, oblong, blunthish, thickish; racemes axillary, solitary, few-flowered, and are, as well as the flowers, covered with velvety mealy down; bracteae ovate, one under each ovary; limb of calyx bluntly 5-toothed; tube of corolla cylindrical; petals 5, linear. *f.* P. S. Native of Java, on trees. Loranthus pentandrus, Lin. mant. p. 63. Blum. bijdr. p. 661. Schultes, syst. 7. p. 110. D. C. prod. 4. p. 305. Leaves 4 inches long, and an inch broad. Corolla 7 lines long, purplish inside. Anthers erect.

**Var. *f. floccus* (Blum. bijdr. p. 661. under Loranthus) racemes crowded; tube of corolla inflated. *f.* P. S. Native of Java, on trees, about Buitenzorg.

**Pentandrous Scruella.** Shrub par.

40 S. *amplexifolium*; glabrous; branches terete; leaves sessile, opposite, corotate at the base, orbicular, coriaceous, marginate; flowers racemose; bracteae rather concave, orbicular, one under each ovary on one side; corolla cylindrical, contracted under the apex; lobes oblong. *f.* P. S. Native of the East Indies, on the Nelligerry mountains, where it was collected by Noton. Loranthus amplexifolius, D. C. prod. 4. p. 305. Loranthus amplexicaulis, Wall. miss. but not of Kuntz. Corolla 15 lines long, of a brownish purple colour. Anthers linear, erect. Calyx truncate. Upper leaves 2 inches in diameter.

**Clasping-leaved Scruella.** Shrub par.

41 S. *heteranthum*; glabrous; branches terete, angular while young; leaves alternate, on short petioles, elliptic or lanceolate, sometimem atenuated at both ends, thick, and coriaceous; racemes axillary, length of the leaves; pedicels twice the length of the calyx; bracteae convex, short, one under each ovary on the outside; bud of corolla nearly straight, somewhat pentagonal; with 5 linear lobes; anthers erect, linear, twice the length of the filaments. *f.* P. S. Native of the East Indies, at Martaban. Loranthus heteranthus, Wall. cat. no. 537. Leaves 4 inches long, and 15-18 lines broad. Flowers 8-10 lines long. Calyx truncate.
LORANTHACEAE. X. SCURRULA. XI. ELYTRANTHE.

Variable-flowered Scurrula. Shrub par. 42 S. prælonga; leaves alternate, ovate, obtuse, tapering at the base, glabrous, of the consistency of parchment; racemes axillary; flowers secund; tube of corolla very long, clavate, angular. ɣ. P. S. Native of Java, near Tjiradjas. Loranthus prælongus, Blum. bijdr. p. 564. Schultes, syst. 7. p. 117. Vahl to C. clavata and S. lungifolia. Tube of corolla yellow, nearly 3 inches long; lobes linear, channeled inside, greenish.

Longest-flowered Scurrula. Shrub par. 43 S. curvata; leaves opposite or alternate, oblong, bluntish, acute at the base, coriaceous, rather veiny, glabrous; racemes axillary, solitary; tube of corolla elongated, curved; lobes reflexed. ɣ. P. S. Native of Java, on Mount Salak, parasitical on trees. Loranthus curvatus, Blum. bijdr. p. 655. Schultes, syst. 7. p. 110. Tube of corolla nearly 1½ inch long, yellow, but having the limb of a pale orange colour. Anters adnate, elongated.

Curved-flowered Scurrula. Shrub par. 44 S. braecteata; every part of the plant clothed with grey starry tomentum; branches terete; leaves small, alternate, obtuse-ovate, obtuse, tapering to the base, rather long petioles; umbels axillary, 5-flowered; braecest oblong, tongue-shaped, one under each ovarium; corolla long, slender, cylindrical at the base, but widening at the apex, with the throat contracted; lobes linear, unilateral, much shorter than the tube. ɣ. P. S. Native of the East Indies. Loranthus braecestus, Heyne, in Roxb. fl. ind. 2. p. 220. Loranthus Heyneanaeus et L. tomentosus, Schultes, syst. 7. p. 102 and 106. Loranthus tomentosus, Roth, nov. spec. p. 191. Umbels densely villous; pedicels one-third of an inch long.

Braecest Scurrula. Shrub par. 45 S. goodenii-foëlia; branches terete, glabrous; leaves alternate, obovate-cuneated, obtuse, somewhat emarginate, tapering into the petioles at the base, rather vein, glabrous in the adult state, but canescent in the young state from stellate decumbous down; peduncles axillary, 2-3-flowered; braecest ovate, acute, one under each ovarium; tube of calyx pubescent, with 5 rather ciliated teeth; corolla cylindrical, cleft on one side: lobes 5, linear, reflexed, unilateral; style filiform. ɣ. P. S. Native of the East Indies, on the Nelligherry mountains, where it is called Mandjil, and where it was collected by Leschenault. Loranthus goodenii-folius, D. C. prod. 4. p. 390. Very nearly allied to S. lobelici-floëa.

Goodenii-flowered Scurrula. Shrub par. 46 S. lobelici-floëa; glabrous; branches terete; leaves obovate-cuneated, obtuse, tapering into the petioles, sparingly veined; pedicels 1-2, axillary, 1-flowered, very short, spreading; braecest ovate, acute, one under each ovarium; tube of calyx cylindrical, cleft on the inner side: lobes 5, linear, reflexed, unilateral; style filiform. ɣ. P. S. Native of the south of India, where it is called Vira-marum and pile-rivili by the natives, and where it was collected by Leschenault. Loranthus lobelici-fólius, D. C. prod. 4. p. 396. Leaves an inch long, and 4 lines broad. Corolla an inch long, red in the dry state. Loranthus cuneatus, Roth, nov. spec. p. 193.?

Lobelia-flowered Scurrula. Shrub par. 47 S. elástica; glabrous; branches strong, columnar: internodes short; leaves sessile, thick, ovate, acute, obsolescent 5-nerved; flowers almost sessile, in fascicles about the joints; tube of corolla cylindrical: having the limb beaked before expansion: segments linear, and more or less numerous, from the base upwards, revolute. ɣ. P. S. Native of Malabar. Loranthus elásticus, Desr. in Lam. dicr. 3. p. 599. Wall. in Roxb. fl. ind. 2. p. 217. Schultes, syst. 7. p. 107. Belutta-itti-cami, Rheed. mal. 10. p. 7. t. 3. The leaves are remarkably thick, and appear both trinerved and triple-nerved.

Cult. The species of this genus are easily distinguished from the rest that are broken off from the old genus Loranthus in the tube of the corolla being curved, and bulged at the base on one side, as in Lobèlla, cleft longitudinally on the upper side, and the segments all leaning to the lower side, and reflexed. The plants have the habit of honeysuckle, but are not cultivable.

XI. ELYTRANTHE (from elytron, elytron, a case or sheath, and anthos, a flower; in reference to the joined bracteae forming a sheath under the flower). Lepeostegères and Elytrânthes species of Blum. in litt. 1829. Loranthus species of authors. Loranthus, sect. iii. Symphyanthus, § 1-34 and 5. D. C. prod. 4. p. 296–299.

Lin. syst. Pentâ-Hexâdiâria, Monogynia. Flowers hermaphrodite, pentameros or hexameros. Petals 5-6, joined together into a tube to the middle, and therefore divided to the middle into a 5-6 cleft regular limb. Stamens 3-6: filaments adnate to the petals at the base, and free at the apex; anthers fixed by the base, erect. Style filiform; stigma obtuse. Racemes axillary; flowers bracteate.—This genus differs from Struthânthus in the corolla being gamopetalous, and from Denophthhe, to which it comes nearest, in the flowers being racemose, not corymbose, and in each flower being usually furnished with more bracteas than one, which are not cup-shaped nor oblique, as in that genus: it also differs from Scurrula in the limb of the corolla being regular, not as in that genus unilateral; and from Lozaxthéra in the anthers not being oscillatory.

§ 1. Anguliflori (from angulus, an angle, and flos, a flower; the flowers are more or less hexagonal from 6 crests at the base). Flowers tubular, usually tramid at the base, and more or less hexagonal from crests, dividing into 6 lobes to the middle; anthers erect. Bracteolas 3, joined together under each flower.

1 E. retusa; glabrous; leaves opposite, on short petioles, obovate-oblong, coriaceous, retuse, or emarginate, with the lateral nerves indistinct; racemes short, usually solitary, rising from the axils of the fallen leaves; flowers pedicellate, each furnished with 1-2 bracteas at the base; limb of calyx entire; tube of corolla clavate, gibbosus, and angular, contracted at the limb: lobes 5-6, lanceolate, reflexed. ɣ. P. S. Native of the Island of Singapore. Loranthus retusus, Jack, in Roxb. fl. ind. 2. p. 212. Schultes, syst. 7. p. 112. The plant fastens itself by long runners to trees. Leaves smooth, about 3 inches long. Margin of calyx entire. Tube of corolla clavate, gibbosus, and angled above, rosy, suddenly contracted at the limb, which is yellowish green, having the lobes or segments shorter than the tube.

Retuse-leaved Elytranthe. Shrub par.

2 E. amplulaeæa; glabrous; leaves opposite, on short petioles, oblong, polished; racemes axillary, solitary or in pairs, much shorter than the leaves; flowers opposite, on short pedi-
of the island of Pulo-Penang. Loranthus oleoides, D. C. prod. 4. p. 297. Loranthus oleifolius, Wall. ms. but not of Cham. et Schlecht. Allied to E. pellens, ex Wall.

**Olivo-like Elytranthe.** Shrub par.

8 E. **globiosa**; plant glabrous, branched; leaves opposite, though sometimes alternate, and 3 in a whorl, oblong, coriaceous, smooth, almost veinless; racemes or spikes axillary, or between the leaves, or from the axils of the fallen leaves, generally solitary, but sometimes 2-3 together, much shorter than the leaves; flowers sessile, opposite, from 3-6 pairs on each spike; bracteas no other than the perianth of the fruit, but according to D. C. they are corollas; limb of calyx truncate; tube of corolla gibbous, 6-sided; limb 6-parted; segments regular, reflexed; berry round-oval, size of a pea. P. S. Native of the East Indies, throughout Bengal on trees. Loranthus globosus, Roxb. fl. ind. 2. p. 206. Leaves 2-3 inches long. Flowers small, of a greenish orange colour. Perianth of the fruit inferior, 2-leaved, the under and exterior corollate, the inner bidentate; that of the flower no other than the circular margin of the pit, which receives the flower. Filaments inserted at the base of the segments of the corolla. Berry smooth, size of a pea, when ripe the pulp is yellow, clammy, and elastic.

**Globos-flowered Elytranthe.** Shrub par.

**Shawly Elytranthe.** Shrub par.

10 E. **spherocephala**; glabrous; branches terete; leaves on short petioles, opposite, ovate-oblong, coriaceous, veinless beneath; racemes axillary, solitary or twain; flowers angular. P. S. Native of Java, about Buitenzorg, Batavia, &c. on trees, where it is called *Mengenndo*, as well as many other species, by the natives. Loranthus spherocephalus, Blum. bijdr. p. 661. and bat. verhandl. 1823. p. 189. Schultes, syst. 7. p. 149. Tube of corolla angular: flower-bud 5 lines long.

**Round-fruited Elytranthe.** Shrub par.

11 E. **patula**; glabrous; leaves opposite, petiolate, elliptic-ovate, coriaceous, smooth, acute; peduncles axillary, or rising beneath the leaves, shorter than the leaves; bracteas 2 or 3, embracing the ovum; limb of calyx entire; tube of corolla acutely 6-angled, equal in length to the segments of the limb, which are 6, narrow, and revolute. P. S. Native of the interior of Bencoolen, on trees. Loranthus pataulus, Jack, in Roxb. fl. ind. 2. p. 214. Schultes, syst. 7. p. 135. Leaves about 3 inches long. Corolla green, tipped with light red, and with a purplish tinge tending to the base; having the tube clavate and dilated upwards. Stigma capitate. Berry subglobose.

**Spraying-paniced Elytranthe.** Shrub par.

12 E. **cochinchenis**; glabrous, much branched; leaves opposite, ovate-lanceolate, acute; peduncles axillary, many-flowered, crowded, furnished with 3 concrete bracteas under each flower: tube of corolla hexagonal, with 6 linear-lanceolate lobes, which burst elastically, and become revolute; stigma capitate; berries ovate. P. G. Native of Cochin-china, on trees in gardens. Loranthus Cochinchenis, Lour. coch. p. 195. Flowers greenish yellow. Berry yellowish red.

**Cochin-china Elytranthe.** Shrub par.

13 E. **avenia**; glabrous; branches terete; leaves opposite, narrow-lanceolate, coriaceous, glabrous, veinless; peduncles crowded, axillary, usually 2-flowered; flowers angular, hexan-
loranthaceæ. xi. elytranthe.

427

4. involvulcâta (the flowers are involucrated with bracteas).

§ 4. involucrati (the flowers are involucrated with bracteas). Flowers tubular, 5-6-cleft. Anthers erect. Bracteas many, crowded, constituting an involucrum around the flowers, which are subcapitate.

19 E. involucrâta; glabrous; branches shining; leaves opposite, on short pedicels, ovate-cordate, smooth; umbels axillary, nearly sessile, much shorter than the leaves, 4-flowered, involucrated by 4 bracteas; bracteas ovate-lanceolate, smooth, entire; calyx villous, with a 5-toothed border; tube of corolla villous, widening towards the mouth; limb regular, 5-parted, with linear-revolute segments; anthers oval; stigma 2-lobed.

§ 5. Elytranthes (from ελύραιος, elytron, a sheath or case, and αὐθος, anthesis, a flower; in reference to the large bracteae. 3 1 2
forming a sheath to the flowers. *Flowers tubular, 6-ovate, hexandrous; lobes of limb linear, acute. Flower-buds nearly terete. Authors erect. Flowers sessile, and decussate along the rachis of the spikes, furnished each with 3 bracteas, one under the flower and two opposite lateral combined ones; all large, concave, and deciduous.

23 E. *Loranthia* (Blum. in litt. 1392.) glabrous; branches compressed; leaves opposite, oval-oblong, acute, coriaceous; spikes axillary, on short peduncles, sub-capitate, each bearing 4 decussate, tribracteate flowers. ₂ P.S. Native of Java, in woods on the mountains. *Loranthus albicans*, Blum. bijdr. p. 665.

Whitish *Elytranthe*. Shrub par.

24 E. ? *obumnitus*; branches terete, straight; leaves spatulately linear, thickened at the apex; peduncles nutant, somewhat secund. ₂ P.S. Native of Brazil, on the banks of the Rio Grande. *Loranthus obumnitus*, spreng. cur. port. 139. Each ovary is supported by a cup-shaped bract, or by 3 concrete ones.

Cleft *Elytranthe*. Shrub par.

Colt. Like the rest of the genera of the present order, the species are not cultivate. The plants have much the habit of *Lonicera*.

XII. NOTHANTHERA (from *notos*, *notus*, the back, and *arnipa*, *anthera*, an anther; the authors are fixed by the back to the filaments; hence they are oscillatory). *Loranthus*, sect. iv. *Notanthera*, exclusive of 1. *Tetraptera*, and 2. *Calanthe*, D.C. prod. 4. p. 307.—*Loranthus* species of authors.

Linn. *Syst. Pentá-Hexátria, Monogynia*. Flowers hermaphrodite. Petals 5-6-7-8, but usually 6, sometimes almost distinct to the base, and sometimes equally joined together at the base, linear or lanceolate. Stamens equal in number to the petals; filaments adnate to the corolla at the base, but free at the apex; anthers fixed by the back, oscillatory or incumbent. Style filiform. Stigma clavate. Berries ovate.—Parasitical shrubs, natives of South America, except one from Asia. Peduncles corymbose or racemose; bractelets usually bearing 3 flowers and 3 bracteas; sometimes the pedicels are 1-flowered, and with a bractea under each flower.

§ 1. *Pentánera* (from *pentos*, *pente*, five, and *μέγας*, *moris*, a part; the flowers are pentameros or divided into 5 parts). *Flowers pentameros and pentandrous*, large, from 1-8 inches long.

1 N. *grandiflóres*; shrub glabrous, dependent; stems terete; leaves on short pedioles, oval, thick; racemes terminal, subcorymbose, few-flowered; pedicels bearing each 1 flower and 1 bracteas; bracteas ovate, concave, length of fruit; petals 5, linear, joined to the middle; anthers versatile. ₂ P.G. Native of Peru; parasitical on trees, where it is called *Hutan Mecân*. *Loranthus grandiflorus*, Ruiz, et Pav. fl. per. 3. p. 45. t. 273. f. a. Schultes, syst. 7. p. 115. Corolla very long. Berry blue, size of an olive.

Great-flowered *Notanthera*. Shrub par.

2 N. *longibracteáris*; glabrous; branches terete; leaves scattered, lanceolate, or ovate-lanceolate, acute, sessile, coriaceous, veinless; spikes terminal; bracteas foliaceous, linear-lanceolate; flowers adhering to the bracteas at the base; flower-bud clavate; petals 5, linear; anthers versatile. ₂ P.G. Native of Peru. *Loranthus longibracteátus*, Desr. in Lam. dict. 3. p. 599. Schultes, syst. 7. p. 117. Leaves 15-24 lines long, and 8-9 lines broad. Corolla 2½ inches long. *Long-bracteát Notanthera*. Shrub par.

3 N. *verticillé*; branches terete, 3 in a whorl; leaves also usually 3 in a whorl, lanceolate, nerveless, glaucous, usually secund; flowers terminal, second, crowded into heads; bracteas ovate, concave, 1 under each flower; petals 5, joined at the base, spatulately-lanceolate and revolute at the apex; anthers oblong. ₂ P.G. Native of Chili, upon trees and shrubs on the banks of the river Andalban. *Loranthus verticillé*, Ruiz, et Pav. fl. per. 3. p. 17. Schultes, syst. 7. p. 117. Berry oval, blackish-purple.

Whitish *Elytranthe*. Shrub par.

4 N. *caicús*; glabrous; branches terete; leaves on short pedioles, oval-lanceolate, or lanceolate, thickish, veinless; peduncles 1-flowered, disposed in terminal racemes, bearing under each flower an oblong bract, which is 3 times longer than the ovarium; petals 5, joined to the middle, and spreading at the apex, linear; anthers incumbent. ₂ P.G. Native of the Andes of Peru, upon trees. *Loranthus cacicús*, spreng. syst. 1. p. 13. *Loranthus glauca*, Ruiz, et Pav. fl. per. 3. p. 45. t. 279. f. b. H. B. et Kunth, nov. gen. amer. 3. p. 438. but not of Thumb. *Loranthus corymbósus*, Dietr. gart. lex. 4. p. 458. Schultes, syst. 7. p. 115. Leaves an inch or more long, and half an inch broad; pedicels 2 lines long. Flowers an inch long, red at base and apex, but yellow in the middle. Berry oval, dark purple. This species is nearly allied to *N. longibracteátus*.

Grey *Notanthera*. Shrub par.

5 N. *Pestrophórum*; glabrous; branches terete, rather glaucous; leaves opposite, on short pedioles, lanceolate, thickish, veinless; peduncles 1-flowered, disposed in a terminal raceme, bearing an ovate, acute bractea under each flower, which is one-half shorter than the ovarium; limb of calyx truncate; petals 5, joined together a little beyond the middle; anthers fixed by the back to the filaments. ₂ P.G. Native of Chili, where it was collected by Poeppig. Leaves an inch long. Flowers 2 inches long.

Poepig’s *Notanthera*. Shrub par.

6 N. *Sterbergianus*; glabrous; branches terete; leaves ovate or oval, obtuse, coriaceous, veinless above; peduncles many, short, 1-flowered, crowded, corymbose, rising from the axis of the upper leaves and the tops of the branches: bracteas ovate, each one under each ovary; and shorter than it; petals 5, linear, hardly concrete at the base; anthers versatile. ₂ P.G. Native of Chili, near La Guardia, and Aconcagua, and on the Cordillera of Chili. *Loranthus Sterbergianus*, Schultes, fil. in herb. Hanke, and syst. 7. p. 116. Loranthus glaucus, Gill. but not of Ruiz and Pav. nor Thumb. Leaves 12-15 lines long, and 8-10 broad; pedicels 1½ line long. Allied to *N. caicús*, but differs in the bracteas being 1 half shorter than the ovaries, not 3 times longer.

*Sterberg’s Notanthera*. Shrub par.

7 N. ? *Pohl*; glabrous; branches terete; leaves oval, obtuse at both ends, on short pedioles, thick, coriaceous, glaucous; the middle nerve hardly distinct at the base, the rest of it obsolete; pedicels axillary, solitary, shorter than the leaves, opposite, dichotomously corymbose, few-flowered; petals 5, linear, thick, almost distinct, bearing each a ligula beneath the stamens; anthers versatile. ₂ P.S. Native of Brazil, where it was detected by Pohl. *Loranthus glaucus*, Pohl. in litt., but not of others. *Loranthus Pohlii*, D.C. prod. 4. p. 308. Leaves 12-15 inches long, and 8-9 broad. Corolla an inch long. Bracteas small, very blunt, one under each flower. Perhaps a species of *Psittacanths*.

Pohl’s *Notanthera*. Shrub par.

₉ 2. *Micrínthera* (from *μικρα*, *mikra*, small, and *ανθος*, *anthos*, a flower; flowers of the species small). *Flowers small, usually hexameros or divided into 6 parts, but in a very few they are divided into 4-5-7 parts, disposed in racemes; the branches of the raceme usually bearing 3 flowers and 3 bracteas each.—Species all natives of America.
8 N. sarmentosus: glabrous, rather scandent, hence the branches throw out roots on one side; branches angular; leaves petiolate, oblong-lanceolate, acute, somewhat complicate and keeled: having the middle nerve rather prominent; racemes axillary, about equal in length to the leaves: having their branches short and angular, and bearing 3 bracteas and 3 sessile flowers each at the apex; petals 6, linear, spathulate; anthers ovate, incumbent. f. P. G. Native of Peru, at Munnà: parasitical on trees. Loranthus sarmentosus, Ruiz et Pav. fl. per. 3. p. 49. t. 278. f. a. Schultes, syst. 7. p. 145. Corolla yellowish, 3-4 lines long. Berry oblong, greyish. Leaves 1½ inch long, and an inch broad; petioles 2 lines long.

Sarmentiaca Notanthera. Shrub par.

9 N. acuminatus: glabrous; branches angular, somewhat sermentose; leaves petiolate, remote, ovate, long-acuminated; racemes axillary, one half shorter than the leaves: having the branches bractiate, and bearing each 3 ovate, concave, acute bracteas, and 3 sessile flowers; petals 6, linear; anthers ovate. f. P. G. Native of the Andes of Peru, in groves. Loranthus acuminatus, Ruiz et Pav. fl. per. 3. p. 49. Schultes, syst. 7. p. 144. Very nearly allied to N. sarmentosus, but differs in the leaves being flat, in the stigma being petalate, and the berries being brownish yellow.

Acuminated-leafed Notanthera. Shrub par.

* * Racemes terminal and axillary. 10 N. Selidewiosa: glabrous; branches tetragonally terete, radicant; leaves obovate, retuse, or emarginate, ending in a recurved mucron, carilaginous, feather-nerved, tapering into the short petioles; racemes axillary and terminal, naked, shorter than the leaves: having the branches bearing 3 flowers and 3 bracteas; limb of calyx lax; corolla 6-parted; with linear lobes; anthers versatile. f. P. S. Native of Brazil. Loranthus Selidewiosa, D. C. prod. 4. p. 312. Loranthus reticus, Cham. et Schlecht. in Linneo, 3. p. 215. but not of Jack. Leaves 20 lines long, and 15-16 lines broad; petioles 4 lines long. Corolla 3 lines long. Stigma thickish.

Sellerio's Notanthera. Shrub par.

11 N. radiicans: glabrous; branches terete, elongated, radi- cent; leaves ovate, oblong, or lanceolate, acuminate, ending in a subulate point, feather-veined, with carilaginous margins, running down the petioles at the base; spikes axillary and terminal; flowers and bracteas by threes; corolla 6-parted, with linear lobes; anthers versatile. f. P. S. Native of Brazil. Loranthus radiicans, Cham. et Schlecht. in Linneo, 3. p. 207. Leaves 5 inches long and 1½ broad; petioles hardly 5 lines long. Corolla 3 lines long. Flowers disposed in something like whorls of five.

Rooing Notanthera. Shrub par.

12 N. buxifolius: branches rather angular, and rather hispid from stiff short hairs; branches terete, and are as well the petioles and leaves glabrous; leaves oval, coriaceous; racemes terminal and axillary, erect; pedicels bearing each 3 flowers and 3 bracteas; corolla tubular, 4-5-6-parted; having the leaves dilated and concave at the apex; anthers versatile. f. P. G. Native of Chili, near Talcahuano: parasitical on various trees. Loranthus buxifolius, Cham. et Schlecht. in Linneo, 3. p. 207. Loranthus Eschholzianus, Mart. in Schultes, syst. 7. p. 117. Leaves rough in the young state. Bracteas fringed at the apex. The root, according to Chamisso, creeps under the bark of the trees on which the plant grows. Style acute at the apex. Corolla 3-4 lines long. This comes very near to N. heterophyllus; and appears only to differ in the branches being covered with short rigid hairs.

Box-leaved Notanthera. Shrub par.

13 N. heterophyllus: branches terete, slender, scabrous, rusty; leaves scattered, on short petioles, coriaceous, mucronate, coriaceous, glabrous; racemes terminal and axillary, angular; pedicels short, bearing each 3 bracteas and 3 flowers; the 3 middle flowers stalked; and the middle one sessile; bracteas small; petals 6, linear, spathulate; anthers incumbent. f. P. G. Native of Chili: parasitical upon trees, especially myrtaceous trees. Loranthus heterophyllus, Ruiz et Pav. fl. per. 3. p. 48. t. 273. f. b. Schultes, syst. 7. p. 135. The old branches are smooth: the younger ones are angled, glabrous, or sometimes roughish from minute rust-colored tubercles. Petals 4-5, concave, and dilated at the apex. Leaves 6-12 lines long, and 4-9 lines broad; petioles 2 lines long. Corolla purplish white, 4-5 lines long.

Variable-leaved Notanthera. Shrub par.

14 N. Elliciophorus; glabrous; branches terete, slender, angular; leaves petiolate, elliptic, somewhat acuminate, thick-coriaceous, veinless, shining above; peduncles axillary and terminal, racemose; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 7, linear, spathulate, joined together to the middle; anthers versatile. f. P. S. Native of Peru, in groves, in high frigid places on the Andes near Pozoza. Loranthus Elliciophorus, Ruiz et Pav. fl. per. 3. p. 47. t. 276. f. a. Schultes, syst. 7. p. 159. Leaves an inch long, and half an inch broad; petioles 2 lines long. Corolla yellow, 4 lines long. Perhaps a species of Gaiadendron.

Elliptic-leaved Notanthera. Shrub par.

15 N. ligustrifolius; glabrous; branches terete; leaves oblong-lanceolate, acuminate, coriaceous; corymbs axillary and terminal, one half shorter than the leaves, solitary; pedicels crowded, bracteas, bearing 2-3 flowers; petals 6, linear, somewhat dilated and concave at the apex; anthers ovate, versatile. f. P. G. Native of Peru, or Chili, where it was collected by Henke. Loranthus ligustrifolius, Schultes, fil. in herb. Henke, and in syst. 7. p. 135. Loranthus ligustrinus, Wildl. herb. ex Schultes, but not of Wall. Leaves 2 inches long, and 9-10 lines broad; petioles 2 lines long. Corolla 4-5 lines long, black in the dried state.

Privet-leaved Notanthera. Shrub par.

16 N. Veæetus; glabrous; branches scandent, terete; leaves elliptic-oblong, obovate, rounded at the apex, thick-coriaceous, glaucous, on short petioles; racemes axillary, solitary; pedicels short, bracteas, bearing each 3 sessile flowers at the apex, drooping in the fructiferous state. f. P. G. Native of Mexico, near Cuernavaca. Loranthus veæetus, D. C. prod. 4. p. 313. H. B. et Kunth, nov. gen. amer. 3. p. 434. Leaves 2 inches long, and 10-12 lines broad. Flowers unknown. Berries ovate-oblong.

Lilicky Notanthera. Shrub par.

17 N. orbicularis; glabrous; branches tetragonal; leaves petiolate, orbicular, acutish, thick-coriaceous, obsolescently veined; racemes axillary, solitary; pedicels short, bearing each 3 sessile flowers at the apex; petals 6, glabrous; anthers ovate. f. P. S. Native of Quito, near Guayaquil, on trees. Loranthus orbicularis, H. B. et Kunth, nov. gen. amer. 3. p. 494. Schultes, syst. 7. p. 143. Leaves 18 lines long and 16-17 broad; petioles 3-4 lines long. Flowers 4 lines long, green on the outside, and white on the inside.

Orbicular-leaved Notanthera. Shrub par.

18 N. salicifolius: plant glabrous, prunose 7 branches te- rete, compressed at the nodi; leaves oblong-lanceolate, acuminate, marginate, petiolate; racemes axillary, solitary or twin, erect, sessile; pedicels very short, bearing each 3 flowers and 3 bracteas; corolla 4-parted, with linear lobes, which are shell-formed at the apex; anthers versatile, stigma capitata. f. P. S.
Native of Brazil. Loranthus soliciifolius, Cham. et Schlecht. in Linnaea. 3. p. 216. Leaves ½ inches long and ½ inch broad; petioles 6 lines long. Flowers a line long.

Willow-leaved Notanthera. Shrub par.

19 N. lanceolatus; glabrous; branches terete, slender, rather angular; leaves on short petioles, lanceolate-oblong; peduncles racemose, axillary, and terminal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 7-9, linear-spatulate, joined at the base; anthers incumbent.

10 F. G. Native of Peru, on the Andes at Píllaro. Loranthus lanceolatus, Ruiz et Pav. fl. per. 3. p. 47. t. 278. f. b. but not of Beavu. Loranthus lanceolatus, Poir. ex Schultes, syst. 7. p. 142. Leaves 2 inches long and an inch broad; petioles 2-3 lines long. Corolla yellow, half an inch long. Berries oblong.

Lanceolate-leaved Notanthera. Shrub par.

20 N. ohyphylles; glabrous; branches terete, but somewhat compressed at the apex; leaves lanceolate-oblong, tapering into the petioles at the base, and much acuminated at the apex, feather-nerved: having the middle nerve rather prominent; racemes axillary, solitary, shorter than the leaves; pedicels opposite, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, acutely joined at the base, longer than the filaments; anthers ovate, erect, incumbent. 

11 F. P. S. Native of Brazil, where it was collected by Pohl. Loranthus ohyphyllus, Pohl. ex D. C. prod. 4. p. 314. Loranthus acuminatus, Pohl. in litt. Leaves 2 inches long. Flower-bud sub-eclavate. Style thickish; stigma truncate.

Short-petalled Notanthera. Shrub par.

21 N. seaveolens; glabrous; branches terete; leaves petiolate, ovate-oblong, acuminnated, rounded at the base, coriaceous; racemes 2-4 together; pedicels short, approximate, brickless, bearing each 3 stalked flowers at the apex; petals 6, linear, spreading; anthers incumbent. 

Sweet-scented Notanthera. Shrub par.

22 N. conduplicatus; glabrous; branches tetragonal; leaves petiolate, ovate, acuminate, acute at the base, rather coriaceous, comparatively compressed; petiole terminal, much branched, leafy: having the branches twin, and as well as the rachis: tetragonal; pedicels very short, bearing 3 flowers and 3 bracteas at the apex; petals 6, linear. 

13 F. P. S. Native of Cumana and Cumanacoa, on trees. Loranthus conduplicatus, H. B. et Kunth, nov. gen. amer. 3. p. 441. Loranthus ancepts, Will. rel. in Schultes, syst. 7. p. 131. Leaves 24-27 lines long, and 14-17 lines broad; petioles 4-5 lines long. Flowers hardly 2 lines long.

Conduplicate-leaved Notanthera. Shrub par.

23 N. attenuatae; plant glabrous, twining; branches terete; leaves rather alternate, obovate-oblong, cuneated at the base, and tapering into the petioles, and mucronate at the apex; mucrone deciduous; racemes axillary, twin or term, shorter than the leaves; pedicels short, bearing each 2-3 bracteas and 2-3 sessile flowers at the apex; petals 6, linear, hardly connected at the base, longer than the filaments; anthers ovate-roundish, fixed by the base. 

Attenuated-leaved Notanthera. Shrub par.

24 N. acepts; glabrous; branches terete; branches and peduncles compressed and 2-edged; leaves alternate or opposite, oblong-elliptic, petiolate, ending in very short mucrones, feather-nerved; racemes axillary, solitary, or twin, and terminal, subcorombose, unequal; pedicels short, bearing each 3 bracteas and 3 sessile flowers at the apex; anthers ovate, erect. 

15 F. P. S. Native of Brazil, where it was detected by Pohl. Loranthus acepts, D. C. prod. 4. p. 315. Loranthus oblongo-ellipticus, Pohl. in litt. Leaves an inch long and 6-6 lines broad; petioles 3 lines long. Corolla 2 lines long. Allied to Loranthus panicifolius.

Two-edged-branched Notanthera. Shrub par.

25 N. ovaatus; glabrous; branches unknown; leaves ovate, acute, somewhat acuminated, petiolate, coriaceous: having the middle nerve rather prominent, and the lateral ones hardly conspicuous; racemes a little shorter than the leaves; pedicels short, bearing 3 bracteas and 3 sessile flowers at the apex; petals 6, linear, distinct, acutish, a little longer than the filaments; anthers erect, fixed by the base. 

16 F. P. S. Native of Brazil. Loranthus ovatus, Pohl. in litt. ex D. C. prod. 4. p. 315. Leaves 2½ inches long and 1½ broad; petioles 2-3 lines long. Branchlets racemose, 2 lines long. Ovary glaucous. Petals 2 lines long. Style thickish, equal at the apex. Perhaps this and the preceding belong to Struthanthus.

Ovate-leaved Notanthera. Shrub par.

Cult. The species are not cultivable, and have the habit of those of the other parasitical genera of the order.

Cult. The species of this genus have the habit of the other parasitical genera of the order, and are not cultivable like them.

† Plants referred to the old genus Loranthus by authors, but the number of the parts of the flowers and their structure being unknown, it is impossible to refer them to any of the genera broken off from that genus; therefore they must stand under the names originally given.

1 L. florulentus (Rich. act. soc. hist. nat. par. p. 107.) branches opposite, spreading, quadrangular; leaves oblong-ovate, very blunt; peduncles solitary and sessile in all the axils.
LORANTHACEÆ. XIII. Loxanthera. XIII. a Gaiadendron.

**Flowering Loxanthus.** Shrub par.

**Braecate-flowered Loxanthus.** Shrub par.

3 L. *tereflœus* (Willd. reed Schultes, syst. 7. p. 161.) branches terete; leaves oblong, petiole, acute; racemes axillary; peduncles 3-flowered. *P. S.* Native of Caracas.

**Thrice-flowered Loxanthus.** Shrub par.

4 L. *laevis* (Willd. reed Schultes, syst. 7. p. 162.) leaves coriaceous, oblong, acute, tapering into the pedicles; flowers terminal, aggregate. *P. S.* Native of South America.

**Laurel-like Loxanthus.** Shrub par.

5 L. *cardiphyllos* (Willd. reed Schultes, syst. 7. p. 162.) leaves ovate-cordate, stem-clasping, opaque; flowers terminal, spicately aggregate. *P. S.* Native of South America.

**Heart-leaved Loxanthus.** Shrub par.

6 L. *tubulifœs* (Willd. reed Schultes, syst. 7. p. 162.) leaves lanceolate, acute; flowers tubular, somewhat spicate, terminal. *P. S.* Native of South America.

**Tubular Loxanthus.** Shrub par.

7 L. *Dianthera* (Willd. reed Schultes, syst. 7. p. 162.) leaves lanceolate, attenuated at the base, obtuse, glaucous, much longer than the spikes; spikes axillary and terminal. *P. S.* Native of South America.

**Gincom-like Loxanthus.** Shrub par.

8 L. *multiflœs* (Willd. reed Schultes, syst. 7. p. 162.) leaves ovate, acuminate, longer than the racemes; racemes axillary; peduncles 3-flowered. *P. S.* Native of South America.

**Many-flowered Loxanthus.** Shrub par.

9 L. *alcertæus* (Willd. reed Schultes, syst. 7. p. 162.) leaves oblong, rather acuminate at the apex; flowers axillary and terminal, panicled. *P. S.* Native of South America.

**Alternate-leaved Loxanthus.** Shrub par.

10 L. *ovallæus* (Schultes, syst. 7. p. 162.) leaves oblong, opaque, coriaceous; flowers terminal, racemose and panicled; pedicels 3-flowered; bracteal ovate, longer than the calyx. *P. S.* Native of South America. Loranthus bracteatus, Willd. rel. but not of Roxb.

**Environed Loxanthus.** Shrub par.

11 L. *microstæchus* (Willd. reed Schultes, syst. 7. p. 162.) leaves elliptic-roundish, petiole; racemes cymose, axillary, 4 times smaller than the leaves. *P. S.* Native of South America. The rest unknown.

**Small-spiked Loxanthus.** Shrub par.

12 L. *macrostæchus* (Willd. reed Schultes, syst. 7. p. 162.) leaves oblong, attenuated at both ends, bluntish, coriaceous; spikes sessile, longer than the leaves, verticillate. *P. S.* Native of South America. The rest unknown.

**Long-spiked Loxanthus.** Shrub par.

13 L. *membrææus* (Willd. reed Schultes, syst. 7. p. 162.) leaves ovate, drawn out at the apex, attenuated, membranous, nerved; flowers twin, 2 inches long. *P. S.* Native of South America. The rest unknown.

**Membranous-leaved Loxanthus.** Shrub par.

14 L. *celtidiformis* (Willd. reed Schultes, syst. 7. p. 161.) leaves ovate, oblique, glaucous beneath; peduncle axillary, aggregate. *P. S.* Native of Guinea. The rest unknown.

**Celtis-leaved Loxanthus.** Shrub par.

15 L. *maculatus* (Blum. bijdr. p. 662.) leaves opposite or alternate, elliptic-oblong, obuse, acute at the base, spotted with black, coriaceous, glabrous; flowers unknown. *P. S.* Native of Java, in the province of Bantam.

**Spotted-leaved Loxanthus.** Shrub par.

**Eucalyptus-like Loxanthus.** Shrub par.

17 L. *Hoffmannseggiæus* (Willd. in Schultes, syst. 7. p. 113.) leaves ovate-oblong, acute; racemes axillary, usually twin; flowers verticillate. *P. S.* Native of Brazil, at Para. Lor. verticillatus, Hoffmannsegg in herb. Willd. Flowers peuantoudous.

**Hoffmannsegg’s Loxanthus.** Shrub par.

†† Species only known by name.

1 L. *acinicorn-Nikkoæus*, Oudh. in Brown, append. 2. 2 L. *calycicus*, R. Brown, in Salih, abyss. 3 L. *congestus*, R. Br. l. c. 4 L. *letus*, R. Br. l. c. 5 L. *serrulatus*, Roxb. ex Steud.

N. B. *Asclepias lacteæ*, Burn. fl. ind. p. 61. is a species of Loxanthus not known.

**Tribe II. Terrestrial shrubs.**

XIII. a Gaiadendron (from *gaia*, *gaua*, the earth, and *dendron*, a tree; these trees grow in earth and not parasitical, like other genera broken off from Loranthus). Loxanthus species of authors.

**Lin. syst. Hexa-Octandria, Monogynia.** Calyx 6-8-toothed. Petals 6-8, narrow, sometimes free and sometimes joined at the base. Stamens 6-8, inserted in the petals. Style filiform; stigma simple. Ovarium oblong-cylindrical.—Terrestrial trees, with obovate leaves and racemes of yellow flowers.

1 G. *eugenioides*,arboreus; branches terete; leaves ovate-oblong, acuminate, running down the pedicles at the base, rather coriaceous; racemes axillary and terminal, solitary or twin; pedicels short, approximate, 3-flowered, bracteate; flowers pedicellate; corolla 5-6-parted; lobes linear-acute; authors incumbent. *P. G.* Native of Peru, on the Andes, near Guacamabanta; and of Brazil. Loranthus eugenioides, H. B. et Kunth, nov. gen. amer. 5. p. 453. Schultes, syst. 7. p. 153. Cham. et Schlecht. in Linnae. 3. p. 214. Loranthus attenuatus, Willd. herb. but not of Poli. Flowers about half an inch long, white, sweet-scented. Racemes 1½ to 3 inches long.

**Eugenie-like Galadendron.** Tree 15 to 20 feet.

2 G. *Tagua*; arboreus; branches terete; leaves oblong, acute, running down the pedicles at the base, coriaceous, shining above and dotted beneath; racemes axillary, solitary; pedicels short, usually 3 together, approximate, bearing each 3 bracteas and 3 flowers; flowers on short pedicels; petals 7, spreading, linear, acute. *P. G.* Native about Santa Fe de Bogota. Loranthus Tagua, H. B. et Kunth, nov. gen. amer. 3. p. 136. Schultes, syst. 7. p. 159. Loranthus arboreus, Mutis mss. Leaves 3½ inches long, and 14-18 lines broad; pedicels 6 lines long. Flowers 9 lines long. Berry ovate-oblong. Very like *N. punctatis*.

**Tagua Gaiadendron.** Tree 15 to 20 feet.

3 G. *laureolus*, arboreus; glabrous; branchlets angular; leaves elliptic-oblong, bluntish, running into the pedicelles at the base, coriaceous, shining above; racemes axillary and solitary, terminal, and panicled; pedicels short, usually by threes, approximate, bearing each 3 bracteas and 3 sessile flowers;
petals 7-8, linear, rather dilated at the apex; anthers incumbent.

Laurel-leaved Gaiadendron. Tree 15 to 20 feet.

5 G. Purace^nse; arboretous, glabrous; branches terete; leaves lanceolate-oblong, acutish, running into the petals at the base, coriaceous, shining above, and beset with black spots beneath; racemes terminal; peduncles short, 3-5-together, approximate, each bearing 3 bracteas and from 1-3 flowers; petals 6-8, linear. L. G. Native on the Andes, about Popayan, in Paramo de Purace. Loranthus Purace^nensis, H. B. et Kunth, nov. gen. amer. 3. p. 437. Schultes, syst. 7. p. 160. Leaves 22-27 lines long, and 9-10 broad; petals 4 lines long. Racemes 4-6 inches long. Corolla yellow. Perhaps sufficiently distinct from N. T^ija.

Purace Gaiadendron. Tree 10 to 15 feet.

6 G. pec^attum; arboretous, glabrous; branches terete; leaves obovate or oval, somewhat attenuated at the base into the short petioles, coriaceous, beset with black dots beneath, having the middle nerve rather prominent; racemes long, terminal, and from the axis of the superior leaves; peduncles somewhat verticillate, bearing each 3 bracteas and 3 sessile flowers at the apex; petals 6, linear-spatulate; anthers incumbent, fixed by the back near the base to the filaments. L. G. Native of the Andes of Peru, in cold places in groves. Loranthus punctatus, Ruiz et Pav. fl. par. 3. p. 47. t. 177. f. a. Presl, in herb. Hae^nke, Schultes, syst. 7. p. 134. Leaves 2 inches long, and 1 broad; petals 2-3 lines long. Corolla yellow, almost an inch long before expansion. Berry ovate-roundish, crowned by the limb of the calyx, which is truncate.

Dotted-leaved Notanthera. Tree par. Cult. For culture and propagation see Nutysia.

XIII. b NUYTSIA (named after Peter Nuyts, a celebrated Dutch navigator, and discoverer of that part of New Holland called Nuytsland). R. Br. in geogr. soc. trans. vol. 1.

L. syst. Hae^nthinia, Monogynia. Teeth of calyx 3-5, unequal. Petals 6-7, linear, distinct. Stamens 6-7, inserted towards the middle of the petals; anthers versatile, sub-bastate, 2-celled. Ovarium turbinated, rather trigonal. Style subulate; stigma acute. Fruit 1-seeded, covered by pulp or glutin, and of a different texture from the rest of the Loranthaceae gener.

A terrestrial tree, native of New Holland.

1 N. flore^nse^; arboretous, glabrous; branches terete; leaves alternate, linear, obtuse, thick; racemes elongated, simple; peduncles longer than the flowers, bearing each 3 bracteas and 3 flowers at the apex. L. G. Native of New Holland, in Van Lewin's Land. Loranthus floribundus, Labill. nov. holl. 1. p. 87. t. 113. Schultes, syst. 7. p. 133. Loranthus celastroides, Sieb. fl. nov. holl. exsic. no. 244. Leaves 2-3 inches long, and 4-5 lines broard. Racemes 6-8 inches long, crowded at the tops of the branches. Corolla 9-10 lines long, sulphur-coloured.

Cult. A mixture of sand, loam, and peat will be a good soil for this singular tree. Cuttings will probably root if planted in sand under a hand-glass.

** XIV. SCHÖPEFFIA (named after John Schoepf, a German botanist, who has written upon the plants in the neighbourhood of Ulm). Schreb. gen. no. 323. D. Don, prod. fl. nep. 145. Wall in Roxb. fl. ind. 2. p. 188. D. C. coll. mem. vi.—Codoni^num, Vahl, act. soc. hist. nat. hafn. 1. p. 206. t. 6.—Ha^nekia, Ruiz et Pav. fl. per. 3. p. 8. but not of their prod.

Arborescent Schoepfia. Tree 8 to 10 feet.

2 S. flexu^osa (Roem. et Schultes, syst. 5. p. 160.) leaves ovate-lanceolate, acute; racemes axillary, solitary, 4-5-flowered; tube of corolla ovate; lobes acute; throat naked. L. G. Native of the islands of Santa Cruz, Montserrat, ex Rohr; and of Guadaloupe, ex Bertero; but in Rohr's specimen the leaves are oblong, while in that of Vahl's they are acuminated; they are therefore two distinct species. Codonium arboreos. Vahl, act. soc. hist. hafn. 2. pt. 1. p. 206. t. 6. symb. bot. 3. p. 36. S. Schreberi, Lam. ii. 2. p. 51. S. Americana, Willd. spec. 1. p. 996. Flowers yellow.

Flexu^os^a-branched Schoepfia. Tree 10 to 12 feet.

** Tube of corolla terete, having the throat furnished with fascicles of hairs at the origin of the stamens.—Species natives of Asia.

3 S. fra^grans (Wall, in Roxb. fl. ind. 2. p. 188.) leaves lanceolate or elliptic-oblong, attenuated at both ends; racemes axillary, solitary, many-flowered; corolla infundibuliform, with a long cylindrical tube; segments of corolla lanceolate, acute. L. G. Native of Nipal, in less elevated situations from Bechenko as far as the valley, where it is rather common; it has also been found in more northern situations. Wall. tent. fl. nep. 1. p. 18. t. 9. D. Don, prod. fl. nep. 145. Symphorin^carpos? odor^ata, Ham. ex D. Don, l. c. Bark of tree thick and spongy, yellowish. Leaves deep green above. Flowers yellow,
exquisitely fragrant, even after being dried, disposed in racemes, which are about half the length of the leaves. Ovarium supported by a calyciform bractea like the rest of the species, which is divided into 2 or 3 unequal acute segments. Corolla rather fleshy; tube nearly an inch long. Drupe pale yellow, almost white, about the size of an olive, 1-seeded from abortion. The perfume of the flowers is of a most delightful kind, and may be perceived on steeping them in warm water even long after they have been dried.

*Fragrant Scheffelia.* Tree 10 to 15 feet.

4 S. *Acuminata* (Wall. cat. no. 486.) leaves ovate, acuminate, obtuse at the base; racemes axillary, many flowered; tube of corolla tetrate; lobes bluish. f. G. Native of Ni-paul, on the Ponduta mountains. Flowers yellow?

*Acuminate-leaved Scheffelia.* Tree 10 to 12 feet.

*Cult.* A mixture of loam, peat, and sand will suit these trees; and young cuttings of them will be easily rooted if planted in sand, and placed under a hand-glass.

**XV. AU'CUBA** (the Japanese name of the shrub). Thunb. *fl. jap.* p. 4. *Lam.* t. 759. D. C. *prod.* 4. p. 274.—A. *Kempf.* *Kempf.* *anc. * 5. p. 775.—Rubási, *Salisb.* *prod.* 68. Linn. *syst.* *Dietc.* *Tetrándria.* Flowers dioecious. Calyx closely adhering, with the margin a little elevated and 4-toothed; teeth obtuse, very short. Petals 4, deciduous, alternating with the calycine teeth, inserted in the margin of the elevated flesh, 4-angled disk ovate, acuminate, fleshy, with the margin truncate on one side, and minutely papillose on both surfaces, valvate in activation, induplicate at the apex. Stamina 4, opposite the petals? Ovarium cylindrical, adhering closely to the tube of the calyx, 1-celled, containing one ovulum. Style very short, thick, tetrate: stigma capitate, thick, fleshy, viscid, obsectely 2-lobed. Berry fleshy, 1-seeded, crowned by the permanent style. The rest unknown.—A small evergreen tree, native of Japan; branches dichotomous or verticillate in the manner of *Lorántthas* and *Viscum*. Leaves opposite, petiolate, broad, ovate-lanceolate, acuminate, to-thed, coriaceous, glabrous, shining, pale green, beautifully spotted with yellow, having the mid-rib rather prominent, the rest of the leaf reticulately veined. Petioles cylindrical. Flowers small, panicled. Panicles many, spike-formed, pedunculate; peduncles rather villous. Bracteae lanceolate, membranous, pale, caducous. Calyx beset with adpressed villi. Petals dark blood coloured. The buds are large, angular, imbricated from conuplicate stipulas; the leaves are large, toothed, and veiny, and the petioles are articulated with the branches and dilated at the base; hence there is some analogy in the genus to *Fréxius.* This genus was included by *Russinier in the order Rhinon.* But from its having no affinity whatever to either of the families into which that order has been since divided, its place in the natural system has remained undetermined; and perhaps also from its want of novelty, the plant has been despised by botanists, and its characters and affinities consequently overlooked. Like the *Sálx Balbylacea,* or weeping-willow, too, we possess only one sex of the tree in Europe, and that the female, which circumstance has likewise prevented its being accurately examined. The structure of the female flower agrees so exactly with that of *Viscum,* that, notwithstanding the different mode of growth of the two genera, and the absence of more accurate details respecting the male blossoms, and the ripe fruit, its arrangement among the *Lorántthas* appears fully justified. It will ultimately be found the connecting link between the *Araltiaceae* and the present family.

1 A. *Japónica* (Thunb. *fl. jap.* p. 64.) f. H. Native of Japan. Banks, *icon.* *Kempf.* t. 6. *Thunb.* *icon.* *fl.* *jap.* t. 12 and 13. *Sims,* *bot.* *mag.* 1197. *Eubásiá dichómous,* *Salisb.* *prod.* p. 68. The *Aucuba* is a well-known laurel-like evergreen shrub, having the leaves mottled with yellow; but in Japan the leaves are said to be sometimes green by Thunberg. According to *Kempf,* the fruit is a red oblong drupe, like a laurel-berry, with a white sweetish pulp, and a kernel with a bitter taste. The shrub is called in the gardens *Aucuba* or *spotted-leaved laurel.*

*Cult.* This is a showy evergreen shrub, well adapted for shrubberies and small gardens. It is easily increased by cuttings from the young wood planted in autumn under a hand-glass or by layers. The shrub will grow in any soil.

**Order CXXVIII. CHLORÁNTHACEAE (plants agreeing with Chloránthas in particular characters).** R. Br. in bot. mag. 2190. (1821) and in Parry, voy. 1824. *Cult.* 17. (1821). Blum. *fl. jap.* (1829) vol. 1.

Flowers disposed in spikes, hermaphrodite or unisexual; with a supporting tridentate calyx. Stamina lateral; if more than one connate definite; anthers 2-4-celled, bursting lengthwise, each adunate to a fleshy connective, which coheres laterally in various degrees; filaments slightly adhering to the ovarium, which is 1-celled; stigma simple, sessile; ovulum pendulous. Fruit drupaceous, indehiscent. Seed pendulous. Embryo minute, placed at the apex of a fleshy albumen; having the radicle inferior, and consequently remote from the hilum; cotyledons divaricate,—Herbaceous plants or under shrubs, with an aromatic taste. Stems jointed, tumid under the articulations. Leaves opposite, simple, with sheathing petioles, and minute intervening stipulas. Flowers disposed in terminal loose slender spikes.

This order is nearly allied to *Lorántthas,* from which it differs in the tridentate calyx, in the want of petals, in the fewer stamens, in the structure of the anthers, and in the inferior radicle, &c. It is said to be nearly allied to *Sarrácena* and *Piperácea,* from both of which it differs in the want of a sack to the embryo, and in the pendulous ovulum, and opposite leaves with intermediate stipulas. The anthers consist of a fleshy mass, upon the face of which the cell lies that bears the pollen; whether their anthers are 1 or 2-celled is a matter of doubt, one botanist considering those that have 2 cells to be double anthers, another understanding those with 1 cell to be half anthers. This order comes nearest in affinity to *Rubáceae,* tribe *Opeubáciarum.*

The whole plant of *Chloránthas officinális* has an aromatic fragrant smell, which is gradually dissipated in drying; but its roots retain a fragrant camphorated smell, and an aromatic somewhat bitter flavour. They are found to possess very nearly the properties of *Aristolóchias serpántarias,* and in a high degree. There seems to be no doubt but that it is a stimulant of the highest order.

**Synopsis of the genera.**

1 Chloránthas. Flowers hermaphrodite. Anther seated on the side of the ovarium, undivided and 2-celled, or trilobed and 4-celled. Ovarium 1-ovulate. Drupé 1-seeded.

2 *Ascarina.* Spikes dioecious. Filament short; anther oblong, 4-furrowed, and probably 4-celled. Stigma 3-lobed. Drupé 1-seeded.
3 Hedyosmum. Flowers monocious. Male aments oblong, naked; anthers numerous, closely imbricated. Female flowers in racemes, with a tridentate calyx. Drupe trigonal, 1-seeded, clothed by the baccate calyx.

LIN. SYST. Montandra, Monogyra, R. Br. Gymandra, Triandra, Spreng. Calyx tridentate or wanting. Corolla wanting. Anther seated on the side of the ovary, undivided, and 2-celled, or trilobed and 4-celled; in the latter case the middle lobe alone is perfect and 2-celled, while the 2 lateral lobes are imperfect and only 1-celled. Ovary 1-seeded; ovulum pendulous; stigma capitata. Drupe 1-seeded. Small subherbaceous shrubs; with opposite toothed leaves, and slender spikes of inconspicuous flowers.

1 C. officinalis (Blum. enum. pl. jay. 1. p. 79. fl. jay. 1. p. 10. t. 1.) stem suffrutesceous; leaves oval-oblong, lanceolate, the superior ones more acuminate than the rest; spikes branched, terminal; anther 3-lobed; middle lobe perfect and 2-celled; lateral ones imperfect and 1-celled. G. Native of Java, in high mountain woods. Strabôpha Noronha, incl. Berries white. The plant has an aromatic and fragrant smell, and is a stimulant of the highest order. It is used in medicine by the Javanese.

Official Chloranthus or Chu-Lam. Shrub 3 to 4 feet.

2 C. brachystachys (Blum. fl. jay. 1. p. 13. t. 2.) stem suffrutesceous; leaves oblong-lanceolate, acuminate at both ends; serrated; spikes branched, terminal; anther undivided, 2-celled. G. Native of Java, in the provinces of Banant and Krawang, in woods on the higher mountains. Ascara serrata, Blum. enum. pl. jay. 1. p. 180.

Short-spiked Chloranthus or Chu-Lam. Shrub 2 to 3 feet.

3 C. monostachys (R. Br. in bot. mag. t. 2190. Lindl. coll. t. 171.) stem suffrutesceous; leaves elliptic, serrated, acuminate; spikes solitary, simple; flowers alternate; anther incurved, 3-lobed; the middle lobe 2-celled and perfect, and the lateral lobes imperfect and 1-celled. G. Native of Java. Flowers yellowish.

One-spiked Chloranthus or Chu-Lam. Fl. Feb. May. Ch. 1819. Shrub 1 to 2 feet.

4 C. inconspicuous (Swartz, in phil. trans. vol. 77. p. 359. t. 15.) suffrutesceous; leaves ovate-oblong, obtuse, serrated, pale beneath; spikes axillary, branched; branches alternate; flowers opposite; anther 3-lobed; middle lobe perfect and 2-celled, the lateral ones imperfect and 1-celled. G. Native of Java and Japan. Nigrina speciata, Thumb. fl. jap. p. 65.

5 C. monandra (R. Br. in bot. mag. under no. 2190.) spikes branched; flowers opposite? anther undivided, 2-celled, perfect. G. Native of China.

Monandra Chloranthus or Chu-Lam. Fl. June. Ch. 1817. Shrub 1 to 1 1/2 foot.

6 C. elation (R. Br. l. c.) shrubby; leaves oblong-lanceolate, serrated, petiolate; spikes slender, long, reflexed, crowded, nearly terminal; anther 3-lobed, the middle lobe perfect, 2-celled, the lateral lobes imperfect and 1-celled. G. Native of China and Cochinchina. Crédous odorifer, Lour. cooh. p. 89. Flowers small, yellow, sweet-scented. Branches long, somewhat scendent. In Cochinchina this plant is grown in gardens for the sake of the scent of the flowers.

Taller Chloranthus or Chu-Lam. Shrub 6 feet.

7 C. chloranthus (Rott. & Schultes, syst. 3. p. 461.) leaves ovate-oblong, acute, doubly serrated; spikes brachiate, axillary. G. Native of Japan, in the interior of the islands. Nigrina serrata, Thumb. act. ups. t. 7. p. 142. t. 5. f. 1. Stem simple, about a foot high. Leaves a hand long, having the serratures acute.

Serrated-leaved Chloranthus or Chu-Lan. Fl. 1 foot.

Cult. A mixture of loam, sand, and a little peat, is a good soil for the species of Chloranthus; and they are easily increased by cuttings under a hand-glass, or by suckers.

II. ASCARINA (from ascopus, ascaris, ascarides, or small round worms; the name is applied to this genus because the anthers are formed like small worms). Forst. chur. gen. t. 59.

LIN. SYST. Montandra, Monogyra. Spikes filiform, dioecious. Perianthium a very short scale. Filament short; anther oblong, 4-furrowed, and probably 4-celled. Style wanting; stigma somewhat 3-lobed, adnate to the ovary.—A tree, with an oblong-serrated stalked leaves, and sheathing stipulas at the base of the petioles.

1 A. polystachya (Forst. l. c.) G. Native of the Society Islands.

Many-spiked Ascarina. Tree.

Cult. See Chloranthus above for culture and propagation.

III. HEDYOSMUM (from υδης, hedy, sweetness, and ους, ous, a smell; the plants are sweet-scented). Humb. et Bonpl. nov. gen. 7. p. 634, 635. Swartz. fl. ind. 2. p. 957. t. 8. Schreb. gen. 2. p. 1453.—Taifilla, Ruiz et Pav. fl. per.

1 H. suxi (Swartz, fl. ind. occid. 2. p. 959. prod. p. 84.) frutescens; branches lax; leaves lanceolate, acuminate; petals short, connate on both sides from stipulaceous membranaceous sheaths at the base, which are retuse and eiliate on the margins. G. Native of Jamaica, in woods, on the highest mountains. Shrub branched. Branchlets tetragonal, jointed, rising from the axils of the sheaths of the petioles. Leaves serrated, pale green. Male aments pedunculate, oblong, mutut, filiform, rising from the sheaths of the female. Female racemes terminal and axillary from the same axils as the male ones, usually tripartite. Calyx tridentate. Drupe triquetrous, hard, shining, brown, clothed by the roundish, scarlet, fleshy calyx. The whole plant has a grateful smell, and an aromatic hot taste.

Nodding-spiked Hedyosmum. Shrub 1 to 4 feet.

2 H. racemosa; leaves oblong, serrated, short-acuminated; female peduncles twin, racemose, flexuous. G. Native of Peru, at Cachero and Pillao, where it is called Carpales and Aptageia. Taifilla racemosa, Ruiz et Pav. fl. per. syst. p. 271. There is a white pellucid sweet-scented resin issues from this plant, which has the scent of gum-anime.

Raceemose-flowered Hedyosmum. Tree 15 feet.

3 H. aerocrenescens (Swartz, fl. ind. occ. 2. p. 961. prod. p. 84.) arborascens; branches straight, erect; leaves ovate-lanceolate; sheaths of petioles cucullate, bidentate; male aments oblong, usually twin; female racemes tripartite. G. Native
of Jamaica and Martinico, on the higher mountains. Branches angular near the sheaths of the petioles, knob, rather fleshy. Leaves serrated, attenuated and obtuse at the apex, brownish green, shining. Stipulaceous sheaths large, encircle, bidentate at both sides. Female flowers crowded on the racemes by threes, sessile. Scales 3-4 under the flowers. Ovarium trigonal. Style triquetrous: stigma obtuse. Fruit white, rather daunaneous. Calyx bicarinate, like that of the first species.

Arborescent Hedyosum. Shrub 12 to 16 feet.

Hairy-leaved Hedyosum. Shrub.

Hairy-leaved Hedyosum. Shrub.

S. Native of New Granada.

Hairy-leaved Hedyosum. Shrub.

Hairy-leaved Hedyosum. Shrub.

S. Native of Peru, in Pati and Muna, where it is called Agyacapi; and New Granada. Tafalla seabra, Ruiz et Pav. fl. per. syst. p. 270.

Smooth Hedyosum. Tree 20 feet.

Bomplandanum (H. B. et Kunth, nov. gen. 7. p. 164. t. 694-695.) leaves oblong, acuminate, glabrous, serrate; male peduncles twin, 3-spined; those of the female branched.

Bomplandanum. Tree 25 feet.

Cult. For culture and propagation see Chloranthus, p. 434, with the exception that the species require more heat. They are shrubs of no beauty.

Calyx having the tube adhering to the ovary (f. 77. c.), and the limb free and 5-lobed (f. 77. d. f. 78. a.). Corolla gamopetalous (f. 77. b. f. 78. b. f. 79. b.), inserted in the calyx, with the tube short (f. 77. b.), or long (f. 78. b.), and the limb 5-lobed (f. 77. b.), and sometimes irregular (f. 78. b. f. 79. b.), not valvate in estivation. Stamens inserted in the calyx, and adnate to the corolla at the base (f. 82. f. f. 79. c.), and alternating with its lobes, and equal in number to them (one of which is sometimes abortive), sometimes exerted (f. 79. c. f. 78. c.), sometimes inclosed (f. 82. f. f. 81. b.); filaments subulate; anthers ovate, 2-celled. Ovarian adnate to the calyx, while young 3-celled (f. 77. c.). Style exerted (f. 78. c.) or wanting; stigmas 3, sometimes distinct, sometimes combined into a head. Berry crowned by the limb of the calyx (f. 77. d. f. 81. g.), usually pulpy, rarely almost dry, many-celled in the adult state, but often 1-celled from the dissepiments, which are very thin, having vanished. Seeds inveted, solitary, twin, or numerous in the cells, but sometimes many of them are abortive; spermatid crustaceous. Embryo in the centre of a fleshy albumen; with a superior radicle, and 2 ovate-oblong cotyledons.—Shrubs, rarely herbs or trees. Leaves opposite, extipulate (rarely furnished with 2 small stipulas at the base of each petiole) simple, undivided, toothed, rarely pinnate, feather-nerved. Flowers terminal, corynobase, or axillary.

Taking Lonicerâ for the type of the order, there will be found a striking affinity with Rubiâceae, Tribe Cinchonaceae in the monopetalous tubular corolla, definite stamens, inferior ovary, and opposite leaves, an affinity which is confirmed by the corolla of the latter being occasionally regular or irregular. With Apeöcyne it has an intimate alliance for the same reasons, differing chiefly in their qualities, with the non-connivance of the anthers, the estivation of the corolla, and the structure of the fruit. To Loranthaceae they also approach, in the structure of the flowers and berries. Besides these points of affinity, Caprifoliaceae probably tends towards Umbelliferae through Sambucus, from the feteid divided leaves and half herbaceous habit. The genus Triostium appears to be a link between this order and Rogniâceae. The fragrance and beauty of the honeysuckle tribe have been the theme of many a poet's song. They consist either of twining or erect shrubs, with clusters of trumpet-shaped, fragrant, white, scarlet, or yellow flowers; or of fine bushes; having cymes of white blossoms. The honeysuckle is the representative of the former and the elder of the latter. Here too is found the modest and delicate Limnæa borealis, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist; but independently of such recommendations, they possess properties of considerable interest. Their bark is generally astringent; that of Lonicerâ corynobas is used for dyeing black in Chili. The flowers of the elder are fragrant, soporous, and sudorific, its leaves and inner bark fetid, caustic, and a drastic purgative, qualities which are also possessed by the honeysuckle. The fruit of Viburnum is destitute of these properties, but has instead an astringe, astringent pulp, which becomes eatable after fermentation, and is made into a sort of cake by the American Indians. Triostium perforatium is a mild cathartic; in large doses it produces vomiting; and its dried or roasted berries have been used as coffee. All caprifoliaceous plants love shady and cool places in both hemispheres, but few have been found in such as endure a very severe climate.

Synopsis of the genera.

 Tribe I.

Sambuci. Corolla gamopetalous, regular, rotate (f. 74. a. f. 75. a.); petals 5, only connected a little at the base, rarely tubular. Style wanting. Stigmas 5, sessile.

1 Sambuci. Limb of calyx 5-cleft. Corolla rotate (f. 74. a.), urceolate. Berry roundish, pulpy, 1-celled, 3-4-seeded (f. 74. b.), hardly crowned (f. 74. c.).

2 Viburnum. Limb of calyx 5-cleft (f. 76. a.), permanent. Corolla rotate (f. 75. a. f. 76. b.), sub-campanulate or tubular. Berry ovate or globose, 1-seeded from abortion, crowned by the calycine teeth.

 Tribe II.

Lonicerâ. Corolla gamopetalous (f. 77. b. f. 78. b.) more (f. 78. b.) or less (f. 77. b.) tubular, usually irregular (f. 78. b. f. 79. b.). Style filiform (f. 78. c.), crowned by 3 distinct or concrete stigmas.

3 x 2
3 TRISTEM. Calyx with an ovate tube and a 5-parted permanent limb (f. 77. a.). Corolla gibbous at the base, almost equally 5-lobed (f. 77. b.). Stamens inclosed. Stigmas oblong, thick. Berry corionaceous, obovately triquetrous (f. 77. c.), crowned by the calyx (f. 77. d.), 3-celled (f. 77. e.), 3-seeded.

5 LONCHEA. Tube of calyx 5-toothed (f. 78. a.). Corolla tubular (f. 78. b. f. 79. b.), funnel-shaped (f. 79. b.), or campanulate (f. 80. a.), with a 5-parted, usually irregular limb (f. 78. b. f. 79. b.). Stigma capitate (f. 78. c.). Berry 3-celled; cells few-seeded.

6 LECYBEA. Calyx with an ovate tube, and a 5-parted irregular limb, ciliated with glands. Corolla funnel-shaped, with the tube gibbous at the base, and the limb 5-parted and campanulate. Stigma capitate. Berry roundish, 5-celled, crowned by the calyx; cells many-seeded.

7 SYMPOCARPOS. Calyx with a globose tube (f. 81. c.), and a small 4-5-toothed limb. Corolla funnel-shaped (f. 81. c.), with an almost regular 4-5-lobed limb. Stigma semi-globose. Berry crowned by the calyx (f. 81. g.), 1-celled, 2 of them empty, and the other 2 containing 1 seed each.

8 ABELEA. Calyx with oblong tube, and a 2-5-parted foliaceous limb. Corolla funnel-shaped, 5-lobed, regular. Stamens 4, somewhat didynamous. Stigma capitate. Ovarium 2-celled; cells 2-seeded. Fruit 1-seeded, crowned by the limb of the calyx.

9 LINNÆA. Calyx with an ovate tube (f. 82. a.), and a 5-parted limb (f. 82. b.). Corolla tubinate (f. 82. d.), somewhat campanulate, 5-lobed (f. 82. d.). Stamens 4, 2 long and 2 short, inclosed. Stigma globose (f. 82. c.). Berry almost dry, small, ovate-globose, 3-celled.

† Genera allied to the present order, but not sufficiently known.

10 AYERIA. Limb of calyx 5-toothed. Corolla hypocrateriform, with a woolly throat and a 5-parted limb. Anthers 5, linear, inserted into the incisures of the corolla. Style equal to the corolla; stigma ovate-oblong. Berry ovate, umbilicate, 1-seeded.

12 KARPATON. Limb of calyx 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-lobed. Style under the superior lip of the corolla; stigma simple. Capsule crowned by the calyx, 1-celled, 4-seeded.

Tribe 1.

SAMBUCÆS (from σαμβοκύ, which the Latins have changed to sambucus, a musical instrument, which is believed to have been made of acutely sharp wood; this wood has always been renowned for its hardness). Tourn. inst. 173. Lin. gen. no. 372. Geer. fruct. t. 27. Lam. ill. t. 216. Schlumberger. Handb. t. 83. D. C. prod. 4. p. 321.—Phyteuma, Lour. coch. p. 138. but not of Lin.

LIN. SYST. Pentandria, Tripétala. Calyx small, but divided into 5 deep segments, permanent. Corolla rotate (f. 74. a.), urceolar, 5-lobed; lobes obtuse. Stamens 5 (f. 74. b.), about the length of the corolla; filaments awl-shaped; anthers roundish, heart-shaped. Style none; stigmas 3, obtuse. Berry globose (f. 74. c.), pulp, of 1 cell, containing 3-5 seeds (f. 74. b.), which are convex on the outside and angular inside.

—Shrubs, rarely herbaceous; having a strong disagreeable scent; stems with a solid spongy pith. Leaves opposite, stalked, pinnate; leaflets toothed, pinnate, or jagged, bi-stipellate or bi-glandular at the base. Flowers white or purplish, disposed in terminal cymes, which are in some flat and in others thyrsoid. Berries purplish, cathartic. Those plants of the genus which have pinnate or jagged leaflets are not true species but only varieties, all the true species having only toothed leaflets.

* Leaves pinnate. Flowers cymose or corymbosae.

1 S. Ebulus (Lin. spec. p. 355.) rootfleshy, creeping; stems herbaceous, simple, deeply and unequally furrowed; leaflets ovate-lanceolate, with a sharp, serrated, unequal at their base; stipulas foliaceous, cut; cymes of 3 main branches; flowers all hermaphrodite. Y. H. Native of Europe, even to Caucasia, in waste ground about hedges. In Britain, in like situations, but not common either in England or Scotland. Smith, engl. bot. t. 475. Curt. lond. 3. t. 18. Woodv. med. bot. suppl. t. 260. Oed. fl. dan. t. 1156.—Mill. ill. t. 226. S. humilis, Lam. fl. fr. 3. p. 370.—Ebulus, Math. valgr. 2. p. 608. with a figure. Cam. prod. 1727. with a figure. Leaves 4-5 inches long, nearly smooth. Flowers all stalked, of a dull purplish hue, with thick white filaments, whose anthers are reddish. Berries globose, black, not always perfect, 3-4-seeded.

Our ancestors evinced a just hatred of their brutal enemies the Danes, in supposing this nauseous, fetid, and noxious plant to have sprung from their blood; hence it was formerly called Dane-wort. Its qualities are violently purgative, sometimes emetic; yet a rob of the fruit is said to have been taken with safety, as far as an ounce. The foliage is not eaten by cattle, nor will noles come where these leaves, or those of any of the species are laid. They also drive away mice from granaries, and the Silesians strew them where their pigs lie, under the persuasion that they prevent some of the diseases which waste the wheat are liable. The specific name is from vulgissant, vulgare, an eruption.

Var. 3. humilis (Mill. dict. no. 5.). Mr. Miller makes this a distinct species. He says that the roots do not creep so much; that the stems do not rise so high; that the leaves have seldom more than 7 leaflets, and towards the top only 5, and much narrower than in the common dwarf elder, deeply cut on their edges, and ending with winged acute points. Y. H. Savi collected this variety about Pisa.
Dwarf-elder or Dane-wort. Fl. July. Brit. Pl. 4 to 5 feet. 2 S. CHINE'SIS LINN. (Lindl. Hort. Trans. 6. p. 297.) root creeping; stems herbaceous, warty, with dark furrows; leaves pinnate; leaflets 7-9, oblong-lanceolate, crenately serrated, naked on both surfaces; flowers monocious: female ones cup-shaped, apetalous and fleshy. \( \gamma \). H. Native of China. A strong, rough herbaceous plant, very like S. Elatus. The male flowers are white and numerous, with brownish-purple anthers.

China Dwarf-elder. Fl. Sept. Clt. 1822. Pl. 5 to 6 feet. 3 S. PALM'ESSIS (Link. in Buch. Can. p. 151.) stems unknown; leaves pinnate; leaflets lanceolate, serrated; petioles, nerves of leaves, and peduncles, densely hairy. \( \gamma \). H. Native of the island of Palma, one of the Canaries, near Saucas.

Palm' Elder. Shrub? 4 S. ADN'ATA WALL. Cat. no. 432.) stems suffruticos; leaves pinnate; leaflets 5-7, oblong-lanceolate, sharply serrated, pubescent along the nerves, unequal at the base: the lower side decurrent; cymes trichotomous; berries ovate, striated, almost dry. \( \gamma \). H. Native of Nipal, at Goaingston. Flowers white.

Adn'at-leaflet Elder. Shrub. 5 S. JAVA'NICA (Reim. in Blum. Bijdr. p. 637.) stems suffruticos; stipulas foliaceous; leaves pinnate; leaflets oblong-lanceolate, acuminate, oblique at the base, sharply and glabrously serrated; corymb with 5-5 main branches. \( \gamma \). G. Native of Java, frequent on the mountains, where it is called Kitespom.

Java' Elder. Shrub. 6 S. GAUDICHAUD'ANA D. C. Prod. 4. p. 322.) stems suffruticos; leaves pinnate; leaflets 5-7, oblong-lanceolate, acuminate, equal at the base, sharply serrated; stipulas ovate, foliaceous, serrated; corymb pedunculate, umbellate, of 5 main rays or branches. \( \gamma \). H. Native of New Holland, at Port Jackson, where it was collected by Gaudichaud. According to the description this appears to be nearly allied to S. Jactaeica.

Gaudichaud' Elder. Shrub. 8 to 10 feet. 7 S. MEX'I'CA'NIA (Presl. in Herb. Heske, ex D. C. Prod. 4. p. 322.) stems suffruticos? leaves pinnate; leaflets 5-7, ovate or oblong-lanceolate, acute, serrated, rather hairy beneath as well as on the petioles and branches; corymb of 5 principal rays or branches. \( \gamma \). H. Native of Mexico. S. subalpina, Cham. et Schlecht. in Linnae. 5. p. 171.

Mexican Elder. Shrub 5 to 8 feet. 8 S. CANADA'SIS (Linn. Spec. 383.) frutescent, glabrous; leaves pinnate or sub-pinnate; leaflets about 4 pairs, oblong-oval, stiffish, acuminate, more or less pubescent beneath, sometimes appendiculately at the base; cymes of 5 main branches. \( \gamma \). H. Native of North America, from Carolina to Canada, in swamps and near hedges, and throughout Canada, as far as the Saskatchewan. Schmidt, A. T. 1. 142. Flowers said to be almost inodorous. Berries deep bluish-black.

Canadian Elder. Fl. Ju. Aug. Clt. 1761. Sch. 6 to 10 ft. 9 S. SIGR'A (Linn. Spec. 385.) arboreous; leaves pinnate; leaflets usually 5, smooth, deep green, ovate or oblong-oval, acuminate, the lower leaflets sometimes ternate; cymes with 5 main branches. \( \gamma \). H. Native throughout the whole of Europe, Caucasus, Siberia, and probably of Japan, in hedges, coppices, and woods, common; plentiful in Britain, in like situations; the varieties rare, except in gardens. Durnham. Arb. t. 65. ed. nov. 1. t. 55. Hayn. tert. bot. t. 32. f. 2. Smith, engl. bot. t. 476. Woolf. med. bot. t. 78. Fl. dan. t. 545. Branches, after a day or two wither, clothed with smooth grey bark, and filled with a light spongy pith. Flowers cream-coloured, with a sweet but faint smell. Berries globular, purplish black; their stalks reddish. It may be remarked that our uncertain summer is established by the time the elder is in full flower, and entirely gone when its berries are ripe. The tree is, as it were, a whole magazine of physic to rustic practitioners, nor is it quite neglected by more regular ones. The berries make a useful and agrable rob, of a slightly purgative quality, and very good for catarrhs, sore throats, &c. The inner bark is more actively cathartic, and so thought beneficial in rustic ailments and cataplasms for burns. The dried flowers serve for fomentations, and make a fragrant but debilitating tea, useful perhaps in acute inflammations, but not to be persisted in habitually.

An infusion of the leaves proves fatal to the various insects which thrive on blighted or delicate plants; nor do many of this tribe, in the caterpillar state, feed upon them: cattle scarcely touch them, and the mole is driven away by their scent. A wine is made from the berries, to be taken warm, with spices and sugar; and they are said to frequently enter into the composition of a less innocent beverage—artificial or adulterated port. An infusion of the inner green bark of the trunk in wine, or the expressed juice of the berries, in the dose of half an ounce, is said to purge moderately, and in small doses to prove debulcerant. The expressed juice of the berries, inopissated to the constitution of a rob, proves an useful aperient medicine, and if continued for a sufficient length of time, is of considerable service in various chronic disorders. The young leaf-buds are strongly purgative, and act with so much violence as to be accounted unsafe. The flowers have an agreeable aromatic flavour, like that of Frontinaeae wine, which they yield in distillation to water, and impart, by infusion, to vinous and spirituous liquors and oils.

Sydenham recommends as an effectual hydragogue diuretic 3 handfuls boiled in a quart of milk and water till only a pint remains, of which one half is to be taken night and morning, and repeated several days. Boerhavae gave its expressed juice in doses from a drachm to half an ounce. It is said also that if sheep who have the rot can get the bark they will soon cure themselves. An infusion of the leaves is useful for gardeners to sprinkle over the buds of such flowers as they wish to preserve from minute caterpillars, for few insects can bear the elder. In Scotland the tree is called Bountry.

Tar. \( \beta \). viriscens (D. C. Prod. 4. p. 322.) fruit green. \( \gamma \). H. S. viriscens, Desr. arb. fr. 1. p. 348.

Tar. \( \gamma \). leucocarpa; fruit white. \( \gamma \). H.

Tar. \( \epsilon \). laciniata; leaflets cut into five segments. \( \gamma \). H. S. laciniata, Mill. Dict. no. 2.—Lob. Icon. 2. t. 164. f. 2. Called Parsley-leaved elder.

Tar. \( \epsilon \). rouzadifolia; leaves ternate; leaflets petiolate, roundish, serrated; corymb few-flowered. \( \gamma \). H. Cultivated in Chelsea garden.

Tar. \( \epsilon \). montrousson; branches striped; flowers of from 5-15 parts, and with from 5-15 stamens; stigmas 5-12; berries irregular. \( \gamma \). H. S. montrousson, Hort.

Tar. \( \epsilon \). variegata; leaves variegated with yellow or white. \( \gamma \). H.

Common or Black-berried Elder. Fl. June. Britain. Shrub 10 to 15 ft. 10 S. PERUV'ANA (H. B. et Kunth. Nov. gen. Amer. 3. p. 429.) arboreous; leaves pinnate; leaflets 7, oblong, acuminate at the base, nearly equal; petioles glabrous; corymb somewhat trichotomous; berries usually 5-seeded. \( \gamma \). H. Native of Peru, on the Andes, in cultivated places, at the elevation of 4000 feet. S. suaveolens, Willd. in Schultes, syst. 6. p. 441. Flowers white. Berries black.

Peru' Elder. Shrub 12 to 20 feet. 11 S. AUSTR'ALIS (Cham. et Schlecht. in Linnae. 3. p. 140.) shrubby; leaves pinnate; stipulas glabrous; leaflets 11-13, ovate-lanceolate, usually unequal at the base; corymb brac-
teate; stigmas 5, sessile; berries 5-celled. \( \text{H} \). Native of Brazil, and cultivated at Talcahuanu in Chili. Flowers cream-coloured? There is a variety of this having 4 stigmas and a 4-celled berry.

*Southern Elder.* Shrub 5 to 10 feet.

** Leaves pinnate. Flowers panicked.

12 S. racemosa (Lin. spec. 386.) shrubby; leaves pinnate; leaflets 5, membranous, oblong, acuminate, serrated, unequal at the base; petioles glabrous; PANICLE ovate. \( \text{H} \). Native of middle and south Europe, and Siberia on the mountains. Jacq. icon. rar. t. p. 59. Duham. arb. t. 66. and ed. nov. t. 56. S. montana, Cam. epit. 976. S. cervini, Tabern. t. 1029. — Lob. icon. t. 163. Leaves pale green, pretty smooth. Flowers of a whitish green colour. Fruit red or scarlet when ripe.

*Var. \( \beta \), laciniata* (Koch, in D. C. fl. fr. suppl. p. 500.) leaflets jagged. \( \text{H} \). Native of the Palatinate of the Rhine.

13 S. PUBENS (Michx. fl. bor. amer. t. p. 181.) shrubby; leaves pinnate; leaflets 5, membranous, ovate-lanceolate or oblong, acuminated, serrated, pubescent, but chiefly on the under side; panicle thyrsoid. \( \text{H} \). Native from Carolina to Canada, on the highest mountains, as far as the Saskatchewan. S. racemosi, Hook. fl. bor. amer. t. p. 279, but not of Lin. Berries red. Flowers whitish. Resembles S. racemosi very much.

*Var. \( \beta \), heptaphylla*; leaves larger than those of the species; leaflets 7. \( \text{H} \). Native of North America, on the east side of the Rocky Mountains; and shores of the Columbia, near Fort Vancouver, and at its confluence with the sea. The Rocky Mountain specimens, and, more especially those from the Pacific, are remarkable for the great size and length of their leaflets, and there being almost constantly seven upon each brachis.

*Downy Elder.* Fl. May, June. Clt. 1812. Sh. 6 to 10 ft.

** Leaves bipinnate.

14 S. Euloïdes (Desv. in herb. mus. par.) suffruthicose; leaves bipinnate; leaflets lanceolate, serrated; PANICLE composed of racemes. \( \text{H} \). Native of China, in the suburbs of Canton. Phyteuma bipinnata, Lour. coch. 128. Branches angular and furrowed. Flowers white. Fruit perforated, 3-celled, many-seeded.

*Dancewort-like Elder.* Shrub 5 to 6 feet.

15 S. PHYTUEOMOSA (D. C. prod. t. 4. 323.) suffruthicose; leaves bipinnate; leaflets lanceolate, serrated, wrinkled; PANICLE many-flowered, divaricate. \( \text{H} \). Native of Cochin- china, on the mountains. Phyteuma Cochinchinensis, Lour. coch. 129. Flowers white. Berry roundish, pertuse, small, 1-celled, many-seeded. Very nearly allied to S. euloïdes.

*Phyteuma-like Elder.* Shrub 5 feet.

† Doubtful species, to be inquired into or excluded from the order.

16 S.? LOUREIRA (D. C. prod. t. 4. 323.) arboreous; leaves pinnate; leaflets 3, broad-lanceolate, quite entire, glabrous. \( \text{H} \). Native of China, on the mountains. S. nigra, Lour. coch. p. 181. but not of Lin. Cymes 5-parted and 5-parted; peduncles long, nearly equal. Fruit a round, small, reddish-brown, 3-seeded inferior berry. The berries are used by the Chinese in coldness of the extremities, as they are of a heating nature, from which quality, and the quite entire leaflets, it is not likely to be a species of Sambucus, but probably a species of Turpinia.

*Loureiro's Elder.* Shrub 5 feet.

17 S.? JAPONICA (Thunb. fl. jap. p. 125.) shrubby; leaves impari-pinnate, with 3-7 pairs of leaflets and an odd one; leaflets ovate, acute, cartilagiously serrated, glabrous; flowers disposed in panicled, trichotomous cymes. \( \text{H} \). Native of Japan. Ovarium superior and style filiform, for which reason it ought evidently to be excluded from the genus; it is probably also a species of Turpinia. Stigmas capitite, white.

*Japan Elder.* Shrub.

18 S.? THUNBERGII; shrubby; cymes 5-parted; leaves somewhat bipinnate. \( \text{H} \). Native of Japan, near Naganaki and elsewhere, where it is called by the Japanese Sokusoso and Sakiti-Teki. Shrub perishing just above the earth every year. S. Canadensis, Thunb. fl. jap. p. 126. This plant is hardly known as well as the S. nigra, Thunb. l. c.

*Thuiberg's Elder.* Shrub.

*Cult.* All the species of elder are of the most easy culture, and will thrive in any soil or situation. The perennial herbageous species creep much at the root, and are difficult to extirpate, having once got hold in the ground. The shrubby and arboreous kinds are easily increased by cuttings, stuck in the ground in autumn or spring. Those species, natives of warmer climates, will require a little protection in severe weather in winter.

**L. SYST. Pentadria. Trigynia.** Limb of calyx small, 5-leafed (f. 76. a), permanent. Corolla rotate (f. 75. a. f. 76. b.), somewhat campanulate, or tubular, with a 5-lobed limb (f. 76. b.). Stamina 5, equal (f. 75. b.). Stigmas 3, sessile. Berry ovate or globose, 1 seeded from abortion, crowned by the calycine teeth. Seeds compressed. — Shrubs. Leaves opposite, petiolate. Corymbus of flowers terminal. Flowers usually white, but sometimes veering to a rose colour.

**§ 1. Leaves quite entire or toothed. Style almost wanting; stigmas 3, sessile.**

1 V. Tinus (Lin. spec. 383.) leaves ovate-oblung, quite entire, permanent; having the ramifications of the veins beneath, as well as the branchlets, furnished with glandular hairs. \( \text{H} \). Native of the south of Europe, in the region of the olives, and of the north of Africa, as of Portugal, Spain, Italy, the south of France, and Algeria. Duh. arb. ed. nov. 2. t. 37. Curt. bot. mag. t. 38. V. lauri-förne, Lam. fl. fr. 3. p. 365. Tinus, Tourn. inst. p. 607. t. 377. Tinus laurifolius, Borkh.
in Rem. arch. 1. pt. 2. p. 20. Corymbs flat. Flowers white, but rose-coloured before expansion, and sometimes afterwards for a little time. Berries dark blue. The Laurestine or Laurestinus is one of the most ornamental of evergreen shrubs, with shining leaves and showy white flowers, which appear during the winter months. The name of Laurestinus was given to the shrub by old authors, they supposing it to be a kind of bay or laurel. The berries are very hot, and inflame the fauces violently, like those of Mizereon; and they are also violently purgative, according to Parkinson; but some kinds of birds are said to eat them greedily.

**Il. hirtum** (Ait. Hort. kew. 2. p. 166.) leaves oval-oblong, hairy beneath and on the margins.  1 H. Native of Portugal and Spain, and the country of Nice. V. Tinus, Mill. dict. no. 4.—Clus. hist. 1. p. 49. no. 1. The flowers of this variety appear in autumn and continue all the winter. It is the most hardy and most common sort, called *Hairly Laurestine.*

V. V. lucidum, Mill. Pers. and Schultes.—Clus. hist. 1. p. 49. no. 11.

**Il. l. lucidum** (Ait. l. c.) leaves ovate-oblong, glabrous on both surfaces, shining.  1 H. Native about Algiers and on Mount Atlas. The cymes as well as the flowers are larger than the common sort; these seldom appear till the spring, and when the winters are short the flowers are killed, and never open unless they are sheltered. Called *Shining Laurestine.*

**Il. g. virgatum** (Ait. l. c.) leaves oblong-lanceolate, pise on the margins as well as on the veins beneath.  1 H. Native of Italy, about Rome and Tivoli, &c.—Clus. hist. no. iii. with a figure. Called *Common Laurestine.*

**Wrinkled** or Large-leaved Laurestine. Fl. Dec. March. Shrub 4 to 6 feet.

3 V. tinoides (Lin. fil. suppl. p. 184.) leaves elliptic-glabrous, quite entire; branches terete, and are as well as the corymbs hairy.  1 G. Native of South America, where it was collected by Mutis.

*Tinus-like Laurestine.* Fl.? Clt. 1820. Sh. 4 to 6 feet.

4 V. glabratum (B. H. et Kunth, nov. gen. amer. 3. p. 428.) leaves ovate-oblong, acuminate, rounded at the base, quite entire, and very glabrous; petioles naked; branches canescent and poudrey; corymbs involucrated.  1 F. Native of South America, in woods near the Andes, about Popayan, at the altitude of 3000 or 4000 feet. V. glabrum, Wildl. in Schultes, syst. 6. p. 639. Calyx bluntly 5-toothed. Flowers white.

**Smooth Laurestine.** Tree 15 to 20 feet.

5 V. Ayavaceae (B. H. et Kunth, nov. gen. amer. 3. p. 428.) leaves ovate, acute, cordate, quite entire, glabrous, shining below, but with the axes of the veins beneath furnished with stellate hairs, as well as the branchlets and corymbs; petioles naked.  1 G. Native of Peru, near Ayavaca, in temperate places, at the elevation of 4000 or 5000 feet. Teeth of calyx roundish-ovate, acute, ciliolate. Flowers white? Perhaps the same as V. tinoides.

Ayavaca Laurestine. Shrub 4 to 6 feet.

6 V. integrifolium (Wall. cat. no. 157. D. C. prod. 4. p. 324.) leaves oval, acute at the base, acuminate, quite entire, glabrous, rather coriaceous, dotless; petioles, branchlets, and peduncles hairy; corollas loose, terminal; fruit oval, compressed.  1 S. Native of the island of Pulau-Penang. This species agrees with *V. Tinus* on the one hand and *V. punctatum* on the other. Calyx teeth erect, exceeding the berries.

**Quite-ear-leaved Laurestine.** Shrub 4 to 6 feet?

7 V. Chinese (Hook. et Arn. in Beech. voy. pt. hot. p. 190.) leaves membranous, broad-elliptic, acute, coarsely and unequally toothed, glabrous above while young, puberulous and dotless beneath; corymbs terminal, pubescent.  1 G. Native of China.

China Laurestine. Shrub.

**V. punctatum** (Hamilt. in D. Don, prod. fl. nep. p. 142.) leaves oval-oblong, quite entire, mucronulate, glabrous on both surfaces, beset with dots beneath; corymbs terminal, smooth, spreading, sessile.  1 H. Native of Nipaul, at Suenbu, where it is called *Heina-sura* by the Nawar people. Teeth of calyx obtuse. Flowers white.

**Dotted-leaved Laurestine.** Shrub.

8 V. punctatum (Wall. cat. no. 465. D. C. prod. 4. p. 325.) leaves elliptic-oblong, acuminate at both ends, glabrous, coriaceous, dotted beneath; branchlets, pedicels, and peduncles beset with scurfy dots; corymbs terminal, trichotomous, shorter than the leaves; berries oval-oblong.  1 G. Native of the East Indies, on the Nellighery Mountains, where it was collected by Notan. Very nearly allied to *V. punctatum.*

**Acuminate-leaved Laurestine.** Shrub.

9 V. Precinatum (Wall. cat. no. 461. D. C. prod. 4. p. 325.) leaves elliptic-oblong, acuminate, glabrous above and dotless beneath, and downy along the nerves, having 1-3 coarse serratures on each side; pedicels short, and are as well as the branchlets and peduncles clothed with villous tomentum; corymbs terminal, with 5 main branches, involucrated by 5 elliptic leaves.  1 G. Native of the East Indies, on the Pundha Mountains. Leaves 5-3½ inches long, and ½ inch broad, feather-nerved; but the 2 lower lateral nerves rise from the base and give the leaf the appearance of being 3-nerved.

**Preamna-like Laurestine.** Shrub 5 to 7 feet.

10 V. nervosum (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) evergreen; leaves elliptic-lanceolate, glabrous, acute at the base and apex, dotless beneath, with a few serratures towards the apex on both sides; nerves impressed above, but prominent beneath, glabrous in the axils, and with numerous transverse conspicuous veins between them; peduncles and pedicels short and glabrous; corymbs terminal.  1 G. Native of China. This is closely allied to *V. precinatum,* Wall, in which plant is observed, besides the character given by D. C. that the axils of the leaves are furnished with a tuft of short hairs, which is totally absent from the present species.

**Nerced-leaved Viburnum.** Shrub.

12 V. Colebrookeanum (Wall. cat. no. 460. D. C. prod. 4. p. 325.) leaves elliptic, acuminate, hardly obtuse at the base, regularly serrate-toothed, glabrous, dotless; petioles, branches, and peduncles scurfy from stellate down; corymbs axillary, pedunculate, without any involucra.  1 G. Native of the East Indies, on the Pundha Mountains. The corymbs are not truly axillary, but are borne on short leafless, axillary branchlets or peduncles, which are furnished with 2 leaves at the base.

**Flowers white.**

13 V. Fruetum (Wall. cat. no. 456. D. C. prod. 4. p. 325.) leaves elliptic-oblong, curved at the base, coarsely and minutely toothed, glabrous above, but villous along the nerves beneath; petioles, branchlets, and peduncles villous; corymbs terminal, pedunculate, of 6 main branches, without any involucra; fruit almost sessile, oval.  1 S. Native of the Burman Empire, on Mount Taung-Dong, near Ava. Leaves 2
CAPRIFOLIACEAE. II. VIBURNUM.

inches long, and half an inch broad, on petioles 2-3 lines long. Flowers white.

*Petiolar Viburnum.* Shrub 4 to 6 feet.

14. *V. xanthanum* (Reinw. in Blum. bijdr. p. 655.) leaves elliptic-oblong, attenuated at both ends, almost quite entire, puberulous on the ribs beneath; corymbs terminal, divaricate, puberulous. *H.* Native of Carolina, among bushes on the mountains. Flowers white.

15. *V. luteum* (Blum. bijdr. p. 655.) leaves oblong, bluntly acuminate, acutely and closely serrated at the base, coriaceous, shining, paler beneath; corymbs terminal, divaricate, puberulous. *H.* Native of Java, in the provinces of Krawang and Tjanjor, among other bushes on the mountains.

*Yellowish Viburnum.* Shrub 4 to 6 feet.

16. *V. prunifolium* (Lin. spec. 383.) leaves roundish-obovate and oval, glabrous, rather membranous, crenately serrated, ending in a short acumen; petioles marginate, glabrous; cymes sessile; berries ovate or roundish. *H.* Native of North America, from New England to Carolina, in hedges and fields; also of Canada about Lake Huron. Wats. dendr. t. 23.—Plak. aln. 46. f. 3.—Duham. 2. t. 28. Flowers white as the rest of the species. Berries dark blue. This species appears to be very nearly allied to *V. nudum,* but the leaves are broader and more membranous.

*Plum-leaved Viburnum.* Fl. May, June. Clt. 1761. Shrub 8 to 10 feet.

*Pear-leaved Viburnum.* Fl. May, June. Shrub 5 to 8 feet.

18. *V. lentis* (Lin. spec. p. 384.) leaves broad-ovate, acuminate, sharply serrated, glabrous; petioles with narrow curled margins; corymbs terminal, sessile. *H.* Native of North America, from New England to Carolina, among hedges, and on the borders of woods. Throughout Canada to the Saskatchewan. Wats. dendr. t. 21. Schmidt, arb. 3. t. 176. ex Rem. et Schultes. sst. 6. p. 657. Flowers white. Fruit black. Serratures of leaves hooked a little, and somewhat cartilaginous. This species is more inclined to grow to a tree than any of the rest. The specific name is from *lentis,* to make pliant, on account of the pliable propendent branches.

19. *V. nudum* (Lin. spec. 383.) leaves oval-oblong, angular at the base, bluntish, with revolute, somewhat crenulated margins, quite glabrous; petioles beset with scale-like scurf or down; corymbs pedunculate, exinvolucrate. *H.* Native from Canada to Georgia, in swamps, particularly on a sandy soil; about Quebec, and on the banks of the Saskatchewan; and of Newfound-land. Wats. dendr. t. 20. Mill. fig. 274. *V.* squamatum, Willd. enum. 1. p. 537. ex Torrey, fl. un. st. p. 319. Wats. dendr. t. 24. Flowers whitish. Berries globose, black, or dark blue. In the southern states this shrub becomes evergreen; the young branches are ferruginous, and sometimes the under side of the leaves. According to Richard in Boot's herb. this is the same as *V. papyrifolium,* Poir.

21. *V. cassiodoides* (Lin. spec. p. 384.) leaves ovate-lanceolate, acute at both ends, crenated, glabrous above, with subvolute edges; under side of leaves, as well as the petioles, which are keeled, and branches, which are tetragonal, covered with scurfy dots; corymbs sessile; fruit ovate. *H.* Native from New York to Carolina, in swamps. *V.* punctatum, Rafin. in litt. Flowers white. Berries bluish-black.

*Shining-leaved Viburnum.* Fl. May, June. Clt. 1738. Shrub 2 to 4 feet.

Flowers white, with the scent of those of *Olea fragrans,* or sweet olive. This shrub has scarcely at all the appearance of a *Viburnum,* from which genus the presence of a style essentially distinguishes it. (f. 76.)

25. *V. lastana* (Lin. spec. p. 384.) leaves cordate, rounded, finely serrated, veiny, clothed beneath, but more sparingly on the upper side, with starry mezal pubescence, like that on the branches, petioles, and peduncles; cymes pedunculate, broad, flat, of numerous crowded white flowers; bracteas several, small, acute. *H.* Native throughout Europe, even to Caucasus, in hedges. In Britain in woods and hedges, especially on...
a chalky or limestone soil. Smith, engl. bot. t. 351. Jacq. austr. t. 341.—V. tomentosum, Lam. fl. fr. 3. p. 363.—Cam. epit. 122. with a figure.—Duhem, arb. 2. t. 103.—Lob. icon. 2. t. 106. A small tree, with copious, opposite, round, pliant, mealy branches. Under side of leaves and branches white from mealy down. Berries compressed in an early state, red on the outer side, yellow on the inner, finally black, with a little mealy astringent pulp. Seed large, flat, and furrowed. The leaves turn of a dark red in autumn. This shrub is hardly worth cultivating for ornament, nor is it of any particular use, except that the bark serves to make bird-lime; but that of the holly is much better. It is supposed to be the viburnum of Virgil. The name *Lantana* is from *lentu* to make pliant, on account of the pliant branches.

26 V. **Lantana** (Michx. fl. bor. amer. 1. p. 179.) leaves roundish-cordate, abruply acuminate, unequally serrated; serrations alvines; branches, petioles, and nerves of leaves clothed with powdery tomentum; corymb terminal, almost sessile; fruit ovate. **f.** H. Native of North America, from Florida to Carolina, principally in the forests called Beech-woods; also seen in Quebec and Lake Huron. V. Lan*ta* *b*.* grandif*ö*l*ium, Ait. hort. kew. ed. 1. vol. 1. p. 392. V. grandifö*lium, Smith, in Rees' cyc. no. 14. V. Lantana *,* Canadë*ns*æ, Pers. ench. 1. p. 327. The outer flowers of the corymbs are abortive and radiant, a circumstance noticed by few botanists. Berries at first red, but at length becoming black. In North America it is known by the name of *bobble-bush.* Very like V. Lantana, but of more humble growth, and the leaves larger and tomentose. *Lantana*-like *Viburnum* or American Way-faring Tree. Fl. June, July. Shrub.

27 V. **Dentatum** (Lin. spec. p. 384.) partly glabrous; leaves ovate, and nearly orbicular, plicate, coarsely and dentately serrated, with the nerves thick and feathered, glabrous on both surfaces; cymes or corymbs pedunculate; fruit nearly globose. **f.** H. Native of North America, from New York to Carolina, in mountain woods, and of Mexico. Jacq. hort. vind. 1. t. 36. Wats. dend. t. 25. V. dentatum *lucidum,* Ait. hort. kew. 1. p. 372. V. dentatum glabella, Michx. fl. bor. amer. 1. p. 179. Flowers white. Berries small, dark blue, crowned by the calyx. In North America the shrub is known by the name of *arrow-wood.*

29 V. **Ellipticum** (Hook. fl. bor. amer. 1. p. 280.) leaves elliptic, obtuse, on short petioles, coarsely serrated at the top, very hairy beneath, but most so on the veins, which are parallel; corymb dense, pedunculate; ovaries very hairy; berries oval-globose, deep black. **f.** H. Native of North America, common on the branches of the Columbia, near its confluence with the Pacific. Bark of branches pale brown. Leaves about 2 inches long.

**Var.** **b.** ovaries glabrous. **f.** H. Growing along with the species.

**Elliptic-leaved Viburnum.** Shrub 2 to 4 feet.

30 V. **Villosum** (Swartz, prod. fl. ind. occ. 1. p. 504.) leaves ovate, acuminate, quite entire, glabrous above in the adult state, but tomentose beneath from stellate down, as well as the petioles and branches; corymb terminal, pedunculate; fruit ovate-oblong. **f.** S. Native of the south of Jamaica, on the mountains. Peduncle and calyces rather villous. Corollas white. This species agrees with *V. Tinus* in the leaves being entire, and from the tomentum with *V. Lantana.* Petioles quadrangular and channeled.

**Villosum** *Viburnum.* Clt. 1824. Shrub 5 to 6 feet.

31 V. **Curtifolium** (D. Don, prod. fl. nep. p. 141.) leaves roundish-oval, quite entire, clothed with stellate tomentum on both surfaces, grey beneath, as well as the branches; corymb terminal, woolly. **f.** H. Native of Nipal, at Srimagur. Flowers white.

**Curtinus-leaved Viburnum.** Shrub.

32 V. **Nervosum** (D. Don, prod. fl. nep. p. 141.) leaves coriaceous, acuminate, serrated, membranous, glabrous above, clothed with stellate down on the petioles and nerves, which is at first dense, but at length scattered; corymb terminal, sessile, with 5-7 long main branches or rays; berries elliptic. **f.** H. Native of Nipal, at Srimagur, where it is called *Pocoeurn* by the natives. V. Lantana, Wall. miss.

**Nerved-leaved Viburnum.** Shrub 4 to 6 feet.

33 V. **Corfolium** (Wall. cat. no. 462. D. C. prod. 4. p. 327.) leaves heart-shaped, acuminate, dentately serrated, membranous, glabrous above, clothed with stellate down on the petioles and nerves, which is at first dense, but at length scattered; corymb terminal, sessile, with 5-7 long main branches or rays; berries elliptic. **f.** H. Native of Nipal, in Kamaon and Gosaingthun. Leaves 4 inches long, and 1/2 broad. Petioles 12-15 lines long. There are 4-6 nerves at the base of the limb of the leaf on each side, rising from the midrib.

**Heart-leaved Viburnum.** Shrub 5 to 6 feet.

34 V. **Mull*al*ia** (Hamilt. in D. Don, prod. fl. nep. p. 141.) leaves ovate, acuminate, distantly serrated, rounded at the base, densely clothed with tomentum beneath, as well as on the branches; corymb terminal, compound, spreading, tomentose; teeth of calyx short. **f.** H. Native of Nipal, at Srimagur. Nearly allied to *V. tomentosum.* Flowers white.

**Mull*al*ia** *Viburnum.*

35 V. **Glaucocarpum** (Wall. cat. no. 463. D. C. prod. 4. p. 327.) leaves ovate, coriaceous, acuminate, glabrous above, except on the middle nerve, densely clothed with stellate down beneath, as well as the branches and peduncles; the margin serrated; serratures distant, small, ciliolous; corymb terminal, with 5-7 main branches, ex involucrate. **f.** H. Native of Nipal, in the valley, and at Kamaon. Wall. pl. rar. asist. 2. p. 54. t. 169. Flowers white. Leaves roundish-cordate. Berries scarlet.

**Starry-haired Viburnum.** Shrub 12 to 20 feet.

36 V. **Involucrum** (Wall. cat. no. 458. D. C. prod. 4. p. 327.) leaves ovate, acuminate, somewhat coriaceous at the base, villous from simple hairs while young, as well as the branchlets; corymb terminal, decomposed; bracteas and bracteoles foliaceous, oval, attenuated at the base, acuminate, nearly entire, exceeding the flowers. **f.** H. Native of Nipal. Branches of corymbs and calyces villous. Flowers white.

**Involucrated Viburnum.** Shrub 4 to 6 feet.

§ 2. Leaves serrated and denticated. Flowers monogynous from the style being a little elongated, and the stigmas being from the style being a little elongated, and the stigmas being

37 V. **E*ös*um** (Thumb. fl. jap. p. 124.) leaves broad-ovate, acuminate, densely serrated, rather villous on both surfaces; 3 L.
petioles tomentose; umbels decompound, pilose; style simple. 
H. Native of Japan. Branches grey, glabrous.

Erose-toothed Viburnum. Shrub. 4 to 6 feet.

38 V. mono'eysum (Blum. bijdr. p. 655.) leaves elliptic-oblong, attenuated at both ends, glandularly denticulated above the base, paler beneath; corymb disarticulate, terminal, downy; flowers monogynous. 
§ 3. Leaves 3-lobed.

39 V. acrifori'um (Lin. spec. 383.) branchlets and petioles pilose; leaves ovate-cordate, usually 3-lobed, acuminated, sharply and loosely serrated, downy beneath; petals glandless, when young stipulate at the base, and rather tomentose; corymb terminal, pedunculate, not radiant. 

40 V. orien'ta'le (Pall. fl. ross. t. 58. f. H.) leaves 3-lobed, acuminated, coarsely and bluntly toothed; petals glandless; corymb terminal, not radiant; fruit oblong, compressed. 
H. Native of Iberia, in woods, on the mountains, &c. Bibl. fl. taur. p. 245. O'pulus orientalis folio amplissimo tridentato, Tourn. cor. p. 42. Flowers white. Seed oval, furnished with 2 channels on both sides, as in V. Lantana. Very like the preceding species.

Sect. II. O'pules (a name altered from populus, the poplar: the leaves resembling those of the poplar). Tourn. inst. t. 376. Meech, meth. p. 605. Outer flowers of the corymb radiant and sterile, much larger than the rest, which are fertile. Seed obcordate.

41 V. O'pules (Lin. spec. 384.) quite glabrous in every part; leaves broad, 3-lobed, acuminated, unequally serrated, venous; petals beset with glands towards the top, and several oblong leafy appendages below; cymes pedunculate, white, with linear bractes: with several of the marginal flowers dilated flat, radiate, and without stamens or pistils; berries elliptical, bright red, very juicy, but bitter and nauseous; seed compressed.

Var. β, stérilis (D. C. prod. p. 328) H. Cultivated in gardens. This variety is called snow-ball-tree or guelder-rose. It is commonly planted in shrubberies along with the lilac and lilifurum, grouping elegantly with the various purple hues of the former, and the golden chain of the latter, but they are all mere summer beauties; nor does any thing profitable or ornamental follow. The several marginal flowers of the corymb in the species are dilated, flat, and radiate, without stamens or pistils. In this variety the whole cyme nearly consists of radiant sterile flowers, and becomes globular. V. O'pulus rösium, Röem. et Schult. syster. 6. p. 635. Knor. del. 2. t. 5 and 6. The snow-ball has been raised from seed by accident, and has been multiplied by cuttings.

Guelder-rose. Fl. May, June. Britain. Shrub 6 to 14 feet.

42 V. ede'+/e (Pursh, fl. bor. amer. 1. p. 203.) leaves 3-lobed, bluish behind, and 3-nerved: lobes very short, denticulately serrated: serratures acuminated; petals glandular; outer flowers of corymb radiant. 
H. Native of North America, from Canada to New York, on the banks of rivers. In Canada from the Saskatchewan to Slave Lake, in lat. 66°. V. O'pulus edulis, Michx. fl. bor. amer. 1. p. 180. A smaller and more upright shrub than the preceding species. The berries of the same colour and size, but when completely ripe more agreeable to eat, and sometimes employed as a substitute for cranberries. It does not seem to differ much from V. oxyeo'coscos except in the broader base of the leaf.

43 V. oxyeo'coscos (Pursh, fl. amer. sept. 1. p. 203.) leaves 3-lobed, acute behind, 3-nerved; lobes divaricate, acuminated, coarsely and distantly serrated; petals glandular; cymes radiant. 
H. Native of North America; on the mountains of New York and New Jersey; and throughout Canada to the Arctic circle, and from Hudson's Bay to the Rocky Mountains, in swamps and shady woods. V. opoloides, Muhl. et cat. 32. V. trifolium, Marsh.arb. p. 192. V. O'pulus Pinnina, Michx. fl. 1. p. 180. V. O'pulus Americana, Ait. hort. kew. 1. p. 273. Flowers white. Berries subglobose, red, of an agreeable acid, resembling that of cranberries, for which they are a very good substitute. Very like the V. O'pulus of Europe.

Var. β, subintegri'folia (Hook. fl. bor. amer. 1. p. 281.) leaves but little cut, very pubescent beneath. 
H. Native on the banks of the Columbia.

44 V. mólle (Michx. fl. bor. amer. 1. p. 180.) leaves nearly orbicular, cordate, plicate, toothed, rather tomentose beneath from very soft down; petals rather glandular; cymes radiant; fruit oblong-ovate. 
H. Native of North America, in Kentucky, near Danville, Tennessee and Upper Carolina, in hedges. V. alnifolium, Marsh. arb. p. 162. Flowers white. Bark deciduous. Very like V. oxyeo'coscos, and perhaps only a variety of it.

45 V. microw'cru'm (Cham. et Schlecht. in Linnaea. 5. p. 170.) leaves subcordate, orbicular, or obovate, short-acute, remotely and minutely toothed, pubescent above, and clothed with hoary tomentum beneath; petals short, without glands; rays of cyme almost sessile. 
H. Native of Mexico, near Jalapa and San Megan del Soldado. Leaves like those of the filbert. Fruit black.

Small-fruitcd Guelder-rose. Shrub 6 to 8 feet.

Sect. III. Solenó'tus (from σωλην, solen, a tube, and limus, the lauraceous; i.e. reference to the corollas being tubular). D. C. prod. 4. p. 328. Corollas not radiant. Corolla obconical or cylindrical. Seeds oval-oblong. This section agrees with the tribe Lonéctrec in the corollas being tubular.

46 V. Dahu'rum (Pall. fl. ross. ed. Svo. p. 52.) leaves ovate, somewhat cordate at the base, crenately serrated, beset with stellate down, as well as the branchlets; corollas dichotomous, few-flowered; corollas tubular, somewhat funnel-shaped, bluntly 5-toothed. 
ed. 1, 1-seeded, at first red, but at length becoming black and sweet, ex Pall. ed. 2. Allied to V. Lantana. Flowers yellowish white.

_Dahurian Viburnum_. Shrub 6 to 8 feet. 47 _V. polycarpon_ (Wall. cat. no. 455.) leaves cordate, ovate, somewhat acuminate, glabrous above, and tomentose from dense stellate white down beneath, but at length rather naked; corymb terminal, 3-rayed, on short peduncles; corollas obovately tubular; berry elliptic, glabrous. ʃ. H. Native of Nipaul, at Kamaon and Sirmore. Leaves 4-5 inches long, and 3 inches broad; petioles 4 lines long.

_Many-fruited Viburnum_. Shrub 6 to 8 feet. 48 _V. cylindricum_ (Ham. in D. Don, prod. f. nep. p. 142.) leaves oval-oblong, acuminate, coriaceous, quite entire, pubescent beneath, and on the branches; corymb terminal, bracteate; corolla cylindrical. ʃ. H. Native of Nipaul, at Kamaon. Very nearly allied to _V. erubescens_, but differs in the singular hairs on the leaves. Bracteae villous, foliaceous, 4-5 lines long. Flowers white.

_Great-flowered Viburnum_. Shrub 5 to 8 feet. 50 _V. erubescens_ (Wall. pl. rar. asiat. 2. t. 134. D. C. prod. 4. p. 329.) leaves elliptic, acuminate, dentately serrated, pubescent along the nerves beneath, when young ornamented with pencilled hairs in the axils of the serratures above; corymbterminal, bracteate; corollas cylindrical. ʃ. H. Native of Nipaul, at Kamaon. Very nearly allied to _V. erubescens_, but differs in the singular hairs on the leaves. Bracteae villous, foliaceous, 4-5 lines long. Flowers white.

_Erubescent Viburnum_. Shrub 10 to 12 feet. 51 _V. coriaceum_ (Blume. bijdr. p. 656.) leaves ovate or oval-oblong, acuminate, dentilicate, coriaceous, glabrous; corymb terminal, fastigate; tube of corolla cylindrical. ʃ. H. Native of Java, in woods on the higher mountains.

_Coriaceous-leaved Viburnum_. Shrub 6 to 7 feet. ʃ. Species natives of Japan, but are not sufficiently known.

53 _V. dilatatum_ (Thunb. fl. jap. p. 124.) leaves ovate, acuminate, unequal, toothed; petioles and peduncles villous; panicule axillary, compound, but not radiant; style simple, very short. ʃ. H. Native of Japan.

_Dilatatum Viburnum_. Shrub. ʃ. 54 _V. tomentose_ (Thunb. fl. jap. 123.) leaves ovate, acuminate, serrated, veiny, tomentose beneath and on the petioles; umbels lateral, radiant. ʃ. H. Native of Japan, in woods. Sijo vulgo Adsai, Kompf. amoen. ex p. 834. Branches glabrous, reddish. Flowers blue, disposed on a dense large round head like the Snow-ball Guelder-rose; some are radiant and sterile, and others are small and pedunculose.

_Tomentose Viburnum_. Shrub. ʃ. 5-6 feet. _Cult._ The species of _Viburnum_ are all beautiful shrubs, and the hardy species are well adapted for ornamental shrubbery. They are either increased by laying in the shoots, or by cuttings under a hand-glass in a shady situation. The greenhouse and hardy kinds are early flowerers, which render them very desirable.

**CAPRIFOLIACEÆ. II. _Viburnum_. III. _Triosteum._**

**_Tribe II._**

_Lin. syst._ _Pentandra, Monoginia._ Tube of calyx ovate; limb 5-parted (f. 77. a.): lobes linear-lanceolate, permanent. Corolla tubular (f. 77. b.), almost equally 5-lobed, gibbous at the base, a little longer than the calyx. Stamens 5, inclosed. Stigma thick, oblong. Berry coriaceous (f. 77. c.), obovately trigonous, crowned by the calyx (f. 77. d.), 3-celled (f. 77. e.), but sometimes only 1-celled at maturity. Seeds 3 in each capsule, rarely 5, bony, elliptic.—Perennial herbs, rarely suffruticose. Leaves tapering into the petioles, and somewhat connate at the base. Flowers axillary, sessile, or on very short pedicels.

1 _T. perfoliatum_ (Lin. spec. 250.) leaves ovate, acuminated, abruptly narrowed at the base, and connate; flowers sessile, appearing verticillate. ʃ. H. Native of North America, in the states of New Jersey, New England, Upper Carolina, and Virginia, in rich rocky grounds, principally in a lime stone soil. Schkuhr, handb. 1. t. 41. Bigel. med. bot. 90. t. 9. _T. majus_, Michx. fl. bor. amer. 1. p. 107.—Dill. clth. p. 394. t. 293. f. 378. Flowers and berries deep purple. Leaves sometimes subasinuated. There are glabrous and pubescent varieties of this species. The roots of this species, as well as those of the following, are used in North America as an emetic for inpecuina.- It was first brought into notice by Dr. Tinkar, and hence it has been called Tinkar's root.

_Berries yellow._

3 _T. Himalaya num_ (Wall. in Roxb. fl. ind. 2. p. 180.) plant covered with long hairs; leaves obovate, acute, connate at the base; lowermost ones free; racemes terminal, bearing the flowers in whorls. ʃ. H. Native of Nipaul, on the Himalaya at Gosasingthang, where it grows on very high and exposed rocks. Stems terete. Leaves membranous, rounded at the end, with a short acumen, 6-8 inches long, about 4 fingers broad, somewhat narrow towards the base. Berries oval, about the size of a small gooseberry, 3-furrowed, 1-celled, 3-seeded, hairy, yellow.

_Himalaya Fever-wort._ Pl. 2 to 3 feet.
IV. DIERVILLA (named by Tournefort in compliment to M. Dierville, a French surgeon, who was the first to introduce D. Canadensis into Europe). "Flowers the peduncles of the Weigelia Sima 1. from—celled, —celled, not crowned by the limb of the calyx, as in most of the other genera of the present order. Seeds numerous, minute.—Erect shrubs. Leaves ovate, acuminate, serrated. Peduncles axillary, bracteate, usually dichotomous, 2-3 or 4-flowered.

Japan Diervilla. Shrub.

Corea Diervilla. Shrub.

Cult. The species of Diervilla are well fitted for the front of shrubberies; and they are easily increased by cuttings put into the ground in autumn and spring; or by suckers, which rise from the roots in plenty.

V. LONICÈRA (named after Adam Lonicer, a German who was born in 1528, and died in 1586. There was another Lonicer, John, who wrote comments on Dioscorides). Desf. fl. atl. 1. p. 183. Lam. ill. t. 150. D. C. prod. 4. p. 530.—Lonicéra species, Lin. and many other authors.—Caprifolium and Xylôsteum, Juss. gen. p. 212.—Xylôsteum, Caprifolium, Chamecerasus, and Periclymenum, Tourn. inst. t. 378 and 379.—Caprifolium and Lonicera, Rœm. et Schultes, syst. —Lonicera and Xylôsteum, Torrey, fl. un. st. L. gen. Pentândria, Monogynia. Tube of calyx 5-toothed (f. 78. a.). Corolla tubular (f. 78. b. f. 79. b.), campanulate, or funnel-shaped: with a 5-cleft, usually irregular limb (f. 78. b. f. 79. b.). Stamens 5. Style filiform; stigma capitate (f. 78. c.). Berry 3-seeded; cells few-seeded. Seeds crustaceous.—Erect or climbing shrubs. Leaves opposite, sometimes connate, entire, but sometimes somewhat runcinate (f. 79. e.) in the same species. Flowers axillary, variously disposed.

* Flowers ringent.—Caprifolium, Tourn. inst. p. 608.

1 L. Caprifolium (Lin. spec. p. 246.) branches twining; leaves deciduous, obovate, acute, glaucous: uppermost ones broader and connate; flowers ringent, terminal, disposed in capitate whorls. ï. H. Native of middle and south Europe, even to the Terek, in woods, hedges, and thickets. In England in like situations; in a wood near Elshfield, Oxfordshire, plentiful; in Chalkpit Close, Hinton, Cambridgeshire, certainly wild; also in another copice in the same parish. In several woods in the south of Scotland. Smith, engl. bot. t. 799. Jour. austr. t. 357. Eng. gard. ent. 14. t. 5.—Dodon, pempt. 411. with a figure.—Math. valg. vol. 2. p. 321. with a figure. Cam. epit. 713. with a figure.—Rivin. irrt. t. 123. Periclymenum perfoliatum, Ger. enac. p. 891. with a figure. Stein twining from left to right. Bends acute, glaucous. The lower leaves are distinct and somewhat stalked; 2 or 3 of the upper pairs united: the uppermost of all forming a concave cup. Flowers in one or more axillary whorls: the uppermost whorl terminal: with a central bud, 6 in each whorl, highly fragrant, 2 inches long, yellowish, with a bluish-coloured tube. Berries elliptical, of a tawny orange colour, each crowned by an almost entire calyx.

Cape's—leaf or Pale-perfoliate Honeysuckle. Fl. May, June. Britain. Shrubby twr.

Caprifoliaceae. E. V. Lonscera.

445

sic. 1. p. 257. Caprifolium implícum, Röm. et Schultes, syst. 5. p. 261. Flowers purplish before expansion, becoming paler on the outside as they expand; white on the inside; but finally changing to yellow, as in the common woodbine. The leaves in Curtis's figure appear to be ovate and acute.

4 L. Cyrenaica (Viv. fl. lib. spec. 12. t. 8. f. 1.) quite glabrous; branches twining; leaves elliptic, glaucous beneath; lower ones sessile, distinct; upper ones truncate at the base, and confluent; flowers disposed in whorled heads. §§. H. Native of Libya, in the vicinity of Cyren, on hills. Said to be allied to L. Caprifolium, but differs in the upper leaves being much smaller, almost as in L. Periclymenum.

Cyren Honeysuckle. Shrub tw.

5 L. Periclymenum (Lin. spec. p. 247.) branches climbing; leaves all separate, deciduous, sometimes downy, glaucous beneath, ovate, obtuse, attenuated at the base: upper leaves the smallest; heads of flowers all terminal, ovate, imbriicated; flowers ringent. §§. H. Native of middle Europe, in hedges, groves, and thickets, common; plentiful in Britain, in like situations. Smith, engl. bot. t. 800. Curt. fl. lond. fasc. 1. t. 15. Oed. fl. dan. t. 998. Schmidt arb. t. 197. Svensk, bot. t. 740. Caprifolium Germanicum, Rau, syn. p. 458. engl. gard. cat. t. 5. Periclymenum, Ger. enmac. p. 891. with a figure Periclymenum Germanicum, Riv. mon. irr. t. 122. P. hor-tense, Gesm. icon. pict. fasc. 1. 38. t. 7. f. 49. Caprifolium Periclymenum, Röm. et Schultes, syst. 5. p. 262. Caprifolium sylvaticum, Lam. fl. fr. p. 365. There are varieties of this species with either smooth, pubescent, or variegated leaves; and when the plant grows by the sea-side they are occasionally more glaucous and rather succulent. Corollas externally deep red, or in the earlier flowering varieties all over buff coloured; in the maritime plant smaller and greenish. Berries nearly globular, deep red, bitter and nauseous, accompanied by permanent bractlets. The early writers attribute virtues to this shrub which are now quite given up, but the beauty and exquisite fragrance of the flowers make it a favourite plant in gardens and shrubberies. This is the true woodbine of poets, though likewise the "twisted eglantine" of Milton. Notwithstanding Curtis's imperfect quotation, Shakspeare is guiltless of this blunder. He says,

"So doth the woodbine, the sweet honeysuckle,
Gently entwist the maple."

Var. β, serotínna (Ait. hort. kew. 1. p. 378.) branches glabrous; flowers late, reddish. §§. H. Hort. angl. 14. no. 4. t. 7. Mill. fig. t. 79. Riv. mon. irr. t. 122. Periclymenum Germanicum, Mill. dict. no. 4. This, the late red honeysuckle, produces a greater number of flowers together than either the Italian or Dutch honeysuckle, and it makes a finer appearance than either of them, during the flowering. It has not been such a long inhabitant of our gardens as the Dutch honeysuckle, for about the year 1715 it was considered a great curiosity, when it was called the Flemish honeysuckle, and was probably brought over by the Flemish florists.

Var. γ, Bélgica; branches smooth, purplish; leaves oblong-oval, of a lucid green above, but pale beneath, on long petioles; flowers in terminal, verticillate heads, each flower arising out of a scaly cover, reddish on the outside, and yellowish within, of a very agreeable colour. §§. H. Periclymenum Germanicum, Mill. dict. no. 4.—Hort. angl. 15. no. 5. t. 6. This, the Dutch honeysuckle, may be trained with stems, and formed into heads, which the wild sort cannot, the branches being too weak and trailing for that purpose.

Var. δ, querofólium (Ait. hort. kew. 1. p. 378.) leaves sinuated like those of an oak. §§. H. This variety is to be found in England in a wood near Kimberley, Norfolk; and near Oxford. There is also a kind of this with variegated leaves. The flowers are like those of the species. This is called the Oak-leafed honeysuckle. Woodbine or Common Honeysuckle. Fl. June, July, Oct. Britain. Shrub tw.

6 L. Fláva (Sims, bot. mag. t. 1318.) quite glabrous; branches twining a little; leaves ovate, sometimes glaucous beneath, with carilagineous margins; upper leaves connately perfoliate; flowers in terminal verticillate heads; corollas rather ringent; with ollong, obtuse lobes. §§. H. Native of the Paris Mountains, South Carolina, or on the Catskill Mountains, New York. Torrey, fl. un. st. 1. p. 243. Caprifolium flavum, Eckl. sketch. 1. p. 271. Caprifolium Fraséri, Pursh, fl. amer. sept. 1. p. 160. Flowers bright yellow, but as they fade becoming orange-coloured, very fragrant.

7 L. Pureícens (Sweet, hort. brit. p. 194.) branches twining; leaves broad-ovate-elliptic, on short petioles, pubescent and ciliated, glaucous beneath: upper ones connately perfoliate; spikes or racemes composed of verticillate heads of flowers; corollas beset with glandular pubescence. §§. H. Native of North America, in Massachusetts, Vermont, New York, and Canada, in many places. Caprifolium pubescentes, Goldie, in edinb. phil. journ. 1822. april. p. 323. Hook, exot. fl. t. 27. L. hirsuta, Eaton, man. bot. ed. 3. p. 341. ex Torrey, fl. un. st. 1. p. 242. L. Goldii, Spreng. syst. 1. p. 758. Flowers yellow. This appears to hold the place in the more northern parts which L. Fláva does in the south; of which indeed Dr. Torrey suspects it to be a variety.

8 L. Parteíflóra (Lam. dict. 1. p. 728.) quite glabrous; branches twining; leaves elliptic, sessile; lower ones somewhat connate: upper ones connately perfoliate, glabrous, very glaucous beneath; flowers in verticillate heads; corollas glabrous; with the tube gibbous at the base on one side; filaments hairy. §§. H. Native of Northern America, or in New England to Carolinia, in rocky shady situations; frequent in Canada, and as far north as the Saskatchewan; and from Hudson's Bay to the Rocky Mountains. Caprifolium partelium, Pursh, fl. amer. sept. 1. p. 161. Lonicera dioica, Lin. syst. veg. ed. 13. p. 181. L. média, Murr. nov. comm. gett. 1776. 28. t. 3. Caprifolium bractéosum, Michx. fl. bor. amer. 1. p. 105. Caprifolium dioecum, Röm. et Schultes, syst. 5. p. 260. Caprifolium glaucum, Meunch. Flowers yellow, smaller than in any of the foregoing species; but it varies exceedingly in the colour of the flowers, for there is a variety mentioned by Michaux having purplish flowers.

Var. β; leaves pubescent or tomentose beneath. §§. H. Native of Canada, along with the species.

9 L. Douglasi (D. C. prod. 4. p. 332.) branches twining; leaves oval, acute at both ends, petiolate, glabrous, ciliated, tomentose on the outside: upper ones connate; flowers disposed in capitate whorls; stigma exerted; stamens inclosed. §§. H.
Native of the western coast of North America, on the banks of the
Leaves 4-6 inches long, dark green. Hooker in his fl. amer.
bor. 1. p. 282. considers this nothing but a variety of L. par-
risifolia.

10 L. ? MICROPHYLLA (Hook. fl. bor. amer. 1. p. 283.)
branches twining; leaves small, on short petioles, cordate, obtuse,
and pinnate, stiff, hispid from pili as well as the branches, pale
and glaucous beneath. ♂, ♀. H. Native of North-west America,
on the subalpine range of Mount Hood, in rocky, partially
shady places, abundant; sparingly at the Grand Rapids, and on
steep rocks near Oak Point, on the Columbia. The specimens
examined have no flowers, but judging from the habit of the
plant it may perhaps safely be referred to this genus, and to
the present division of it. The leaves are hardly 6 lines long,
uniform, exactly cordate, very villous as well as the stems with
brown hairs.

Small-leaved Honeysuckle. Shrub tw.
11 L. GRATIF (Ait. hort. kew. 1. p. 221.) branches twining;
leaves permanent, ovovate, rather mucronate, glaucous beneath
and reticulate veined, glabrous; upper ones connately peri-
lolate; spikes composed of approximate whorles of flowers;
corollas ringent. ♂, ♀. H. Native of North America, from
Carolina to New York, on the mountains, rambling among
rocks in shady moist situations, but rare. Hort. angl. p. 15.
no. 10. t. 8. Caprifoliyum grattum, Pursh, fl. amer. sept. 1.
p. 161. Reem. et Schultes, syst. 5. p. 262. L. Virginiacum,
Marsh, arb. 136. ? Periclymenum Americum, Mill. dict. no.
7. Branches reddish brown. Flowers inclining to scarlet on
the outside, according to Pursh. Corolla ringent, reddish
on the outside, and yellow inside. Berries red.

* * Limb of corolla nearly equal.—Periclymenum, Tourn.

12 L. SEMPERVIRENS (Ait. hort. kew. 1. p. 230.) quite gla-
bruous; leaves permanent, evergreen, ovovate or ovate, glaucous
beneath, glabrous: upper ones connately perfoliate; spikes
nearly naked, composed of whorls of flowers; tube of corolla
ventricose on the upper side; limb nearly regular, with 5
roundish lobes. ♂, ♀. H. Native of North America, from
New York to Carolina, in stony dry woods. Hort. angl. t. 7.
Knor, deU. t. 53. Caprifoliym sempervirens, Michx. fl. bor.
amer. 1. p. 105. Periclymenum Virginiacum, Mill. dict. no.
1. Altarnus sempervirens, Rehd. ex Steud. Periclymenum
Virginiacum, Riv. mon. 116. Branches brown. Leaves deep
green above, 2 inches long and an inch broad. Whorls of
flowers usually 3, at the top of each branch. Flowers of a
beautiful scarlet outside and yellow inside, about 1 inch long,
imodorous. There are several varieties of this species, particu-
larly one with an almost upright stem.

Tar. a, major (Ait. l. c.) leaves roundish. ♂, ♀. H. Curt.
bog. mag. 781. Schmidt, arb. 1. 104. Great Trumpet Honeys-
uckle.

Tart. / minor (Ait. l. c.) leaves oblong, acute at both ends:
upper ones obtuse, perfoliate. ♂, ♀. H. Sims, bog. mag.
1753. Ker. bog. reg. t. 556. L. connata, Meerb. icon. t. 11.
Small Trumpet Honeysuckle. According to the figure in bog.
mag. the flowers are scarlet both outside and inside.

Evergreen or Trumpet Honeysuckle. Fl. May, June. Clt.
1656. Shrub tw.

13 L. CILIOSA (Poir. suppl. 5. p. 612.) plant twining; upper
part of the branches hairy on one side; leaves coriaceous, reti-
culated, ovate, on short petioles, glaucous beneath, and ciliate
on the margins: upper ones connately perfoliate; spikes composed
of approximate verticillate heads of nearly sessile flowers; tube
of corolla hairy, ventricose in the middle: limb nearly equal.
♂, ♀. H. Native of North America, on the banks of the
Kooskookey. Caprifoliym ciliOum, Pursh, fl. amer. sept. 1.
p. 160. L. ciliata, Dietr. lex. suppl. 4. p. 293. Flowers dark
yellow. Peduncles beset with glandular hairs.

14 L. OCCIDENTALIS (Hook, fl. bor. amer. 1. p. 282.) twining;
leaves oval, almost sessile, glabrous, ciliate, glaucous beneath:
upper ones connately perfoliate; flowers disposed in
verticillate heads; corolla glabrous, with an elongated tube,
which is gibbous above the base: the limb nearly equal; sta-
mens almost inclosed. ♂, ♀. H. Native about Fort Van-
couver, on the Columbia. Caprifoliym occidentale, Lindl. bot.
reg. t. 1457. Caprifoliym ciliOum, Doug. mss. The flowers
are longer than any other British North American species, and
of a full orange red. Branches and peduncles glabrous.

15 L. VILLOSA (Willd. mss. ex Kunn. D. C. prod. 4. p. 332.)
leaves ovate-oblong, ending in an acute, cuspidate point, ciliate,
pilos on the nerves beneath: upper ones connately perfoliate;
flowers disposed in a verticillate terminal head; heads sessile:
tube of corolla long; limb nearly equal. ♂, ♀. H. Native of
New Spain, in frigid places. Caprifoliym pilosum, H. B. et
Kunth, nov. gen. amer. 3. p. 457. t. 298. Flowers purple.
Pilos Honeysuckle. Shrub tw.

Sect. II. Xylostilum (xylo, xylon, wood, and aor, oston, a
bone; the wood of L. xylostilum is as hard as bone). D. C.
fl. fr. ed. 3. vol. 4. p. 271. D. C. prod. 4. p. 333.—Xylostion,
Juss. gen. 212.—Lonicerœ, Rem. et Schultes, syst. 5. p. 19.
—Xylostion and Chamaecerasus, Tourn. inst. p. 609.—Xyl-
estium and Isika, Adans, fam. 2. p. 501.—Cobaœa, Neck. elem.
no. 219. Pedicels axillary, 2-flowered, bicrateate at the apex.
Berries twin, distinct, or joined together more or less, 3-celled
in the young state, rarely 2-celled in the adult state; the limb
of the calyx is generally deciduous, therefore the fruit is usu-
ally not crowned.—Climbing or erect shrubs. Leaves never con-
nate.

§ 1. Nisitao (Nin-tao or Sin-tao is the name of L. Japonica
in China). D. C. prod. 4. p. 333. Oovaria and berries altogether
different. Stems scandent. Flowers irregular.

16 L. MACRANTHIA (D. C. prod. 4. p. 333.) branches twining,
hispid; leaves oval or oblong, rather ciliate at the base, and
acuminated at the apex, except along the nerves; pedicelles axillary
and terminal, 2-flowered, longer than the petioles, the whole
forming an ample leafy raceme; calycine segments subulate,
hispid; corolla very long. ♂, ♀. H. Native of Nipanu, at
Suembaru, and of Silhet. Caprifoliym macranthum, D. Don,
nica, Wall. in litt. and in Roxb. fl. ind. 2. p. 174. Leaves 3-5
inches long, shining above, and villous along the nerves and
margins; beautifully reticulate, glaucous, villous, and hairy
beneath. The flowers are at first snow-white and gradually
changing into a beautiful yellow, acquiring thereby a peculiarly
varied appearance. Berries nearly globular, smooth, deep
purple, covered slightly with a pale bloom, crowned by the
permanent villous calyx, 3-celled; cells 4-seeded. In Nipanu
this species embellishes most of the forests, both in the valley
and on the surrounding hills.

Large-flowered Honeysuckle. Fl. April, June. Shrub tw.
17 L. CONFLNS (D. C. prod. 4. p. 333.) branches twining, pubescent;
leaves ovaee, acute, rounded at the base, downy on both
surfaces as well as on the peduncles; pedicelles axillary,
longer than the petioles, 2-flowered, opposite, disposed in some-

1
hings like a thyrse at the tops of the branches; calycine segments ovate, and are as well as the corollas pubescent. 18. L. 

13 L. C. prod. 4. p. 333.) glabrous in every part; branches twining; leaves petiolate, oblong-lanceolate, shining above and pale beneath; peduncles short, 2-flowered, about the length of the pedicels; tube of corolla very long and filiform; limb bilabiata. 18. H. Native of China and Nepal. Lonicera longiflora, Sabine, ex Lindl. bot. reg. 1232. Nin-
tòoa longiflora, Sweet, hort. brit. ed. 2. Caprîfolium Japonicum, D. Don, prod. fl. nep. 140. Caprîfolium Nepalense, G. Don, in Loud. hort. brit. 79. Flowers several inches long, at first snow white, but finally changing to a golden yellow colour.

19 L. Japonica (Thumfl. jat. p. 89.) stems twining, flexuous, hairy; branchlets opposite, very hairy, bearing 2 leaves and 2 sessile flowers at the top of each; leaves petiolate, ovate, acutish, villous, pale beneath; uppermost ones the smallest; corolla tubular, irregular, villous. L. Caprifolium longiflorum, Sabine, ex Lindl. bot. reg. 1232. Nin-
tòoa longiflora, Sweet, hort. brit. ed. 2. L. Chinensis, Wats, deld. brit. 117. L. flexuosa, Loddi. bot. cab. 1037. Ker. bot. reg. 712. but not of Thumb. Leaves about an inch long. Corolla about an inch long, red, and villous on the outside and white inside, sweet-scented, equal in length to the stamens.

20 L. Java (D. C. prod. 4. p. 334.) stem twining; leaves ovate or oval-oblong, acuminate, rounded at the base, ciliated, glabrous above, glaucous and tomentose beneath; peduncles 2-flowered, axillary, solitary, but so much crowded at the tops of the branches as to appear somewhat corymbose. L. Caprifolium Javanicum, Blum. bijdr. p. 653. Java Honeysuckle. Shrub tw.

21 L. Lourei (D. C. prod. 4. p. 334.) climbing or tufting; leaves ovate-oblong, acuminate, subacute at the base, rather pilose on both surfaces; peduncles 2-flowered, axillary, solitary; those at the tops of the branches disposed in dense heads. L. Lourei, Blum. bijdr. p. 653. Flowers white?

Lourei's Honeysuckle. Shrub tw.

22 L. Cochinchinensis; climbing or tufting, much branched; leaves ovate, pubescent, small; peduncles 2-flowered, axillary; corolla 2-stamened, bilabiate. L. Native of Cochín-china, among bushes and in hedges. L. Xylosteum, Lour. coeh. p. 150. Tube of corolla very long; limb bilabiata: one of the lips 4-cleft and the other entire. Berry red. Flowers white.

Cochin-China Honeysuckle. Shrub tw.

23 L. Tsuropus (Hook. et Arn. in Beech. voy. pt. bot. p. 190.) branches twining, pubescent; leaves petiolate, oblong, acute, obtuse at the base or cordate, glabrous above in the adult state, and densely clothed with velvety pubescence beneath; peduncles bibracteate at the apex, 2-flowered, axillary, solitary, one half shorter than the pedicels: the terminal ones forming a kind of head; calyx villous: with minute, ovate, acute teeth; tube of corolla elongated, equal, villous. L. H. Native of China. Lonicera Periclymenum, Lour. coeh. p. 150. Closely allied on the one hand to L. confusum, D. C. from which it differs in the leaves being smooth above, and in the shorter peduncles, and on the other to L. Leschenaultii, Wall. which, however, is said to have ovate-subcordate ciliated leaves; and villous branches.

Telfair's Honeysuckle. Shrub tw.

24 L. Leschenaultii (Wall. in Roxb. fl. ind. 2. p. 173.) branches twining; leaves ovate, subcordate, acute, quite entire, smooth above, hoary and villous beneath: with the margins ciliated; pedicels 2-flowered, axillary, solitary, or in terminal fascicles. L. H. Native of the East Indies, on the Nelli-
gerry Mountains, where it is called Moule Gouda by the natives.

Leschenault's Honeysuckle. Shrub tw.

25 L. Glabra (Wall. in Roxb. fl. ind. 2. p. 173.) glabrous in every part; branches twining; leaves ovate, acuminate, glaucous beneath, glabrous except on the nerves beneath, which are pubescent; peduncles axillary and terminal, short, villous, bearing towards the apex several opposite, approximate, very short, 2-flowered pedicels; tube of corolla rather short, cylindrical, widening at the apex; bracteas ovate. L. H. Native of Nepaul, on the top of Sheopore, and from Kabelas in the valley. L. nigra, Thumb. jat. p. 89. and in Lin. trans. 11. p. 530. ? Bark of branches shining, brownish. Leaves 3-5 inches long, seldom obtuse at the base; the upper surfaces polished; petioles about half an inch long, surrounding the stem and branches with an elevated margin, as in L. acuminata. Flowers yellow, smooth, with a purplish bloom on the outside, supported by a common involucrem, consisting of 6 very small, ovate, ciliated bracteas. Calycine segments subulate, ciliated. Tube of corolla about an inch long, widening at the apex into a bilabiate limb, which as well as the filaments and style are rather hairy; upper lip trifid, obtuse, the intermediate lobe retuse: the under lip oblong. Berries distinct, almost black, 3-celled; cells 4-seeded.

Smooth Honeysuckle. Shrub tw.

26 L. Acuminata (Wall. in Roxb. fl. ind. 2. p. 177.) branches twining; villous; leaves ovate to oblong, cordate, acuminate, slightly hairy, membranous; peduncles axillary, longer than the pedicels, villous, 2-flowered; bracteas linear, acuminate, ciliated, longer than the ovaries; corolla not gibbous, funnelf-shaped. L. H. Native of the Himalaya, at Gossamthn.
CAPRIFOLIACEÆ.
V. LONGICERA.

Leaves 3-5 inches long; petioles half an inch long. At the apex of the peduncles there is usually an involucrem of 6 small bracteas, which are hairy. Flowers like those of L. _Xylsteum_, and about the same size; they are yellow, tinged with pale purple, slightly hairy on the outside. Calyceine segments lanceolate, ciliated, blisterish. Style and filaments hairy.

_Acuminated-leaved_ Honeysuckle. Shrub tw.

27 L. _acuminata_ (Wall. in Roxb. fl. ind. 2. p. 178.) branches twining; leaves ovate, cuspidate, acute, or acuminate, rounded or subacute at the base, pubescent above, villous beneath; peduncles axillary, shorter than the petioles, 2-flowered; calyx cup-shaped, acutely 5-lobed; corolla gibbous, funnel-shaped, villous; ovaries villous. ♂. ♂. Native of the East Indies, on Mount Gurval. Branches villous. Leaves 3 inches long, on very short petioles. Peduncles smooth. Bracteas ciliated with long hairs. Flowers resembling those of _L. Xylsteum_ both in size and colour.

_Var. β_, _Reglešina_ (Wall. cat. no. 487. D. C. prod. 4. p. 334.) leaves oval; petioles length of petioles. ♂. ♂. Native of Nipaan, on Simroore and Kamzan.

_Diverse-leaved_ Honeysuckle. Shrub tw.

28 L. _lygisiea_ (Wall. in Roxb. fl. ind. 2. p. 179.) branches slender, twining, covered with ash-grey, shining, smooth bark; young shoots villous; leaves ovate-lanceolate, hardly petiolate, shining, ciliated, obtuse at the base, acute at the apex; peduncles villous, axillary, very short, 2-flowered; limb of calyx truncate; berries distinct, and are as well as the ovaries covered by a common membrane. ♂. ♂. Native of Nipaan, on the mountains, in woods. Xylsteum ligistrinum, D. Don, prod. fl. nep. p. 140. X. Naišica, Hamilt. mss. ex D. Don. l. e. Young shoots surrounded at the base with some lanceolate, acute, quadrifidly imbricated bud-scales. Leaves dark green above, pale and reticulated beneath; petioles villous. Bracteas 2 at the apex of each peduncle. Corollas yellowish-white, funnel-shaped, half an inch long; tube gibbous and pubescent at the base, villous within; limb nearly equal, spreading, divided into 5 ovate, obtuse, ciliated segments. Filaments smooth, about the length of the limb of the corolla. Ovaries distinct, 3 celled; cells 3-seeded.

_Priet-leaved_ Honeysuckle. Shrub tw.

29 L. _lanceolata_ (Wall. in Roxb. fl. ind. 2. p. 177.) stems almost erect, bushy? leaves lanceolate, acuminate, hairy, acute at the base and glaucous beneath; peduncles axillary, longer than the petioles, and like them villous; berries distinct, globose, smooth; bracteas 2 linear and 4 ovate. ♂. ♂. Native of Nipaan, at Gosaingsthan. Stem covered with fibrous epidermis, probably erect. Branches slender, pubescent. Leaves pubescent above and shining, glaucous and hairy beneath, with somewhat repent margins. Petioles short. Berries the size and colour of black currants, smooth, crowned, 3-celled, supported by 2 linear and 4 ovate bracteas, the latter recurved and shorter.

_Lanceolate-leaved_ Honeysuckle. Shrub erect?

30 L. _cartenans_ (Schlousb. mar. 1. p. 88.) branches twining, and are as well as the leaves canescent from down; leaves petiolate, ovate, cordate, bluish; peduncles 2-flowered, longer than the petioles; bracteas and lobes of calyx oblong. ♂. ♂. Native of hedges about Mogondor, and on Mount Trara in Mauritania; and of Sicily at Palermo, ex Guss. fl. sic. 1. p. 250. L. biflora, Desf. fl. atl. 1. p. 184. t. 52. Corolla bilabiata, attenuated at the base, velvety on the outside. Berries nearly distinct.

_Canescents_ Honeysuckle. Shrub tw.

§ 2. _Chamecetra_ (The name signifies a kind of false cherry; the fruit of some of the species resemble cherries). _D. C. prod._

4. p. 335. Berries distinct, but usually connected together at the base, and diverging at the apex. Corolla hardly gibbous at the base or equal. Erect bushy shrubs.

_Var. γ_, _rubiflora_ (D. C. l. e.) flowers red. L. Sibirica, Hortul. ex Pers. encl.

_Tatarian_ Honeysuckle. Fl. April, May. Ch. 1752. Sh. 4 to 6 feet.

32 L. _cillata_ (Muhl. cat. p. 22,) erect; leaves ovate or oblong, cordate, thin, ciliated, villous beneath in the young state; peduncles elongated; bracteas 2, ovate, 3 times shorter than the ovaries, which are distinct; corolla bluntly spurred at the base: with short, nearly equal lobes; berries distinct, red, divericate. ♂. ♂. Native of North America, on mountains among rocks, in rich soil; from Canada to Virginia, and throughout Canada to the Saskatchewan, frequent. Xylsteum ciliatum, Pursh, fl. sept. amer. 1. p. 161. L. Tataica, Michx. fl. amer. 1. p. 166. but not of Lin. L. Cannalensis, Roem. et Schultes 5. p. 560. Flowers white, with a tinge of red or yellow; tube veiutrose above; limb with short, acute segments. Style exerted. The variety β of Pursh is _l'cucinium albianum_.

33 L. _Pyrenaica_ (Lin. spec. p. 248.) glabrous, erect; leaves obovate-lanceolate, acute, glaucous beneath; peduncles 2-flowered, shorter than the leaves; bracteas oblong-linear, foliaceous; flowers almost regular; berries globose, distinct. ♂. ♂. Native of the Pyrenees, on calcareous rocks, in exposed situations. Duham. arct. 2. t. 110. ed. 2. vol. 1. t. 15. Magn. hort. p. 209. with a figure.—_Caprifoliium Pyrenaicum_, Lam. fl. fr. 2. p. 366.—Xylsteum, Tourne. inst. 609. Corolla white, twice the size of those of _L. Xylsteum_, funnel-shaped; limb 2-hisp., flat; with equal, obtuse segments.

_Pyrceon_ Honeysuckle. Fl. May. Ch. 1739. Sh. 4 to 5 ft.

34 L. _punccea_ (Sim. bot. mag. t. 2469.) erect; leaves ovate, subacute at the base, of the same colour on both surfaces: peduncles axillary and almost terminal, 2-flowered, shorter than the leaves; tube of corolla rather gibbous at the base; segments of corolla nearly equal, irregularly arranged, 3 one way and 2 another; berries distinct? ♂. ♂. Native country unknown. Symphoricarpos puniceus, Sweet. Flowers deep red or crimson. Leaves sometimes 3 in a whorl on the young shoots.

_Crimson-flowered_ Honeysuckle. Fl. April, May. Ch. 1821. Shrub 2 to 4 feet.

35 L. _Xylsteum_ (Lin. spec. 248.) erect, downy; leaves
ovate, acute, petiolate, soft; peduncles 2-flowered, shorter than the leaves; bracteas hairy, double: the 2 outer ones lanceolate, spreading; inner a small conecave scale under each germ; berries oval, distinct, 1-celled, 6-seeded. \( \varphi, H. \) Native nearly throughout the whole of Europe, even to Caucasus, in thickets, hedges, and rocky places, and by the sides of woods. In Britain in like situations; in the fissures of rocks under the Roman wall near Sewing-Heads, or rather Sewing-Heads, in Northumberland, plentiful; and certainly wild, in a copiose called the Hacketts, to the east of Houghton Bridge, 4 miles from Arundel, Sussex. Smith, engl. bot. t. 916. fl. grt. t. 232. Oed. fl. dian. t. 808. —Dutch. arb. l. p. 153. t. 59.—Riv. mon. irr. t. 120.—Mill. fig. 167. f. 1. Caprifolium dumetorum. Lam. fl. fr. p. 367. Xylotolemum dumetorum. Monc. math. p. 502. Flowers small, cream-coloured, downy. Calyx of 5 obtrous lobes. Berries scarlet. A shrub of little beauty and no known utility, though common in plantations. Stammes and styles villous. The wood is extremely hard.

**Var. \( \beta, \) leucocarpa** (D. C. prod. 4. p. 335.) berries white.—Dutch. arb. ed. 2. vol. l. p. 52.

**Var. \( \gamma, \) xanthocarpa** (D. C. l. c.) berries yellow.—Duham. l. c. 

**Var. \( \epsilon, \) melanolcica** (D. C. l. c.) berries black.—Bauh. pinn. 451.

Bong-wooded or Upright Fly Honeysuckle. Fl. July. Brit. Shr. 4 to 5 ft.

36 L. xiura (Lin. spec. 247.) erect; leaves oval-oblong or elliptic, on short petioles, rather villous while young, but nearly glabrous in the adult state; peduncles 2-flowered, elongated, shorter than the leaves. \( \varphi, H. \) Native of Middle Europe, in subalpine woods, as in France, Switzerland, Austria, Silesia, Piedmont, &c. J. acq. aust. t. 314. Schmidt, arb. t. 110. Caprifolium rosemum, Lam. fl. fr. p. 368. Chamaecerasus nigra, Delarb. fl. auv. ed. 2. p. 130.—Gesn. fasc. 37. t. 8. f. 48. Corolla redish and pubescent on the outside, but whitish on the inside. Bracteas 4 under the ovaries: the 2 outer ones lanceolate: and the inner quadrilobed. Berries black, globose, joined together at the side.

**Black-fruitied Honeysuckle.** Fl. March, May. Cit. 1597. Shrub 3 to 4 ft.

37 L. hirsuta (Pall. ex Willd. Miss. Led. fl. ross. alt. ill. t. 212.) branches hirsute; leaves ovate, ciliated, petiolar, glabrous on both surfaces; peduncles 2-flowered; bracteas ovate-elliptic, exceeding the berries. \( \varphi, H. \) Native of Siberia, on the Altaiian mountains. Branches opposite, glabrous or bristly, brownish. Leaves 2 inches or 1½ inch long, and an inch broad, glabrous on both surfaces, cordate at the base. Flowers greenish white, pendulous. Berries distinct, purple.

**Hispid Honeysuckle.** Shrub 2 to 3 feet.

38 L. flexuosa (Thumb. in Lin. trans. 2. p. 330. but not of Loddd. nor Ker.) erect, branched; branches very villous at the apex; leaves ovate-oblong, acute, on short petioles, glabrous; petioles villous; nerves of leaves puberulous; flowers axillary, few, almost sessile; berries globose, glabrous. \( \varphi, H. \) Native of Japan, L. nigra, Thumb. fl. jap. p. 80. but not of Lin. L. brachypoda, D. C. prod. 4. p. 335. Stems flexuous. Leaves about an inch long; upper ones the smallest. Peduncles hardly a line long. Berries distinct, ovate, acuminated, black.

**Flexuous-stemmed Honeysuckle.** Fl. June, July. Cit. 1806. Shrub 4 to 5 feet.

§ 3. **Cupulatae** (from κοφας, κυπας, a curve, and κοφας, anthus, a flower; in reference to the flowers being gibbous on one side at the base). D. C. prod. 4. p. 336. Berries either distinct or joined together. Corollas very gibbous on one side at the base. Erect bushy shrubs.

39 L. obesa (Willd. miss. in Schultes, syst. 5. p. 257.)
cordate; peduncles thickened a little under the flowers. \( \gamma \). H. Native of Siberia. L. Sibirica, Vest. in Roem. et Schultes, syst. 5. p. 299.

**Alpine Honeysuckle.** Fl. April, May. Clt. 1596. Shrub 3 to 5 feet.

44 L. microphylla (Willd. rel. in Roem. et Schultes, syst. 5. p. 238.) leaves elliptic, acute at both ends, glaucous beneath; peduncles 2-flowered. \( \gamma \). H. Native of Eastern Siberia. L. \( \gamma \). fl. ross. alt. ill. t. 213. L. Alpigena, Sievers. The epidermis falls from the branches. Leaves rather villous on both surfaces, sometimes rounded at the base. Peduncles shorter than the leaves. Corollas greenish, yellow. Berries joined, of a reddish orange colour.

**Small-leaved Honeysuckle.** Clt. 1818. Shrub 3 to 4 feet.

45 L. Webbiana (Wall. cat. no. 476. D. C. prod. 4. p. 336.) erect; leaves ovate-oblong, acuminate, obtuse at the base, on very short petioles, pilose along the nerves, and ciliated on the margins; peduncles 2-flowered, 3 times shorter than the leaves; berries semi-concrete. \( \gamma \). H. Native of the East Indies, in Srinagar. Habit almost of L. Alpigena, but differs in the leaves being pilose and ciliated, in the peduncles being equal in length to the internodes, not longer than them, &c. Corolla unknown.

**Webb’s Honeysuckle.** Shrub 3 to 4 feet.

46 L. Giovanniana (Wall. cat. no. 481. D. C. prod. 4. p. 337.) erect; leaves elliptic or lanceolate, acute at both ends, membranous, glabrous; peduncles 2-flowered, 3 times longer than the petioles, but 3 times shorter than the leaves; bracteas linear, length of ovarium; corollas gibbous at the base; berries joined. \( \gamma \). H. Native of the East Indies, in Sirmore, where it was collected by Mr. Giovanni. Allied to L. Alpigena, but the leaves are much thinner, the petals longer, the flowers smaller and sometimes solitary by abortion.

**Gowan’s Honeysuckle.** Shrub 3 to 4 feet.

47 L. angustifolia (Wall. cat. no. 480. D. C. prod. 4. p. 337.) erect; leaves elliptic or lanceolate, acuminate, glabrous; peduncles 2-flowered, a little shorter than the leaves; bracteas linear, twice the length of the ovary; berries joined together completely; corollas nearly equal, pubescent on the outside. \( \gamma \). H. Native of Nipan, in Kassan, and of Sirmore. Branches numerous, smooth. Leaves 15 lines long and 4 lines broad, pale and glaucous beneath; petioles 2-3 lines long. Corolla pale, 4 lines long.

**Narrow-leaved Honeysuckle.** Shrub 3 to 4 feet.

48 L. oblongifolium (Hook. fl. bor. amer. 1. p. 284. t. 100.) erect; leaves oblong or oval, clothed with velvety pubescence beneath; peduncles elongated, erect; bracteas obsolete; tube of corolla hairy, gibbous at the base on one side; limb unequal, deeply bilabiate; the upper lip 4-toothed, and the lower one nearly entire; berries joined in one, which is bimucilicate at the top, bluish black in the dried state. \( \gamma \). H. Native of North America, in the island of Montreal, in the St. Lawrence; about Montreal, Lake Winnipeg, and of the western parts of the state of New York. Xylosteum oblongifolium, Goldie, in edinb. phil. journ. 6. p. 323. Corolla hairy, yellow? Berries bluish black, size of a pea.

**Oblong-leaved Honeysuckle.** Fl. April, May. Clt. 1823. Shrub 4 feet.

50 L. orientalis (Lam. dict. 1. p. 731.) erect; leaves on very short petioles, ovate-lanceolate, acute, quite entire, smoothish; peduncles 2-flowered, shorter than the leaves; bracteas 2, setulose; berries joined in one, sometimes bilobate and bimucilicate at the apex, 10-seeded. \( \gamma \). H. Native of Iberia and Asia Minor, in woods. Biebr. fl. taur. et suppl. no. 396. L. Caucasia, Pall. fl. ross. 1. p. 57. L. caerulea, Güld. itin. 1. p. 423. ex Pall. Chamaecerasus orientalis f. turificio, Tornocor. p. 42. Berries black (Lam. Biebr.), dark blue (Pall.). Leaves stiffish, veiny, larger than in L. caerulea. Flowers greenish yellow. This is perhaps nothing more than L. caerulea.

**Oriental Honeysuckle.** Fl. April, June. Clt. 1825. Shrub 3 to 5 feet.

51 L. ibérica (Biebr. fl. taur. and suppl. no. 395.) erect; leaves petioleate, cordate, roundish, tomentose or pubescent; peduncles 2-flowered, shorter than the leaves; bracteas oblong, ciliated; berries joined together to the middle, globose. \( \gamma \). H. Native of Iberia, about Tiflis and at the Derwen. Stev. mem. soc. mose. 3. p. 257. Xylosteum ibericum, Biebr. cent. pl. rar. 1. t. 13. ex suppl. Corollas lirid, form of those of L. Alpigena, Ovarium tomentose. Berries blood-coloured. Leaves like those of Cotoneaster vulgaris.

**Iberian Honeysuckle.** Fl. April, May. Clt. 1824. Shrub 3 to 4 feet.

* Species not sufficiently known.

52 L. quinquilocularis (Hardw. asiat. res. 6. p. 351. ex fl. ind. 2. p. 174.) shrub bushy; leaves petiolar, elliptic, acute, quite entire; peduncles short, 2-flowered; berries 5-celled. \( \gamma \). H. Native of the East Indies, in valleys about Shreeangar. Very like L. ligustriun, Wall. but differs in the 5-celled fruit, and is therefore probably a species of Legestertia.

**Five-celled-Fruited Honeysuckle.** Shrub.

53 L. corystoides (Lin. spec. 249.) leaves ovate, acute; corysts terminal. \( \gamma \). F. Native of Chili, near Conception, where it is called Yitu. Iitu. Feuill. obs. 2. p. 760. t. 45. Lorrainthus utii, Molina, szch. t. 139. ex Schultes, syst. 7. p. 161. Fiedrichia violacea, Sprang. syst. 1. p. 406. but the plant does not belong to Rubieae, according to Bertero, in merc. chil. 1829. may. p. 611. nor Lorrainthaceae, in consequence of the fruit being many-seeded. But from the flowers being 4-eleft, it is probably a genus of the present order. Leaves an inch broad, fine green. Corolla blood-coloured; and calyx 4-eleft to the middle. Stamens 4. Style yellow. Fruit form and colour of an olive; with sweetish flesh.

**Corystis-bowered Honeysuckle.** Shrub 12 feet.

54 L. quadrifolia (Willd. spec. 1. p. 986.) stem unknown;
leaves 4 in a whorl, ovate-lanceolate, glabrous, bluish; peduncles twin, 2-flowered, length of leaves; bracts 2, linear; berries distinct; the former much smaller than the latter. Corollas like those of *L. xiphistemon*, but having the tube narrower.

Four-leaved Honeysuckle. Shrub.

Cult. All the species of honeysuckle are truly ornamental, particularly the climbing and twining species, which are well adapted for training on trellis work or arbours, or against walls. The greenhouse twining kinds have a fine appearance, trained on the rafters. The upright hardy species are well fitted for decorating shrubberies. They all grow well in any common garden soil, and are easily increased by cuttings taken off in autumn, and planted in a sheltered situation: those of the tenderer kinds under a hand-glass.

VI. LEYCESTERIA (named by Dr. Wallich after his friend William Leycester, formerly Chief Judge of the principal native court under the Bengal Presidency, who during a long series of years and in various distant parts of Hindoostan, has pursued every branch of horticulture with a munificence and zeal and success, which abundantly entitle him to that distinction). Wall. in Roxb. fl. ind. 2. p. 181. pl. rar. asiat. 2. p. 21. t. 120.

Lin. Syst. Pentandria, Monogynia. Calyx with an ovate tube and an unequally 5-parted, permanent limb; segments unequal, small, linear, glandularly ciliated. Corolla funnel-shaped, having the tube gibbous above the base, and the limb campanulate, and divided into 5 ovate, nearly equal lobes. Stamins 5; filaments exerted. Stigma capitate. Berry roundish, crowned by the calyx, 5-celled; cells many-seeded. Seeds smooth, shining, ovate. Albumen fleshy. Embryo minute, terete, centrifetal.—A beautiful large rambling shrub, with elongated fistular branches, which rise from scaly buds. Leaves opposite, ovate-lanceolate, acuminate, petiolate, smooth, entire, membranous, glaucous, with an obtuse, subcordate base; petioles pilose. Flowers white, with a tube of purple, middle-sized and sessile, in fascicles, disposed in approximate whorls of fives and sixes, the whole forming short leafy drooping racemes, which terminate the branches and branchlets. Bracteae large, foliaceous, purplish, pubescent, and ciliated, lanceolate, acuminate, terminating the rachis with their concave bases; there are generally 6 under each whorl of flowers, of which the 2 outer ones are 2 or 3 inches long, rounded, and generally connate at the base: the 4 at the base of the racemes considerably larger than the rest. Berries deep purple, approaching to black, as large as a common-sized gooseberry; pulp very soft; cells 8-10-seeded. This genus appears to be intermediate between the present order and Rubiaceae, but from the last it is distinguished in the want of stipulas.

1 L. formosa (Wall. in Roxb. fl. ind. 2. p. 182.). H. Native on the highest mountains, surrounding the valley of Nipaul; and of the much more northerly situations towards Goaingsthan. It is also found at an elevation of seldom less than 6000 feet above the plains, among the pine and oak forests of Bishupur, as at Huttoo and Desoo in the Ttkaoorae of Koonthul, blossoming from June to August, and called by the natives Nukoro. Haméla comáta, Puerari, ms. Dr. Govan remarks, with great propriety, that this is a most beautiful shrub when in blossom, from the contrast of the deep green hue of its stem and leaves with the purple colour of the large bracteas and the berries.

Cult. This elegant shrub grows best in a light soil; and it is easily increased by cuttings planted in autumn or spring, or by seeds which ripen in abundance. It is well fitted for decorating the front of shrubberies; but being rather tender, should be protected in winter by a mat, or the hauin of herbaceous plants.

Lin. Syst. Pentandria, Monogynia. Tube of calyx globose (f. 81. c.); limb small, 4-5-toothed. Corolla funnel-shaped (f. 81. c.), almost equally 4-5-lobed. Stamina 5, hardly exerted. Stigma semi-globose. Ovarium adnate, 4-celled; fertile cells containing only one ovulm each; and the sterile ones few ovula. Berry 4-celled, crowned by the calyx (f. 81. c.), having 2 of the cells empty, and the other 2 containing one seed each. —Erect elegant bushy oppositely branched shrubs. Leaves oval, quite entire. Peduncles short, axillary, one or many flowered. Flowers lilac-cate, small, white or rose-coloured, on short pedicels.

1 S. vulgáris (Michx. fl. bor. amer. 1. p. 100.) flowers disposed in axillary cipate clusters, composed of nearly sessile racemules. H. Native of Virginia, Carolina, and Pennsylvania, in sandy dry fields. Lonicéra symphoricarpus, Lin. spec. 249. S. parviflora, Desf. cat. Symphória conglomerata, Pers. ench. 1. p. 214. Symphória glomerata, Pursh, fl. amer. sept. 1. p. 162.—Schmidt. arb. t. 115.—Dill. eth. t. 278. f. 560.—Hort. ang. 83. t. 30. Corolla white. Berries red, size of hemp seed; but according to Pursh the flowers are small, red, and yellow; and the berries purple. Branches brown, smooth. Leaves elliptic, obtuse, glaucous, and pubescent beneath. The berries are cup-shaped, and ripen in winter.

2 S. racemósus (Michx. fl. bor. amer. 1. p. 107.) flowers disposed in nearly terminal loose interrupted racemes, which are often leafy; corolla densely bearded inside; style and stamina inclosed. H. Native of North America; on mountains near Lake Mistassins; on the banks of the Missouri; of Upper Canada; also abundant in the Saskatchewan; on the banks of the Columbia, and at Puget's Sound, and Nootka Sound, north-west coast. Symphória racemósa, Pursh, fl. amer. sept. 1. p. 162. Sims, bot. mag. 2211.

Lodd. bot. cab. t. 230. S. leucocárpá, Hort. Leaves glaucous beneath. Corolla rose-coloured. Berries large, white. This is a fine shrub, very common in our gardens, easily known by its large white berries, and small red flowers. The S. elongata and S. heterophylla, Presl, in herb. Haeke, which were collected about Nootka Sound, do not differ from this species, in which the lower leaves are sometimes deeply sinuated.

3 S. occidentális (Richards, in Frankl. 1st journ. ed. 2. append. p. 6.) spikes dense, terminal, and axillary, drooping; corolla and segments densely bearded inside; style and Stamina a little exerted. H. Native of British North America, in the woody country, between lat. 54° and 64°, and known under the name of wolfberry; abundant about the Saskatchewan and Red River; and about Fort Vancouver, on the Columbia. According to Dr. Richardson this species comes very near S. racemósus, but is distinguished by the larger, less glaucous, fruit.
more rigid, and denser foliage, and by the flowers being arranged in dense drooping spikes, larger than in S. racemosa, and by the
prominent style and stamens.

Western St. Peter's-wort. Shrub 4 to 6 feet.
4 S. microphyllum (H. B. et K.) nov. gen. ancr. 3. p. 424.) flowers axillary, solitary; leaves roundish-ovate, bluntish, pubescent. F. F. Native of Mexico, in the temperate parts
near Moran, at the altitude of 4000 feet. Symphoria micro-
phylla, Wild. in Schultes, syst. 1. p. 757. Ainsitinis micro-
phyllus, Wild. in Schultes, syst. 5. p. 223. Corolla white.

Small-leaved St. Peter's-wort. Shrub 4 to 6 feet.
5 S. Glaucescens (H. B. et K.) nov. gen. 3. p. 294. t. 295.)
flowers axillary, solitary; leaves elliptic, acute, somewhat mu-
crenate, smoothish. F. F. Native of Mexico, on the moun-
tains near Santa Rosa, at the elevation of 4000 feet. Symphoria

Glansescens St. Peter's-wort. Shrub 3 to 4 feet.

Cult. Symphoricarpos is a genus of very beautiful and deli-
crate shrubs, well adapted for shrubbery or borders. They grow in any common garden soil; and are easily increased by cuttings,
which should be planted either in autumn or spring.

VIII. ABELIA (named by Mr. Brown after Clarke Abel,
M. D., physician to the embassy to China under Lord Amherst;
he collected and brought home many interesting plants). R. Br.
crat. and descrip. pl. Abel, 1818. in 4to. p. 5. with a figure.
D. C. prod. 4. p. 339.

LIN. SYST. Tetradria, Monogynia. Calyx with an oblong
tube, and a 2 or 3-parted foliaceous limb; the segments oblong.
Corolla tubular, funnel-shaped, 5-lobed: lobes ovate, nearly
equal. Stamens 4, dihyalynous or nearly equal. Stamina capitale.
Ovarium 5-celled; of the cells contain many ovules, but all be-
come abortive, and the third contains only one ovulum, which
comes to perfection. Pericarp 1-seeded, indehiscent, crowned
by the foliaceous limb of the calyx.—Decumbent or weak gla-
brous shrubs. Leaves petiolar, dentately crenated. Peduncles
axillary, trichotomous or trifid, or terminal and undivided.
Involucre 2 or many flowered, composed of 6 or more leaves.

1 A. Chinese (R. Br. l. c.) involucrem 2-flowered; pen-
duncles trichotomous; stamens exerted. F. G. Native of
China, in the province of Kiang-si at the Lake Po-yang, where
it was collected by Dr. Clarke Abel. Tube of corolla 3-nerved;
4 of the nerves approximate, and the fifth remote. Ovaryum
having one nere on one side, and 4 on the other. Leaves ovate,
finely pubescent.

China Abelia. Shrub 2 to 3 feet.

2 A. Telefora (R. Br. in Wall. pl. asiat. rar. l. p. 14. t. 15.)
flowers by thres, forming terminal corymba; lateral flowers
furnished with 3 bractes; middle one sessile, naked; calyx 5-
parted; the segments foliaceous, linear, and ciliate; leaves
ovate-lanceolate, acuminate, quite entire, ciliate, with hyaline
hairs. F. G. Native of the East Indies, on the highest moun-
tains of Northern and Western Kamaon towards the Himalaya,
where it is called Kuuki. Flowers pale red, delightfully frag-

Three-flowered Abelia. Tree small.

3 A. Uniflora (R. Br. in Wall. pl. asiat. rar. l. p. 15.) pedun-
cles 1-flowered, tribracteate. F. G. Native of China.

One-flowered Abelia. Shrub.

Cult. A mixture of loam, peat, and sand will be a good soil
for the species of Abelia; and they may be easily increased by
cuttings planted in any light soil, with a hand-glass placed over them.

IX. LINN. E A (this little northern plant, long overlooked,
depressed, abject, flowering early, Linnaeus selected to transmit
his own name to posterity). Gron in Lin. gen. no. 774. Juss.
—Campánula spec. C. B. Tourn. &c.

LIN. SYST. Didynamia, Angiosperma. Calyx double, superior
one of one leaf; in 5 deep, erect, lanceolate, acute, equal seg-
ments (f. 82. b). Corolla bell-shaped (f. 82. d.); tube cylin-
drical, gradually dilated upwards, about twice the length of the
superior calyx; limb divided into 5 deep, nearly equal, slightly
spreading segments (f. 82. d.). Stamens 4, inclosed, dihyalynous
(f. 82. f.): the 2 uppermost ones the shortest. Ovarium globu-
lar, of 3 cells. Style cylindrical, gently swelling upwards, declin-
ing longer than the corolla (f. 82. e.); stigma obtuse. Berry dry,
ovate-oblong, of 1-cell, membranous, closely invested with the
inferior calyx, and crowned with the superior one. Seed soli-
ary, filling the cavity.—A trailing, somewhat shrubby plant, of
an elegant aspect, and rendered most interesting to a botanist on
account of the name given, with the concurrence of Linnaeus, by
his friend Dr. J. F. Gronovius.

N. TERRAEVIRIDIS (Lin. spec. 880.) F. H. Native of Lapland,
Sweden, Norway, Russia, Germany, Switzerland, Savoy, Si-
beria, &c., in dry, stony, shady, mossy, fir woods, on the moun-
tains. In Scotland the plant was first found in an old fir wood at
Inglisamidie, on the borders of Mearnsire in 1795; it has
since been found in several similar situations in the highlands of
Scotland. In North America in several parts, as in the states of
New England, New Hampshire, Vermont, but more particularly
in Canada throughout the woody

country from Lake Huron to the Arctic circle; and from
Newfoundland and Labrador on the east to the Columbia, Una-
Wahl. fl. lapp. 170. t. 9. f. 3. Od. fl. dan. t. 3.—A trailing, sub-
shrub, cing, and evergreen plant, forming broad leafy
patches; the young shoots hairy and leafy. Leaves roundish
or ovate, firm, crenate in the fore part, slightly hairy, and of a full
green above, paler beneath. Peduncles axillary, about a finger
in length, bearing each 2 elegant, pendulous, flesh-coloured
flowers at the apex, which are said to be very fragrant at night.
A pair of very small leaves stand at the origin of the partial
flower-stalks, or pedicels, and there is often a larger pair or
two at the lower part of each peduncle. Corolla variegated
internally with rose colour and yellow. The American plants are
generally stronger than the European ones.

Cult. This elegant little trailing evergreen shrub will not
grow in cultivation unless in a peat border, where it will thrive
and flower freely; and most so if the border is in a shady situa-
tion. It is sometimes grown in large pots or pans, filled with
peat earth, and grows luxuriantly. It is easily increased by
separating the creeping stems when rooted.

† Genera allied to Caprifoliaceae, but are not sufficiently
known.

X. AFDIA (from afdia, afdos, to break; in reference to the
durability of the wood of this tree). Lour. inep. p. 143. D. C.
prod. 4. p. 346.

LIN. SYST. Pentaevirid, Monogynia. Tube of calyx adnate
to the ovarium; limb 3-toothed, erect. Corolla superior, salver-shaped, with a woolly throat and a 3-parted limb: the segments lanceolate. Anthers 5, linear, inserted in the recesses between the segments of the corolla. Style equal in length to the stamens: stigma ovate-oblong. Berry ovate, umbilicate, 1-seeded.—A large tree, with very durable wood and spreading branches. Leaves opposite, lanceolate, quite entire, glabrous. Racemes axillary, short, loose. Flowers white.

1 A. Cochinchinensis (Lour. l. e.) H. G. Native of Cochinchina. The wood of this tree is white and heavy, composed of thick fibres; and is used for the purpose of forming the foundation of bridges, being imperishable either by being under water or under ground.

Cochinchina Aidia. Tree large.

Cult. Any common soil will suit this tree; and cuttings will be easily rooted if planted under a hand-glass.

LIN. SYST. Tetranda, Monogynia. Tube of calyx adnate to the ovary; limb 8-sep. Corolla tubular; with 5-6 cleft nearly equal limb. Stamens 4, epipetalous, nearly equal. Style filiform: stigma 2-lobed. Fruit 2-celled?—A twining shrub. Leaves opposite, petiolate, somewhat sagittate, a little serrated, acute. Flowers axillary, solitary, birracemate; bracteas cordate, winged on the outside.—This genus is said by Rafinesque to be allied to Linn.Æa, but the plant is wholly unknown to other botanists.

1 V. volubilis (Rafin. l. c.) Æ. G. Native of Abyssinia.

Twining Valentiana. Shrubby shrub.

Cult. See Aidia, p. 432. for culture and propagation. The plant is well fitted for training up the rafter in a green-house.

LIN. SYST. Diandria, Monogynia. Tube of calyx adhering to the ovary; limb 4-toothed. Corolla tubular, 4-cleft, bilabiate. Stamens 2; anthers 2-celled; lobes remote. Style under the upper lip of the corolla: stigma simple. Capsule crowned by the calyx, 1-celled? 4-seeded. Stem hermaphroditic? angular; branches flat-lobed. Leaves opposite, sessile, oblong, hastate, unequally toothed at the base, acuminated, glabrous. Flowers small, sessile, disposed in whorls. According to the author it is allied to Diérella, but the genus is entirely unknown to any other author.

Cult. This plant will grow best in a border of peat earth, and may probably be increased by dividing at the root.

Tube of calyx adhering to the ovary (f. 94. e. f. 97. g.). limb variable, truncate (f. 93. a.), or of many lobes, usually regular; the sepals or lobes equal in number to the petals (f. 84. c.), very rarely intermixed with accessory teeth. Corolla gamopetalous, inserted in the upper part of the tube of the calyx, usually with a 4-6 lobed limb (f. 93. b. f. 84. c.), rarely with a 3 or 9-parted limb (f. 101. b.); the tube either short (f. 84. b.) or long (f. 92. c.); the lobes or segments twisted or valvate in restoration. Stamens equal in number to the segments of the corolla, alternating with them, and more or less adnate to its tube (f. 83. g. f. 91. b.). Anthers oval, 2-celled (f. 111. c.), bursting inwardly. Ovarium situated within the calyx, and adhering to it (f. 94. e. f. 103. g.), usually 2 (f. 94. c.) or many celled (f. 103. g.), rarely 1-celled by abortion: always crowned by a fleshy urceolus, or the limb of the calyx (f. 103. f). Style one, rising from the urceolus (f. 83. d.): stigmas usually 2, distinct (f. 105. c.), or more or less combined (f. 83. e.), rarely more than 2. Fruit baccate (f. 107. h.), capsular (f. 95. k.), or drupaceous (f. 103. g.), or many celled (f. 103. g.); cells 1-2 or many seeded. The seeds, where they are solitary in the cells, are sometimes fixed by the apex, but usually by the base; but where they are numerous in the cells, they are fixed to a central placenta, and are usually horizontal. Albumen large, horny or fleshy. Embryo straight, or a little curved, inclosed in the middle of the albumen; with a terete radicle turned towards the hilum; and foliaceous cotyledons.—Trees, shrubs, and herbs, with terete or tetragonal branches. Leaves simple, girded by a marginal nerve, and therefore quite entire, opposite or verticilate, always bistipulate. Stipulas variable in cohesion and form, interpetiolar or intratubolar. Flowers arranged in various ways, but usually in panicles or corysteb, rarely unisexual by abortion.

This well marked order is nearly allied to Compositæ, from which its distinct stamens, bilocular, and plurilocular ovary and inflorescence, distinguish it, and consequently it participates in all the relation of that extensive order. From Apocynaceæ in the activation of the corolla, the presence of stipulas, and the inferior ovary distinguish it, yet, according to Mr. R. Brown, there exists a genus in equinoctial Africa which has the interpetiolar stipulas and seeds of Rubiaceæ and the superior ovary of Apocynaceæ, thus connecting these two orders, Congo, p. 448. There is a striking affinity between Rubiaceæ and Caprifoliaceæ in the monopetalous tubular corolla, definite stamens, inferior ovary, and opposite leaves, which is confirmed by the corolla of the latter being occasionally regular or irregular. The tribe Operculariæ, referred to this order by Mr. R. Brown (Congo, p. 447) and others (A. Rich. ed. 4. p. 483), is remarkable for having but 1-seed, and the number of stamens unequal to the lobes of the corolla, and therefore occupies an intermediate station between the Rubiaceæ and Dipsociææ. The tribe Stelláceæ is distinguished from the rest of the order in the stipulas being as large as the leaves, and of the same form and consistence, having from 1-3 between each leaf on both sides, forming with them a kind of star or whorl, from which circumstance the name stellate is applied. The leaves in this tribe can only be distinguished from the stipulas by the axillary buds.

Powerful febrifugal or emetic qualities are the grand features of this order, the most efficient products of which in these two respects are Quinina and Ipecacuanha. The febrifugal properties depend upon the presence of a bitter tonic astrigent
principle, which exists in great abundance in the bark; those of Cinchôna are known to depend upon the presence of two alkaloids, called cinchonine and quinine, both of which are combined with kineic acid; two principles which, though very analogous, are distinctly different, standing in the same relation to each other as potass and soda. Turner, p. 648. Dr. Sertürner has obtained some other vegato-alkaloids from Cinchôna, one of which he calls cinnioidia. Brande, journ. 12. p. 417. new series. The existence of this is denied by M. M. Neury and Deloandre, ibid, July, 1820, p. 442. A detailed account of the qualities, synonyms, and commercial names of the species of Cinchôna is given in Mr. Lambert's work on the genus Cinchôna, 4to. London, 1821. In the same work is the translation of Baron Humboldt's account of the Cinchôna forests of South America. Three species of Cinchôna, the C. ferruginea, C. Veilissorsi, and C. Remigiâna, are found in Brazil, where they are used for the same purposes as the Peruvian bark, to which, however, they are altogether inferior. St. Hil. pl. usu. bras. no. 2. The French Guiana bark possesses properties analogous to those of Cinchôna, and is obtained from Portlândia hexandra the Contaéa speciosa, Aublet. Humb. cinch. forest. p. 43. The Quinquina Pitou and Quinquina des Antilles are produced by species of the genus Ezoctaënum, and are remarkable for possessing properties similar to those of the true Quinquina, but without any trace of either cinchonine or quinine. St. Hil. pl. usu. bras. no. 3. A kind of fever-bark is obtained at Sierra Leone from Roráebata ftrifigina. Besides, there are a great number of other species possess barks more or less valuable. Pincknàya pibens is the fever-bark of Carolina; Condamae cortymbosa, Isertiâ ofcinosa, Antirheà, and Morinda Rögen, are all of the same description. A lightish brown, bitter, and powerfully astringent extract, called Gambier, is obtained at Malacca by boiling the leaves of Naíceâ Glâmbr; it is sometimes substituted for gum-kino, Ainslie, 2. p. 106. A decoction of the leaves, as well as the root, of Cântium parrifórum is prescribed in India in certain kinds of flux, and the last is supposed to have anthelminthic properties, though neither has much sensible taste or smell. The bark and young shoots are also used in dysentery. Ainslie, 2. p. 63. Among the emetics, Ipecacuanha holds the first rank; it is the root of Cepheiàs Ipecaùânhà, a little creeping-rooted half-herbaceous plant, found in damp shady forests of Brazil. Similar properties are found in the roots of other Rubiaceæ plants of the same country, as in Richardâoâna rôsen and R. scébra, Bartâria ferrigínea and B. Pâuga, &c. A peculiar alkaline principle, called emetia, is found in Ipecaùânhâ, which contains 16 per cent. of it. Turner, p. 633. The Râiz ïretta, which is celebrated for its power in curing dropsy, and in destroying the dangerous consequences of bites of serpents, is said to be related to Ipecacuanha. Edinb. phil. journ. 1. p. 218. Several species of Psychôtria, as P. enêética, &c. and Gelôpida renìfórmis, are substitutes for Ipecacuanha. The spurious barks called Quinquina Pitou, are capable of exciting vomiting. The powdered fruit of Íândia dumbar, is a powerful emetic. An infusion of the bark of the root is administered to nauseate in bowel complaints. Ainslie, 2. p. 186. According to Roxburg, the root bruised and thrown into ponds where there are fish, intoxicates them, as Cœclus bidius. Ainslie, 2. p. 186. Psychôtria Názà and Palicœureen Maregraviâ, both called Erca de rata, are accounted poisonous in Brazil; but nothing very certain seems to be known of their properties. Edinb. phil. journ. 14. p. 267. The root of Morinda umbellâta in the Moluccas, and that of M. citrifólia in India, is used for dyeing red and brown; and the bark of M. Rögo for ink. The leaves of Oldenândia umbellâta are considered by the native doctors of India as expectorant; and the root is employed in India for staining neckanes. Ainslie, 2. p. 101. Coffee is the roasted seeds of a plant of this order, Cofìa Arâbica, and is supposed to owe its characters to a peculiar chemical principle called coffein. Turner, p. 689. The part roasted is the albumen, which is of a hard horny consistence; and it is probable that the seeds of most of the plants of the present order, whose albumen is of the same texture, would serve as a substitute. This would not be the case with those with fleshy albumen. The fruit of some Garînias Ñínpa and of Ñanfícrâ, the Voa Vangà and of Madagascare, and Sarcocephalus esculentus, are succulent and eatable. The root of Râbia tâtcarí is the madder, one of the most important dyes with which we are acquainted; a quality in which the roots of many other plants belonging to the tribe Stellâtâ participate in a greater or less degree. The roots of Râbia Munjîsta yield the madder of Bengal. Ainslie, 1. p. 203. The torrefied grains of Galîum are said to be a good substitute for coffee. The flowers of Galîum vèrum are used to curdle milk. An infusion of Aspërula cyanâcheia has a little astringency, and has been used as a gargle. Aspërula odorât, or Woodnuff, is remarkable for its fragrance when dried; it passes for a diuretic. Râbíà Názà is said to be poisoneous.

Opposiçe leaves, with intervening stipulas, a monopetalous corolla, with a definite number of stamens, are the great characteristics of Rubiaceæ; an order of such extent, that it embraces a very large proportion of the whole phlegomous plants, including within its limits humble weeds and lofty trees. Among them the plants of beauty or value are innumerable; of the former description the genus Ñâçu, Bouvárdia, Catesbeà, Portlándia, Cardenâia, Hamêlia, Cepheiàs, Augústea, and many others, are notable examples.

Synopsis of the genera.

A. Cells of fruit many-seeded.

TRIBE I.

CINCHÔNAŒÆ. Fruit capsular, 2-celled; cells many seeded. Seeds winged.—Trees or shrubs. Stipulas interpetiolar.

SUBTRIBE I. NAUCLEÆæ. Flowers capitate, sessile, upon a globose receptacle (f. 83. e. f. 84. k.).

1 NAUCLEA. Tube of calyx oblong; limb truncate or 5-toothed (f. 83. b.), with linear lobes. Corolla funnel-shaped (f. 83. c.), with a slender tube and naked throat. Stigma tumid, undivided (f. 83. d.). Capsules sessile, not attenuated at the base.

2 UNEA. All as in Naúcelea, but differs in the flowers being scattered on the receptacle. Calyx urceolate 5-cleft. Capsules pedicellate, clavate, attenuated at the base.
3 Adenia. Tube of calyx oblong; limb campanulate, 5-parted (f. 84. a.), permanent. Corolla funnel-shaped, 5-lobed (f. 84. b. c.), with a naked throat and valvate lobes. Anthers almost sessile (f. 84. c.), inclosed. Stigma capitate (f. 84. b.). Capsules membranous, 4-valved (f. 84. g.), pyramidal. Seeds 2-4 in each cell.

4 Breonisia. Limb of calyx 5-parted. Corolla with a terete tube, and a flat, 5-lobed, spreading limb. Stamens inserted in the throat, half-exserted. Style very long; stigma bipartite. Ovaryum 2-celled; cells 7-8-ovulate: ovula fixed to membranous placentas, and hanging from the axis.

Subtribe II. Cincnooee. Flowers more or less pedicellate, never seated on a globose receptacle.

6 Stevenisia. Calyx girded by a 4-lobed involucre; limb bipartite, deciduous. Corolla salver-shaped, with a short tube, and a bluntly 6-7-parted limb. Anthers 6-7, sessile in the throat. Capsule globose, areolate at the apex. Seeds a little winged, pubescent at the top.

7 Coutarea. Limb of calyx 6-parted. Corolla funnell-shaped, with a short tube, and a bluntly 6-lobed limb. Stamens inserted in the bottom of the throat; anthers linear, exserted. Capsule obovate, compressed; valves bifid at the apex. Wings of seeds membranous.

8 Hillia. Calyx girded by a 4-leaved involucre; limb 2-4-parted, permanent. Corolla with a long tube (f. 85. b.), and a 4-6-parted limb (f. 85. b.). Stamens 4-6, inclosed, sessile beneath the throat (f. 85. c.). Capsule elongated, crowned. Seed ending in a pencil-formed tail (f. 85. c.).

9 Hymenopogon. Limb of calyx 5-parted, permanent. Corolla salver-shaped, with a very long tube, and a 5-parted limb. Stamens 5, inclosed, inserted in the top of the tube, which is inflated. Capsule oblong, clavate, 10-merous, crowned. Seeds appendiculate at both ends.

10 Cincnoa. Calyx 5-toothed (f. 86. a.). Corolla with a terete tube, and a 5-parted limb (f. 86. b.), which is valvate in aestivation. Anthers linear, inserted in the middle of the tube (f. 86. a.), a little exserted. Capsules dehiscing at the valves, crowned. Seeds girded by a membranous lacerated wing.

11 Cosmbelea. Calyx 5-toothed. Corolla with a long tube, and a 5-lobed limb, which is valvate in aestivation. Anthers oblong, exserted. Stigma bipartite. Capsule somewhat 4-valved, dehiscing from the apex. Seeds girded by a lacerated wing.

13 Luculia. Calyx 5-toothed (f. 87. c.), deciduous; lobes foliaceous. Corolla with a longish tube, and a 5-lobed expanded limb, which is imbricate in aestivation. Stamens almost inclosed (f. 87. a.); anthers linear. Stigma 2-parted (f. 87. b.). Capsule dehiscing at the dissepiment from the apex. Wings of seed jagged.

14 Hymenolycetion. Calyx 5-toothed. Corolla tubular, with a 5-cleft limb, which is valvate in aestivation. Stamens exserted; anthers peltate. Capsule not crowned, dehiscing at the dissepiment. Wing of seeds bifid at the base.

15 Extostemma. Calyx 5-toothed. Corolla with a terete tube, and a 5-parted limb, which is plicate in aestivation. Anthers linear, exserted. Capsules crowned, dehiscing at the cells. Seeds girded by a membranous entire border.

18 Bouvardia. Limb of calyx 4-parted (f. 89. a. b.). Corolla funnel-shaped, tubular (f. 89. c.), with a 4-parted (f. 89. a.) spreading short limb. Stamens adnate at the base to the tube, but free above the middle. Anthers linear, inclosed. Capsule membranous, globose, compressed. Seeds girded (f. 89. a.) by a membranous border.

19 Pinckneya. Calyx 5-parted; the fifth lobe expanded into a coloured leaf. Corolla with a cylindrical tube, and a 5-cleft limb, which is valvate in aestivation. Stamens inserted at the base of the tube, exserted; anthers peltate. Capsule compressed, 2-celled, dehiscing at the dissepiment. Seeds surrounded by a wing, which is emarginate at the base.

20 Calycophyllum. Limb of calyx truncate or bluntly toothed; one of the teeth expanded into a membranous stalked coloured leaf. Corolla campanulate or funnel-shaped; limb 5-parted. Stamens rising from the throat; anthers oval, exserted. Style ending in 2 reflexed stigmas. Capsule oblong. Seed fixed to the linear placentas, girded by a narrow wing.

 Tribe II.

Gardeniaeae. Fruit indehiscent (f. 94. b.), fleshy, usually 2-celled, rarely 1-celled by abortion. Seeds not winged. Albumen fleshy.—Trees or shrubs, with opposite leaves, and interpetiolar stipulas.

Subtribe I. Sarcocephalae. Flowers sessile, collected into a head (f. 90. a. b.) upon the receptacle. The fruit combined together into one (f. 90. b. c.).

21 Sarcocephalus. The calyces are closely joined together into a globose fleshy head (f. 90. b.); limb of calyx with a very short margin. Corolla funnel-shaped, 5-cleft. Anthers
sessile in the throat. Stigma undivided. Berries many seeded.

Seed small, somewhat reniform.

24 Canephora. Limb of calyx 5-6 toothed. Corolla with a somewhat campanulate tube, and a 5-6-lobed limb. Anthers 5-6, oblong, almost sessile, inclosed. Stigma bifid. Fruit bacceat 

22. 2-celled, many seeded. Ovala imbricate, inserted in spongy axillary placentas; but according to Rich the fruit is peashaped, 2-seeded, and crowned by the calyx.

Subtribe II. Gardenie. Flowers distinct, not joined together into a head.

25 Burschella. Limb of calyx drawn out beyond the ovary, 5-cleft (f. 91. a.) beyond the middle. Corolla clavately funnelf-shaped (f. 91. b.); throat naked: lobes imbricated, and twisted in revivification. Filaments adnate to the tube (f. 91. b.) at the base; anthers incised. Stigma bearing 5 convex crests on the outside, and tufts of hairs. Berry crowned by the calyx, turbinate-globose. Placentas adnate to the disseminum. Seeds angular. Flowers capitate.

26 Acteopanax. Limb of calyx 6-toothed. Corolla salver-shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb. Anthers 6, inclosed, linear. Stigma clavate. Berry obovate-oblong, 2-3-celled. Seeds disposed in 2 rows in each cell, nearly orbicular, separated by the horizontal disseminum.

27 Mussella. Limb of calyx 5-parted, deciduous, one of the outer lobes usually drawn out into a large petiolar colored leaf. Corolla funnel-shaped, with a 5-parted limb and a villous throat. Anthers 5, sessile, linear. Stigma bifid. Fruit ovoid, fleshy, indescent, many seeded. Seeds scabrous. Placentas rising from the middle of the disseminum, pedunculate, bifid at the apex. Flowers corombose.

29 Cassia. Limb of calyx short, entire. Corolla tubular, ruged on the outside, with a villous throat, and a 6-parted limb. Anthers 6, oblong, nearly sessile, inserted among the hairs in the throat. Stigma bifid. Berry globose, crowned, many seeded. Placentas fixed to the middle of the disseminum.

32 Posoqueria. Limb of calyx short, 5-toothed. Corolla funnel-shaped, with a very long terete tube, a villous hardly dilated throat, and a 5-parted spreading limb. Stamens 5, arising from the throat, free, a little exserted. Style filiform, bifid at the apex. Berry ovate, crowned, succulent, many seeded.

33 Oxyanthus. Limb of calyx acutely 5-toothed (f. 92. a.). Corolla with a very long slender tube (f. 92. c.), a glabrous throat, and a regular 5-parted limb (f. 92. d.). Stamens 5, exserted (f. 92. f.), free at the throat; anthers acute. Style clavate at the apex (f. 92. e.). Fruit baccaet.

34 Stylocoryna. Limb of calyx 5-toothed Corolla salver-shaped or funnel-shaped, with a cylindrical tube, and a 5-parted limb. Stamens 5, inserted in the mouth of the corolla; anthers linear, very long. Stigma clavate (f. 92. g.). Berry globose, crowned by the calyx, almost dry. Placentas spongy, adnate to the middle of the disseminum on both sides. Seeds angular.

35 Ge'ni'a. Limb of calyx truncate or subdentate. Corolla salver-shaped, the tube not exceeding the calyx, and the limb large and 5-parted. Anthers linear, exserted, sessile in the throat. Stigma clavate. Berry corticate, somewhat 4-celled, attenuated at both ends, crowned by the tubular calyx. Seeds many, horizontal, imbedded in pulp.

36 Garde'nia. Limb of calyx truncate or toothed (f. 93. a.). Corolla funnel or salver-shaped (f. 93. b.), having the tube much longer than the calyx; limb twisted in revivification (f. 93. c.), 5-9-parted, spreading. Anthers 5-9, linear, nearly sessile in the throat. Stigma clavate, bifid. Berry fleshy, crowned by the calyx, incompletely 2-5-celled. Seeds minute, immersed in the fleshy parietal placentas.

37 Ra'ntia. Limb of calyx 5-lobed. Corolla salver-shaped, with a short tube, and a 5-parted limb. Anthers inclosed, sessile, within the throat. Stigmas 2. Berry nearly dry, crowned by the calyx, many seeded. Seeds fixed to the central placenta, imbedded in the pulp.

38 Chapel'fria. Limb of calyx 5-parted, permanent. Corolla with a slender tube, a 5-parted limb, and a villous throat. Stamens 5, nearly sessile, inclosed, inserted in the middle of the tube. Stigma bipartite. Fruit ovoid, rather fleshy, crowned by the erect, large, spreading limb of the calyx, many seeded. Seeds angular, and clothed with adpressed golden silky down.

2, linear. Fruit globose, crowned, dry, hard. Placentas 2, thick, adnate to the dissepiment. Seed nestling on the surfaces of the placentas.

40 Menestoria. Limb of calyx 5-parted. Corolla with a long terete tube, an almost naked throat, and a 5-lobed limb. Anthers 5, oblong, sessile within the tube. Stigma bifid, inclosed. Fruit baccate, nearly dry, not crowned. Placentas adnate to the dissepiment, many seeded.

41 Helospora. Limb of calyx campanulate, 4-toothed. Corolla with a longish tube, a naked throat, and a 4-lobed spreading limb. Anthers 4, linear, inclosed. Style 4-cleft at the apex. Berry crowned, tetragonal, not divided into cells, but having the seeds immersed in the pulp, and disposed crosswise in a double series.

42 Hypotis. Limb of calyx sheath-formed, cleft on one side, and drawn out into a mucronate uricle on the other. Corolla funnel-shaped, with the tube a little incurved, and the limb blunt and 5-lobed. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Ovarium girdled by a 5-crenate urceolus. Stigma of 2 adpressed lobes. Berry ovate, crowned. Seeds numerous, minute.

45 Po'chellia. Limb of calyx small, 5-toothed. Corolla with a short obconical tube and a 5-lobed limb, which is twisted in estimation. Anthers 5, linear, sessile in the tube. Stigmas 2, exserted a little. Berry dry, obovate, crowned. Seeds 4-6 in each cell, deformed, clothed with silky down.

46 Cup'ia. Limb of calyx 5-parted, permanent. Corolla funnel-shaped, with a terete tube, which is a little longer than the calyx, and gradually widening to the throat; and a 5-parted recurved limb. Filaments very short; anthers oblong. Style 2-lobed at the apex, or 10-angled. Berry globose, crowned. Placentas spongy, central, few-seeded at maturity. Seed angular, wrinkled at the hilum.

47 Tare'enna. Limb of calyx 5-parted, permanent, reflexed. Corolla unknown. Berry globose, 8-striped, crowned. Placentas central, spongy. Seed 1-6 in each cell, horizontal, semilunate, rugged.

51 Pe'tu'nga. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a villous throat. Stamens 4, a little exserted. Style villous; stigma bidentate. Berry globose, umbilicate. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb.; but according to Blume scale-formed, and imbricated downwards.

52 Hig'gi'sia. Limb of calyx 4-toothed, permanent. Corolla funnel-shaped, somewhat campanulate, with a short tube, a 4-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube; anthers ovate, inclosed. Stigmas 2, exserted. Berry oblong, somewhat tetragonal, crowned, many seeded. Placentas adnate to the dissepiment.

54 Cat'es'ea. Limb of calyx 4-toothed or 4-parted. Corolla funnel-shaped, with a very long tube, which is gradually dilated to the throat; and a 4-lobed limb. Stamens 4, inserted in the bottom of the corolla; anthers linear, exserted. Stigma bidentate. Berry globose or oblong, crowned. Placentas spongy, fixed to the top of the dissepiment. Seeds numerous, scale-formed, collected into two fasicicles in each cell.

Tribe III.

Hedyoti'dee. Fruit capsular (f. 95. k.), 2-celled, dehiscing at the cells; and rather membranous and indehiscent; cells many-seeded. Seeds not winged.—Shrubs or herbs, with opposite leaves. Stipulas interpetiolar.

Subtribe I. Rondeletie'æ. Stipulas twin on both sides, combined or distinct, but neither sheathed nor divided into many bristles.—Trees or shrubs.

55 Condami'ne. Calyx campanulate (f. 95. a.), 5 crenate or 5-toothed; limb deciduous. Corolla funnel-shaped (f. 95. b.), with a somewhat curved tube, which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. b.). Stamens inserted above the middle of the tube (f. 95. c.), or near the throat; anthers oblong-linear, bifid at the base (f. 95. f.), length of corolla. Stigma 2-lobed (f. 95. e.). Capsule turbinate, truncate, opening in the middle of the cells (f. 95. k.). Seeds wedge-shaped (f. 95. i.).

56 Alse'is. Limb of calyx superior, 5-parted. Corolla cupul-
shaped, with a 5-lobed limb and a bearded throat. Stamens 5, free to the base of the corolla, exserted. Stigma divided. Ovary 2-celled, many ovulate.

57 Macrosyneum. Limb of calyx minute, 5-toothed, permanent. Corolla tubular, with a widened throat and a 5-lobed limb; tube pentagonal at first. Stamens 5, free from the corolla, except at the very base, hairy above the middle; anthers oblong, inclosed. Stigma obsolete, 2-lobed. Capsule 2-valved; valves dehiscing at the sides. Seeds acute, imbricated.

58 Chimarrhia. Limb of calyx almost wanting, entire. Corolla with a short tube and a 5-cleft spreading limb: lobes hairy in the middle outside. Stamens 5, inserted at the top of the tube, hairy at the base; anthers oval. Capsule obovate or turbinate, crowned; valves semibifid. Seeds many.

59 Augoste'a. Limb of calyx 5-parted. Corolla funnelf-shaped, much longer than the limb of the calyx; tube widened at the apex, a little incurved; limb 5-parted, spreading. Anthers 5, sessile in the sinuses of the corolla, and shorter than its lobes. Style hairy at the base; stigma bifid. Capsule oblong, separable from the calyx, and naked at maturity, but crowned. Seeds many, tetragonal.

60 Portoandia. Limb of calyx 5-parted; tube 5-nerved. Corolla large, funnelf-shaped, with a short tube, a wide throat, and a bluntly 5-lobed limb. Stamens 5, inserted in the bottom of the throat; anthers long, a little exserted. Stigma univulvate. Capsule obovate, crowned, and retuse at the apex; valves dehiscing at the apex. Placentas coriaceous, central. Seeds scabrous.

61 Bikria. Calyx with an 8-ribbed tube, and a 4-parted limb. Corolla clavate, tetragonal, with a 4-cleft limb. Anthers 4, linear, not exceeding the limb. Capsule ovate, at length separating from the calyx, 2-celled or nearly 4-celled; valves bifid at the apex. Placentas narrow. Seeds small, created on the margins.

62 Isidorea. Limb of calyx 5-parted. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb. Stamens inserted in the very base of the corolla, and equal in length to it, monadelphous and hairy at the base; anthers oblong, obtuse. Stigma bilamellate. Capsule nearly globose, pentagonal, truncate at the apex, crowned. Coecula delicient, many seeded. Seeds angular, furnished with a cup-formed membrane at the base.

64 Rondeletia. Limb of calyx 4-5-parted, permanent. Corolla with a cylindrical tube and a 4-5-lobed spreading limb. Anthers 4-5, sessile on the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned; valves cleft in the middle. Placentas central. Seed angular, few in the cells at maturity.

65 Wendlandia. Limb of calyx very short, permanent, 4-5-toothed. Corolla with a terete tube, which is longer than the calyx, and a 4-5-lobed spreading limb. Stamens 4-5, rising from the top of the tube; anthers oblong, exserted. Stigma bifid. Capsule ovate-globose, crowned; dehiscing at the cells at top, many seeded.

66 Xanthophyllum. Limb of calyx 4-5-cleft. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft spreading limb. Stamens 4-5, exserted, inserted in the throat, convoluted. Style perforating the disk of the ovary. Stigma 2-lobed, gaping. Drupes dillymous, crowned, divided into 2 many seeded cells. Placentas prominent, fixed by the middle on both sides. Seeds angular, minute.

67 Carphalia. Limb of calyx 4-parted, permanent. Corolla with a long filiform tube, a ventricose hairy throat, and a 4-parted limb. Anthers oblong, almost sessile, inclosed. Stigma bifid. Capsule crowned, dehiscing at the cells; valves semiquilliferous; cells many seeded.

69 Vire'tia. Limb of calyx divided into 5 sesoecous lobes. Corolla funnel-shaped, with an obovate tube, a naked throat, and having the limb divided into 5 linear-oblong ciliolate lobes. Stamens 5, much exserted; anthers linear, oscillatory, bifid at the base. Stigma univulvate. Capsule globose, dehiscing at the cells, at first crowned. Seeds numerous, 4-5-sided, a little muriculated. Hairy half herbaceous plants.

71 Augustemma. Limb of calyx 3-4-5-toothed. Corolla rotate, spreading, 3-5, rarely 3-4-parted. Stamens alternating with the lobes of the corolla. Anthers large, exserted, cohering at the apex. Style perforating the fleshy disk; stigma globose. Capsule crowned, dehiscing radiately at the apex. Placentas convex, adnate to the disseminatum. Seeds numerous, angular.—Herbs.

73 Tel'a. Limb of calyx 5-toothed. Corolla with an oblong tube, and a 5-cleft toothed curved limb. Anthers inclosed. Capsule many seeded.—A procumbent herb.

74 Dentella. Limb of calyx 5-cleft. Corolla funnel-shaped, 5-cleft, with a hairy throat; lobes furnished with one tooth on each side. Anthers 5, inclosed, nearly sessile. Stigmas 2. Capsule or berry dry, almost indehiscent, nearly globose, crowned. Placentas fleshy, prominent on both sides within the cells. Seeds small, ovate.—Creeping herbs.

Subtribe II. Hedyotae. Stipulas formed into a sheath on each side, adnate to the pedicels, and ending in many bristles at the apex.—Herbaceous or suffruticous plants.

76 Hedyotis. Limb of calyx 4-toothed, permanent. Corolla tubular, with a bearded throat, and a 4-cleft limb. Stamens exerted a little; anthers ovate-roundish, small. Capsule ovate, crowned, dehiscing at the cells. Seed numerous, minute, angular.

77 Oldenlandia. Limb of calyx 4-toothed, permanent. Corolla with a short tube, a 4-cleft limb, and a villous or glabrous throat. Stamens a little exerted; anthers ovate or orbicular. Stigma undivided or bifid. Capsule nearly globose, crowned, dehiscing at the vertex by a loculocoidal chink. Seeds numerous, small, half immersed in a globose placenta.

78 Gonostea. Limb of calyx short, truncate, somewhat 4-toothed. Corolla having the tube inflated at the base, the throat villous, and the lobes keeled. Stamens inclosed. Stigmas 2, obtruse, sessile. Capsule compressed, furnished with a double wing on each side, which also runs down along the pedicel, crowned, dehiscing between the stigmas. Seeds numerous, small, sericoculcate.

79 Kohoutia. Limb of calyx 4-toothed. Corolla with a long terete tube, and a 4-lobed limb: lobes cuspidate. Anthers sessile within the tube, inclosed. Style bifid at the apex. Capsule globose, crowned, dehiscing at the cells. Seeds numerous, small, half immersed in pits on the globose pedicellate placenta.

80 Kaua. Limb of calyx 4-cleft or 4-toothed. Corolla salver-shaped, with a long tube and a 4-cleft limb. Anthers linear or oblong, nearly sessile within the throat. Style bifid at the apex. Capsule globose, crowned, dehiscing at the apex at the cells. Seeds numerous, small, angular, inserted on fleshy placenta, which are fixed to the middle dissepiment.

81 Asotis. Limb of calyx 4-toothed (f. 96. a.), permanent. Corolla salver-shaped (f. 96. b.), with a 4-lobed limb, and an almost glabrous throat. Anthers inclosed or exerted (f. 96. c.). Stigma somewhat 2-lobed (f. 96. c.). Capsule ovate, crowned, dehiscing at the cells at the apex. Seeds 4-8 in each cell, rather angular.

82 Rachicallis. Limb of calyx 4-lobed, furnished with 1-3 teeth between each of the lobes. Corolla with a long terete tube, a short spreading 4-lobed limb, and a beardless throat. Anthers at the throat inclosed. Stigma 2-lobed. Capsule subdidymous, dehiscing at the cells, crowned. Seeds angular, 8-20 in each cell.

83 Lu'ca. Limb of calyx divided into 4 bifid teeth, permanent. Corolla with a very short tube and a 4-lobed limb. Stamens shorter than the corolla. Style short, bifid. Capsule globose, didymous, dehiscing at the cells and near the dissepiment; hence it is somewhat 8-valved at the top. Seed 2 in each cell, ex Spreng., 5-6, ex Rich.

84 Polyprénum. Limb of calyx 4-parted. Corolla with a very short tube, a bearded throat, and a 4-lobed limb. Stamens 4, inclosed. Style undivided. Capsule ovate, compressed, dehiscing at the cells. Placentas oblong, adnate to the bottom of the dissepiment. Seeds numerous, very minute, angular.

Tribe IV.

Iseritie. Fruit drupaceous (f. 97. g.), composed of from 2 to 6 many seeded pyrene or cocciula (f. 97. f.). Albumen fleshy.—Shrubs or herbs. Leaves opposite. Stipulas interpetiolar.

85 Metabo'loos. Limb of calyx 4, rarely 5-cleft. Corolla funnel-shaped, with a 4, rarely 5-parted limb. Stamens 4-5, inserted in the throat of the corolla. Stigma bifid or quadridif. Berry dry, crowned, divisible into 2-4 cocciula. Seeds angular, fixed to the prominent placenta.—Suffrutose herbs.

86 Gonza'lea. Limb of calyx 4-lobed. Corolla funnel-shaped or salver-shaped, villous outside; with a long cylindrical tube, and a hairy or downy throat. Stamens 4, inclosed. Stigmas usually 4, adpressed to each other. Berry of 3-4 pyrene. Seeds angular, dotted, minute.

87 Isérite. Limb of calyx 4-6-toothed (f. 97. e.). Corolla with a long tube (f. 97. b.), 6-lobed at the apex (f. 97. c.), woolly inside, having the recesses between the lobes drawn out into crests. Stamens 6, inclosed (f. 97. d.). Stigmas stellate. Berry globose (f. 97. g.), crowned (f. 97. h.), composed of 6 triquetrous pyrene (f. 97. f.).

Tribe V.

Hamellie. Fruit bacca, many celled (f. 98. f. h.); cells many seeded. Albumen fleshy.—Shrubs or trees, opposite or verticillate leaves, and interpetiolar stipulas.

89 Évo'sma. Limb of calyx very short, 4-toothed (f. 98. a.). Corolla subrotate (f. 98. c.), 4-cleft. Stamens 4, inserted in the throat (f. 98. b.); anthers ovate, inclosed, or nearly so. Stigma thick or 4-lobed. Fruit crowned (f. 98. g.), 4-celled (f. 98. h.).

90 Sapi'cea. Limb of calyx 4-5-parted. Corolla salver-shaped, with a long slender tube, a 4-5-parted limb, and a hairy throat. Stamens 4-5, inclosed, or nearly so. Style 4-5-lobed at the apex. Berry globose, crowned, 4-5-celled.

91 Oló sty'la. Limb of calyx very short, 5-toothed. Corolla subrotate, with a short tube, which is pilose inside, and 4 reflexed lobes. Stamens 5, inserted in the throat; anthers linear, exerted. Style undivided. Berry crowned, 4-celled.

96 Schadea. Limb of calyx truncate or subdenticulated. Corolla funnel-shaped, with a terete tube, a dilated pilose throat, and a 5-lobed spreading limb, each lobe usually furnished on the inside with a retrograde callous tooth. Anthers 5-8, linear, nearly sessile, inserted in the throat, hardly exserted. Stigma biform or quadrifid. Berry pea-shaped, 3-4-sided, crowned, 2-4-celled. Seeds imbedded in the pulp.

97 Brignolla. Limb of calyx 4-toothed; teeth unequal. Corolla with a short tube, and a 6-lobe limb, which is very hairy inside as well as the throat. Stamens 6, inserted in the tube; anthers linear. Stigma capitate, undivided. Fruit globose, fleshy, crowned.

98 Patilla. Limb of calyx tubular, with a sinuated, very short, 5-toothed border. Corolla tubular, 5-parted, densely clothed with silky down inside. Stamens 5, inserted in the tube; anthers oblong-cordate, inclosed. Style undivided. Berry roundish, crowned, 4-6, but usually 5-celled. Seeds fixed to a fleshy, 2-lobe placenta.

99 Polyphragmum. Limb of calyx entire or 5-toothed. Corolla salver-shaped, bristly, with a terete tube, and a 10-parted limb. Stamens 10, inserted in the middle of the tube; anthers linear, inclosed. Stamens numerous. Berry globose, 10-20-celled, with 1 series of seeds in each cell.

100 Moreia. Limb of calyx erect, nearly entire. Corolla short, tubular, with a 5-parted limb, which is imbricate in resurrection. Stamens 5, inserted in the throat, exserted; anthers linear. Style fusiform towards the apex; stigma biform. Fruit fleshy, 4-5-celled; cells 2-3-seeded.

B. Cells of fruit usually 1-seeded, rarely 2-seeded.

Tribe VI.

Cordeira. Fruit baccate, of many cells; cells 1-seeded. 
Differs from the neighbouring tribes in the cells being 1-seeded. Shrubs with opposite leaves, and broad intercostal stipules.

101 Tricalydia. Flowers hermaphroditic.

102 Cordiera. Flowers unisexual.

Tribe VII.

Guettardaceae. Fruit drupaceous (f. 101. d. f. 103. f.)

composed of 2-5 1-seeded pyrenes or nuts (f. 103. g.). Seeds terete, elongated, usually erect. Alumen fleshy.—Shrubs or small trees. Leaves usually opposite, rarely 3 in a whorl, with intercostal stipules.

Subtribe I. Morindaee. Flowers and fruit congregated, or joined together into a head.

103 Morinda. Character the same as that of the subtribe.

Subtribe II. Guettedae. Flowers distinct, not concrete.

104 Myrsineodora. Limb of calyx tubular: with an entire border. Corolla funnel-shaped, 4-cleft, the throat closed from arched scales or hairs. Stigma simple (Jack.), or quadrifid (Blum.). Drupe baccate, composed of 4 triquetrous pyrenes.

106 Hyporatherum. Limb of calyx 4-toothed. Corolla small, subcampanulate, with a villous throat, and a 4-cleft spreading limb. Stamens 4, inserted in the mouth of the tube. Stigma biform. Drupe crowned, 2-celled; cells containing 2 pyrenes.

107 Nectera. Limb of calyx small, 4-toothed. Corolla funnel-shaped, sub-campanulate, 4-lobed (f. 100. b.) glabrous inside. Stamens rising from the bottom of the corolla (f. 100. c.), adnate to the tube; anthers roundish, hardly exserted. Stigmas 2 (f. 100. d.), hairy. Berry roundish, uniloculate, containing 2-4 pyrenes. Herbs creeping.

108 Mitchella. Limb of calyx large, 4-toothed. Corolla funnel-shaped, with a terete tube; having the throat as well as the lobes hairy inside. Stamens adhering to the tube almost to the throat; anthers ovate, hardly exserted. Stigmas 4, inclosed. Berry nearly globose, crowned, containing 4 pyrenes. Creeping herbs.

109 Mephitidae. Limb of calyx 3-6-parted or toothed. Corolla funnel-shaped, 4-6-cleft, usually hairy. Stamens 4-6, inserted towards the throat; anthers linear, exserted, or inclosed. Stigmas 4-9. Drupe baccate, crowned, containing 4-9 pyrenes.

111 Guettarda. Limb of calyx permanent or deciduous, truncate or irregularly toothed (f. 101. a.). Corolla salver-shaped, with a cylindrical tube (f. 101. c.), and a 4-9-lobed limb (f. 101. b.). Anthers 4-9, inserted in the throat, sessile, inclosed. Stigma capitate, rarely 2-lobed. Drupe crowned (f. 101. d.), containing a 4-9-celled angular putamen (f. 101. e.); cells 1-seeded.

112 Malanea. Limb of calyx 4-toothed. Corolla small, nearly rotate, with a very short tube, and a 4-lobed spreading limb. Stamens exserted; anthers roundish. Drupe dry, crowned, containing a 2-celled putamen; cells 1-seeded.
113 Antirrhē'a. Limb of calyx campanulate, 4-toothed. Corolla tubular, 4-cleft. Anthers nearly sessile in the throat, not exserted. Stigma bifid. Drupe sub-baccate, crowned, containing a 2-celled patamen; cells 1-seeded.

116 Timōn'ius. Limb of calyx tubular, truncate, 2-6-toothed. Corolla tubular, salver-shaped, with a 4-6-parted spreading limb, and a naked throat. Stamens 4, almost sessile, inserted in the upper part of the tube; anthers 4, oblong-heart-shaped. Stigmas 2, digitately 5-cleft. Drupe globose, crowned, containing 7-23 bony 1-seeded nuts.

117 Hamiltonia. Limb of calyx 5-parted. Corolla funnel-shaped, with a long tube (f. 102. b.), and a 5-lobed limb (f. 102. c.). Stamens 5, inserted in the throat, inclosed. Stigma 5-cleft. Capsule crowned, delising at the apex, containing 5-1-seeded pyrene.

118 Lepōter'mis. Calyx inclosed by a 2-leaved calyciform involucrem; limb 5-lobed. Corolla funnel-shaped, scabrous, with a terete tube, which is pilose inside, and a 5-lobed cuspidate limb. Stamens 5, very short, inclosed. Stigma 5-cleft. Fruit 5-celled, 5-seeded?

119 Psath'u'ra. Limb of calyx campanulate, 5-6-toothed. Corolla bearded inside, with a short tube, and a 5-6-lobed spreading limb. Anthers 5-6, nearly sessile in the throat. Stigma 5-6-lobed. Berry globose, crowned, containing 6 pyrenae.

121 Pyro'stria. Limb of calyx 4-5-toothed. Corolla subcampanulate, 4-5-cleft; throat tomentose. Stamens 4-5, hardly exserted. Stigma capitulate, bifid. Fruit pear-shaped, not crowned, containing 4-8 bony nuts.

122 Octa'viā. Limb of calyx hardly any, truncate. Corolla unknown. Ovary inclosed by a fleshy disk, which is perforated in the middle. Drupe fleshy, globose, not crowned, containing 8 pyrene.

123 Litosa'nthēs. Limb of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short, spreading 4-cleft limb. Stamens 4, inclosed; anthers linear. Stigma 4-toothed. Drupe succulent, obovate, umbonate, containing 4 nuts.

124 Eryth'als. Limb of calyx short, with a 5-10-toothed border. Corolla rotate, without a tube, 5-10-parted. Stamens 5-10, hardly adnate to the corolla at the base; anthers linear. Stigma bilamellate. Drupe globose, crowned, containing 5-10 pyrene.

127 Gynōchotodes. Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside; lobes connivent below and spreading above, each furnished with an inflexed point at the apex. Stamens 4-5, inclosed, inserted in the base of the corolla. Stigma bifid, warted. Drupe globose, umbilicate, containing 4 pyrene.

128 Ceilosper'mum. Limb of calyx quite entire, deciduous. Corolla with a short tube, and a 4-6-cleft, spreading limb. Stamens 4-5, exserted, inserted in the throat; anthers linear, incumbent. Stigma bifid. Drupe globose, umbilicate, containing 4 pyrene.

129 Ancylana'thus. Limb of calyx 5-parted (f. 103. a.). Corolla tubular (f. 103. b.), incurved; limb regular, 5-cleft (f. 103. c.); lobes cuspitate. Anthers 5, sessile in the throat (f. 103. c.). Stigma 5-lobed (f. 103. d.). Fruit 5-celled (f. 103. g.); cells 1-seeded.

130 Phalla'ria. Calyx with a globose tube, and an acutely 5-toothed limb. Corolla tubular, 5-cleft; lobes spreading or reflexed. Anthers 5, ovate, at the throat. Style filiform, crowned by an elongated thick stigma. Ovaryum 2-seeded.

131 Hyllactium. Limb of calyx 5-toothed. Corolla funnel-shaped, with a long tube and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed. Stigma cylindrical, 5-furrowed. Drupe dry, containing 2-celled rugged nut: one of the cells usually abortive.

132 Cuvis'era. Limb of calyx 5-parted. Corolla campanulate, 5-cleft, spinescent at the apex. Anthers 5, at the throat, inclosed. Stigma dilated, with a reflexed margin. Fruit baccate, 5-celled; cells 1-seeded.

136 Bili'o'nia. Limb of calyx 5-7-parted. Corolla salver-shaped, with a 5-7-parted limb, and the throat bearded by bristles inside. Stamens 5-7, adnate to the tube. Ovarium covered by a nectariferous nectarulus at the apex. Style 1, crowned by 4 stigmas. Drupe 1-seeded by abortion.
TRIBE VIII.

PEDERIES. Fruit 2-celled, indehiscent, hardly fleshy, the rind easily separated from the seeds or carpels. Carpels compressed, 1-seeded (f. 104. f.), hanging from a filiform axis. Albumen fleshy.—Climbing shrubs, with opposite leaves, and interpetiolar stipulas.

137 Lygodios'idea. Limb of calyx 5-toothed (f. 104. a.). Corolla having the tube much longer than the teeth of the calyx (f. 104. b.), with a hairy throat and a 5-lobed limb (f. 104. c.); lobes revolute. Anthers sessile within the tube (f. 104. c.). Stigmas 2, slender (f. 104. d.). Fruit indehiscent, crowned (f. 104. g.), containing 2 carpella.

TRIBE IX.

COFFEAE. Fruit 2-celled (f. 105. k. f. 107. c.), baccate, containing 2 1-seeded bony nuts (f. 107. d.), which are flat inside, and usually marked by a furrow on the outside; rarely only containing 1 nut from abortion. Albumen bony.—Trees or shrubs, with opposite leaves. Stipulas interpetiolar, 2 on each side, combined or distinct.

SUBTRIBE I. COFFEAE. Flowers distinct, not joined together.

142 Ca'nthium. Limb of calyx 4-5-toothed. Corolla with a short tube, a bearded throat, and a 4-5-lobed spreading limb. Stigma undivided, globose or nitriform. Berry globose or didymous, crowned.

144 Psy'dranx. Limb of calyx 5-toothed, deciduous. Corolla with a short tube, a hairy throat, and a 5-lobed reflexed limb. Stamens inclosed. Style exserted; stigma bilamellate. Berry fleshy, obovate, areolate at the apex.

146 Nes'cia. Limb of calyx hardly any, quite entire. Corolla with a short tube, a 5-cleft limb, and a naked throat.

Stamens 5, inclosed, nearly sessile, inserted in the throat; anthers linear, acute. Stigmas 2, face to face. Ovarium 2-celled.

147 Diplo'spora. Limb of calyx subcampanulate, 4-toothed. Corolla with a broad tube, a pilose throat, and a 4-lobed spreading limb. Stigma bifid. Ovarium 2-celled. Fruit unknown.

149 Sidebo'ndron. Limb of calyx hardly any, somewhat 4-toothed. Corolla with a long terete tube, a 4-lobed obulate limb, and a glabrous throat. Anthers 4, oblong, sessile at the throat. Style bifid at the apex. Berry dry, subglobose, not crowned.

150 Euma'chia. Limb of calyx 4-toothed, deciduous. Corolla funnel-shaped, with a short tube, a naked throat, and a 4-parted spreading limb. Stamens 4, inserted at the bottom of the tube; anthers oblong, inclosed. Stigma bifid. Berry globose, not crowned.

151 Declie'xuia. Limb of calyx 4-parted (f. 106. b.). Corolla funnel-shaped (f. 105. g.), with a terete tube (f. 105. f.), a bearded throat, and a 4-lobed reflexed limb. Stamens 4, inserted in the throat; anthers linear, incumbent, exserted (f. 105. e.). Stigma bifid (f. 105. c.). Berry nearly dry, somewhat didymous, compressed (f. 105. k.), crowned (f. 105. b.).

152 Tetr'ea. Limb of calyx 4-parted. Corolla short, funnel-shaped, 4-cleft; lobes spreading; throat beset with long hairs. Stamens inserted in the upper part of the tube, exserted. Style inclosed: stigmas 2. Drupe oblong, compressed, crowned.

153 Choco'e'ca. Limb of calyx 5-toothed. Corolla funnel-shaped, with an obconical tube or throat, and a 5-lobed acute limb. Stamens 5, downy, hardly adnate at the bottom of the corolla; anthers linear, inclosed. Style clavate or 2-lobed at the apex. Berry somewhat didymous, compressed, crowned.

154 Mara'nis. Limb of calyx somewhat turbine, semi-quincunx. Corolla funnel-shaped, with an obconical tube, which is bluntly 5-toothed or 5-lobed at the apex. Stamens inserted into the middle of the tube, inclosed; anthers ovate. Stigma undivided or somewhat 2-lobed. Berry globose, crowned.

155 Sal'd'nia. Limb of calyx somewhat campanulate, obliquely repand. Corolla with a short tube, an acute 4-parted limb, and a hairy throat. Stamens 4, inserted in the throat, hardly exserted; anthers oblong, nearly sessile. Fruit ovoid, compressed, crowned, drupaceous, 1-celled and 1-seeded by abortion, small.

156 Sclosa'xthus. Lobes of calyx 4, linear-lanceolate. Corolla tubular, tetragonal before expansion. Stamens adnate to the lower part of the tube, downy, not exserted; anthers linear. Stigmas 2. Drupe nearly globose, crowned, containing a 2-celled 2-seeded nut.

157 Chome'lia. Limb of calyx 4-toothed. Corolla salver-shaped, with a long slender tube, a glabrous throat, and a 4-lobed limb. Anthers 4, almost sessile in the throat. Style bifid at the apex, situated among the anthers. Drupe ovate, crowned, containing a 2-celled 2-seeded nut.

158 Bac'onta. Limb of calyx bluntly 4-cleft. Corolla fun-
nel-shaped, with a short terete tube, a bearded throat, and 4 oblong lobes, which are longer than the tube, and twisted in aestivation. Anthers 6, linear, almost sessile, exserted. Style exserted. Stigma undivided. Berry dry, 2-celled, 2-seeded.

159 *Ixora*. Limb of calyx small, 4-toothed (f. 106, a.). Corolla salver-shaped (f. 106, b.), with a slender terete tube (f. 106, d.), and a 4-parted spreading limb (f. 106, b.). Anthers 4, almost sessile in the throat. Style bifid (f. 106, e.) at the apex, equal in length to the corolla or a little longer. Berry drupaceous, crowned, nearly globose.

160 *Pave'tha*. All as in *Ixora*, but differs in the style being exserted beyond the corolla, and clavate, undivided, or hardly bifid at the apex.

162 *Coussaerea*. Limb of calyx tubular, sinuately 4-toothed. Corolla with an elongated terete tube, which is hardly subtilim under the apex, and a glabrous throat. Stamens 4, inserted in the upper part of the tube, inclosed; anthers oblong-linear. Stigma bilobate, hardly exserted. Berry ovate-globose, hardly fleshy, crowned, 1-celled, 1-seeded.

163 *Polvzus*. Limb of calyx obsoletely denticulated, deciduous. Corolla with a cylindrical tube, which is shorter than the 4-5 lobes of the limb, and a villous throat. Anthers hardly exserted. Style short; stigmas bifid. Berry drupaceous, nearly globose, not crowned.

166 *Para'mea*. Limb of calyx very short, 4-toothed, or entire. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear lobes. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, marked by 8 crenae at the apex, 1-celled by abortion at maturity.

167 *Strep'melia*. Limb of calyx campanulately tubular, 4-5-toothed. Corolla tubular, with a 4-5-parted spreading limb, and a naked throat. Stamens inserted in the middle of the tube, pilose in the free part; anthers linear, inclosed. Fruit ovoid, crowned.

168 *Coffe'a*. Limb of calyx small, 4-5-toothed (f. 107, a.). Corolla tubular, funnel-shaped, with a 4-5-parted spreading limb (f. 107, b.). Stamens 4-5, inserted in the middle of the upper part of the tube, exserted or inclosed. Style bifid at the apex. Berry umbilicate (f. 107, h.), not crowned.

169 *Antheura*. All as in *Psychotria*, but differs in the corolla being rotate and 5-parted; in the anthers being sagitate at the base and caudate at the apex; in the style being subulate, and longer than the corolla, and in the stigma being simple.

171 *Psychotria*. Limb of calyx 5-lobed or 5-toothed. Corolla funnel-shaped, short, 5-cleft; limb spreading or recurved; throat bearded or glabrous. Stamens 5; anthers exserted or inclosed. Stigma bifid. Berry drupaceous, crowned.

172 *Antônia*. Calyx having the tube clothed with imbricate scales and a 5-cleft limb. Corolla funnel-shaped, with a bearded throat and a 5-parted limb. Stigma ovate, bifid. Berry 2-celled.

173 *Palicou'rea*. All as in *Psychotria*, except the corolla, which is tubular and cylindrical, and a little gibbous at the base or curved, 5-cleft, bearded beneath the middle inside. The teeth of the calyx, and the lobes of the corolla, sometimes rather unequal.

174 *Chara'tia*. Limb of calyx urceolate, rather tubular, entire or 5-toothed at the apex. Corolla with an elongated equal tube, and 5 short acutish erect or spreading lobes. Anthers 5, inserted in the mouth or top of the tube, inclosed or a little exserted. Stigmas 2. Berry ovate, crowned, hardly dry.

175 *Jackia*. Limb of calyx unilaterial, trifid at the apex. Corolla funnel-shaped, with a filiform tube and a campanulate 5-parted limb. Anthers a little exserted, filiform, sessile at the throat. Style exserted, pilose in the middle; stigma ovate, globose, longitudinallly furrowed.

**Subtribe II. Cephel'dear.** *Flowers disposed in heads, involucrated by bracteas.*

177 *Carapichea*. All as in *Cephe'lis*, but the anthers and stigmas are a little exserted. Berry dry, salicate, divisible into two parts, crowned. The nuts are smooth on the outside, not as in *Cephe'lis* striated on the outside.

180 *Pata'bea*. Limb of calyx very short, entire, or 4-toothed, rarely 5-6-toothed. Corolla with a short, nearly terete tube, and 4-6 spreading lobes. Anthers 4-6, sessile within the throat. Stigma bluntly bifid. Berry globose, crowned, smooth, 2-celled, 2-seeded.

181 *Saum'ania*. Limb of calyx bluntly 4-toothed or sinuated. Corolla with a short tube and a 4-lobed limb. Stamens with very short filaments, and very long linear anthers. Style undivided. Berry dry, crowned, compressed, 1-celled and 1-seeded from abortion.
Tribe X.

Spermacoceae. Stigma bilancellata (f. 189 b). Fruit dry, and rather fleshy, usually composed of 2 1-seeded mericarps, rarely of 3-4, which are sometimes joined together and sometimes separating, indehiscent, but sometimes dehiscing in various ways. Albumen between fleshy and horny.—Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually divided into many bristles at the apex.

Subtribe I. Cephalanthae. Flowers and fruit sessile, densely aggregate, seated on a globose receptacle. Fruit divisible into two parts. Shrubs.

182 Cephalanthus. Limb of calyx angular, 4-toothed. Corolla tubular, slender, with a 4-cleft limb. Stamens 4, short, inserted in the tube, hardly exserted. Style exserted; stigma capitate. Fruit crowned.

Subtribe II. Euspermacoceae. Flowers distinct. Fruit dry, usually divisible into 2 parts, and sometimes in 3 or 4 parts.—Usually herbs, rarely shrubs.

183 Democrita. Lobes of calyx 5, lanceolate, acute, stiff. Corolla, stamens, and style unknown. Fruit 2-celled, 2-seeded when young, but becoming 1-celled from the dissepiment having vanished at maturity. Seeds free within the pericarp.—A shrub.

184 Octodon. Limb of calyx with 8 very short teeth. Corolla campanulate, 4-cleft, beset with adpressed hairs inside, which are tipped with glands. Stamiens inserted in the bottom of the tube. Stigma globular. Capsule turbinate, oblong, 2-celled, 2-valved, dehiscing at the dissepiment.

185 Borriana. Limb of calyx 2-4-toothed. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamens 4, exserted or inclosed. Stigma bifid or unidivid. Capsule crowned, 2-celled, dehiscing at the dissepiment when mature; coccula bursting by a longitudinal chink inside.

186 Spermacoe. Limb of calyx 2-4-toothed (f. 108 a.), with sometimes accessory teeth. Corolla salver-shaped or funnel-shaped, 4-lobed (f. 108 c.). Stigma bifid or unidivid. Capsule crowned (f. 108 f.), 2-celled; nuts divisible into two parts from the apex, one open and the other closed.

187 Hexaste'palum. Limb of calyx 6-parted. Corolla campanulate funnel-shaped, with an obconical tube and 4 lanceolate lobes. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, divisible into two parts at the dissepiment; the dissepiment being double the nuts are both closed.

188 Diaea. Calyx with a 2-4-toothed limb, rarely more. Corolla funnell-shaped, with a 4-lobed limb. Stamens 4, exserted or inclosed. Style bifid or unidivided. Fruit crowned, 2-celled, divisible into two parts: the parts indehiscent.

189 Triodon. Limb of calyx 2-4-toothed, with sometimes other accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bifid. Capsule papery, crowned, 2-celled: nuts 2, indehiscent, having the axis tridentate and remaining after the nuts have fallen.

190 CRUSEA. Limb of calyx constricted above the ovary, profusely cleft into 4 linear lobes, and 4 accessory small ones. Corolla salver-shaped, with a long tube, a glabrous throat, and 4-lobed limb. Stamens exerted. Style exerted, bifid at the apex. Fruit of 2 indehiscent nuts, adhering to a flat membranous permanent axis, but at length separating from it.

192 Knusia. Teeth of calyx 4, unequal. Corolla salver-shaped, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stigma 2-lobed. Fruit 2-celled: the 2 nuts usually separating from the base to the apex at the dissepiment. Seed ovate-triangular.

194 Mitracarpum. Limb of calyx 4-toothed; teeth unequal. Corolla salver-shaped, with a terete tube, having a circular line of hairs near the base inside, a glabrous throat, and a 4-lobed limb. Anthers exserted or inclosed. Stigma bifid. Capsule membranous, crowned, 2-celled, circumcised about the middle.

195 Crucksha'nsia. Limb of calyx 4-toothed: teeth usually having an accessory tooth on each side, I or 2 of which are usually expanded into roundish wings. Corolla salver-shaped, with an elongated tube, a 5-cleft spreading limb, and a glabrous throat. Stamens 5, exserted, inserted in the mouth of the corolla. Anthers linear-oblong, fixed by the base. Stigma bifid, pilose. Capsule globose, subdidymous, crowned, 2-celled, 4-valved: cells 2-seeded. Seed obovate, tubercular.

198 Gaillonia. Limb of calyx 5-7-toothed; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb. Stamens 5-7, exserted from the throat. Style filiform; stigma 2-lobed. Fruit ovoid, containing 2 separable indehiscent nuts.

199 Machaon'ia. Limb of calyx small, 5-parted. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 5, inserted in the throat; anthers subcordinate, exserted. Stigma bipartite. Capsule somewhat tetragonal, crowned, containing 2 1-seeded indehiscent nuts, which are fixed to the top of a linear axis.—Shrubs or trees.
Subtribe III. Putorieae. Fruit rather fleshy, not divisible.
—Shrubs and herbs.

200 Serissa. Limb of calyx 5, rarely 4-cleft, with sometimes accessory teeth. Corolla funnel-shaped, having the tube hairy inside, and the limb 5, rarely 4-parted; lobes induplicate in abortion, hence somewhat trident at the apex. Stamens 5, rarely 4; anthers linear, exserted. Style inclosed, bifid at the apex. Berry nearly globose, 2-celled, 2-seeded.

201 Ermônea. Limb of calyx 4-6-parted, permanent. Corolla salver-shaped, with a terete subtetragonal tube, a naked throat, and 4-6 lanceolate revolute lobes. Stamens longer than the corolla; anthers acute. Style exserted; stigma emarginate. Berry roundish, crowned, 2-celled, 2-seeded.

204 Seieńhora. Limb of calyx tubular, truncate, nearly entire. Corolla funnel-shaped, with a spreading limb, having the tube hairy inside. Stamens 4, exserted; anthers incumbent. Stigma bifid. Drupe bacate, crowned, 8-furrowed, containing 2 1-seeded nuts.

Tribe XI.

Anthospermeae. Flowers sometimes dioecious. Corolla rotate or funnel-shaped; lobes valvate in abortion. Styles 2, distinct from the base, or joined together more or less; stigmas capitate. Fruit constantly of 2 indehiscent 1-seeded mericarps. Seed hardly distinct from the calyx and pericarp. Albumen horny.—Sometimes subshrubs, but usually herbs. Leaves opposite, bearing buds in the axils, having 1-2 or 3 leaf-formed stipulas, on each side, forming whorls along with them. The leaves are only to be distinguished from the stipulas by being furnished with axillary buds.

212 Sherardia. Limb of calyx 4-6-toothed, permanent. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stamens 4. Style one, 2-lobed. Fruit crowned, dry, bipartite.

213 Asperula. Limb very short, 4-toothed, deciduous, or obsolete. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined at the base, and sometimes nearly to the apex. Fruit didymous, not crowned, almost dry.

217 CalliPeltis. Limb of calyx not perspicuous. Corolla 4-parted, campanulate. Stamens 4, very short. Stigmas 2. Fruit oblong, somewhat incurved, 1-seeded from one of the mericarps being abortive.

218 Valla'ntia. Flowers by threes: the middle one hermaphrodite and fertile, the 2 lateral ones male, and joined to the middle one. Limb of calyx denticulated, permanent.
teeth many, irregular, stiff. Corolla of the male flowers trifid, of the hermaphrodite one quadrifid. Stamens 3-4. Styles in the female flower 2. Fruit 3-horned.

**Tribe XIII.**

**OPECULARIÆ.** Fruit 1-celled, 1-seeded, joined together laterally into a head (f. 112, b.), and at length opening by 2 valves at the apex.—Herbs or subshrubs, with opposite leaves. Stipulas on each side, distinct or concretes.

220 OPECULAÆ. Limb of calyx 3-4-lobed. Corolla 3-4 cleft. Stamens 1-5. Style short; stigmas 2, slender. Seeds nearly smooth.—Herbs suffruticosæ at the base (f. 112.).

221 LIPÔSIMA. Limb of calyx 4-parted. Corolla with a tubular base, a ventricose throat, and a 4-lobed limb; tube hairy inside, bearded at the top. Stamens 4, inserted in the throat. Stigmas 2. Capsule globose, 2-celled, but usually only 1-celled from the rupturing of the disseipment, many seeded, crowned by a deciduous operculum.

† Rubiaceæ genera not sufficiently known.

222 PSILOBIUM. Limb of calyx spreading, 5-parted. Corolla with a short tube and a 5-parted limb. Stamens 5, fixed to the base of the corolla. Stigma clavate, 10-winged, exserted. Fruit cylindrical, silique-formed, crowned, 2-celled, many-seeded. Seeds fixed to the central axis, 2 series in each cell.—Shrubs.

223 PLATYÆRIUM. Limb of calyx rotate, 5-parted, rarely 4-parted. Corolla coriaceous, funnell-shaped, with a short tube, which is woolly inside, and a 5, rarely 4-parted limb, which is twisted in rotation. Anthers sessile in the tube. Style clavate, spirally 10-ribbed. Ovarium 2-celled, crowned by an epignous disk.—Shrub, very nearly allied to *Psilobium*.

224 STIPULAÆ. Calyx small, tubular, with a 5-toothed border. Corolla tubular, slender. Stamens 5? Heads of flowers axillary, nearly sessile, surrounded by a large calyceiform 5-toothed villous involucrem.

226 HIMANTHUS. Calyx with a tuberous tube, and a loose permanent 5-parted unequal limb. Corolla funnel-shaped, having the tube much longer than the calyx, and a 5-cleft limb. Stamens 5, capillary, very short, inserted in the tube. Style clavate: stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Flowers spicate, sessile, involucrated by a large deciduous bractea before expansion. Perhaps belonging to *Rubiaceæ*.

## 1. Nauclea

**Tribe I.**

**Subtribe 1. NAUCLEÆ (shrubs agreeing with the genus Nauclea in the globose flowers).** D. C. prod. 4, p. 343. Flowers capitate, sessile upon a globose receptacle (f. 85. c. f. 84. k.).

**Lin. syst.** Pentadëria, Menogynia. Calyx with an oblong tube (f. 83. a.), and a short, truncate, or 5-toothed limb (f. 83. b.); lobes linear. Corolla funnel-shaped (f. 83. c.), with a slender tube, a naked throat, and 5 spreading, oval-oblong lobes (f. 83. c.). Anthers incised (f. 83. g.), or exserted, always shorter than the lobes of the corolla. Style filiform (f. 83. e.), exserted; stigma oblong (f. 83. d.), or ovate, turbinoid, undivided. Capsules 2-celled (f. 83. h. i.), sessile upon the receptacle, not gradually attenuated to the base. Seeds numerous, imbricate, winged, fixed to oblong placentæ, which are adnate to the disseipment. Embryo inverted in a fleshy albumen.—Unarmed trees, rarely shrubs, natives of India and Africa. Leaves opposite, or 3-4 in a whorl, petiolate or sessile. Stipulas interpetiolar, deciduous. Peduncles terminal and axillary, each bearing a globose head of flowers. Bracteæ wanting at the base of the head of flowers, but with linear paleæ among the flowers. Flowers crowded, sessile. This genus differs from Cephalanthus in the parts of the flowers being quinary, and in the cells of the flowers being many-seeded; and from Sarcocéphalus in the fruit being capsular, not bacate; and from Uncaria in the capsules being sessile, not attenuated at the base.

**Sect. 1. NAUCLEÆ (altered from Nauclea).** Lobes of calyx short, acute, or wanting.

### § 1. Capsules growing together in the head.

1. **UNDULÁTA (Roxb. fl. ind. 2. p. 117.) arboreous; branches brachiate; leaves petiolate, ovate-oblong, obtuse, undulated, shining; stipulas elliptic, obtuse, almost the length of the petals; peduncles terminal, solitary; capsules united.** S. Native of the Moluccas. Peduncles drooping, each bearing a large globular head of numerous, small, most beautiful yellow fragrant flowers. Anthers seated in the 5 fissures of the corolla, with hardly any filaments.

Undulated-leaved Nauclea. Fl. May, June. C1t. 1820. Tree 20 feet.

2. **GLABÆRIMA (Bartl. in herb. Heneq ex D. C. prod. 4. p. 944.) branches tetragonal; leaves ovate, glabrous, flat; stipulas oval, length of petals; peduncles solitary; terminal; capsules united.** S. Native of the island of Luzon. This species differs from *N. undulata* in the leaves not being undulated or shining, in the petals being 1 inch long, not 2 inches. The heads are referrible to the fruit of *Plátannas*, but are smooth. Quite-glabrous Nauclea. Tree 12 to 15 feet.

3. **WALLCHIANA (R. Br. in Wall. cat. 6089.) branches quadrangular; leaves broad, roundish-elliptic, obtuse at both ends, but sometimes cuneated at the base, glabrous; peduncles terminal, solitary; stipulas elliptic, obtuse; stamens exerted;
fruit combined. ƒ. S. Native of the East Indies, on the banks of rivers.

Wallich's Nauclea.  Shrub.  
4 N. cadunda (Roxb. in Rees' cycl. vol. 24, no. 6.) arborescent; leaves petiolate, broad-ovate, cordate, obtuse, coriaceous, smooth; stipulas obovate; peduncles terminal, solitary; capsules united. ƒ. S. Native of Ceylon. N. cordata, Roxb. fl. ind. 2, p. 118. Peduncles drooping, each bearing a large beautiful globular head of very fragrant bright yellow flowers. Bracteae a small irregularly 4-toothed withering ring, round the peduncle near the base, within the stipulas. Anthers connate, on very short filaments, from the mouth of the tube just under the fissures of its border.

Conduplicate-capsuled Nauclea. Fl. May, June. Cit. 1820. Tree 20 to 30 feet.

5 N. sericea (Wall. cat. no. 6095.) branches tetragonal; leaves elliptic, obtuse at both ends, almost sessile, smooth; heads terminal by threes; middle one on the shortest peduncle; corollas clothed with silky villi. ƒ. S. Native of the Burman empire, on the banks of the Irrawaddy at Hennarava; and at Chittagong. Capsules combined.

Silky Nauclea. Shrub.
6 N. Brunonis (Wall. cat. no. 6097.) branches obscurely tetragonal; leaves broad, roundish, cordate at the base, smooth above and pubescent beneath, as well as on the petioles; peduncles terminal, trichotomously panicked; the middle ones shortest; stamens exerted; fruit combined; stipulas elliptic, obtuse, pubescent. ƒ. S. Native of the East Indies, at Ploavong.

Brown's Nauclea. Shrub.
7 N. Bartlingii (D. C. prod. 4, p. 344.) branches from compressed to terete; leaves nearly sessile, cordate at the base, oblong, acute, shining above, at length glabrous, pubescent beneath as well as on the branches; stipulas ovate, obtuse, pubescent on the outside, deciduous, longer than the petioles; peduncles terminal, solitary; fruit united, rather tomentose. ƒ. S. Native of Luzon, near Sorzogon. N. mollis, Bartl. in herb. Heneke, but not of Blume. Heads size and form of the fruit of Phellinus.

Bartling's Nauclea. Tree 20 feet.
8 N. diversifolia (Wall. cat. no. 6096.) branchlets tetragonal; leaves of various sizes and shapes, but usually elliptic, obtuse at the apex, and somewhat cordate at the base, smooth, on longish petioles; peduncles terminal, trichotomously panicked; the middle one always short; heads globose; fruit combined; stamens exerted. ƒ. S. Native of the East Indies, in various parts of the Burmese empire.

Diverse-leaved Nauclea. Shrub.
9 N. polycephala (Wall. cat. no. 6100.) leaves oblong-lanceolate, long-acuminate, glabrous; peduncles forming a terminal panicule; heads small; fruit combined. ƒ. S. Native of the East Indies, on the mountains of Silhet.

Many-headed Nauclea. Shrub.

§ 2. Capsules distinct in the heads.

10 N. macrophylla (Roxb. fl. ind. 2, p. 120.) arborescent; leaves stem-clasping, very broad, oval, obtuse, villous on the nerves beneath; stipulas linear-lanceolate; peduncles terminal, solitary, recurved; capsules distinct. ƒ. S. Native of Amboyna. Trunk of tree straight, like that of a pine or fir. Branches decussate. Leaves 8-24 inches long, and 6-8 inches broad. Peduncles length of the stipulas; each supporting a head of numerous, short, beautiful pale yellow sweet-smelling flowers, which is 3 inches in diameter. Stigmas exerted, pure white. Placentae to which the seeds are attached linear.

Long-leaved Nauclea. Tree 30 to 40 feet.

11 N. sessilifolia (Roxb. fl. ind. 2, p. 124.) arborescent; leaves oblong, sessile, rather cordate at the base and clasping the stem, rounded at the apex; heads terminal, solitary; capsules distinct, 4-valved. ƒ. S. Native of the East Indies, in the forests of Chittagong. The rest unknown.

Sessile-leaved Nauclea. Tree.

12 N. ovatifolia (Roxb. fl. ind. 2, p. 124.) arborescent; leaves sessile, oval, or elliptic; heads of flowers terminal, solitary. ƒ. S. Native of the East Indies, in the forests of Silhet, where it is called Shal by the natives. The rest unknown.

Oval-leaved Nauclea. Tree.

13 N. cadabra (Roxb. fl. ind. 2, p. 121.) arborescent, glabrous; branches brachiate; leaves petiolate, coriaceous, ovate, obtuse at the base, and acuminate at the apex; stipulas triangular; peduncles terminal, solitary, usually shorter than the heads, which are globose; lobes of calyx linear; stamens exerted, shorter than the lobes of the corolla. ƒ. S. Native of the East Indies, about Calcutta; and of Malabar. Katon-jaka, Rheed. mel. 3. t. 33. and therefore Cephalaria orientalis, Lin. spec. ed. 1. p. 95. N. citrifolia, Poir. dict. 4. p. 435. Flowers orange-coloured, collected into heads about the size of a small apple (Roxb.). Style white, exerted; stigma thickish, oblong. Capsules distinct, 4-celled at top. Seeds not winged. Leaves 5-10 inches long. Kadamba is the native name of the tree. It is common about Calcutta, where it grows to be a large tree, and is not only highly ornamental, but very useful from the extensive close shade it yields.

Cadamba Nauclea. Cit. Tree 30 to 40 feet.

14 N. barnifolia (Roxb. cor. 1. p. 40. t. 52. fl. ind. 2. p. 122.) arborescent, glabrous; branches brachiate; leaves petiolate, obovate, obtuse, or short acuminate; stipulas oval; peduncles terminal, solitary, or by threes, when 3 the middle one is shortest; heads globose, bracteate; limb of calyx truncate. ƒ. S. Native of the East Indies, almost every where; and is a native of all the coast of Coromandel, but chiefly in the mountains and south of the Philippines. Ham. in Lin. trans. 15. p. 94. N. barniflora, Pers. ench. 1. p. 202. Wall. in litt. N. orientalis, Gaertn. fruct. 1. p. 151. t. 50. exclusive of the synonymes, ex Ham. Branches numerous, spreading, forming a large oval shal y head. Heads of flowers light yellow, globose, size of a plum. Anthers on short filaments. Style much exerted. The wood is of a light chestnut colour, firm and close grained; is used for various purposes, where it can be kept dry, but exposed to wet it soon rots. (f. 83.)

Small-leaved Nauclea. Tree 30 to 40 feet.

15 N. glabra (Roxb. fl. ind. 2. p. 121.) leaves elliptic, smooth; stipulas linear; peduncles terminal by threes; lobes of calyx triangular; stigma globose; cells of capsule 3-4-seeded. ƒ. S. Native of the Moluccas. The leaves, according to Blum. bijdr. p. 1099, are oval, bluish, attenuated at the base; and the peduncles are trifid from the calyx of the leaves. Glabrae Nauclea. Tree.

17 N. excelsa (Blum. bijdr. p. 1099.) leaves oval, acute, rounded at the base, coriaceous, glabrous; stipulas oblong, obtuse, pubescent; peduncles terminal by threes (or trifid from 5 to 2
the leaves having fallen). \( N \). S. Native of Java, in the mountain woods of Scrib and Panang. Said to be allied to \( N. glabra \). Heads of flowers globose. Fruit sometimes sessile and sometimes pedicellate, but probably from abortion.

**Tall Nauclea.** Tree 30 to 40 feet.

18. *N. obtusa* (Blum. bijdr. p. 1009.) leaves ovate-oblong, obtuse, coriaceous, glabrous, downy in the axis of the veins beneath; stipules oblong, obtuse; peduncles solitary or by threes, terminal, length of pedicels. \( N. S. \) Native of Java, in the woods on Mount Tjerina.

**Obtuse-leaved Nauclea.** Tree.

19. *N. stellata* (Wall. cat. no. 6102.) branches terete, smooth; leaves lanceolate, glabrous; peduncles solitary, terminal, bearing each a globose crowded head of flowers. \( N. G. \) Native of Cochín-china. Cephalanthus stellatus, Lour. coch. Flowers apparently red.

**Stellate Nauclea.** Shrub.

20. *N. rotundifolia* (Roxb. fl. ind. 2. p. 124.) arboresous; leaves petiolate, roundish-oval, obtuse; stipulas oblong, obtuse, many-nerved; heads terminal, on short peduncles; capsules distinct. \( N. S. \) Native of the East Indies, in Chittagong; and of the Society Islands. The rest unknown.

**Round-leaved Nauclea.** Tree.

**Var. 3. Luzonicaulis** (D. C. prod. 4. p. 345.) pubescent; leaves pubescent beneath, but less so above; throat of corolla densely bearded. \( N. S. \) Native of the island of Luzon, one of the Philippines. *N. Africana*, Cham. et Schlecht. in Linnaea 4. p. 149. Perhaps a proper species.

**African Nauclea.** (Shrub 6 to 10 feet.)

22. *N. Caxion* (D. C. prod. 4. p. 345.) leaves ovate, obtuse at the base, and acutish at the apex, glabrous above, pale beneath and rather pilose on the nerves; panicule terminal, elongated; having the branchlets opposite, and each bearing a globose head of flowers, 3-5 in number; bracteae ovato-oblong, deflexed, under the branchlets of the panicule \( N. S. \) Native of South America, probably in Peru. Cinchona globifera, Pav. quin. ined. N. polycepha, A. Rich. mem. soc. hist. nat. par. 5. p. 289. Heads dense, many-flowered. Flowers velvety on the outside. Fruit unknown. Perhaps a species of *Cephalanthus*, but differs from that genus in the flowers being pentamerous.

**Cinchona Nauclea.** Shrub.

23. *N. myriocéphala* (Delile, in Caill. pl. afr. p. 67. no. 54.) shrubby, glabrous; leaves 4 in a whorl, lanceolate, tapering into the petioles; stipulas united into a 4-toothed ring; peduncles axillary, smooth, slender, longer than the petioles; heads of flowers globose; calyxes and corollas small, pubescent. \( N. S. \) Native of the north of Africa, at Singue.

**Small-leaved Nauclea.** Shrub.

24. *N. lanceolata* (Blum. bijdr. p. 1009.) leaves on short petioles, oblong-lanceolate, acuminate at both ends, coriaceous, glabrous; stipulas oblong, obtuse; peduncles terminal, solitary. \( N. S. \) Native of the west of Java, in mountain woods. Cephalanthus orientalis, Blum. cat. hort. bekannt. p. 38. Flowers varying to tetrandrous.

**Lanceolate-leaved Nauclea.** Shrub.

25. *N. grandifolia* (D. C. prod. 4. p. 345.) leaves rather large, obovate or ovate-oblong, obtuse, acute at the base, rather undulated, glabrous; stipulas oval, about equal in length to the pedicels; peduncles terminal, solitary, length of petioles. \( N. S. \) Native of Java. *N. macrophylla*, Blum. bijdr. p. 1010. but not of Roxb. There is a variety of this species in the province of Bantam, having the leaves all obovate and undulated, and another in the province of Rembang having larger and more undulated leaves.

**Great-leaved Nauclea.** Tree or shrub.

26. *N. cordata* (Blum. bijdr. p. 1011. but not of Roxb.) leaves roundish-cordate, renate at the apex, glabrous; stipulas oblong-roundish, united at the base, length of petioles; peduncles terminal, solitary. \( N. S. \) Native of Java, on Mount Salak.

**Cordate-leaved Nauclea.** Shrub or tree.

27. *N. orientalis* (Lam. ill. 153. f. 1.) arboresous; leaves oval-oblong, on short pedicles, smooth; stipulas oblong; peduncles axillary, opposite: upper ones solitary, 5 times longer than the heads of flowers, which are globose. \( N. S. \) Native of the East Indies, Java, and China. Poir. dict. 4. p. 435. Blum. bijdr. p. 1006. Ham. in Lin. trans. 15. p. 94. — Bancâuls, Rumph. amb. 3. t. 55. f. 1. Authors inclosed. Style much exserted; stigma ovate.

**Eastern Nauclea.** Tree 15 to 20 feet.

28. *N. canescens* (Barrl. in herb. Hamke, ex D. C. prod. 4. p. 346.) branches tetragonal; leaves on short petioles, elliptic, short-acuminated, glabrous above and canescent beneath; peduncles compressed; lower ones axillary, opposite: the upper ones from the falling of the leaves appear racemose, and are as well as the heads tormentose; lobes of calyx linear, obtuse. \( N. S. \) Native of the Island of Luzon. Stipulas deciduous, at the sides of the leaves, oblong-linear, twin, on both sides in the upper part of the racemes.

**Canescent Nauclea.** Shrub or tree.

29. *N. rotundifolia* (Barrl. in herb. Hamke, ex D. C. prod. 4. p. 340.) glabrous; branchlets terebrated; leaves petiolate, roundish-cordate, short-acuminated, paler beneath; peduncles axillary, opposite, solitary, compressed, articulated in the middle; heads globose, tormentose; segments of the calyx ovate. \( N. S. \) Native of the Island of Luzon. Corolla hoary from tomentum; with an elongated tube; and roundish lobes. The sterile peduncles become hardened and hooked, as in the genus *Uncaria*.

**Round-leaved Nauclea.** Tree or shrub.

**Sect. II. Pentacorysia** (from πέντε, pente, five, and κορύξ, korux, a club; in reference to the 5 club-shaped lobes of the calyx). *D. C. prod. 4. p. 346.* Segments of calyx (or bracteoles) elongated and club-shaped.

30. *N. coriifolia* (Roxb. cor. 1. p. 40. t. 53. fl. ined. 2. p. 122.) arboresous; leaves petiolate, roundish-cordate, villous beneath; stipulas ovate, peduncles 1-3 together, axillary; bearing each a globose head of flowers; lobes of calyx and stigmas clavate. \( N. S. \) Native of Coromandel and Cottala, on the mountains, in the southern peninsula of India. Petioles terete, rather villous, in length to the peduncles. Flowers yellowish. Seed 6 in each cell of the capsule, membranaceous winged, never imbricated, but bifid at the apex. Leaves 4-12 inches each way, on petioles from 2-3 inches long. Peduncles downy, from 1-4. The wood is exceedingly beautiful, its colour is like that of box-wood, but much lighter, and at the same time very close-grained. It is to be had of a large size, from 1-2 feet or more in diameter, and is used for almost every purpose, where it can be kept dry. For furniture it answers exceedingly well, being light and durable. This is probably the *N. sterculifolia*, A. Rich. mem. soc. hist. nat. par. 5. p. 289.

**Heart-leaved Nauclea.** Tree 40 to 50 feet.

*Purple-flowered Nauclea.* Tree 20 feet.

32. *N. Roxburghii,* shrub glabrous; leaves roundish, obtuse, cordate at the base, on long petioles; stipulas large, oblong, obtuse. -fly. S. Native of the East Indies. *N. stipulacea,* Roxb. herb.

*Roxburgh's Nauclea.* Shrub.

33. *N. pedunculata* (Wall. cat. no. 6091.) arborescent, smooth; leaves ovate-elliptic, coriaceous, acuminate, smooth; peduncles terminal by threes, not so long as the upper pair of leaves; heads of flowers globose. -fly. S. Native of Pulo Penang. *N. purpurea.* Roxb. herb. Flowers purplish?

*Pedunculatata Nauclea.* Shrub.

34. *N. calycina* (Bartl. in Hækne herb. ex D. C. prod. 4. p. 346.) glabrous; leaves petiolate, oblong, attenuated at both ends; stipulas deciduous; peduncles terminal, solitary, or by threes, bearing caducous bracteas under the apex; lobes of calyx 5, clavate; style not exerted. -fly. S. Native of the Island of Luzon, one of the Philippines. Very nearly allied to *N. purpurea,* and is probably the same, but the calyx is pal., not purple, and the branches are tetragonally compressed, not terete.

*Large-calyx Nauclea.* Tree 15 to 20 feet.

35. *N. stipulacea* (D. C. prod. 4. p. 346.) arborescent; leaves broad-obovate, glabrous, downy on the nerves on the under surface as well as on the petioles and branchlets; stipulas ovate, large, leafy; heads of flowers globose; corolla villous on the outside; calyx quite entire, truncate; bracteoles or lobes of calyx 5, club-shaped. -fly. S. Native of Africa, on the banks of the Gambi near Alberda. *N. macrophilla,* Perr. et Leprieur. mss. but not of Roxb. nor Blum. The dehiscence of the capsule exhibits distinct carplets within the calycine tube, which is cleft lengthwise; the segments cohering at the apex, and proped by 5 claw-like bracteoles on the outside.

*Stipulacetus Nauclea.* Tree 20 to 40 feet.

† Species not sufficiently known.

36. *N. morinda* (Blum. bijdr. p. 1011.) arborescent; leaves ovate, acute, rounded at the base, ribbed, glabrous, bearing depressed glands in the axis of the ribs on the under surface; stipulas spatulate, coloured, viscid, one half shorter than the petioles. -fly. S. Native of Java, on Mount Salak. Flowers unknown.

*Morinda-leaved Nauclea.* Tree.

37. *N. roxellana* (Blum. bijdr. p. 1010.) leaves rather large, oval, acute, rounded at the base, sometimes subcordate, glabrous above but rather villous beneath and on the branchlets; stipulas ovate, obtuse, rather villous beneath. -fly. S. Native of Java, on Mount Salak. Flowers unknown. Allied to *N. macrophilla,* Roxb.

*Soft Nauclea.* Tree.

*Cult.* All the species of this genus are of the most easy culture. A mixture of loam, sand, and peat is the best soil for them; and cuttings root readily in the same kind of earth under a hand-glass, in heat.

II. UNCARIA (from uncus, a hook; the old or inferior peduncles are converted into hooked axillary spines). Schreb.
Hard-leaved Uncaria. Shrub cl. 4 U. ovalifo'lia (Roxb. fl. ind. 2. p. 128.) leaves oval, petiolate, acute, smooth on both surfaces; peduncles axillary and terminal, compound; receptacle of flowers as well as the capsules villous. 5. Native of Pulo-Penang. Leaves sometimes obovate, from 3-6 inches long. Peduncles bearing from 1-3 heads of flowers, on pedicels which are as long as the common peduncle, and furnished with a sheathing 4-6-cleft bract in the middle of each. Pedicels short, recurved, channelled.

Oval-leaved Uncaria. Shrub cl. 5 U. pilosá (Roxb. et Wall. in fl. ind. 2. p. 130.) branches villous, obscurely tetragonal; leaves oval, acuminate, sometimes subcorporate, hairy on both surfaces, on very short pedicels; stipulas bipartite or twin; segments lanceolate, acute, longer than the pedicels; peduncles axillary, opposite, villous, divaricate, at length recurved and spinescent. 6. Native of Nipaul, in the valley of the forest in Sankoo, and at Bleempedi; and of Chittagong and Java. Wall. pl. rar. asiat. 2. p. 55. t. 170. Nauclea scándens, Smith, in Rees's cyclo. vol. 24. no. 9. Nauclea pilosa, Blum. biijdr. p. 1013.? Branches clothed with rusty hairs; young shoots silky. Leaves from 5-7 inches long. Peduncles jointed, and bear a whorl of about 6 small linear-lanceolate bracteas, which are hairy without and smooth within. Flowers hairy, whitish, forming round dense heads of 2 inches in diameter. In the Java plant there are 4-6 ovate-lanceolate, acuminate, pilose, rather membranous bracteas in a whorl at the top of each peduncle, under the head of flowers. Perhaps distinct from the plant of Roxburgh.

Filo-se Uncaria. Shrub cl. 6 U. lañósá (Wall. in Roxb. fl. ind. 2. p. 131.) every part of the plant is clothed with long rust-coloured hairs; leaves ovate-lanceolate, acuminate, smooth above, on short pedicels; stipulas twin, on both sides, ovate, membranous, recurved; peduncles axillary, opposite, short, at length converted into spinose hooks; corollas almost smooth; capsules on long pedicels. 7. Native of Pulo-Penang and Sumatra, and other East Indian islands. Nauclea lanosa, Poir suppl. 4. p. 54. Nauclea setigera, Blum. biijdr. 1013.? Branches rather quadrangular. Leaves 3-5 inches long. Stipulae hairy without, permanent. Pedicels about an inch long, surrounded by a whorl of 4 lanceolate bracteas. Capsules smooth, ash-coloured. In the Java plant, the branches are almost smooth, hardly hispid; and the upper surfaces of the leaves are glabrous, or scarcely hispid, but villous beneath on long adpressed hairs; fruit oblong, glabrous, shorter than the pedicels; lobes of calyx oblong, ciliated.

Woolly Uncaria. Shrub cl. 8 U. macrophyl'la (Wall. in Roxb. fl. ind. 2. p. 132.) branches tetragonal, pubescent, with 2 opposite furrows; leaves petiolate, broad-ovate, acuminate, smooth and shining above, villous beneath, coarsely nerved and reticulated; stipulas caducous; heads of flowers axillary, solitary, opposite, tomentose. 9. Native of the East Indies, from Silbét. Leaves from 6-7 inches long. Peduncles opposite, axillary, and terminal, 2 inches long, covered with rusty hairs, about 5 lines under the apex they are jointed and surrounded by a ring of 5-6 lanceolate, spreading, villous bracteas. Flowers covered with ash-coloured dense pubescence.

Long-leaved Uncaria. Shrub cl. 10 U. vucá (Roxb. fl. ind. 2. p. 133.) branches simple, glabrous, with 3 opposite furrows; leaves ovate-lanceolate, acuminate, smooth above, villous beneath; stipulas bipartite, opposite, and terminal, 2 inches long, covered with pilose hairs. Flowers covered with short rusty hairs; fruit oblong, glabrous, shorter than the pedicels; calyx oblong, ciliated. 11. Native of the Burman empire at Amherst. Fruit sessile.
9. U. issinensis (D. C. prod. 4. p. 348.) branches acutely tetragonal; leaves on short petioles, having a narrow cordate recess at the base, roundish-elliptic, short-acuminated, shining above, reticulately veined beneath, and cuneate from down between the veins; peduncles axillary, solitary, recurved, compressed; flowers on long pedicels. \( \text{\textbackslash n} \) Native of Java, on the mountains of Scribu. Nauclea terreja, Blum. bijdr. p. 1014.

Iron Uncaria. Shrub cl.

17. U. sessilifructus (Roxb. fl. ind. 2. p. 130.) leaves elliptic, smooth, acuminate; peduncles axillary, bearing from 1-5 heads of flowers: also terminal, bearing many heads of flowers; capsules sessile. \( \text{\textbackslash n} \) Native of the East Indies, in the forests of Chittagong. The shrub supports itself by strong spiral axillary hooks. The terminal peduncles form themselves into a kind of racemose panicle.

18. U. africana; leaves ovate-lanceolate, acuminate, on short petioles; flowers disposed in a loose globular head; terminal calyx and corolla villous on the outside; hooks axillary, twisted, or reflexed. \( \text{\textbackslash n} \) Native of Sierra Leone, on the banks of rivulets. Corolla greenish yellow.

African Uncaria. Shrub 4 to 6 feet. cl.

19. U. guianensis (Gmel. syst. 1. p. 570.) branches tetragonal; leaves petiolate, ovate, acute, glabrous; stipules solitary, on both sides, triangular; peduncles solitary, bracteolate in the middle, axillary, opposite, and terminal; lower ones sterile and converted into flat, hooked spines. \( \text{\textbackslash n} \) Native of Guiana, on the banks of rivers and rivulets. Ouroupia guianensis, Aubl. guian. 1. p. 177. t. 68. Nauclea aculeata, Lam. ill. t. 153. f. 2. Poir. dict. t. 4. p. 456. Hayn. term. bot. t. 29. f. 5. U. aculeata, Willd. in Ust. del. opusc. 2. p. 200. The flowers in the same head are variable in colour, yellow, white, green, red, russet, and blackish: they are very fragrant.

Guiana Uncaria. Shrub cl.

20. U. tomentosa (D. C. prod. 4. p. 349.) arboreous; branches somewhat quadrangular, downy; leaves ovate-elliptic, acute, clothed with fine pubescentomentum beneath, and shining above with the nerves downy; stipulas broad ovate; peduncles villous, disposed in a terminal panicle: and the lowermost ones converted into axillary hooks. \( \text{\textbackslash n} \) Native of New Granada, on the banks of the river Magdalena, near Naer. Nauclea tomentosa, Willd. in Rom. et Schultes, syst. 5. p. 221. N. aculeata, H. B. et Kuhn, nov. gen. amer. 3. p. 282. Corolla clothed with silky pubescence on the outside. Peduncles also axillary, bearing 1-3 stalked hooks.

Tomentose Uncaria. Treec.

Cult. See Nauclea, p. 469. for culture and propagation.

L. A. D. Synt. Pentandria, Monogynia. Calyx with an oblong tube, and a campanulate 5-parted, permanent limb (f. 84. a.). Corolla funnel-shaped, 5 lobed (f. 84. b, c); throat glabrous; lobes valvate in astivation. Anthers almost sessile (f. 84. e.), at the recesses between the lobes, inclosed. Style exserted (f. 84. d); stigma capitate-ovate. Capsule membranous, ob-pyramidal, 2-celled; valves 4 (f. 84. g), dehiscent from the apex; central axis permanent, bearing the calyx at the apex. Seeds 2-4 in each cell, oblong, margined (f. 84. k), inserted near the top of the cell, hanging by spongy funicles.—Glabrous shrubs, natives of China. Branches terete, opposite. Stipulas twin, on both sides, joined at the base, yellowish, lanceolate. Leaves lanceolate, glabrous. Peduncles axillary, rarely terminal, solitary. Heads of flowers glabrous, without any involucre, yellowish. Flowers sessile, crowded, intermixed with peltate. Receptacle pileous.—This genus is intermediate between Nauclea and \textit{Ophthalanthus}, and probably not distinct from the first.
RUBIACEÆ. III. ADINA. IV. BREONIA. V. LECANANTHUS. VI. STEVENSON. VII. COUTAREA.

1 A gloriolus (Salish, par.
loud, t. 115.) leaves lanceolate; peduncles shorter than the leaves.  ♀ G. Native of China. Naï-

2 A peduncula (D. C. prod. 4. p. 349.) leaves obovate-
lanceolate; peduncles twice the length of the leaves. ♀ G. Native of China. Naïcòa
Cult. The culture and propagation of the species of Adina are the same as those of Naïcòa, p. 469, but do not require so much heat.

IV. BREONIA (this name is not explained, but is perhaps so called after some botanist of the name of Breon). A. Rich. mem. soc. hist. nat. par. 5. p. 290. D. C. prod. 4. p. 620.

Lin. syst. Pentandria, Monogynia. Calyx with a 5-parted
limb, and truncate sub-cuneated lobes. Corolla with a terete
tube, and a flat, spreading, 5-lobed limb: having the lobes oval-
lanceolate. Stamens half exerted, inserted in the throat of the corolla. Style very long, exserted; stigma bipartite, with the
lobes approximate. Ovarium 2-celled; cells 7-8-ovulate; ovu-
las fixed to the membranous placentas, which hang from the axis. Fruit somewhat crustaceous, indehiscent.—A tree. Leaves opposite,
very large. Stipulas connate. Flowers disposed in axillary, solitary, globose heads, which stand on long peduncles;
each peduncle girded by a beaked involucrum, which at length
bursts on one side and falls off.—This genus is nearly allied to
Naïcòa, but probably referrible to Sarcocephàlce, by the fruit
being indehiscent.

1 B. MADAGASCARIE'SIS (A. Rich. l. c.). ♀ S. Native of Madagascar.
Madagascar Breonia. Tree.
Cult. See Naïcòa, p. 469, for culture and propagation.

V. LECANA'THUS (from lever, lancea, a bow, and
arbo, anthos, a flower; in reference to the cup-like involucrum
under the head of flowers). Jack, mal. misc. vol. 2. ex Wall.

Lin. syst. Pentandria, Monogynia. Limb of calyx cam-
panulate, dilated, coloured, divided irregularly. Corolla with a
short tube, and a 5-lobed limb, which is valvate in restitution.
Anthers large, inserted in the tube of the corolla. Style bifi-
stigma linear, thick. Ovarium 2-celled; cells many-seeded;
placentas semi-cylindrical or convex, central. The rest un-
known.—A radican shrub, with tetragonal stamens, with 2 of the
angles more prominent than the other 2. Leaves opposite, on
short pedioles. Stipulas ligulate. Flowers pale red, disposed in
terminal, dense, globular heads; each head involucrated by a
salver-shaped involucrum.—This genus is nearly allied to
Naïcòa.

1 L. eriÆscens (Jack, l. c.). ♀ S. Native of Singapore.
Leaves on short pedioles, ovate-lanceolate, acute at both ends,
about 8 inches long. The involucrum which surrounds each
head of flowers is entire and cup-shaped. Flowers sessile.
Ovarium crowned by a prominent nectareal ring.
Reddish-flowered Lecanathus. Shrub.
Cult. See Naïcòa, p. 469, for culture and propagation.

Subtribe II. CINCHO'NEEE (shrubs and trees agreeing with Cinchona in important characters). D. C. prod. 4. p. 349.
—Cinchonæce and Manettieæ, Cham. et Schlecht. in Linneæa. 4. p. 178. Flowers on longer or shorter pedicels, not seated
on a globose receptacle, as in those of the first subtribe. (f. 86.
f. 88. f. 89.)
VI. STEVENSON (in honour of Edward Stevens, who rendered important services to St. Domingo, while he was consul
but not of Neck.

Lin. syst. Petandria, Monogynia. Calyx with a sub-
globose tube, girded at the base by an unequally 4-lobed invo-
lucre; limb biformed, deciduous: having acute lobes. Corolla
salver-shaped, with a short tube and a spreading bluntly 6-
parted limb. Anthers 6-7, sessile in the throat of the tube.
Stigma bilamellate. Capsule globose, arcoleate at the apex, and
subsent in the areole, 2-celled, containing 2 coccii, which
are separable from the calyx: one of them only deliscient.
Placentas central, connecting the margins of the valves. Seeds
minute, numerous, oval, winged a little, rather subsent at the
apex.Embryo straight in the fleshy albumen: having the
radicle turned towards the hyllum.—A much branched shrub,
native of St. Domingo; having the branches clothed with resin.
Leaves oval, white beneath, finely reticulated. Stipulas joined
into a short sheath. Flowers axillary, solitary, white, on short
pedicels, girded by 4 concrete bractæ, forming a kind of invo-
lucre to each flower.

1 S. buxifolia (Poit. l. c.). ♀ S. Native of St. Domingo,
Near La Vigue du Cap Francais.
Bor-leaved Stevensia. Shrub 10 to 12 feet.
Cult. See Naïcòa, p. 469, for culture and propagation.

VII. COUT'AREA (this name is not explained by Aublet).
—Portlandia species, Schreb.

Lin. syst. Hexandria, Monogynia. Calyx with a turbinately
oblong tube, and a 6-parted limb: having the segments sub-
ulate. Corolla large, funnell-shaped, with a short tube, an obcu-
cional ventricose throat, and a bluntly 6-lobed limb. Stamens
inserted at the bottom of the throat; anthers linear, much ex-
serted. Stigma funniform. Capsule coriaceous chartaceous,
ovate, compressed, 2-celled; valves bifiid at the apex. Pla-
centas spongy, at length nearly free. Seeds compressed, erect,
girded by a membranaceous margin. Embryo long, in fleshy
albumen: having a centripetal radicle, and flat cotyledons.—
South American trees. Leaves ovate, acuminate, on short
pedicels; stipples broad, short, acute. Peduncles usually trifid,
axillary, and terminal. Flowers white, sometimes septamorous.
This genus comes very near to Portlandia.

1 C. speciosa (Aubl. guian. 1. p. 301. t. 122.) leaves gla-
ebraous on both surfaces; peduncles trifid, 3-flowered; coro-
lla broad, funnel-shaped. ♀ S. Native of Guiana, Cayenne,
Island of Trinidad, and Carthagena, and between Caracas and
La Guaya, among bushes. Lam. ill. t. 127. Portlandia hex-
andra, Jacq. amer. 63. t. 182. f. 20. Swartz, fl. ind. occid. 1.
p. 385. The tree is much branched at the top. Corolla large,
purple. ex Aubl.
2 C. campanilla (D. C. prod. 4. p. 350.) leaves glabrous above, but villous beneath as well as the calyces and peduncles; peduncles trifid, 3-flowered. 

Native to South America, about the Carolinas, where it was collected by Vargas, who says it is called Campanilla by the natives. Flowers and fruit one half smaller than those of S. speciosa, and the capsule is less compressed, and ribless.

Campanilla Coutarea. Shrubs 3 to 4 feet.

3 C. Mexicana (Zucc. et Mart. in linn. 1820. ex D. C. prod. 4. p. 350.) leaves glabrous on both surfaces; peduncles 1-flowered, biretacteolate at the base; corolla funnell-shaped, with very blunt lobes. Native to Mexico.

Mexican Coutarea. Shrub or shrub-tree.

† Species hardly known.

4 C. latifolia (Moc. et Sesse, fl. mex. icon. ined, ex D. C. prod. 4. p. 350.) pedicels 1-flowered, bracteolate; the diameter of the flower equal to its length. Native to Mexico, where it is called Copalchi by the natives. Leaves oval, attenuated at the base. Pedicels axillary, usually twin. Corolla white. Stigma bilaminellate. Capsule less compressed, ornamented with 6 ribs and scattered tubercles.

Broad-flowered Coutarea. Shrub or shrub-tree.

5 C. flavescens (Moc. et Sesse, l. c. ex D. C. l. c.) pedicels numerous, bracteolate; the diameter of the flower almost one half smaller than its length. Native to Mexico. Superior leaves sometimes by threes, oval, attenuated at the base. Pedicels 3 in a whorl, twice bifid, only bracteate under the ramifications. Flowers yellowish, smaller and narrower than in the preceding species.

Yellowish-flowered Coutarea. Shrub or shrub-tree.

Cult. For culture and propagation see Nauclea, p. 469.

Lin. syst. Tetra-Heptandria, Monogynia. Calyx with an ovate tube, girded by a 2-4-leaved involucel at the base; limb 6-parted; segments narrow, acute, permanent. Corolla with a long terete tube, a short ventricose throat, and a 6-6-parted limb (f. 85. b), with spreading flat oval lobes. Stamens 4-6, sessile beneath the mouth of the tube, inclosed (f. 85. c). Stigma thick, bifid (f. 85. d). Capsule elongated, 2-celled, crowned by the limb of the calyx; cells dehiscing from the top inside. Placentas 2, central. Seeds imbricated downwards, rather compressed, each ending in a pencil-formed tail (f. 85. e). Embryo straight, in a sparing fleshly albumen; having the radicle turned towards the hilum. Small glabrous shrubs or subshrubs. Leaves obovate, green, rather fleshy. Stipulas oval, membranous, foliaceous, deciduous, the 2 upper ones constituting an involucre. Flowers terminal, solitary, elongated, white. Fruit follicle-formed.

1 H. longiflora (Swartz. obs. p. 135. t. 5. f. 1.) flowers hexa- drous; corollas 6-cleft, with linear-lanceolate, rather revolute segments. Native to Jamaica, Guadaloupe, Martinico, Cuba, the hotter parts of Mexico, on the decayed parts of old trees, and among moss. H. parasitica, vol. iii.

Jack. amer. p. 96. t. 66. Perhaps there are two species confused under this name. Lobes of calyx, ex Jacq. 6, but according to Swartz 2-4, and in the specimens examined only 2. The involucel, according to Swartz, is 6-leaved, but according to Jacquin and the specimen examined only 2-leaved, constantly composed of the 2 superior stipulas. The branches, according to Swartz and Jacquin, are terete, but according to the figure in the fl. mex. and the specimen examined tetragonal. In the figure of bot. mag. t. 721. the branches are round, the leaves ovate, smooth; 2-leaved, limb of the corolla of 6 twisted segments, and the limb of the calyx apparently 6-cleft. The flowers are white and very fragrant.

2 H. Brasilien'ssis (Cham. et Schlecht. in Linnaea. 4. p. 201) corollas 6-cleft, hexagonal; segments ovate-lanceolate, obtuse. Native to Brazil. Leaves oval, acuminate. Tube of corolla 3 inches long.

Brazilian Hillia. Shrub.

3 H. tetandra (Swartz, fl. ind. occ. 1. p. 630. icon. t. 11.) flowers 4-cleft, tetragonal; segments ovate. Native to Jamaica, on the high mountains among the roots of bushes. Leaves obovate, pale green. Roots creeping, tuberous. Lobes of calyx 4, emu cata-oblung, of which are deciduous. Leaves of involucel 4, 2 of them smaller than the other two. Flowers yellowish-white, having the tube nearly an inch long and tetragonal. Seeds papose at the apex.—Perhaps H. Tuxtliensis. Moc. et Sesse, fl. mex. ined., which was collected about Taxulna in Mexico, is distinct from this species, in consequence of the calyx being 2-lobed, and the involucel 2-leaved.

Cult. The species of this genus delight in a mixture of turfy loam, peat, and sand; and cuttings will soon strike root in the same kind of soil, or in sand under a hand-glass, in heat.

IX. HYMENOPOGON from hymen, a membrane, and pagon, a beard; the seeds are furnished with a membranous appendage at each end. Wall. in Rosb. fl. ind. 2. p. 156. D. C. prod. 4. p. 331. but not of Beauv.

1 H. parausiticus (Wall. l. c.) Native to the East Indies, growing on trees, and sometimes on rocks, on Sheepore, Chandagiri, near Hetouna, and between that place and Chittagong. Stems rooting, as well as the branches, covered with pale ash-coloured bark. Leaves 5-7 inches long. Seeds linear, smooth, terminated by a long linear membranous, sometimes bifid appendage, measuring altogether 3 lines in length.

Parasitic Hymenopogon. Shrub.

Cult. See Hillia above for culture and propagation.

X. CINCHO'NA (said to be named in honour of the Countess de Chinchon, vice queen of Peru, who was cured of a fever 3 P

§ 1. Capsule dehiscing at the base.—Normal species.

1 C. lanceolata (Ruiz et Pav. fl. per. 3. p. 1. t. 23.) leaves oval - lanceolate, acute, nated on both surfaces, as well as the branches, shining; panicle bractiate, much branched, smooth; calyceal teeth ovate, acuminate; segments of corolla linear-lanceolate; stigma emarginate; capsule ovate, ribbed. 7. S. Native of Peru, in the mountains of Loxa, and other cold mountainous regions; as well as of New Granada, between Guaduas and Santa Fe de Bogota, where it was collected by Mutis. C. lancifolia, Mutis, period. de Santa Fe, p. 465. Humb. in mag. der. gesell. nat. fr. berl. 1807. p. 116. Alib. tract. des fleurs, p. 374. C. nitida, Ruiz et Pav. fl. per. 2. p. 50. t. 191. C. angustifolia, Ruiz et Pav. quin. suppl. p. 11, with a figure. C. glabra, Ruiz, quin. 2. p. 64. C. Cucumaeifolia, Pavon, miss. Quinquina orange, Mutis, quin. Cascarilla officinalis, Ruiz, quin. p. 56. Cascarilla Lampro, Ruiz, quin. 2. p. 64. C. Cinchona Condamine, Humb. et Bonpl. pl. equin. 1. p. 33. t. 10. Humb. in mag. der. gesell. nat. fr. berl. 1807. p. 112. nov. gen. amer. 3. p. 490. C. officinalis, Lin. syst. veg. cd. 10. p. 929. Condamine in mem. de l'Academie de Paris, 1738. p. 114. Lam. ill. t. 164. f. 1. Vahl. skrilt. af. natur. selfkob 1. t. 1. Lamb. mon. t. 1. C. stupca, Pav. miss. Cascarilla fina de Urutapinga of the Spaniards. This species varies extremely in the form of the leaves. The celebrated Mutis has, with great propriety, considered his C. lancifolia the quina Naranganda or Quinquina orange of Santa Fe, as identical with the Quina fina de Urutapinga of Humb. et Bonpl. C. Condaminea. Although it is probable that several species of this important genus afford the Peruvian bark of the shops, of these three only are admitted into our national pharmacopoeias, to which the names of C. lanceolata, C. oblongifolia, and C. cordifolia have been applied, designating respectively the pale, the red, and the yellow bark. The present species was first described and figured by the astronomer Con- damine in 1738, in the mem. de l'Academie. It is described by Humboldt as a handsome tree of from 30 to 40 feet in height, and exuding wherever it is wounded a yellow astringent juice. The stipulas are acute and silky. The flowers are of a very pale rose-colour, supported on pedicels, which are powdered and silky, as well as the calyx. The tube of the corolla is silky, and the border white and woolly above. This is the pale bark of the shops.

Lancolate-leaved Cinchona or Pale Peruvian-bark. Tree 30 to 40 feet.

2 C. cordifolia (Mutis, miss. Humb. in mag. &c. p. 117. nov. gen. amer. 3. p. 401.) leaves roundish-ovate, coriade at the base or attenuated, rather pilose beneath and on the branchlets, naked and shining above; panicule brachiate, diffuse, pubescent; teeth of calyx roundish-mucronulate; corolla silky on the outside; limb bearded; stigma 2-lobed; capsule oblong-ovate, cylindrical, ribless. 7. S. Native of Peru, on the mountains of Loxa, in the kingdom of Quito; and of New Granada. Rhode, mon. p. 58. Steph. and Church. med. bot. 3. t. 175. Quina amarilla. Genitals inclosed. Flowers pale red. This species is totally distinct from Cinchona purpurascens, hisrita, and ovata of Fl. peruv., which Humboldt and Bonpl. in their before-mentioned work have given as synonyms of Mutis's plant. It differs from C. ovata, Ruiz et Pav. the C. pubescens of Vahl, with which it has the greatest affinity in the shorter pedicels, by the broader round teeth of the calyx, by the filaments being twice longer, and, lastly, by its capsules being smooth, and without ribs. The bark of this tree is known to the natives by the name of Quina amarilla, Cascarilla de Loxa, and Cascarilla amarilla, and is the yellow or orange bark of the shops. It is described as a middle-sized tree, with a trunk of moderate thickness, and covered with smooth brownish bark; the younger branches are quadrangular. All the species of Cinchona vary very much in the shape and smoothness of their leaves, according to the altitude in which they grow, to the severity or mildness of the climate, to the trees standing single, or being closely surrounded by other plants, to the luxuriance of growth, and the greater or less humidity of the soil. Coriade leaves occur but seldom in the present species; however, almost every branch exhibits some of them.

Cinchona bark appears to have been long known as a medicine in Peru; but we have not a satisfactory account at what period, nor by what means, the febrifugal virtues of this valuable remedy were first discovered. Some say a patient had been cured of an intermittent fever by having drank the water of a lake, which had acquired a bitter taste from Cinchona trees which had lain in it; others that a lion had cured himself of the ague by instinctively chewing Cinchona bark, and had directed the attention of the Indians to this tree. “That animals,” observes Humboldt in his Dissertation on the Cinchona forests of South America, "have taught men is a very common form of the traditions of nations. The valuable antedote Bijuco del Guaco, a plant described by Mutis, which is probably a species of Milkan, and has been erroneously confounded with Agapina of Brasil, is also said to have attracted the notice of the Indians, as is affirmed of the Falco serpentaries, by the Falco Guaco of New Granada fighting with serpents. However, that the great American lion without mane (Félix concolor) should be subject to the ague is just as bold an hypothesis as the assertion of the inhabitants of the pestential valley, Gualla Bamba, near the town of Quito, that even the vultures (Fittur nitra) in their neighbourhood were subject to that disorder. Indeed in the regions of the Cinchona forests there is not a Félix concolor, so fond of warmth, to be found; but at the most the cat Puma, not yet properly described, and which we have met with in heights of 2,500 toises. The story so often copied
respecting the Countess Chinchon, vice-queen of Peru, is probably still more doubtful than it is generally supposed to be. There certainly was a Count Chinchon, Don Jeronimo Fernandez de Cabrera Bobadella y Mendoza, who was Viceroy of Lima from 1629 to 1639. It is very probable that his wife, after her return to Spain in 1640, was the first to introduce the Cinchona bark to Europe. The name of Pulvis Committitiva appears even more ancient than that of Pulvis Jesuinitca or Pulvis patrum. But I do not believe that the Corregidor of Loza, Don Juan Lopez de Cunllores, who is said to have cured the Countess of ague, received this remedy from the Indians. In Loza there is no tradition whatever of this kind, nor is it probable that the discovery of the medicinal power of the Cinchona belongs to the primitive natives of America; if it is also considered that these natives (like the Hindoos) adhere with unalterable pertinacity to their customs, to their food, and to their nostrums; and that notwithstanding all this the use of the Cinchona bark is entirely unknown to them in Loza, Guatemala, and far around. In the deep and hot valleys of the mountains of Cata-mango, Rio Calvas, and Macara, agues are extremely common. But the natives there, as well as in Loza, of whatever cast, would die rather than have recourse to Cinchona bark, which, together with opiates, they place in the class of poisons, exciting mortification. The Indians cure themselves by lemonade, by the oleaginous aromatic oil of the small green wild lemon, by infusions of Sceoparia dolicis, and by strong coffee. In Malagatica only, where many bark-peeters live, they begin to put confidence in the Cinchona bark. In Loza, there is no document to be found which can elucidate the history of the discovery of the Cinchona; an old tradition, however, is current there, that the Jesuits, at the felling of the wood, had distinguished, according to the custom of the country, the different kind of trees by chewing their barks; and that on such occasions they had taken notice of the considerable bitterness of that of the Cinchona. There being always medical practitioners among the missionaries, it is said they had tried an infusion of the Cinchona in the tertian ague, a complaint which is very common in that part of the country. This tradition is less improbable than those of the majority of European authors, and among them the late writers Ruiz and Pavon, who ascribe the discovery to the Indians. The medicinal powers of the Cinchona was likewise entirely unknown to the inhabitants of the kingdom of New Granada."

Cinchona bark is stripped from the trunk and branches in the dry season, from September to November; it is dried by exposure to the sun, and after being imported into Europe is sorted for sale. It is brought to this country in chests, each of which contains from 100 to 200 pounds weight of bark, mixed with dust and other impurities. According to Humboldt, the quantity of this drug annually exported from America is from 12,000 to 14,000 quintals. The kingdom of Santa Fe furnishes 2000 of these, which are sent from Cartagena; 110 are furnished by Loza, and the provinces of Huamanga, Cuenca, and Jean de Bراقamoros, and the thick forests of Guaneabamba and Ayavaca, furnish the rest, which is shipped from Lima, Guayaquil, Payta, and other ports on the South Sea.

The pale bark of the shops, the Quina Naranjada, and Cascarilla fina de Cuitsanga of the Spaniards, which is obtained from C. lanceolata, is preferred in South America to all the other kinds of bark. It is in pieces, 5 or 6 inches long, singly or doubly convoluted, externally of a greyish brown colour, to which crusts of lichens often adhere, and is internally when fresh broken of a bright cinnamon hue. There are often intermixed with this others of a coarser texture, thicker, and nearly flat, which appears to be obtained from the trunk and larger branches. The fracture is smooth and even; its powder is of a pale colour; its taste is bitter and astringent; its smell peculiar and aromatic.

The yellow bark, named Quina amarilla, Cascarilla de Loza, and Cascarilla amarilla, is less rolled than the pale bark, and the pieces are larger and thicker. Externally it is of a greyish brown, and covered with lichens; internally of a much deeper orange than the pale bark. It has a more bitter taste, with a less aromatic odour, and with scarcely any sensible degree of astringency.

The red bark is sometimes rolled, but more commonly in flat thick pieces, covered with rough entire reddish brown epidermis. It has a smooth fracture. It is composed of three layers; the inner one being of a dark ferruginous colour, is more bitter and astringent than the pale and yellow bark.

These three kinds of bark are only distinguished in Britain; but M. Von Bergen, a drug broker of Hamburg, who has written a valuable monograph on the Cinchonas, enumerates eight kinds as distinguished in commerce; and the drug merchants of Spain enumerate about 50 different kinds of bark: these are probably obtained from as many species of Cinchona, or several of them may be obtained from the same species—the difference depending upon the age, state, and habitats of the trees.

Qualities and chemical properties.—Few vegetable substances have undergone so many analyses, by the most eminent chemists, as the different varieties of Peruvian bark. The basis of all of them is woody fibre, combined with which are various principles capable of being abstracted by different solvents. The taste of all is more or less bitter and astringent. Boiling water extracts all their active principles, affording a solution of a pale brown colour; this infusion is transparent when hot, but on cooling becomes turbid, and a precipitate is deposited, which is soluble in alcohol. The decoction has a very astringent taste, and a deep brown colour. By long boiling the virtues are nearly destroyed, owing to the chemical change and precipitation of its active matter. Alcohol, in all its modifications, is a powerful solvent of the active principles of Cinchona. A saturated solution of ammonia is also a solvent of them, but acetate acid acts less imperfectly than even water. Vauquelin found that an infusion of the pale bark reddened litmus paper; was copiously precipitated by solution of galls, and in a smaller degree in yellowish flocculent flakes by solution of isinglass. A solution of tartar emetic was rendered turbid, and slowly precipitated by it; solution of superacetate of lead produces quickly a copious precipitate. The addition of a solution of the sulphate of iron to the infusion changed the colour to a bright olive green, but was scarcely precipitated. The powder macerated in sulphuric acid afforded a golden yellow tincture, which reddened litmus paper, and left a pellicle of bitter resin when evaporated on the surface of water, to which it gave the colour of the tincture. This coloured water did not precipitate the solution of galls and of tartar emetic, and occasioned no precipitate on the addition of the solution of sulphate of iron. With alcohol it produced a deep orange coloured tincture, which precipitated sulphate of iron, tartrated antimony, and tannin. The agency of the different menstrua on the red and yellow varieties of the Cinchona produce nearly the same results as on the common or pale bark. The filtered solution of yellow bark has a pale golden hue, with a shade of red; it is bitter, reddens litmus paper, and precipitates solution of galls. On adding a solution of isinglass, a pinkish yellow precipitate is produced; superacetate throws down a precipitate; tartrated antimony gives a precipitate in pale yellowish flakes. A solution of the sulphate of iron changes its colour to a bluish green, and slowly lets fall a precipitate of the same colour. The aldeollic tincture appears to have an affinity respect the same as that afforded by the pale bark. The red bark has a more nauseous taste than the barks of the other species.
The aqueous infusion is of a pale ruby colour; its action on the solutions of galls and of isinglass is nearly the same as those of the two former species, but it is not altered by tartarised antimony, nor by the superacetate of lead; and the solution of iron occasions a dirty yellow colour only, little being precipitated. The alcoholic tincture is of a deep brownish red colour, and precipitates the solution of the sulphates of iron and of tartarised antimony; the former of a black colour, and the latter red. From the experiments of Vaquelin, Fabroni, and others, it appears that the active principles of Cinchonas consist chiefly of cinchonine, resin, extractive gluten, a very small portion of volatile oil, and tannin. Vaquelin has determined the presence of a peculiar acid, to which he gives the name of kinic acid, in some varieties of the bark. The following are the most important results that have been obtained by MM. Pelletier and Caventon, respecting the composition of the three official species.—1st, In pale bark they found aciddulous kinate of cinchonine, a green fatty matter, which they term red cinchonine; tannin, a yellow colouring matter, kinate of lime, gum, starch, and woody fibre. 2nd, In yellow bark they found that the alkaline base differs from cinchonine in being uncrystallizable, very soluble in ether, and forming salts with the acids very different from those of cinchonine. The chemical constituents of the yellow bark are an aciddulous kinate of this salt, which they have named quinine, a deep yellow fatty matter, red cinchonine, tannin, yellow colouring matter, kinate of lime, starch, and woody fibre. 3rd, Red bark contains aciddulous kinate of cinchonine, kinate of quinine, red cinchonine, tannin, kinate of lime, yellow colouring matter, starch, and woody fibre. The difference between the pale, the red, and the yellow barks, depends principally on the quantity of the two alkaline bodies, cinchonine and quinine, found in them. The pale bark contains cinchonine, but a very small portion of quinine; the alkalii, again, which predominates in the yellow bark, is quinine; while in the red bark, and some spurious kinds, there is a combination of both these substances. The presence of cinchonine, as a distinct vegetable principle, was first discovered in Peruvian bark by Dr. Duncan, of Edinburgh. The separation of cinchonine from the pale bark, and of quinine from the yellow bark, is a very simple operation. It consists in digesting the bark, coarsely powdered, in weak sulphuric acid, and then to repeat this digestion with about half the quantity of liquid, till all the soluble matter is extracted. To this decoction a small quantity of powdered slacked lime is added, somewhat greater than is necessary to saturate the acid; the precipitate that ensues (a mixture of cinchonine and the sulphate of lime,) is collected, dried, and boiled for a few minutes in alcohol, which takes up the cinchonine, but will not dissolve the sulphate of lime; the solution is decanted off while still hot, and fresh portions successively added for the repetition of the same operation, until it ceases to act on the residuum, which is then merely sulphate of lime. The different alcoholic solutions are then put into a retort, and considerably evaporated, during which and on cooling acicular crystals of cinchonine are deposited. By repeating the solution once or twice, in boiling alcohol, and again crystallizing, the cinchonine will be obtained in a perfectly pure state. Its crystals are semi-transparent, have a pearly lustre, and are usually obtained in the form of small needles. It has but little taste, and requires 700 parts of water for its solution, but boiling alcohol dissolves it much more abundantly; it is sparingly soluble in oils and sulphuric ether. At a moderate heat it is partly volatilized, and partly decomposed. It combines with different acids, forming neutral salts. Mr. Brande found that it contained no oxygen, 100 parts consisting of about 80 parts of carbon, 13 of nitrogen, and 7 hydrogen. It has an intensely bitter taste, and exerts the same action on the animal economy as the bark itself, but it is less generally used in medicine than the other active principle of the bark, quinine, because the yellow bark from which it is procured is more plentiful; the quinine, therefore, is cheaper than cinchonine, and equally efficacious. Quinine may be obtained from the yellow bark in the same manner as cinchonine is prepared from the pale bark, or by adding an alkali to the solution of the sulphate of quinine. Quinine is not crystallizable like cinchonine, but on the application of heat it melts into a kind of paste. It has a much more bitter taste than the other, and is very sparingly soluble in water. They differ also remarkably in their chemical composition, cinchonine containing no oxygen, while in quinine there is a notable proportion of this element. According to Mr. Brande, it consists of about 5.55 parts of oxygen, 7.65 hydrogen, 13 nitrogen, 73.80 carbon. By digesting quinine in a weak solution of sulphuric acid, the sulphate of quinine is obtained, which is the salt now generally used for medicinal purposes. The most approved process for preparing this salt was pointed out by Mr. Henry. A kilogramme of bark (2 lbs. 3 oz. 5 dr.) is reduced to a coarse powder, and boiled twice for about a quarter of an hour in 1 or 1.5 pints of water, 2 ounces of sulphuric acid being added to it. In this manner the quinine, or the sulphate of quinine, are left in the solution. It is digested repeatedly in alcohol, till it no longer imparts any bitter taste to this fluid; the alcoholic solutions are then evaporated till a very bitter viscid substance is obtained, which becomes brittle as it cools. This is the quinine separated from almost all the other ingredients of the bark, and by digesting it in dilute sulphuric acid a solution of sulphate of quinine is obtained, which crystalsizes on evaporation. It is a white pulverent substance; it crystallizes in small white 4-sided prisms, which are distinguished by their pearly lustre. It is not very soluble, therefore not affording a very bitter taste; but by adding a drop or two of acid to the solution, its solubility is increased, and then it becomes intensely bitter. It is decomposed by the alkalies and earths; it volatilizes at a moderate heat, and it can unite with an excess of acid, forming a bisulphate of quinine. The sulphate of quinine is frequently adulterated with starch, pipe-clay, and various other substances. To determine its purity, the simple process of heating it is sufficient; if it evaporate entirely without charring and melting, it is pure; but if it should turn black or smell sweetish, it is probable that sugar or starch is present. Pure quinine is seldom used in medicine, but the sulphate possesses in a very eminent degree the medicinal properties of Peruvian bark, one grain, or one grain and a half, being equivalent to a draught of the bark in substance. In Paris it has superseded, in a great measure, the Peruvian bark, and is now extensively used in this country in all cases where that valuable medicine is indicated, in doses of from 2 to 5 grains.

Medical properties and uses.—Peruvian bark has been long known as one of the most powerful and valuable tonics we possess, and may be administered with great freedom in all cases where that class of remedies are indicated. The only effects of an overdose are headache and nausea. It also possesses antiseptic and astrigent powers in a very eminent degree, and is universally employed as a febrifuge in the cure of intermittent and remittent fever, in diseases of debility, such as typhus, erysipelae, in passive hemorrhages, confluent small pox, in dysentery, in some cutaneous diseases, as lichen agra, and livida, in purpura, in some varieties of erysipelas, in gangrene, in dyspepsia, and even in acute rheumatism and gout. The
decoction of yellow cinchona bark, given in large quantities, is
the best antidote to the poison of tartar-emetic.

**Cordate-leaved Cinchona** or Yellow Peruvian-bark. Tr. 30 to 40 ft.

3 C. **rotundifolia** (Pavon, miss. Lamb. cinech, p. 5.) leaves roundish, naked above and shining, pilose beneath and on the branchlets; panicle bractiate, pubescent; calycine teeth very short; corolla clothed by silky tomentum outside, with a bearded limb; style exerted; stigma bipartite; capsule linear, terete. ñ S. Native of Peru, in the forests of Loja, in the province of Cuenca. Segments of corolla ovate. Anthers shorter than the filaments. Lobes of stigma linear, flat, and obtuse. This is a very distinct species, being easily distinguished from all its congeners by its narrow cylindrical capsules, and by the narrow linear divisions of the stigma.

**Round-leaved Cinchona.** Tree 30 to 40 feet.

4 C. **ovalifolia** (Humb. et Bonpl. pl. equin. 1. p. 65. t. 19. nov. gen. 3. p. 403.) leaves oval or obovate, naked above and shining, but pilose on the veins beneath; calycine teeth ovate, acute; corolla clothed by silky tomentum outside, with a bearded limb; anthers twice longer than the filaments; stigma bipartite; capsules oval, constricted at the apex. ñ S. Native of Peru, in the forests of Loja, in the kingdom of Quito; Pavon; and on the Andes of Peru, near Cuenca; Humboldt and Bonpland. Panicle bractiate, pubescent. Flowers white. Segments of corolla linear. Lobes of stigma linear, obtuse. This species must not be confounded with the C. ovalifolia of Mutis, the C. macrocarpa de Vahl, or Quinquina blane of New Granadas, which are totally different.

**Oval-leaved Cinchona.** Tree 15 to 20 feet.

5 C. **Purpea** (Ruiz et Pav. fl. per. 2. p. 52. t. 193.) leaves oval or ovate, acute at the apex, and attenuated at the base, at length naked on both surfaces and shining; panicle corymbose, pubescent; anthers shorter than the filaments, but exceeding the throat; corolla clothed by silky tomentum outside, with a bearded limb; stigma 2-lobed, inclosed; capsules narrow, ovate-oblong, attenuated at the apex. ñ S. Native of the lower mountains of the Andes, in forests, at Chinchao, Pati, Muna, Casape, Casapillo, &c. (Pavon); and of the Andes of Peru, near the city of Jaen de Bracamoros. C. seroriculărís, Humb. et Bonpl. pl. equin. 1. p. 165. t. 47. nov. gen. 3. p. 492. Casapillo, Bracamoros and Casarcarla, Red. et Humboldt, bor. de Bogomorada, Ruiz, quinol. p. 67. Casarcarla bobo de Bogomorada. Corolla rose coloured. Capsule bisulcate, pubescent when young, but glabrous in the adult state. This is distinguished from the preceding species by its more acute smooth leaves; by its corymbic panicles; by its filaments being longer than the anthers, and their surpassing the throat of the corolla; by the capsules, which are ovate-oblong, narrowed, and without ribs; and, lastly, by the shorter and broader lobes of the stigma.

**Purple-flowered Cinchona.** Tree 40 feet.

6 C. **Fuscens** (Vahl, in act. havn. 1. p. 19. t. 2. Lamb. mon. t. 2.) leaves broad-ovate, or roundish-ovate, acute, on long petioles, rounded at the base or acutish, naked and shining above, but clothed with pilose tomentum beneath, as well as the branchlets: panicle bractiate, diffuse, clothed with rusty tomentum; corolla clothed by silky down on the outside, with a bearded limb; anthers almost sessile; stigma 2-lobed; capsule oval-oblong, obsolesly ribbed, tomentose. ñ S. Native of Peru, in forests on the lower mountains of the Andes, towards Puzuzo and Panao; and also of the forests of Huannaco, Ruiz et Pavon. C. ovata, Ruiz et Pav. fl. per. 2. p. 52. t. 195. Casarcarla pallida, Ruiz, quinol. p. 74. Casarcarla de Pato de Galgareta. Petioles 2 inches long. Teeth of calyx very short, acute. Corolla purplish outside and white inside, with ovate obtuse segments. Genitalis inclosed. Style exceeding the anthers. Lobes of stigma ovate.

**Pubescent Cinchona.** Tree 30 to 40 feet.

7 C. **morada** (Ruiz et Pav. fl. per. 2. p. 52. t. 194.) leaves broad, ovate or obovate, naked and shining above, but pilose in the axils of the veins beneath; panicle crowded, pubescent; anthers shorter than the filaments, hardly exerted; style very short; stigma 2-lobed; capsule elliptic, attenuated at the apex. ñ S. Native of the Andes of Peru, in cold elevated forests towards St. Antonio de Playa Grande, where it was first observed by John Tafalla. Corolla clothed with silky down on the outside, with a bearded limb, and ovate segments. Calycine teeth very short, acute. Lobes of stigma ovate. Capsule bisulate, ribless. This species has some affinity with C. Condamineae, but its small flowers, and elliptical ribless capsules, together with its very short style, and other marks, readily distinguish it.

**Small-flowered Cinchona.** Tree 20 to 30 feet.

8 C. **Humboldtiana** (Lamb. cinech. p. 7.) leaves lanceolate, acute at both ends, naked above, but villous beneath, as well as on the branchlets; panicle glomerate, villous; calycine teeth very short, acute; corolla clothed by silky down outside, with a bearded limb; anthers sessile, inclosed; stigma exerted, emarginate; capsules ovate, hairy, glomerate. ñ S. Native of Peru, in the kingdom of Quito, in forests near the town of Jaen de Bracamoros. Pavon. This is a strongly marked and very distinct species; there is none with which it can be confounded; it is the C. villosa, Pavon, miss.

**Humboldt’s Cinchona.** Tree 20 to 30 feet.

9 C. **Glandulifera** (Ruiz et Pav. fl. per. 3. t. 224.) leaves oval, acutish at both ends, naked and shining above, very pilose beneath, as well as on the branchlets; with undulated rather revolute margins; panicle bractiate, very pilose; corolla pilose outside, with a bearded limb; calycine teeth very short, mucronate; segments of corolla ovate; stigma emarginate; capsules ovate, drooping. ñ S. Native of Peru, in the kingdom of Quito, at Loxa, Pavon. C. microphylla, Mutis, miss. C. quercifolia, Pavon, miss. C. Mutisii, Lamb. cinech. p. 9. Anthers exerted, shorter than the filaments. Corolla white.

**Var. β**; leaves oval, obtuse, rounded at the base, and rather cordate. ñ S. C. quercifolia, var. crispa, Pavon, miss.

**Gland-bearing Cinchona.** Tree 10 to 12 feet.

10 C. **bisulca** (Ruiz et Pav. fl. per. 2. p. 51. t. 192.) leaves oval, acute at the base, base with bristly hairs, as well as the branchlets, veiny above, and at length naked; flowers glomerate, base with bristly hairs; calycine segments lanceolate, acuminate; corolla pilose outside, with a bearded limb; stigma 2-lobed; capsule ovate. ñ S. Native of Peru, on the Andes, in forests in cold elevated places, towards Piliao and Acomayo. Ruiz et Pavon. Casarcarla delgado, Ruiz, quinol. p. 60. Flowers red. Humboldt and Bonpland have confounded this with the C. cordifolia of Mutis, with which it has not the least resemblance.

**Hairy Cinchona.** Tree 20 to 30 feet.

11 C. **striocarpa** (Lamb. cinech. p. 12.) leaves lanceolate, acute at both ends, naked above, but pilose on the veins beneath; teeth of calyx ovate, acute; corolla clothed by silky tomentum outside, with a glabrous limb; anthers sessile; style very short; stigma emarginate; capsule linear, terete. ñ S. Native of Peru, in forests in the kingdom of Quito, near the city of Jaen de Bracamoros. Pavon. C. species nova, Pavon, miss. Panicle diffusely branched, pubescent. Segments of the corolla linear, obtuse. Very like C. Condamineae, but very distinct.

**Narrow-fruited Cinchona.** Tree.

12 C. **caduceiflora** (Bonpl. in pl. equin. 1. p. 167. H. B. et Kunth, nov. gen. amer. 3. p. 411.) leaves broad-obovate, acute at the base, naked and shining above, but pilose in the axils of the veins beneath; panicle bractiate, pubescent; calycine teeth ovate, obtuse; corolla clothed with silky down outside, having the limb glabrous above, and the segments linear-oblong; an-
thera a little exerted; style very short; stigma bipartite; capsulae oval-oblong. \( H \). S. Native of Peru, on the Andes, near the city of Jaen de Bracanoros. Humboldt and Bonpland. C. magnifolia, Humb. et Bonpl. pl. equin. p. 139. t. 39. exclusive of the synonyme of Flora Peruviana. Cascarilla bova of the Peruvians. Segments of corolla shorter than the tube. Lobes of stigma linear, flat. 

**Caudicaceae.** X. **Cinchona.**

§ 2. Capsule dehiscing at the apex.—*Mariana* species.

13. C. macroca BPA (Vahl, in act. harr. i. p. 26. t. 8. exclusive of the synonymes.) Lamb. mon. p. 22. t. 5.) leaves broad-elliptic, very blunt, densely clothed with rough tomentum beneath, as well as on the branches; calyx entire, with rather prominent teeth; corolla large, clothed by silky down outside, with a bearded limb, and lanceolate segments, which are recurved at the apex; genitals inclosed; stigma emarginate; capsule pear-shaped, tomentose. \( H \). S. Native of Peru, in the forests of Loxa, Guayaquil, and Cuenca; and of New Granada. C. ovalifolia, Mutis, miss. Humb. in mag. &c. p. 118. Cosminbiana species nov. Pavon, miss. Called Quina blanca, and Quinquima blane de Santa Fe. Corymb faw-flowered, Calyx unreperate, entire. Style furrowed. This species ought not to be confounded with the C. ovalifolia of Humb., to which it has not the least resemblance.

**Large-leaved Cinchona.** Tree 30 to 40 feet.

14. C. oblongifolia (Mutis, miss. Humb. in mag. &c. p. 118. Rhode, mon. p. 57, exclusive of the synonymes,) leaves oblong or cordate, densely clothed with scabrous hairs on both surfaces, as well as the branchlets; panicle bracteate, corymbose, scabrous from hairs; segments of corolla pilose outside, but glabrous inside, linear; genitals inclosed; anthers 3 times longer than the filaments; stigma bipartite; capsule ovate. \( H \). S. Native of Peru, in forests in the mountains of Loxa; and of New Granada, near Maraquia. H. B. @ Kunth, nov. gen. amer. s. p. 401. exclusive of syn. of fl. per. and Ruiz, quinol. Called Quina roga and Cinchona vulgo Azahar. Flowers white. This is a very distinct plant from C. magnifolia of Ruiz et Pav. It is distinguished from it by its leaves being rounded at the base, often coriace, covered on both sides with rough pilose tomentum, sometimes the older leaves, however, become nearly naked above; the corolla is covered on the outside with bristly pilose hairs, while that of C. magnifolia has short down, and in the shape of the capsules. 

**Oblong-leaved Cinchona.** Tree 12 to 20 feet.

15. C. magnifolia (Ruiz et Pav. fl. per. 2. p. 52. t. 196. but not of Humb. et Bonpl.) leaves broad-roundish-oval, naked and shining above, and densely clothed with tomentum beneath; panicle bracteate, corymbose, tomentose; calyx teeth short, acute; corolla clothed with silky tomentum outside, but having the limb glabrous above, and the segments lanceolate; anthers inclosed; style exserted; stigma bipartite; capsules linear, terete. \( H \). S. Native of Peru, on the Andes, in very hot places in forests, on the banks of mountain streams, at Chinecho, Cuchero, and Chacalolua. Ruiz et Pavon. C. oblongifolia, Steph. and Churchil, medi. bot. 4. t. 184. Cascarilla amarilla, Ruiz, quinol. p. 71. This species of Cinchona is regarded as yielding the red bark of the shops. Flowers white, sweet-scented.

**Large-leaved Cinchonia or Red Peruvian-bark.** Tree 40 ft.

16. C. Pavonii (Lamb. conch. p. 8.) leaves orbicular or cordate, naked above, but clothed with rusty tomentum beneath, as well as the branchlets; corymbs clothed with rusty tomentum; calyx unreperate, entire, obseletly dentilicate; tube of corolla very long, clothed by silky tomentum outside, with a bearded limb; anthers sessile; stigma deeply bipartite; capsules very long, terete. \( H \). S. Native of Peru, in the king-

---

**Acute-leaved Cinchona.** Tree 20 feet.

18. C. hexandra; leaves large, oval, obtuse, clothed with ocharaceous villi beneath, as well as on the branchlets and flowers; corollas 5-6-cleft; stamens 5-6. \( H \). S. Native of Brazil, in mountain woods, in the provinces of Rio Janeiro and Minas Geraes. Bauhna hexandra, Pohl. pl. bras. i. p. 10. t. 8. China, Eschwege, Journ. bras. p. 86. Quino do Rio de Janeiro, mem. acad. Lisb. 3. pt. 2. p. 96. The bark is thin, of a bay colour on the outside, but blood-coloured within, very bitter, and is used by the Brazilians as a febrifuge, in place of Peruvian bark. Corolla purple. 

**Hexandra Cinchona.** Tree.

§ 3. Flowers disposed in interrupted elongated axillar racemes. Corollas villous on the outside. Capsules dehiscing from the apex. Seeds peltate, girded by a membranous wing.—*Remija*, C. bibl. urae, 1829. science, vol. 2. p. 185. prod. 4. p. 357. The species are called Quina de Serra or Quina de Remio throughout Brazil. 

19. C. ferruginea (St. Hil. append. voy. p. 8. pl. usuol. bras. 1. t. 3.) leaves oblong-lanceolate, rather narrow, coriaceous, clothed with rusty villi beneath, as well as the branches, with revolute margins; racemes interrupted, hardly branched; corolla tomentose outside. \( H \). S. Native of Brazil, in the province of Minas Geraes, on arid mountains. Remijia ferruginea, D. C. prod. 4. p. 357.—Macrocnemum no. 1. Velloz. in Vand. fl. 14. Leaves usually 3 in a whorl. The fascicles of flowers on the raceme are opposite. The bark is bitter and astringent, and is used in place of Peruvian bark in Brazil, under the names of Quina de Remio and Quina de Serra. 

**Rusty Cinchona.** Shrub 4 to 5 feet.

20. C. vellozii (St. Hil. pl. usuol. bras. p. 1. no. 2.) leaves ovate, coriaceous, acuminated at both ends, clothed with rusty villi beneath as well as on the branchlets; racemes interrupted, hardly branched; corolla tomentose outside. \( H \). S. Native along with the preceding. Remijia Vellozii, D. C. prod. 4. p. 357.—Macrocnemum, no. 2. Vell. in Vand. fl. p. 14. This differs from the preceding species in the flowers being on shorter pedicels, in the bracteae being less linear, and in the flowers being longer and more numerous. Fascicles of flowers on the racemes opposite. The bark of the species is used in Brazil in place of Peruvian bark, under the name of Quina de Serra. 

**Velloz's Cinchona.** Shrub 4 to 5 feet.

21. C. remijiana (St. Hil. pl. usuol. bras. p. 1. no. 2. in a note) leaves broad-elliptic, obtuse, cuspidate; the upper ones decurrent at the base, clothed with rusty villi beneath, as well as the branchlets; racemes interrupted, hardly branched; corolla
villous on the outside. ʃ. S. Native of Brazil, along with the two preceding species. C. Remyiühana, Spreng. Syst. 1. p. 705. Remújia Hilari, D. C. prod. 4. p. 357. Clusters of flowers opposite, on the raceme. The bark of this species is also used in place of Peruvian bark, under the name of Quina de Remijo.

Remijo's Cinchona. Shrub.

22 C. Candollei; leaves oblong, acute, attenuated at the base, undulated, coriaceous; panicles axillary,verticillately branched; the branches interruptedly racemose; corolla villous on the outside. ʃ. S. Native of Brazil. Remújia paniculátis, D. C. prod. 4. p. 357. Branches trigonal. Branches and branchlets of panicle angular. Leaves clothed with rusty down beneath, as well as the branchlets and panicle. Fruit unknown.

De Candolle's Cinchona. Shrub.

† Species not sufficiently known.

23 C. Pelaíeá (Pav. quinol. Incl. D. C. bibl. univ. 1829. &c.) leaves roundish, hardly apiculate, membranous, beset with velvety hairs on the petioles and on the nerves beneath, and velvety between the nerves, but puberulous above; stipulas oval, obtuse, equal in length to the petiole; panicle glabrous, much branched; fruit oblong-terete, crowned by the calyx, glabrous. ʃ. S. Native of South America, and probably of Peru. This is a very distinct species. Fruit 5-7 lines long. Stipulas an inch long.

Pelitala Cinchona. Tree.

24 C. Muzoneínsis (Goudot, in phil. mag. 1828. febr. p. 132.) leaves ovate-oblong, acute, attenuated at the base; stipulae revolute; panicle bractiále; corolla white, with a bearded limb. ʃ. S. Native of Columbia, in the extensive forests about the town of Muzo.

Muzo Cinchona. Tree.

25 C. Lambertaína (Mart. in bot. zeit. no. 7. p. 119. 1831.) leaves petiolate, oval, rather cordate, bluntish, glabrous above and shining, soft and opaque beneath, and pilose on the nerves; cymes compound, terminal; fruit cylindrical, ribbed, glabrous, dehiscing on one side; seeds girded by a narrow jugged margin. ʃ. S. Native of South America, on the banks of the Amazon.

Lambert's Cinchona. Tree.

26 C. Bergiaína (Mart. in bot. zeit. no. 7. p. 119. 1831.) branches and all the younger parts of the tree clothed with rusty hairs; leaves oblong-lanceolate, tapering into the short petioles, flat; thryse axillary, interrupted, bracteate at the base; capsule oblong-cylindrical. ʃ. S. Native of South America, on the banks of the Amazon.

Bergia's Cinchona. Tree.

 Cult. All the species of this very interesting genus are grown with great difficulty in the stoves of our gardens. The best soil for them is a mixture of turfy loam and sandy peat. Cuttings should be taken off when ripe, and planted in a pot of sand, which should be plunged under a lead-glass in a moist heat.

LIN. SYST. Pentándria, Monogyónia. Calyx 5-toothed. Corolla tubular, with a 5-toched limb, which is imbricate in aestivation. Stamens exserted; filaments bearded in the middle; anthers roundish, peltate; cells loosened at the base. Stigma 2-toched. Capsule 2-celled, dehiscing in the middle of the cells, many-seeded; having the dissepiment complete. Seeds small and narrow.—A tree, native of Peru, with pinnate inflorescence.

1 L. Es'ea (D. Don, in Lin. trans. vol. 17. incl.). ʃ. S. Native of Peru, on the Andes at Pozuzo, and in the tract of St. Antonio de Playa Grande. Cinchona rosa, Ruiz et Pav. fl. per. 2. p. 54. t. 139. Cinchona Tarantárum, Pavon, miss. Cascarilla Pardo, Ruiz, quinol. p. 77. Leaves lanceolate-ovate, acute at both ends, naked, and shining on both surfaces. Paniècle crowded. Corolla tubular, rose-coloured: segments broad-
ovate. Capsules ovate, bisulcate, glabrous. Humboldt, on the authority of Zea, has joined this with Cinchona lanceifolia of Mutis, with which it has not the least affinity. Called *Asmonich* in Peru.

Rose-coloured-flowered *Lassionema*. Tree.

*Cult.* See *Cinchona*, p. 479, for culture and propagation.

**XIII. LUCULIA (Luculi swa is the name given to the tree by the Nipaulse).** Sweet, brit. fl. gard. t. 143. D. C. prod. 4. p. 357. D. Don, in *Lin. trans.* vol. 17. *Ined.*

Lin. syst. *Pentandra*, *Monogynia*. Calyx 5-parted (f. 87. c.). *Stipulas* (f. 87. b.), segments foliaceous. Corolla tubular, with a 5-lobed limb, which is imbricate in restoration. Stamens almost inclosed (f. 87. a.). Anthers linear. Stigma bipartite (f. 87. b.). Capsule 2-celled (f. 87. b.), dehiscing at the dissection from the apex, many-seeded, crowned by the calyx. Seeds samaroid, surrounded by a jagged membranous margin.—A tree, native of Nipaul: having cyanose bracteate inflorescence.

*Cult.* A very good rich light soil will suit this tree; and cuttings may be rooted in sand under a glass-house, but with great difficulty.

Lin. syst. *Pentandra*, *Monogynia*. Calyx 5-toothed. Corolla tubular, with a 5-cleft limb, which is pleated in restoration. Anthers linear, exerted. Stigma 2-lobed. Capsule 2-celled, dehiscing at the cells, many-seeded; valves venteriose, membranous. Dissection complete. Seeds girded by a membranous, reticulated border, which is biiid at the base.—Trees, natives of the East Indies, with compressed branches: coriaceous, petiole leaves; deciduous, glandularly ciliate stipulas; and small, inconspicuous, greenish, pubescent flowers, disposed in fascicles, the whole forming racemoce panicles. Floral leaves one under each branch of the panicle, lanceolate, convex, venous, on long petioles, similar to the large calyceal teeth of *Musse-n*da, but placed in a different situation.

1 H. _exclu'sum_ (Wall. in *Roxb. fl. ind.* 2. p. 358.) leaves oblong, downy: floral ones coloured and blistered; stipulas ciliate, serrated; panicles axillary and terminal; anthers almost sessile in the mouth of the tube; partition of capsule contrary. E. S. Native of the East Indies, in the mountainous parts of the Circars, and chiefly of the valleys, where it grows to be a large tree. It is called *Bandarao* in the Tehsiga language. *Cinchona excldens*, *Roxb. cor.* 2. p. 3. t. 106. Tratt. tab. t. 170. The lower pair, or two of the ramifications of the panicle, are ornamented each with a pair of coloured floral leaves. Panicles terminal, large. Flowers fasicelled, small, greenish white. The infusion of one fresh leaf in water all night had little taste, but struck quickly a deep purplish blue with a chalybeate. The two inner coats of the bark (the outer light spongy stratum is tasteless) possess both the bitterness and astringency of Persian bark, and when fresh in a stronger degree: the bitterness is not so quickly communicated to the taste as chewing the bark, as that of the former, but is much more durable, and chiefly about the upper part of the faxes. The wood is firm, close-grained, of a pale mahogany colour, and very useful for many purposes.

**Tell Hymenodictyon.** Fl. July, Aug. Ch. 1820. Tree 20 to 50 feet.

2 H. _thyrsi-flor'um_ (Wall. in *Roxb. fl. ind.* 2. p. 151.) leaves ovate, downy, pale beneath: the floral ones coloured and reticulated; thryse terminal and axillary, drooping; stipulas oblong, fringed with coloured glands; limb of corolla urceolate; partition of capsule contrary. E. S. Native of the East Indies, in the interior parts of Bengal. *Cinchona thyrsiflora*, *Roxb.* Branches forming a large ovate head to the tree. Leaves from 2-8 or 10 inches long. Thryse very dense. Flowers small, greenish yellow, fasicelled. The floral pair or two of leaves are on longer petioles than the rest.

**Thyra-flowered Hymenodictyon.** Fl. June, July. Ch. 1819. Tree 20 to 30 feet.

3 H. _fla'cicircum_ (Wall. in *Roxb. fl. ind.* 2. p. 152.) leaves ovate-elliptic, smooth, and shining above; stipulas oblong-spata
tulate, ciliate; racemes axillary, slender, pendulous; capsules oblong. E. S. Native of the East Indies, on the north side of the preceding species, towards the bottom; and in the valley of Noakote. Leaves from 6-10 inches long: having the margins slightly waved. Common peduncle pubescent, bearing a hardly coloured, lanceolate-oblong, pubescent, reticulated floral leaf, which is convex on the upper side, and concave on the under. It comes very near the preceding species, but differs, however, in having broader, elliptic, downy leaves, and much thicker both terminal and axillary subcompound racemes; its capsules too are much broader.

**Flaccid Hymenodictyon.** Tree 20 to 30 feet.

4 H. _obovat'um_ (Wall. in *Roxb. fl. ind.* 2. p. 153.) leaves obovate, acuminated, smooth: floral ones lanceolate, acuminated, reticulated, convex, glaucous; stipulas ovate, acute, glandularly ciliate; racemes axillary and terminal, a little branched, erect. E. S. Native of the East Indies, and perhaps of Wynaad. Young shoots green, much compressed. Rachis of peduncles villous. At the apex of each peduncle there is a floral palmill leaf, 2 inches long, convex and a little rugose above: glaucous and concave, beautifully veined, and rather pubescent beneath.

**Obovate-leaved Hymenodictyon.** Tree.

*Cult.* See *Cinchona*, p. 479, for culture and propagation.

segments, which are induplicate in aestivation. Stamens exserted; anthers narrow-linear, having the cells adnate at the base. Stigma undivided. Capsule 2-celled, dehiscing at the discission from the apex, many-seeded. Seeds girded by an entire membranous border.—Trees or shrubs, usually glabrous. Leaves oval or lanceolate, on short pedioles. Stipulas solitary on each side. Peduncles axillary and terminal. Flowers white or reddish. The disks of all the species are destitute of quinine and cinchonine, according to St. Hilaire.

SECT. I. Pito'nia (the bark of some of the species is called Quinquina Piton in the Antilles). D. C. prod. 4. p. 559. Limb of calyx parted almost to the base into teeth of various lengths. Corolla glabrous; having the tube longer than the segments. Stigma undivided.—Species all natives of the Caribbean Islands. The bark is fibrifugal, somewhat emetic, and is sold in the shops under the name of Quinquina Piton of the Antilles.

1 E. Caribae'um (Rom. et Schultes, syst. 5. p. 18.) leaves ovate-lanceolate, acuminate, glabrous; pedicels axillary, 1-flowered, rather shorter than the pedioles; calyx bluntly 5-toothed; style and stamens about equal in length to the corolla. ♀. S. Native of the Caribbean Islands, Guadaloupe, St. Domingo, Jamaica, Santa Cruz, &c.; and of Mexico. Chinchona Caribae'a, Jacq. amer. t. 179. f. 65. obs. 2. t. 17. Lamb. mon. t. 4. Lamb. from Linn. 26. t. 4. Chinchona Javanica, Wright, in roy. soc. trans. Lond. p. 67. p. 504. t. 16. Andr. bot. rep. t. 481. Flowers white, sweet-scented, about the length of the leaves; but according to Jacquin they are pale flesh-coloured. Stamens, according to Andrews's figure, shorter than the segments of the corolla. Dr. Wright says that the jessuit's bark of Jamaica rises only to 20 feet, with leaves of a rusty green colour; and the young buds of a bluish green hue. The bark is generally smooth and grey on the outside, though in some rough and scabrous, when well dried, and the inside of a dark brown colour. Its flavour is at first sweet, with a mixture of the taste of horse radish and of the aromatics of the East, but when swallowed of that very bitterness and astrigency which characterises the Peruvian bark. It grows near the sea shore, and is called in Jamaica Sea-side beef.

2 E. longi'flore'num (Rom. et Schultes, syst. 5. p. 18.) leaves linear-lanceolate, attenuated at both ends, glabrous; pedicels axillary, very short; teeth of calyx long, linear-lanceolate, glabrous; corollas 3 or 4 times longer than the leaves. ♀. S. Native of St. Domingo. Chinchona longiflora, Lamb. mon. p. 38. t. 12. exclusive of the synonymes. Flowers white, 5 inches long before expansion; segments linear; tube very long.

3 E. canes'cens (Bartr. in herb. Hänke, ex D. C. prod. 4. p. 559.) leaves ovate-oblong, acuminate, canescent from villi on both surfaces as well as on the branchlets; pedicels axillary, 1-flowered. ♀. S. Native of Mexico. The canescent down on the leaves, branches, pedicels, and young fruit distinguishes it from all the other species. Flowers unknown. Capsule naked at the apex, not crowned by the calyx. Pedicels length of fruit.

Canescent Exostemma. Tree.

cinchonum, white, about the size of those of E. Caribae'um, sweet-scented.

Narrow-leaved Exostemma. Tree. 10 to 15 feet.

5 E. cori'ceum (Rom. et Schultes, syst. 5. p. 20.) leaves ovate, scarcely acute, coriaceous, glabrous on both surfaces, shining; branches and flowers glabrous; pedicules axillary, 2-3-flowered; teeth of calyx short, acute; corollas about the length of the leaves; capsules ovate, smooth. ♀. S. Native of St. Domingo. Cinchona coriacea, Poir. dict. 6. p. 38. Pedicules 2 or 3 times shorter than the leaves. Seed girded by a membranous wing. Corolla glabrous, 2 inches long, with a terete tube and narrow reflected segments. Branches of panicle dichotomous.

Coriaceous-leaved Exostemma. Tree.

6 E. lineate'um (Rom. et Schultes, syst. 5. p. 15.) leaves ovate, acuminate, and are as well as the branches and flowers glabrous; pedicules terminal, cinchobose; calyx segments linear; capsule pentagonal. ♀. S. Native of St. Domingo. Cinchona lineata, Vahl. symb. 2. p. 27. act. hist. nat. hafn. 1. p. 20. t. 4. Lamb. mon. p. 26. t. 6. Panicle cinchobose, terminal, trichotomous. Leaves marked with lines on the upper surface. Flowers an inch long, white.

Lineated-leaved Exostemma. Tree. 20 to 30 feet.

7 E. parvi'folium (Rich. in Humb. et Bonpl. pl. eqnin. 1. p. 132.) leaves ovate, mucilaginous, furnished with porose glands in the axils of the nerves; pedioles, branches, and pedicules pubescent; fascicles of flowers axillary and terminal, crowded; teeth of calyx short. ♀. S. Native of the Caribbean Islands.

Small-flowered Exostemma. Tree.

8 E. brachya'rium (Rom. et Schultes, syst. 5. p. 19.) leaves elliptic, obtuse, and are as well as the branches and flowers glabrous; pedicules terminal, cinchobose; teeth of calyx short, acute; capsules ovate or obovate, ribbed. ♀. S. Native of the eastern parts of Jamaica, in shady parts of mountains. Cinchona brachycarpa, Swartz, prod. p. 43. fl. ind. occid. 378. Lindsay, roy. soc. trans. edinhb. 1794. p. 214. t. 5. Vahl. act. soc. hist. nat. hafn. 1. p. 22. Lamb. cinch. p. 18. t. 8. Panicle terminal, cinchobose, trichotomous. Corolla 3 inches long before expansion, pale red or flesh-coloured. Leaves 5-6 inches long, deep green. The bark, when wounded, emits a whitish juice; which becomes of a brownish purple colour on drying, and is easily reduced into a greyish purple powder, which is at first sweet, but afterwards very bitter and astringent.

Short-fruited Exostemma. Tree. 20 feet.

9 E. triflo'reum; leaves lanceolate, obtuse, attenuated at the base, quire glabrous, and shining on both surfaces; branches glabrous; corynob compound; pedicules 2-3-flowered; calycin teeth subulate; corolla with a very long filament tube, and long, narrow, linear, dependent segments; capsule obovate. ♀. S. Native of Jawnaca. Cinchona triflora, Wright, in edinhb. med. journ. p. 240. Lamb. cinch. p. 15. It comes nearest to E. floribundum, but differs from it in the leaves being ovate-elliptic, acuminate, not attenuated at the base; the coryons of flowers are also much larger and closer; the teeth of the calyx are shorter and broader; the tube of the corolla is much shorter and wider; and the capsules oblong-cylindrical.

Three-flowered Exostemma. Tree. 20 feet.

10 E. floribun'da (Rom. et Schultes, syst. 5. p. 19.) leaves elliptic, acuminate, and are as well as the branches and flowers glabrous; pedicules terminal, cinchobose; teeth of calyx short, acute; capsules turbinate, smooth. ♀. S. Native of the Caribbean Islands, Jamaica, Guadaloupe, St. Domingo, St. Lucia, and Trinidad, in woods on the banks of mountain streams. Cinchona floribunda, Swartz, prod. p. 41. fl. ind. occid. p. 375. Lamb. mon. p. 17. t. 7. Cinchona montana, Badier, in journ. phys. 1789. febr. p. 129. t. 1. Cinchona, St. Lucieae, David, phil. vol. iii.

**Bundle-flowered Exostemma.** Cît. 1794. Tree 20 to 80 ft.

11 E. Capitâ'tem (Spreng. new, entd. 2. p. 143.) leaves ovate, coriaceous, glabrous; flowers capitate; calyx small, 5-toothed; corolla with a long tube, and revolute segments. S. Native of South America. Perhaps only a variety of E. floribôdum.

Specimens of this tree were received under the name of St. Lucia bark.

**Capitate-flowered Exostemma.** Tree.

**Sect. II. Brachya'nthum (from brachys, short, and anthos, a flower; in reference to the tube of the flower being shorter than the segments).** D. C. prod. 4. p. 560. Limb of calyx divided even to the base into teeth. Corolla having the tube shorter than the segments of the limb, or at the longest hardly equal in length to them. Stigma sometimes undivided, and sometimes somewhat 2-toothed. Corolla glabrous, or pubescent on the outside.

12 E. Philosophum (Roem. et Schultes, syst. 5. p. 366.) leaves oval, acute, crowded, and are as well as the branches and flowers glabrous; peduncles terminal, corymbose; teeth of calyx short, acute; tube of corolla rather shorter than the segments of the limb; filaments hairy. S. Native of the Philippine Islands, at Manila: and in Santa Cruz de la Laguna. Cinchôna Philippica, Cav. Icon. 4. t. 329. Peduncles axillary, trichotomous, coriaceous, bearing 2 leaves at the origin of the branches, about the length of the leaves. Corolla 9 lines long before expansion. Stigma elate, marked by a furrow on each side, probably from the cohesion of the lobes. Capsule turbinate, 5 lines long, crowned by the calycine limb. Bark bitter and astrangent.

**Philippine Exostemma.** Tree 10 to 15 feet.

13 E. Coryme'ferum (Roem. et Schultes, syst. 5. p. 20.) leaves oblong, acute, and are as well as the branches and flowers glabrous; peduncles axillary, corymbose, bearing 2 leaves just below the ramifications; teeth of calyx short, acute; segments of corolla hardly shorter than the tube. S. Native of the islands of Tongatabu and Ebaove, in the Pacific Ocean, where it is cultivated for the elegance and odor of its flowers. Cinchôna corymbrifera, Forst. act. nov. ups. 3. p. 176. Lin. fil. suppl. p. 144. Lamb. echin. p. 25. t. 5. Leaves deep green, size of those of Coffea Arbôrica; having the nerve purplish beneath. Corymb trichotomous. The bark is very bitter and sub-astringent, and very like Jesuits' bark. Flowers white, but reddish on the outside.

**Corymb-bearing Exostemma.** Tree 10 to 15 feet.

14 E. Peruvianum (Humb. et Bonpl. pl. equin. 1. p. 153. t. 38.) leaves ovate or oblong, acute, rounded at the base: the superior ones sessile and coriaceous; peduncles terminal, sessile; peduncles and calyces pubescent; corolla silky outside. S. Native of Peru, on the declivities of the Andes, in cold places by the sides of streams, at the altitude of 3000 feet. H. B. et Kînth, nov. gen. amer. 3. p. 404. Cinchôna Peruviâna, Poir. suppl. 4. p. 649. Flowers rose-coloured. Leaves smooth, deep green above. Segments of corolla hardly shorter than the tube. Filaments glabrous, adnate to the throat of the corolla. Stigma obsoletely 2-toothed. Teeth of calyx acute.

**Peruvian Exostemma.** Tree 10 to 12 feet.

15 E. Corymbo'sum (Spreng. syst. 1. p. 706.) leaves oblong-lanceolate, acute, and are as well as the branches and flowers glabrous; corollas terminal, bractiate; teeth of calyx almost linear, acute, spreading; segments of corolla about equal in length to the tube. S. Native of Peru, in hot places between Chaulla and Muna. Portândia corymbosa, Ruiz et Pav. fil. per. 2. p. 49. t. 190, f. a. Leaves shining above, 2-3 inches long. Corolla white; having the limb reflexed. Capsule fuscous, turbiniate. Seeds girded by a membranous wing, hence it is not a species of Portàndia.

**Corymbose-flowered Exostemma.** Tree 15 to 18 feet.

16 E. Dissimilifica'tum (Roem. et Schultes, syst. 5. p. 17.) leaves cordate-oblong, quite glabrous; limb of corolla longer than the tube; capsules almost linear, very narrow. S. Native of South America, at the altitude of 6000 or 7000 feet. Cinchôna dissimiliformus, Mutis, in Humb. berl. mag. nat. 1. p. 120.

**Dissimilar-flowered Exostemma.** Tree.

**Sect. III. Pseudoste'mma.** Limb of calyx campanulate, sub-tubular, truncate, or somewhat 5-toothed. Corolla usually villose on the outside: having the tube shorter than the segments of the limb. Stigma usually 2-toothed. Fruit unknown. Flowers disposed in panicles. Species natives of Brazil. Perhaps a proper genus.

17 E. Cupi'liatum (St. Hil. pl. usul. bras. t. 3. f. A.) leaves ovate-lanceolate, cuspidate, nerved, villous beneath; pedal terminal; limb of calyx campanulately tubular, obscurely 5-toothed, longer than the ovariun; corolla villos on the outside: with the segments longer than the tube; filaments villos in the middle; stigma bifi. S. Native of Brazil, in woods. Leaves 9-15 lines long. Corolla white, 2-4 lines long. Fruit unknown. It is called Quino do mato, and the bark is used as a substitute for Peruvian bark.

**Cuspidate-leaved Exostemma.** Tree 8 to 10 feet.

18 E. Austra'le (St. Hil. pl. usul. bras. t. 3. f. B.) leaves ovate, nerved, rather villous beneath; peduncle terminal, sessile, tripartite; limb of calyx campanulate, shorter than the ovariun, bluntly 5-toothed; corolla rather pubescent on the outside: with the segments longer than the tube; filaments glabrous; stigma undivided. S. Native of Brazil, in woods. Leaves 12-15 inches long, and 7-8 broad. Style villous. The bark of this and the preceding species is employed by the Brazilians in the cure of intermittent fevers, from the want of more efficacious remedies. It is bitter and a little astrangent.

**Southern Exostemma.** Tree 8 to 10 feet.

19 E. Roman'num (Cham. et Schlecht. in Linnaea. 4. p. 179.) leaves obovate-elliptic, acute at both ends, rather granular when examined under a lens; peduncle trichotomous, loosely pyramidal; limb of calyx quite entire; corolla glabrous on the outside, but the throat is villous, and the segments are rather pilose on the inside, and a little longer than the tube; stigma 2-toothed. S. Native of Brazil, within the tropics.

**Var. a, lepis'im (D. C. pro. 4. p. 361.) leaves large; tube of corolla shorter than the segments of the limb.

**Var. b, leve' (D. C. l. c.) leaves lanceolate; tube of corolla longer than the segments of the limb.

**Shiny Exostemma.** Tree.

20 E. Soi'zum (Mart. resis. ex Linnaea. 5. p. 45.) leaves obovate or ovate, acute, glabrous; corollas few-flowered, terminal; capsules hardly an inch long, obovate, compressed; valves usually 1-nerved; seeds transversely oblong, with a broad margin.

**Soi'zum's Exostemma.** Tree.

21 E. Macroco'mia; branches naked; leaves oblong-spatulate, acuminate, tapering into the short petioles, smooth on both
surfaces, shining; stipulas connate at the base, and running sound the petioles, and forming a callous semicircular margin to them; thyrsse axillary, panicked, loose; flowers minute, tetramerous; fruit cylindrical; seeds furnished with a quite entire rounded membrane at both ends. \* S. Native of South America, on the banks of the Amazon. Cinchona macrocénema, Mart. in bot. zeit. no. 7. p. 119. 1831.

**Long-stemmed Exostemma. Tree.**

**Cul.** See Cinchona, p. 479, for culture and propagation. The species are of freer growth than those of **Cinchona**; and the cuttings should not be too ripe when taken off.

**Lin. syst.** *Pentándria, Monogónia.* Flowers dioecious from abortion. Calyx with a short obovate tube, and a small limb, which is 5-toothed to the base. Corolla funnel-shaped, with a slender tube, a villous throat, and a 5-parted limb. Stamens exserted in the male flowers, but abortive and enclosed in the female flowers. Style exserted in the female flowers, and bifid at the apex, but abortive in the male flowers. Capsule globose, coriaceously chartaceous, marked by an areola at the apex from the fallen calyx, 2-celled, dehiscing at the cells, 2-valved. Seeds small, fixed to central placenta, imbricated downwards, girded by a membranous wing; albumen fleshy.—Smooth, climbing or straggling shrubs, natives of the Mauritius. Roots exuding a yellow juice when bruised. Leaves oblong or roundish. Stipulas solitary on each side, broad, very short. Peduncles axillary, many-flowered, coriaceous, with opposite branchlets. Flowers fragrant, orange-coloured, sometimes hexameric.

**Fragrant Danaís. Shrub cl.**

2. D. *laxiflorá* (D. C. prod. 4. p. 361.) leaves obovate, obuse, and cupuplicate; coryumbs loose, sub-panicled; capsule not furrowed, crowned by the erect permanent calyicine teeth. \* C. S. Native of Madagascar and Bourbon. Petioles 4 lines long. Panicle of female flowers 2-3 inches long, but that of the males is unknown.

**Loose-flowered Danaís. Shrub cl.**

**Round-leaved Danaís. Shrub cl.**

4. D. *sulpíca* (Pers. ench. 1. p. 198.) leaves ovate; capsule furrowed, crowned by the calycine segments, which are falcate. \* C. S. Native of the Mauritius, where it climbs over the highest trees.

**Furrowed-fruited Danaís. Shrub climbing.**

**Cult.** A mixture of loam, peat, and sand will be a good soil for the species of *Danaís*; and cuttings will be easily rooted under a hand-glass, in heat. They are well fitted for training up the rafters in a stove.

**Lin. syst.** *Tetra-Pentándria, Monogónia.* Calyx with a turbinate tube, and the limb parted into as many lobes as there are corolline segments, or double that number (f. 88. a.), and often furnished with lobules in the recesses between the segments. Corolla funnel-shaped, with a terete tube, a hairy throat (f. 88. c.) and a 4 (f. 88. b.), rarely 5-parted limb. Anter sessile in the throat. Capsule ovate, compressed, crowned by the calycine lobes (f. 88. d.), dehiscing from the apex to the base at the dissepiment (f. 88. a.); the divisions boat-shaped. Placentas somewhat exserted from the dissepiment. Seeds imbricate, almost sessile, peltate, surrounded by a winged membranous border, which is usually toothed. Embryo erect, in fleshy albumen; cotyledons foliaceous, lanceolate.—Perennials, herbaceous, or suffruticose plants: having the stems and branches twining and slender. Leaves ovate-oblong, or subcordate. Stipulas broad, short, acute, usually adhering to the petioles at the base. Peduncles axillary, 1 or many-flowered.

**Sect. 1. Lyógustum (from λυγος, a twig; in reference to the twizzy stems).** D. C. prod. 4. p. 362.—Lýgustum, P. Browne.—Manettia, Mutis, Lin. and Schreb. Lobes of calyx twice the number of those of the segments of the corolla, usually 8 (f. 88. a.), rarely 10; besides the accessory lobules.

1. M. *reclináta* (Lin. mant. p. 555.) stem herbaceous, reclinate, weak, branched; leaves ovate, acute, pubescent beneath; peduncles axillary, many-flowered, shorter than the leaves; pedicels opposite, hairy. \* C. S. Native of Mexico. Corolla white. Calyx 8-lobed; lobes linear, concave, hairy. Nacidhea *réciníata*, Poir. in Lam. dict. 4. p. 416.

2. M. *racemoosa* (Ruiz et Pav. fl. per. 1. p. 88. t. 89.) stems twining; branches tetragonal; leaves ovate or oblong, acuminate; stipulas semi-circular, acuminate, ciliated; racemes axillary, few-flowered, longer than the leaves; corollas hairy. \* C. S. Native of Peru, in groves at Cuchero and Chincho.

3 & 2

---

**Fig. 88.**
RUBIACEÆ. XVII. MANETTIA.

Heart-leaved Manettia. Fl. Aug. Oct. Clt. 1832. Pl. tw. 9 M. glabra (Cham. et Schlecht. in Linnaea. 4. p. 159.) plant quite glabrous; stems twining; leaves cordate, acuminate; peduncles axillary, 1-flowered.  y. c. G. Native of the South of Brazil, among bushes, on the banks of rivers and rivulets, as on the Uraguay. Corolla scarlet, glabrous on the outside, but clothed with white villi above the base inside. Stigma club-shaped. Stipulas with a subulate point in the middle. Segments of calyx narrower than in M. cordifolia, which is plant very similar, and which Hook. and Arnott consider identical.

Glabrous Manettia. Pl. tw. 10 M. gracilis (Cham. et Schlecht. in Linnaea. 4. p. 169.) plant puberulous, twining; leaves petiolar, ovate-lanceolate, acuminate; peduncles axillary, 1-flowered; calyx glabrous.  y. c. S. Native of the south of Brazil. Very like M. glabra, but is distinguished by the characters given, in the flowers being smaller and slenderer, also scarlet; in the calycine lobes being narrower, and in the anthers being linear.

Slenor Manettia. Pl. tw. 11 M. pubescens (Cham. et Schlecht. l. c. p. 170.) plant cinerose from down; stems twining; leaves petiolar, ovate, obtuse at the base, and acuminate at the apex; stipulas furnished with a short acutish base and axile hairs; 1-flowered; calyx cise segments longer than the tube, but at length equal with it.  y. c. S. Native of the south of Brazil. Very like the two preceding species. Corolla scarlet, 3 times longer than the limb of the calyx.

Pubescent Manettia. Pl. tw. 12 M. villosa (Cham. et Schlecht. l. c. p. 172.) plant twining; branches cinerose tomentose from roughish down; leaves petiolar, ovate, somewhat acuminate, acutish at the base; stipulas triangular; peduncles axillary, 1-flowered; segments of the calyx linear, one half shorter than the tube of the corolla; corolla pubescent on the outside; capsule ovate, rather villous.  y. c. S. Native of the south of Brazil.

Villosa Manettia. Pl. tw. 13 M. attenuata (Nees. et Mart. in nov. act. bonn. 12. p. 14.) stem scarlet, almost terete; roughish; leaves ovate-lanceolate, attenuated at both ends, clothed with pubescent tomentum beneath; peduncles axillary, 1-flowered.  y. c. S. Native of Brazil, on the road to Felisbert, and in fields at the mountain called Grao-major, in the province of the Miness. Lobes of calyx 4, lanceolate, acuminate, erect, pubescent. Corolla glabrous, 2 inches long, crimson, with ovate atchis reflexed lobes. Upper leaves 3 in a whorl.

Attenuated-leaved Manettia. Shrub tw. 14 M. acutiflora (Ruiz et Pav. fl. per. 1. p. 58. t. 89. f. b.) plant glabrous; stems twining, terete; leaves lanceolate, very acute, petiolar; stipulas acuminate, adpressed, broad at the base; peduncles axillary, 1-flowered; tube of calyx hardly longer than the calyx.  y. c. S. Native of Peru, in groves, in the province of Pautahual. M. acutiflora, Rem. et Schultes, syst. 3. p. 203. Nacbea acutiflora, Poir. suppl. 4. p. 55. Lobes of calyx 4, lanceolate-linear, acute. Corolla purple, villous outside, as well as in the throat.

Acute-flowered Manettia. Shrub tw. 15 M. umbellata (Ruiz et Pav. fl. per. 1. p. 58. t. 90. f. a.) plant glabrous; stems scarlet, terete; leaves lanceolate, very acute, petiolar; stipulas acuminate, adpressed, broad at the base; peduncles axillary, 1-flowered; tube of calyx hardly longer than the calyx.  y. c. S. Native of Peru, in groves, at Muna. Nacbea umbellata, Poir. suppl. 4. p. 55. Bracteas 2-4, surrounding the flower from the number of an aboleron. Lobes of calyx 4, lanceolate. Corolla blue, with a bearded throat.

Unbellate-flowered Manettia. Shrub cl.

Sect. II. NACBEB (Anblet does not give the meaning of this word). D. C. prod. 4. p. 563. Lobes of calyx equal in number to the lobes of the corolla, usually 4, without any accessory lobules.

8 M. cordifolia (Marr. spec. med. bras. 1. p. 19. t. 7.) stems herbaceous, twining, terete, roughish; leaves ovate, cordate at the base, acute at the apex, finely pubescent on both surfaces; peduncles axillary, 1-flowered.  y. c. G. Native of Brazil, in the province of Minas Geraes, at Villa Rica, in hedges and on the margins of woods. Roots woolly, brown, and are an excellent remedy in dropsy and dysentery. Lobes of calyx 4, ovate-lanceolate, downy. Corolla scarlet, an inch long, glabrous outside, and villous inside.

One-flowered Manettia. Shrub cl.

guian. 1. p. 96. t. 57. f. 1. Calyx oblong, compressed; having 4 furrows on each side, and 8-lobed at the apex; lobes narrow, acute, fleshy. Corolla having a white tube, spotted with red, a throat closed by yellow hairs: and 4 oval, acute lobes, which are scarlet and villous above.

Scarlet-flowered Manettia. Fl. May, July. Clt. 1806. Shrub tw. 4 M. lyceum (Swartz, prod. 4. p. 362. fl. ind. occ. p. 325.) stem suffrutescent, flexuous, scendent; branches filiform; leaves ovate, acute, veiny, roughish on the nerves beneath; stipulas subulate, very short; peduncles axillary, longer than the leaves, many-flowered.  y. c. S. Native of the south of Jamaica, on the higher mountains. Spreng. syst. 1. p. 413. exclusive of the syn. of Kunth. Lygistum, Browne, jam. p. 142. t. 3. f. 2. but the calyx is said to be 4-lobed and the fruit baccate and 4-celled, and is therefore the Petesia Lygistum, Lin. spec. 180. the Lygistum axillare, Lam. ill. 1. p. 256. t. 67. f. 2., in which the calyx is delineated with 4 lobes, and therefore also the Cococypsilum biformum, Willd. spec. 1. p. 618.; the Fernélia bifora, Rem. et Schultes, syst. 3. p. 187. Perhaps 2 species are here confused, one with a 4-lobed calyx and the other with an 8-lobed calyx: having 4 of the lobes lanceolate, and 4 of them toothed and smaller.
16 M. rosea (Pohl, in lett D. C. prod. 4. p. 364.) stems rather twining, compressedly angular, rather pubescent; leaves oblong, acuminate, glabrous; stipules broad, short, acuminate; peduncles axillary, bifid, 2-flowered, shorter than the leaves.

7. c. S. Native of Brazil. Lobes of calyx 4, lanceolate, longer than the tube of the calyx. Corollas rose-coloured, larger than in any other species of the genus, pubescent outside, with oblong ciliated segments.

Rose-coloured-flowered Manettia. Shrub tw.

17 M. ru'tta (Willd. spec. 1. p. 625.) stems suffrutescent, twining; leaves ovate, acute, on short petioles; peduncles somewhat corymbose at the apex, longer than the leaves.

Painted-leaved Manettia. Shrub tw.

18 M. fimbria'ta (Cham. et Schlecht. in Linneea. 4. p. 173.) plant twining and quite glabrous; leaves petiolate, elliptic, acuminate, acute at the base; peduncles lateral, 1-3-flowered; lobes of calyx ovate-lanceolate, a little shorter than the tube of the corolla; lobes of corolla fringed with long hairs; stigma 4-lobed.

7. c. S. Native of the south of Brazil.

Fringed-flowered Manettia. Pl. tw.

19 M. pes-do-diö'dia (Cham. et Schlecht. l. c. p. 174.) stems twining, obscurely tetragonal, glabrous, marked by a ciliated line at the apex; leaves petiolate, broad-oval, acuminate, acute at the base; stipulas triangula, ciliated; peduncles lateral, 1-3-flowered; segments of calyx lanceolate, acuminate, ciliated; corolla clothed with smooth tomentum outside; capsule tetragonal, pear-shaped.

False-Diödia Manettia. Pl. tw.

20 M. cili'a'ta (Cham. et Schlecht. l. c. p. 176.) stems twining, tetragonal; angles winged, ciliated; leaves on short petioles, lanceolate, acuminate, ciliated, rather coriaceous; stipulas ciliated, ending each in a reflexed acumen; peduncles 1-5-flowered, pubescent; segments of calyx lanceolate, acuminate, ciliated; corolla clothed with rusty tomentum on the outside; capsule obconical.

7. c. S. Native of the south of Brazil.

Ciliated-stemmed Manettia. Pl. tw.

21 M. albi-fióra (Schott, miss. ex Pohl, in lett. D. C. prod. 4. p. 364.) stems herbaceous; branches tetragonal, rather pilose; leaves oblong, acuminate at both ends, pubescent on both surfaces; stipulas broad, short, cuneate; pedicels numerous, 1-flowered, rising imbellately from the axis of the leaves.

7. c. S. Native of Brazil. Calyx with a turbinate, rather tetragonal tube, and 4 lanceolate lobes. Corolla white. Fruit unknown.

White-flowered Manettia. Pl. tw.

† Species not sufficiently known.

22 M. Ge'rte'ri (D. C. prod. 4. p. 364.) stems and leaves unknown; capsule ovate, compressed a little, bisulate, crowned by the 4-parted limb of the calyx.—The rest unknown. Nacieba gibraba, Gaertn. fil. carp. 3. p. 102. t. 197. f. 5.

Gaertner's Manettia. Pl. tw.

23 M. secundifióra (D. C. prod. 4. p. 364.) plant herbaceous, scandent; leaves ovate-lanceolate-linear; racemes axillary, subcuneus, few-flowered; flowers on short pedicels, bracteate.

Second-flowered Manettia. Pl. cl.

Cult. All the species of Manettia are worth cultivating for the beauty and elegance of their flowers. A mixture of loan peat and sand is the best soil for them. They are easily propagated by young cuttings in the same kind of soil under a hand-glass, in a moderate heat.

LIN. Syst. Tetrandria. Monogynia. Calyx with a subglobose tube (f. 89. a.), and a 4-parted limb (f. 89. b.); lobes linear-subulate (f. 89. b.), sometimes with a tooth between each lobe. Corolla funnel-shaped (f. 89. c.), tubular, elongated, beset with velvety papillae outside, with a naked throat, and a 4-parted spreading short limb (f. 89. d.). Stamens having the filaments alinate to the tube at the base, and free from about the middle (f. 89. e.); anthers linear, inclosed. Stigma bilamellate (f. 89. f.), exserted. Superior part of the ovary naked. Capsule membranaceous, globose, a little compressed, 2-celled, and dehiscing at the cells above; valves semi-septiforous. Placentas orbicular. Seeds many in each cell, compressed, imbricated downwards according to the figure of Salisbury, but upwards according to the figure in fl. mex., girded by a membranous wing.—Shrubs, natives of Mexico. Leaves opposite or in whorles. Stipulas narrow, acute, adnate to the petioles on both sides. Peduncles terminal, 3-flowered or trichotomous and corymbose.—This genus is very nearly allied to Manettia.

§ 1. Leaves disposed in whorles. Corollas flesh-coloured or pale red, having the tube bearded inside.

1 B. linea'ris (H. B. et Kunth, nov. gen. amer. 3. p. 383.) branches terete, when young pubescent; leaves 3 in a whorl, linear, with revolute edges, scabrous above, but canescent from hairs beneath; corollas trichotomous; lobes of calyx 5 times shorter than the tube of the corolla, which is hairy.

7. G. Native of the temperate parts of Mexico, near St. Augustin de Las Cuevas, Morán, &c. Corolla 8 lines long, pale red.

Linear-leaved Bouvardia. Shrub 5 feet.

2 B. ange'strioli (H. B. et Kunth, l. c. p. 384.) branches terete, smooth; leaves 3 in a whorl, lanceolate, with revolute edges, glabrous above, but beset with fine hairs beneath; corollas somewhat trichotomous; lobes of calyx 2 or 3 times shorter than the tube of the corolla, which is hairy.

7. G. Native of temperate parts of Mexico, along with the preceding. There is a variety of this species with 5-cleft flowers. Flowers pale red.

Narrow-leaved Bouvardia. Shrub.

3 B. hirtéilla (H. B. et Kunth, l. c.) branches terete; branchlets and leaves hairy on both surfaces, lanceolate, with revolute edges; flowers corymbose; lobes of calyx 5-6 times shorter than the tube of the corolla, which is hairy.

7. G. Native about the city of Mexico. Flowers pale red or flesh-coloured.

Hairy Bouvardia. Shrub.

4 B. quattre'strioli (D. C. prod. 4. p. 365.) branches striated, rather downy; leaves 4 in a whorl, lanceolate, acuminate, rather scabrous above, and pubescent beneath; corollas trichotomous; lobes of calyx 6 times shorter than the tube of the
corolla, which is pilose. G. Native about the city of Mexico. Carphalae? pubiflora, Moc. et Sesse, fl. mex. icon. ined. Flowers scarlet, 12-14 lines long. Perhaps only a variety of B. hirtella.

**Four-leaved Bouvardia.** Shrub.

Var. r, cayena (D. C. pro. 4. p. 365.) leaves oblong-lanceolate, acuminate; style exerted. G. Cultivated in gardens.

Var. r, oxida (D. C. l. c.) leaves ovate, acute. G. Bouvardia triphylla, var. b, Salisb. Parad. t. 88. 

Jacquins’s Bouvardia. Fl. April, Nov. Clt. 1794. Shrub 2 to 3 feet.

6 B. irova (H. B. et Kunth, l. c. p. 385.) branches tetragonal, striated, and are, as well as the leaves, smoothish; leaves 4 in a whorl, obvolute; corymbs trichomous. G. Native of Mexico, between Chapaltepec and Texcoco. Herb 1-5 feet high, ex Bonpland. Perhaps this is a true species of Bouvardia, ex Kunth.

Obovate-leaved Bouvardia. Pl. 1 to 3 feet.

§ 2. Leaves opposite. Corolla with a beardless tube.

7 B. versicolor (Ker, bot. reg. t. 254.) branches terete, glabrous, velvety when young; leaves opposite, lanceolate, ciliated; corymbs 3-flowered, trichomous, drooping; lobes of calyx 8 times shorter than the tube of the corolla, which is glabrous both inside and outside. G. Native of South America, but in what place is unknown. Corolla with a scarlet tube, which is 9 lines long, but having the limb yellowish inside.

8 B. triflora (H. B. et Kunth, nov. gen. amer. 3. p. 386. t. 288.) branches terete, glabrous; branchlets rather hairy; leaves opposite, lanceolate-oblong, acute, rounded at the base, beset with fine hairs; peduncles terminal, 3-flowered; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. G. Native of the temperate parts of Mexico. Céstrum spermacocifolium, Willd. rel. miss. in Roem. et Schultes, syst. 4. p. 808. Corolla white, with the tube 5-6 lines long.

**Three-flowered Bouvardia.** Shrub.

9 B. longiflora (H. B. et Kunth, l. c. p. 386.) branches compressedly tetragonal, glabrous; leaves opposite, oblong, acute, cuneated at the base, glabrous; flowers terminal, solitary, sessile; lobes of calyx 3 or 4 times shorter than the tube of the corolla, which is glabrous. G. Native of temperate parts of Mexico, near Santa Anita, where it is called by the natives Flor de San Juan; also near Queretaro and Huanajauto, ex Cav.; and at Pascoaro, ex Cervantes, in herb. Hanke. Aginëtia longiflora, Cav. Icon. 6. p. 51. t. 572. f. 1. Corolla white, with the tube 2 or 3 inches long. Stipulas usually cleft into 2 awns at the apex.

Long-flowered Bouvardia. Clt. 1827. Shrub 2 to 3 feet.

10 B. cavansilleii (D. C. Prod. 4. p. 366.) suffruticosum; leaves opposite, ovate-lanceolate, acuminate, rather villous beneath; peduncles terminal, trilobed, 3-flowered; capsule transversely ovate, somewhat didymous. G. Native of Mexico. Aginëtia multijlora, Cav. Icon. 6. p. 52. t. 572. f. 2. without flowers.

Cacavilles’s Bouvardia. Shrub.

11 B. cordiformi (D. C. Prod. 4. p. 366.) suffruticosum; leaves opposite, on very short petioles, cordate, acute; corymbs terminal, sessile, 8-10-flowered. G. Native of Mexico. Ixora cordifolia, Moc. et Sesse, fl. mex. icon. ined. Corolla from dirty yellow to scarlet, 6-7 lines long.

Heart-leaved Bouvardia. Shrub.

Cult. The species of this genus usually bear red or scarlet flowers, and are therefore worth cultivating in gardens. The readiest way of increasing them is by pieces of the roots, planted in a pot of good mould, and placed in a warm situation; or they may be increased by young cuttings, which root readily under a hand-glass, in a mixture of sand, peat, and loam, in heat.

XIX. PINCKNEYA. XX. CALYCOPHYLLUM.

Lin. Syst. Pentandria, Monogynia. Calyx 5-parted, having one of the segments large, coriaceous, and coloured. Corolla tubular, with a 5-selved limb, which is valvate in aestivation. Stamens 5, exserted, inserted in the base of the tube; anthers petaloid. Stigma emarginate. Capsule 2-valved, dehiscing at the diaspemnt. Seeds compressed, surrounded by a winged membranaceous margin, which is emarginate at the base.—A tree, native of North America. Branches opposite. Leaves oval, acute at both ends, tomentose beneath, as well as the branches. Stipulas deciduous. Flowers rather large, pubescent, pale red, bracteolate, disposed in cymes; the cymes rising from the axils of the upper leaves. Large calycine leaves, white, tinged with red. 

1 P. ruhen (Mich. l. c.) G. Native of North America, in Georgia, on the banks of the river St. Maria, in muddy places; and on the banks of the New river in South Carolina. Pursh, fl. amer. sep. 1. p. 158. Ell. sketch. 1. p. 368. Cinchona Cinchona, Poir. Dict. 6. p. 40. Pinkmeya pubescens, Pers. ench. 1. p. 197. The bark of this tree is used in place of Peruvian bark in Georgia and Carolina, under the name of few beating.

Downy Pinckneya. Fl. June, July. Clt. 1786. Tree 20 ft. Cult. This tree is usually treated as a greenhouse plant in Britain; but thrives much better against a south wall, with the protection of a mat in severe weather. A mixture of sand and peat is the best soil for it; and cuttings planted in sand, with a hand-glass placed over them, will strike root.

XX. CALYCOPHYLLUM (from κυλyx, calyx, a calyx, and φυλλον, phyllon, a leaf; in allusion to one of the teeth of the calyx being expanded into a large petiolate coloured leaf.) D. C. Prod. 4. p. 367.—Macrocómum, Vahl, symb. 2. p. 38. but not of Browne.—Mussaenda species, Poir.
Lin. syst. Pentandra, Monogynia. Limb of calyx truncate, or bluntly 5-toothed; one of the teeth expanded into a perianth colourless or bluish lobed, with a 5-parted limb. Stamens 5; filaments rising from the throat, free, length of corolla; anthers oval, exerted. Style ending in 2 reflexed stigmas. Capsule dehiscing at the apex, oblong, 2-angled, many seeded. Seeds fixed to the linear pascalas, imbricate, oblong, girded by a very narrow membranous wing. — Small smoothish trees, natives of the West Indies. Leaves opposite, petiolate, membranous, glabrous above, but villos on the veins beneath. stipules short, broad, deciduous. Flowers disposed in axillary and terminal trichotomous corymb; peduncles compressed. Habit of Mussaenda. 1 C. candidissimum (D. C. prod. 4. p. 367.) leaves ovate, bluntly acuminate; corymb terminal; limb of calyx truncate, except the petiole leaf; corolla campanulate, with a bearded throat. 5. S. Native of St. Martha, Vahl, and near St. Fernando de Atabapo, on the banks of the Orinoco, H. B. and Kunth; and of Cuba, about the Havana. Macrocœnum candidissimum, Vahl, symb. 2. p. 38. t. 30. Musse'nda candidissima, Rœm. et Schultes, syst. 5. p. 251. M. candida, Poir. dict. 4. p. 395. The peduncles of the corymbs are 2-edged. Calyxes villous. Flowers 3 together, the middle one bearing a petiole leaf, but the 2 lateral ones are naked. Leaves 2-3 inches long. Leaf of calyx hardly an inch long, white, sometimes ovate, and sometimes subcordate.

Very white-leaved Calycophyllum. Tree 20 feet. 2 C. coccolinum (D. C. prod. 4. p. 367.) leaves elliptic-lanceolate; corymb axillary, disposed in an elongated panicle; limb of calyx bluntly 5-toothed; corolla somewhat funnelform, glabrous. 5. S. Native of the island of Trinidad. Macrocœnum coccolinum, Vahl, symb. 2. p. 38. t. 29. Musse'nda coccolina, Poir. dict. 4. p. 395. Leaves a foot long and a hand broad. Flowers crowded, few, bearing each an ovate-oblong, purple or scarlet calyceous leaf, which is about 6 inches long.

Scarlet-leaved Calycophyllum. Clt. 1823. Tree 20 feet. 3 C. tubuloseum (D. C. prod. 4. p. 367.) leaves oval, acute at the base, acuminate at the apex, clothed with fine velvety down on both surfaces; panicles terminal; limb of calyx bluntly 5-toothed; corolla tubular, pubescent on the outside; large lobe of calyx petiolar, orbicular and pubescent on the nerves and veins. 5. S. Native of Brazil. Macrocœnum tubulosum, A. Richard, in herb. mus. par. Capsule ovate truncate, dehiscing from the apex to the base at the dissepiments. Anthers exerted. Filaments joined together beyond the middle into a tube.

Tubular-stamened Calycophyllum. Tree. Cult. Like Musse'nda this genus is remarkable for the large coloured segment of the calyx, which see for culture and propagation, p. 492.

Tribe II.

GARDENIACEÆ (this tribe agrees with the genus Gardenia in important characters). A. Rich, disse. p. 108. D. C. prod. 4. p. 367.—Gardenia and Cocoyeséleæ, Cham. et Schlecht. in Linnaen. 4. p. 138. and 197. Fruit baccate, 2-celled, or from aborted ovules only 1-celled; cells many seeded. Alumen fleshy. — Trees or shrubs, with opposite leaves, and interpetiolar stipules.

Subtribe I. SARCOCEPHALIEE (agreeing with Sarcocephalus in the fruit being combined and fleshy). D. C. prod. 4. p. 367. Flowers collected into a truss of one (f. 90. a.), sessile upon the receptacle. Fruit combined (f. 90. b.).

XXI. SARCOCEPHALUS (from σαρκός sarx, sarkos, fleshy, and κεφάλα, kephale, a head; in allusion to the fruit being combined into a fleshy head). Azf. in herb. Banks, Sabin. hort. trans. 5. p. 442. t. 18. D. C. prod. 4. p. 367.—Cephalia, Thonn. in Schum. pl. guin. p. 105.

Lin. syst. Pentandra, Monogynia. Flowers 5-6-parted, sessile upon the globose receptacle (f. 90. a.), which with the calyxes are combined into a globose fleshy mass. Limb of calyx with a very short margin. Corolla funnel-shaped, 5-lobed; lobes erect, obtuse. Anthers sessile in the throat of the corolla. Style exerted; stigma oblong, capitate, undivided. Berries 1-celled; many seceded, the whole combined into one mass (f. 90. b.), which is areolate from the margins of the calyxes. Seeds small, somewhat kidney-shaped. — A spreading branchy shrub. Leaves opposite, on short petioles, roundish-oval, acute, shining above, and pubescent in the axils of the veins beneath. Stipulas solitary on each side, triangular, undivided, almost concrete at the base. Heads terminal, on short peduncles or sessile, about the size of a peach. Flowers rose coloured or yellowish.

1 S. esculentus (Sabin. in hort. trans. 5. t. 18.) Native of Guinae, in many parts, as of Sierra Leone and Gambia. Lindl. bot. reg. t. 1827. Cephalia scandens, Thonn. in Schum. pl. guin. 105. Nafchen laterula. Smith in Rees’ cycly. 24. no. 5. The heads of fruit are edible, and by the negroes of Sierra Leone called peach; they are brown when ripe. Cephalia scandens of Schum. is probably a distinct species, as the Sierra Leone plant does not climb at all. (f. 90.)

Edible-fruitted Sarcocephalus.

Cult. A mixture of loam and peat is the best soil for this fruit, and cuttings are easily rooted in the same kind of soil under a hand-glass, in heat. The shrub requires to be kept in a strong heat, or it will neither flower nor fruit.

XXII. ZUCCARINIA (J. G. Zuccarini, a professor in the academy at Monach; author of some papers in the transactions of that academy). Blum. bijdr. (1820.) p. 1008. but not of Spreng. (1827.)

1 Z. macrophylla (Blum. l. e.) 5. S. Native of the west of Java, in woods on the mountains, where it is called Kibara. Leaves more than a foot long.

XXIII. LUCINEÁ (Lucina is one of the names of Juno or Diana). D. C. prod. 4. p. 368.

Lin. syst. Tetrandria, Monogynia. Flowers combined into a dense head. Margin of calyx entire. Corolla funnel-shaped,
RUBIAEÆ. XXIII. Lucinaea. XXIV. Canephora. XXV. Burchellia. XXVI. Amaoua.

—A glabrous somewhat dichotomous shrub. Leaves petiolate, ovate, acuminate, smooth, coriaceous. Stipulas short, interpetiolar. Axillary peduncles opposite, but the terminal ones subumbellate. Heads few-flowered. This genus differs from Burchellia, in the fruit being many-seeded, not 1-seeded.

Morinda-like Lucinaea. Shrub cl.

Cult. See Sarcocapheæ, p. 487, for culture and propagation.

L. LINNAEÆ: Flora Æxandria, Monogyna. Calyx with an obvolute tube, a 5-6-toothed limb; and triangular, leucocoele, bluish, rather concave teeth. Corolla with a campanulate tube, and a 5-6-lobed spreading limb. Anthers 5-6, oblong, almost sessile, not exserted. Stigma bifid. Fruit baccate? 2-celled? cells many seeded. Seeds compressed, inbricated, inserted in an axillary spongy receptacle. The fruit, according to A. Rich. l. c., is pea-formed, crowned, and 2-seeded.—A glabrous shrub, native of Madagascar. Leaves elliptic, coriaceous. Stipulas solitary on both sides, triangular, acute. Flowers on the top of dilated peduncles, or sessile on the top of the branches, intermixed with distinct scales, girded by a tubular toothed involucre. This genus appears to be intermediate between the subtribes Sarcocephalæ and Gardneriæ.

C. Axillaris (Lam. ill. t. 151. f. 1.) leaves elliptic, acute, on short pedioles; peduncles axillary, thickened from the base to the apex, ending in a 5-6-lobed cupula at the apex, which bears the flower. f. S. Native of Madagascar, where it is called Allou-ga-la-y by the natives. Poir. suppl. 2. p. 77, exclusive of the diagnosis.

Axillary-flowered Canephora. Shrub.

Cult. See Sarcocapheæ, p. 487, for culture and propagation.

Subtribe II. Gardneriæ (containing shrubs agreeing with the genus Gardneria in having distinct flowers). D. C. prod. 4. p. 368. Flowers distinct, never combined into a head.

L. LINN. Syst. Pentändria, Monogyna. Calyx with an obvolute tube, having the limb 5-cleft beyond the middle (f. 91. a.), and drawn out above the ovary. Corolla of a clavate funnel-shape (f. 91. b.), with a naked throat, and 5 short lobes (f. 91. c.), which are inbricated and twisted in aestivation. Stamens 5; filaments adnate to the tube, but free above the middle; anthers almost sessile, inclosed (f. 91. b.). Stigma oblong-clavate (f. 91. c.), and appearing as if it were composed of 2 concrete ones, bearing five convex crests, and a series of tufts of hairs. Berry crowned by the calyx 2-celled, turbinate, globose Placentæ adnate to the dissemine. Embryo slender.—Shrubs, native of the Cape of Good Hope. Leaves ovate, acute, a little cordate at the base, petiolate. Stipulas interpetiolar, broad, cinnatifid at the apex, deciduous. Flowers scarlet, disposed in heads at the tops of the branches, sessile upon a villous receptacle, intermixed with small distinct bracteoles; and each head is propped by the ultimate pair of leaves.

1 B. Capeïnaës (R. Brown, in Ker, bot. reg. t. 466.) leaves ovate, acute, clothed with hispid pubescence; stipulas very broad, and very crenate, capitulate at the apex; anthers adnate to the upper part of the tube of the corolla. f. G. Native of the Cape of Good Hope, where it is called from the hardness of the wood buffel-horn. Cham. et Schl. in Linnea. 4. p. 146. Lonicera Bubalina, Linn. fil. suppl. p. 146. Thumb. fl. cap. 187. Cepæ'lis Bubalina, Pers. ench. 1. p. 202. Flowers 9-10 lines long, of a deep scarlet colour. (f. 91.)

2 B. Capeïfeldra (Linn. bot. reg. t. 891.) leaves oval-lanceolate, smoothish; stipulas ovate, each ending in a short point; anthers inserted in the middle of the tube of the corolla. f. G. Native of the Cape of Good Hope. Cinchôna Capeïnaës, Burn. herb. B. Bubalina, Sims. bot. neg. t. 2599. Canéphora capitate, Lam. ill. t. 151. f. 2?. Poir. suppl. 2. p. 77, exclusive of the country. Flowers 7-8 lines long, orange coloured.

Cult. The species of Burchellia thrive well either in the warm part of a green-house, or the cold parts of a stove, and therefore may be termed hardy stove plants. Their heads, of beautiful scarlet and orange coloured flowers, make them desirable for collections. They grow well in a rich light soil, or a mixture of turfy loam, turty peat, and sand; and cuttings taken off not too ripe strike root readily, if planted in sand and placed under a glass, in a moderate heat.

L. LINN. Syst. Hexandria, Monogyna. Limb of calyx tubular, terete, 6-toothed, falling off very slowly. Corolla salver-shaped, with a terete tube, which is longer than the calyx, and a 6-parted spreading limb; lobes oblong. Anthers 6, inclosed, linear. Stigma clavate. Berry obvolute-oblong, coriaceous, areolate at the apex, 2-3-celled. Seeds disposed in 2 rows in each cell, flat, depressed, nearly orbicular, separated from each other by small horizontal disseminations.—Trees or shrubs, natives of South America. Leaves opposite or 3 in a whorl, on short pedioles, nerved, glabrous. Stipulas oblong, deciduous. Flowers almost sessile, disposed in corymb at the tops of the branches.

—Perhaps the fruit is at length 1-celled, from the dissemination having vanished, ex Aubl.

1 A. Guianaës (Aubl. guian. suppl. p. 13. t. 375) brownish trapeziform, crowned, clothed with adpressed pubescence; leaves usually 3 in a whorl, broad-elliptic, acuminate, nerved; flowers crowded, almost sessile; limb of calyx tubular, elongated. f. S. Native of Cayenne. The leaves in the specimens examined are all 3 in a whorl, but are sometimes op-
posite according to Desfontaines, mem. mus. 6. p. 12. t. 4. Hamelia sessiliflora, Willd. spec. 1. p. 981. Hamelia glabra, Lam. dict. 3. p. 65. Duhamelia glabra, Pers. ench. t. p. 208. Berry obovate, areolate at the apex, from the calyx having fallen off, 2-3-celled; cells bearing each 2 rows of seeds, and distinct sepal; hence the fruit appears 4-6-celled at first sight in the dry state.

Guiana Amaioua. Shrub appears 4 to 6 feet.

2 A. Euphória (Desf. mem. mus. 6. p. 14. t. 5.) branchlets nearly terete, smoothish; leaves opposite, obovate, acuminate, nerv'd; coryblms of flowers on short peduncles; flowers crowded, almost sessile; limb of calyx tubular, short. f. S. Native of Cayenne. Fruit unknown.

Beach-leaved Amaioua. Shrub appears 4 to 6 feet.

3 A. intermedia (Mart. in Schultes, syst. 7. p. 90.) branches terete, glabrous; leaves opposite, oblong, attenuated at both ends, ciliolate; flowers crowded, almost sessile, silky; upper 2 stipulas forming an involucre to the head of flowers. f. S. Native of Brazil, in the province of Bahia, in woods.

Intermediate Amaioua. Shrub appears 4 to 6 feet.

Corymbose-flowered Amaioua. Shrub appears 8 to 9 feet.

5 A. Perúviana (Desf. mem. mus. 6. p. 16. t. 4. f. B.) leaves opposite, elliptic, nerv'd, acuminate, shining on the upper surface; flowers aggregate, corollas. f. S. Native of Peru. Said to be nearly allied to the preceding.

Peruvian Amaioua. Shrub appears 4 to 6 feet.

6 A. Sacrogla (Mart. in Schultes, syst. 7. p. 91.) branches angular and bristly at the apex; leaves 3 in a whorl, obovate-lanceolate, attenuated at the base, saccately scrobiform, hairy, costately nerv'd; flowers terminal, crowded, on short peduncles; calyxes elongated. f. S. Native of Brazil, in woods, at Barra do Rio Negro, where it is called by the natives Folha de Cominato and Com-jurara.

Suck-bearing Amaioua. Shrub appears 4 to 6 feet.

7 A. Brasiliána (A. Rich. diss. ex D. C. prod. 4. p. 370.) p. 222. (Mart. in Schultes, syst. 7. p. 92.) leaves opposite, leaves serrate; flowers aggregate; leaves elliptic, acuminate; flowers small, disposed in crowded calyces; segments of corolla very short. f. S. Native of Brazil.

Brazilian Amaioua. Shrub creeping.

Cult. See Mussea'da, p. 492, for culture and propagation.

Lin. syst. Pentandria, Monogynia. Calyx with an oblong-turbinate tube, a 5-parted limb, and decided erect acute lobes, one of which is usually drawn out into a large peetiate, reticulately nerv'd, coloreful leaf. Corolla funnel-shaped, with a 5-parted limb, and a villous throat. Anthers 2, sessile within the tube, linear, inclosed, and sometimes a little exserted. Stigma bifid.

Fruit ovoid, fleshy, naked at the apex from the limb of the calyx being deciduous, indehiscent, 2-celled; cells many seeded. Placentas pedunculate, bifid at the apex, rising from the dissepiment, and appearing like a Burundian cross. Seeds very numerous, small, lenticularly compressed, scabrous. Embryo in fleshy albumen, with the radicle thick, and turned towards the vol. III.

SECT. I. BELLÉLLA (the name of one of the species in Malabar). Rheed. mal. and Adams. One of the calyces lobes is always drawn out into a large coloured reticulately veined bracteate-formed leaf, which has been through want of proper caution taken for and called bracteae. Anthers sessile within the tube of the corolla, inclosed. Capsule ovate.

1 M. speciósa (Poir. suppl. 4. p. 37.) leaves broad-oval, acute, rather villous at the nerves and veins above, pubescent beneath, teeth of calyx obtuse, one of which is usually petiolate, large, and coloured; corolla tubular, with obtuse lobes. f. S. Native of South America, in Caracées. Macrocérumm speciosum, Jacq. hort. schœnbru. 1. p. 19. t. 43. The bracteae-formed calyce leaves are rose coloured. Coryblms fastigate, rather villous; bractea subulate. Style exerted. Anthers inclosed. Corolla villous on the outside, an inch long, with a rose coloured limb.

2 M. aculeiúla (Bartl. in Haenze, herb. ex D. C. prod. 4. p. 370.) leaves oval, acuminate, acute at the base, glabrous, except the nerves and veins, which are pubescent on the under surface; coryblms trichotomous pubescent; teeth of calyx acute, one of which is usually large, petiolate, ovate, and coloured; corolla tubular, with acute lobes. f. S. Native of Mexico. Stipulas villous on the outside, bifid, acuminate, and deciduous. The large calyce leaf is 5-nerved and acuminate. Perhaps only a variety of M. specíosa.

Acute-flowered Mussænda. Shrub appears 5 to 6 ft.

3 M. Frondósa (Lin. spec. 251.) leaves oblong, acuminate, villous; branches and coryblms downy; stipulas subulate; coryblms terminal, dichotomous, somewhat panicked; lobes of calyx elongated, subulate, one of which is petiolate, ovate, acuminate, membranous and puberulous. f. S. Native of the East Indies, Java, Malabar, &c. Belilla, Rheed. mal. 2. p. 27. t. 157. M. zeylanica, Bum. zeyl. 165. t. 76. M. formosa, Lam. mant. p. 338. M. frondósa, Roxb. et Wall. in fl. ind. 2. p. 227. Lam. ill. t. 157. f. 1. Flowers of a deep golden colour. The bractea-formed leaf of the calyx is 2 inches long and white.

4 M. glabra (Vahl. symb. 3. p. 38.) leaves oval, acuminate at both ends, glabrous on both surfaces, as well as the branches; coryblms terminal, smoothish; segments of calyx broad-lanceolate, acute, one of which is large, petiolate, glabrous, and acute. f. S. Native of the East Indies. Lodd. bot. cab. t. 1269. Tómiun Principissimum, Rumph. amb. 4. t. 51. Flowers yellow. The bractea-formed leaf of the calyx is about 4-5 inches long, white.

5 M. calvénia (Wall. cat. no. 623.) leaves oblong or oblong, acuminate, tapering to both ends, almost glabrous, except on the nerves; stipulas villous, cuspidate at the apex; calyxes downy: segments large, ovate, cuspidate; the large foliaceous segment petiolate, ovate, elliptic, acuminate, yellow; young branches and peduncles villous; peduncles terminal and axillary, coryblm, or trichotomous, bearing a single flower in each fork; fruit turbinate. f. S. Native of the East Indies, in the Burmese empire, on Mount Taong Dong, and at Prome. Flowers yellow.

Large-calyced Mussænda. Shrub appears 5 to 6 feet.

6 M. villósa (Wall. cat. no. 624.) leaves oblong, acuminate-
ated, tapering at the base, on short pediotes, hispid from villi on both surfaces; petiotes, young branches, and peduncles very villous; stipulas linear-lanceolate, cuspitate, very villous; corymsbs trichotomous, terminal: calyx villous: segments linear: the large, foliaceous segment petiote, elliptic, yellow. \( ^{\pi} \) S. Native of Penang. Flowers yellow.

*Villons* Mussenda. Shrub 4 to 6 feet.

7 M. *samaetens* (Roth, Nov. gen. et spec. p. 152.) leaves elliptic, tomentose on the under surface, as well as the petiotes and branches; corymsbs terminal; bractea-formed leaf of calyx roundish, pubescent, reticulately veined. \( ^{\pi} \) S. Native of the East Indies.

*Sumatra* Mussenda. Shrub 5 to 6 feet.

8 M. *acuminata* (Blum, bijdr. p. 98.) leaves lanceolate, acuminate at both ends, pubescent on the mid-rib on both sides; corymsbs terminal, trichotomous, pubescent; lobes of calyx linear, acuminate: one of which is drawn out into an elliptic-oblong leaf. \( ^{\pi} \) S. Native of Java, at the head of the river Tijukundi, on Mount Gede.

*Acuminated* Mussenda. Shrub 5 to 6 feet.

9 M. *nisida* (D. Don, prod. fl. nep. p. 139.) leaves oval, acuminate, pilose; branchlets hispid; pedicels and calyces very bristy; stipulas lanceolate; segments of calyx ovate, acute: one of which is petiolate, ovate, acuminate, hispid on the petiole and villous on the nerves. \( ^{\pi} \) G. Native of Nipal, at Narainghetti. The lobes of the corolla are rounded and mucronate. It comes near to M. *frondosa*, but the leaves of that species are canescent from tomentum beneath, and the segments of the calyx are linear and elongated.

*Hispid* Mussenda. Shrub 5 to 6 feet.

10 M. *erythrophylla* (Schum. pl. guin. p. 116.) branches velvety from short soft down; leaves ovate, cuspitate, pubescent above, and villously tomentose beneath; stipulas villous, deciduous; corymsbs terminal, trichotomous, villous; calyce segments subulate: one of which is large, petiolate, ovate-acuminate, and very villous; tube of calyx hispid. \( ^{\pi} \) S. Native of Guinea, where it was collected by Thonning. The bractea-formed calyce segments are 4-5 inches long, and 2 inches broad, 5-nerved, and of a reddish colour. Corolla hardly twice the length of the calyx. Habit of M. *frondosa*, under which name it was described from Ternurri.

*Red-leaved* Mussenda. Shrub 5 to 6 feet.

11 M. *eutollea* (Delil. in Caill. pl. afr. p. 65. t. 1. f. 1. Caill. voy. t. 62.) leaves almost sessile, ovate-lanceolate, acute, nervet, and tomentose beneath; stipulas twin on each side, lanceolate-subulate; corymsbs terminal, trichotomous; calyce teeth subulate: one of which is often petiolate, oval, and acute. \( ^{\pi} \) G. Native of Arabia, on the mountains of Hadie and elsewhere; and about Singue in Nubia. Ophiorhiza lanceolata, Forsk. egyp. arab. p. 42. Manetia lanceolata, Vahl, symb. p. 1. p. 12. Mussenda lanceolata, Spreng. syst. t. 1. p. 765.; but not of Poir. The bractea-formed calyce leaf is yellowish, as well as the flowers. Corolla an inch long, slender.

*Yellow-bractea* Mussenda. Shrub 5 to 6 feet.

12 M. *isertica* (C. D. v. sch. p. 4. 1. p. 371.) leaves elliptic, on short petiotes, and are as well as the branches glabrous; flowers disposed in corymsbous panicles; peduncles and corollas clothed with canescent villi; bractea-formed calyce lobes large, roundish, and glabrous. \( ^{\pi} \) S. Native of Guinea, where it was collected by Isert. M. macrophylla, Schum. pl. guin. 118. but not of Wall.

*Isert*’s Mussenda. Shrub 5 to 6 feet.

13 M. *areli*; every part of the shrub is villous; leaves ovate-lanceolate: having the veins clothed with rusty hairs beneath, as well as the petiotes; corymsbs pilose, crowded; bractea-formed calyce segment large, white, and villous; cap-
sules villous. \( ^{\pi} \) S. Native of Sierra Leone, by the sides of rivulets, among other bushes. Flowers yellow.

*Afzelia*’s Mussenda. Shrub 4 to 6 feet.

14 M. *purebsrens* (Ait. hoc. kew. ed. 2. vol. 1. p. 372.) leaves ovate-oblong, acuminate, pubescent on the nerves; stipulas twin on each side, subulate; corymsbs terminal; calyce lobes subulate: one of which is petiolate, ovate, and acute; corolla with a slender tube, and acute lobes. \( ^{\pi} \) G. Native of China, where it is called *Cym un fa*. M. pubescens, Sims, bot. mag. 2099. Loddi. bot. cab. t. 451, but not of Humb. et Bonpl. *Corollas* small, yellow, clothed with adpressed down on the outside. The branches are rather scandent, and the bractea-formed calyce segments are white.

15 M. *variolosa* (Wall. cat. no. 6259.) branches and pediotes hispid and warted; leaves elliptic-lanceolate, hispid from stiff hairs on both surfaces, as well as on the petiotes; corymsbs trichotomous, terminal; the large foliaceous segments of the calyx roundish, mucronate, triple-nerved, somewhat cor-
date and somewhat cuneated at the base; white, fruit roundish, not crowned, warted; calyce teeth short. \( ^{\pi} \) S. Native of the East Indies, at Amherst, Chappedong, and Tavoy.

*Warted-fruit* Mussenda. Shrub 5 to 6 feet.

16 M. *corymbosa* (Roxb. fl. ind. 2. p. 290.) leaves oblong, pointed, and are as well as the branches smooth; corymsbs terminal, smooth; stipulas coriaceous at the base, and cuspitate at the apex; calycines segments sessetous: the bractea-formed one ovate-lanceolate; lobes of corolla ovate, acute. \( ^{\pi} \) S. Native of Ceylon, Malabar, and other parts of the East Indies. The bractea-formed calyce segment is white, and the border of the corolla orange-coloured, but greenish underneath. In some parts of India the white floral leaves are brought to table as an esculent herb.

*Corymbose-flowed* Mussenda. Shrub 5 to 6 feet.

17 M. *macrophylla* (Wall. in Roxb. fl. ind. 2. p. 288.) branchlets beset with soft silky hairs; leaves ovate, acuminate, pubescent; stipulas broad-ovate, bifid, acuminate and recurved at the apex; corymsbs terminal, trichotomous, very pilose, on short peduncles; calyce segments foliaceous, broad, oblong-lanceolate; bracteas large, very hairy. \( ^{\pi} \) S. Native of Nipa-

*pentium the mountains Chindaguery and Nagaroon. Branches tetragonal, brown. Leaves green above and pale villous beneath. Stipulas nearly twice as long as the petiotes. Corymsbs shorter than the uppermost pair of leaves. There are generally 3 floral leaves in each corymb, which are snow white, and 2-3 inches long. Bracteas large under each division of the inflor-

*ence. Flowers large, orange-coloured, hairy outside. Ber-

ries dark purple, hairy, size of a marrowleaf pea.

*Long-leaved* Mussenda. Shrub 5 to 6 feet.

18 M. *wallchi*; leaves long, elliptic, tapering much to

both ends, acuminate, quite glabrous; corymsbs glabrous, tri-

chotomous, terminal; the large petiolate calyce leaflets gla-

rous, triple-nerved, white, acuminate; fruit roundish, crowned by the calyce segments, which are linear. \( ^{\pi} \) S. Native of the East Indies, at Tavoy and Rangoon. M. longifolia, Wall. cat. no. 6258, but not of Lam.

*Wallich’s* Mussenda. Shrub 6 to 8 feet.

19 M. *incana* (Wall. in Roxb. fl. ind. 2. p. 299.) shrub hoary in every part from adpressed soft hairs; leaves ovate-

oblong, almost sessile, white beneath; stipulas broad at the base, lanceolate at the apex, adpressed; corymsbs terminal, ses-

sile, faciulately, feath-flowered; bracteas linear-subulate; bractea-

formed segment of the calyx large, ovate, petiolate, and acu-

minated. \( ^{\pi} \) G. Native of Nipal, towards Gosaingsthan. Root simple, slender. Stem about the thickness of a goose quill, undivided, though seldom with 1 or 2 slender alternate
brances. Leaves rather longer than the interstices, which are pretty equal, about 5–6 inches long, villous above. Stipulas about the length of the petioles, furnished with a number of glands inside on the lower part. Corynbs very hairy. Floral leaves subcordate, milk white, downy. Tube of corolla very long, hairy.

**Hoary Mussaenda.** Shrub 2 to 3 feet.

20 **M. cuneiformis** (D. Don, prod. fl. nep. p. 139.) leaves cuneate-oblong, acuminated, downy on both surfaces as well as on the branches; stipulas lanceolate, acuminated; coryms terminal; bracteas lanceolate; calycine segments linear, acute, 5 times shorter than the corolla: one of which is bractea-formed, petiolar, oval, acuminated; tube of corolla villous. H. S. Native of Nipal. The large calycine segment is probably white, and the flowers are probably yellow.

**Wedge-leaved Mussaenda.** Shrub 4 to 6 feet.

**Sec. II. La'ndia** (M. de la Land, a correspondent of the Museum of Natural History at Paris), Comm. herb. D. C. prod. 4. p. 372. Lobes of calyx equal or nearly so; having none of the segments expanded into bractea-formed leaves. Capsule naked at the apex, not crowned by the calyx. Leaves opposite.

21 **M. la'ndia** (Lam. ill. t. 157. f. 2.) Poir. dict. 4. p. 392.) leaves ovate, acuminated, clothed with villous pubescence on both surfaces; branches, petioles, coryms and corollas villous; lobes of calyx equal, triangularly lanceolate, 12 times shorter than the tube of the corolla. H. S. Native of the Mauritius, where it is called Quinquina indigene, or Indigenous Peruvian bark, and is used in the cure of fevers. M. latifolia, Poir. suppl. 4. p. 36. dict. science. nat. 33. p. 452. Rodélia Lándia, Spreng. syst. 1. p. 707. M. holosericea, Smith, in Rees' cycl. vol. 24. no. 6. Bracteas linear, acute. Corolla an inch long, hairy outside.

22 **M. uniflora** (Wall. cat. no. 6264.) young branches, tube of corolla, calyxes, and fruit villous; leaves small, rather villous, roundish, acute, running down the petioles at the base; stipulas villous, narrow; calycine segments subulate; corolla with a long tube and a spreading limb; flowers solitary, terminal. H. S. Native of the East Indies, at Tavoy. Flowers as large as those of the common jasmine, probably white.

**One-flowered Mussaenda.** Shrub 1 to 2 feet.

23 **M. staminani** (Michx. med. ex Borry in litt. D. C. prod. 4. p. 372.) leaves oval, ending in short cuspitate points, hardly pubescent, unless on the nerves; branches, coryms, and corollas pubescent; lobes of calyx equal, elongated, lanceolate, 6 times shorter than the tube of the corolla. H. S. Native of the Mauritius. Oxyanthus cymosus, Reichb. in Sieb. fl. maur. exsic. 2. no. 78. M. Lándia, Smith, in Rees' cycl. vol. 24. no. 5. Tube of corolla 1½ inch long, ss in M. Lándia. The lobes of the calyx are 3 lines long in the present plant, while in that of M. Lándia they are hardly a line and a half long.

**Stadmann's Mussaenda.** Shrub 4 to 6 feet.

24 **M. arcuata** (Lam. dict. 4. p. 392.) leaves oval-oblong, acuminated, rather pilose on the nerves beneath; branches, coryms, and corollas glabrous on the outside; lobes of calyx linear-subulate, a little unequal; tube of corolla very villous inside. H. S. Native of the Mauritius. Sieb. fl. maur. exsic. 2. no. 78. Lándia stelligera, and Lándia astrogírapha, Comm. ex herb. mus. Paris. The flowers are yellow, and when immersed in water tinge it with the same colour. Limb of corolla glabrous outside. Branches arching.

**Arch-branched Mussaenda.** Clt. 1882. Shrub 4 to 5 ft.

25 **M. tomentosa** (Wall. cat. no. 6265.) branches downy; leaves elliptic or ovate-elliptic, acute, clothed with white woolly
down on both surfaces; calyx downy, with subulate segments; stipulas subulate, twin on both sides; tube of corolla long, slender, hairy, with a broad, spreading border; berries roundish, crowned by the calyceal teeth; coryms terminal, trichotomous. H. S. Native of the East Indies, on the Ginge mountains. Flowers apparently white, as large as those of jasmine.

**Tomentose Mussaenda.** Shrub 4 to 6 feet.

26 **M. elegans** (Schum. pl. guin. p. 117.) leaves oval, ending in short cuspitate points, and are as well as the branches glabrous; coryms terminal, trichotomous, pubescent; segments of calyx linear, spreading a little; tube of corolla very hispis, but the lobes are glabrous. H. S. Native of Guinea, where it was collected by Thou., M. discolor, Thonna, in herb. Vahl, ex Peerari. Very distinct from M. discolor, Wild. **Elegant Mussaenda.** Shrub 4 to 6 feet.

27 **M. cordifolia** (Wall. cat. no. 6260.) glabrous in every part; leaves ovate-oblong, acuminated at the apex and corolate at the base, glabrous, coriaceous, on short petioles; coryms trichotomous, terminal; berries turbinate, not crowned. H. S. Native of Polo Bangan.

**Heart-leaved Mussaenda.** Shrub 5 to 6 feet?

28 **M. pæbala** (Wall. cat. no. 6261.) branches and leaves rather hispid from scattered hairs; leaves ovate-lanceolate, acuminated, tapers to both ends; stipulas subulate; coryms terminal, crowded; tube of corolla very long, slender, rather swollen near the top; calycine segments linear. H. S. Native of the East Indies, at Tavoy. M. angustifolia, Wall. miss. Apparently a rambling, small shrub.

**Small Mussaenda.** Shrub rambling.

29 **M. sericea** (Blmn. bijdr. p. 986.) leaves ovate-oblong, acuminated, attenuated at the base, glabrous, except on the veins underneath; branches silky; coryms terminal, trichotomous, silky. H. S. Native of the Moluccas. Segments of calyx linear-lanceolate, silky, all equal. Tube of corolla elongated, densely tomentose.

**Silky Mussaenda.** Shrub 4 to 6 feet.

30 **M. repens** (Wall. cat. no. 6263.) root creeping; leaves elliptic, acuminated, rather hispid; petioles, young branches, and coryms clothed with brown villi; stipulas subulate, villous; coryms terminal; calyx downy, with linear-subulate segments; corolla long, slender, swelling a little near the top. H. S. Native of Silhet. The leaves opposite each other are unequal in size.

**Creeping Mussaenda.** PI. ½ to 2 feet.

5 **Sec. III. Ca'anthie** (from ca'au, kaio, to burn or nip, and arboe, anthus, a flower; the flowers of the species are deprived of the large calyceine leaves). D. C. prod. 4. p. 372. Lobes of calyx equal, all linear or setaceous, permanent, therefore the flower is crowned. Leaves 3 in a whorl. Stipulas broad at the base, acute at the apex, alpresse, coriaceous.—Species natives of Madagascar. Perhaps a proper genus.

31 **M. citriformia** (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, ovate, almost sessile, coriaceous, and are as well as the branches glabrous; stipulas broad at the base, acute, short; coryms terminal; lobes of calyx linear. H. S. Native of Madagascar. Habit of Ruanofila. Corolla small, yellow.

**Citrone-leaved Mussaenda.** Shrub 5 to 6 feet.

32 **M. longifolia** (Lam. in Poir. dict. 4. p. 393.) leaves 3 in a whorl, lanceolate-oblong, rather tomentose from short down; stipulas broad at the base, acute; coryms terminal; lobes of calyx setaceous; capsule ribbed. H. S. Native of Madagascar. Very similar to the preceding species. Leaves green above and whitish beneath. Fruit pyriform, with 8 or 10 longitudinal ribs.

**Long-leaved Mussaenda.** Shrub 5 to 6 feet.
† Species not sufficiently known.

33 M.? glomerulata (Lam. in Poir. dict. 4. p. 393.) leaves ovate, acute, smoothish beneath, but clothed with fuscous velvety down above and on the petioles; branches rather villous; flowers terminal, glomerate; calyx campanulate, with a 5-6-toothed limb. t. S. Native of French Guiana. Rodelèita glomerulata, Spreng. syst. 1. p. 707. Peduncles and calyces beset with white silky hairs. Corolla tubular, white, rather villous outside. Stamen 5-6.

Globrate-flowered Mussenda. Shrub 5 to 6 feet.

34 M. niscoton (Pet. Th. in Willd. rel. ex Schultes, syst. 5. p. 254.) hairy; leaves scabrous, strigose above, and clothed with canescent pili beneath; flowers coriaceous, permanent. t. S. Native country unknown, as well as flowers.

Two-coloured-leaved Mussenda. Shrub.

35 M.? Chinea'ssis (Lour. coeh. p. 152.) leaves in fascicles, lanceolate, glabrous; flowers solitary, terminal; berries 4-celled, many-seeded. t. G. Native of China, in the suburbs of Canton. Calyx 5-parted, with lanceolate segments. Seeds bony, almost kidney-shaped. This is certainly not a species of Mussca'nda.

China Mussenda. Shrub 5 to 6 feet.

36 M. echinolbes (Willd. rel. ex Schultes, syst. 5. p. 254.) leaves oblong, acute, glabrous; flowers coriaceous. t. S. Native country unknown. A climbing shrub. Echites-like Mussenda. Shrub cl.

37 M. tetrandra (Schultes, syst. 5. p. 254.) leaves smooth, glabrous, acute; coriaceous; petals tetrandrous. t. S. Native country unknown. Macroleuconum tetrandrum, Cav. ann. sc. ex Schultes.

Tetrandrous-flowered Mussenda. Shrub.

Cult. Some of the species of this genus are very pretty, and worth cultivating in collections. A mixture of loam and peat is the best soil for them; and cuttings are easily rooted in the same kind of mould under a hand-glass, in heat.

XXVIII. KUTCHUBE'A (named after — Koutchouba, minister of the home department of Russia; a promoter of the sciences). Fisch. in litt. ex D. C. prod. 4. p. 373.

Lin. syst. Octandria, Monogynia. Calyx with a turbinate tube, and a tubular truncate limb, which is longer than the ovary. Corolla with a cylindrical tube, much longer than the calyx, a villous throat, and an 8-parted limb, which is twisted in avastion; segments of corolla lanceolate, acuminated. Anthers 8, almost sessile, oblong, acute, inserted in the throat of the corolla among the hairs. Style filiform; stigma large, clavate, with 2 lobes, which are applied to each other, hairy and convex on the outside, but flat and smooth on the inside. Fruit unknown.—A glabrous tree, native of Guiana. Branches terete. Leaves oblong, bluntnash, on short petioles. Stipulas ovate, broad, short, combined, permanent, sometimes biform. Flowers terminal, somewhat coriaceous, pedicellate, large, bracteless. Corolla purple at the base and pale at the apex.—This genus comes very near Genipa and Cassu'pa; from the first it differs in the tube of the corolla being much longer than the calyx; and from the second in the calyx being tubular, and in the stigma being clavate; and from both in the greater number of the parts of the flower.

1 K. insigne (Fisch. l. c. with a figure). t. S. Native of French Guiana, where it was collected by Martin. A tall elegant tree. Tube of corolla 3 inches long, coriaceous. Famous Kutchubea. Tree. Cult. For culture and propagation see Muccsea'nda above.

Lin. syst. Hexandria, Monogyinia. Calyx with a globose tube and a short entire hardly perepicous limb. Corolla much longer than the calyx, tubular, wrinkled on the outside, with a villous throat, and a 6-parted short limb; lobes acutish and spreading a little. Anthers 6, almost sessile, inserted in the throat of the corolla among the villi. Stigma bifid, slender, inclosed. Berry almost globose, crowned, 2-celled, many-seeded; placenta fixed to the middle dissemination. Seeds minute.—An American tree. Leaves ovate-oblong, on long petioles, coriaceous, rather tomentose, about a foot long. Thyrse panicled, terminal, with opposite flowers. Bracteoles 2-3 under each flower, sometimes adnate to the calyx. Corolla 1-2 inches long, pale red.

1 C. verrucosa (Humb. et Bonpl. l. c.). t. S. Native of South America, in shady places on the banks of the Rio Negro, near San Carlos. H. B. et Kuntz, nov. gen. amer. 3. p. 412. Warted Cassu'pa. Tree 30 to 40 feet.

Cult. See Muccsea'nda above for culture and propagation.

Lin. syst. Pentandria, Monogyinia. Limb of calyx turbinate, urceolate, almost quite entire, deciduous. Corolla with a short tube, a 5-parted spreading limb, and a briskly throat. Stamens 5, seated in the mouth of the tube; filaments short; anthers linear, rather incumbent, exserted. Style short; stigma thick, 2-lobed, exserted. Berry globose, unoblate, crowned by the circular base of the calyx, 2-celled, many-seeded; placenta membranous, stipitate, rather fleshy, transversely lamellate. Seeds compressed. — Climbing shrubs, natives of Java. Leaves distich. Stipulas interpetiolar, individed, or twin and rather concre. Flowers rising from the axis of the leaves in dense corymb, unilateral.—This genus comes near to Canthium and Bertilia, but differs from them in the undivided limb of the calyx, and in the short tube of the corolla.

1 G. acuminata (Blum. l. c.) leaves ovate or elliptic-oblong, acuminated, almost sessile, glabrous; cymes short, indifolious; pedicels numerous, 1-flowered. t. S. Native of Java, on the west side, on the mountains. Leaves 7-8 inches long.

Acuminated-leaved Gynopachys. Shrub cl.

2 G. tomentosa (Blum. l. c.) leaves sessile, rather corymbose-oblong, acuminated, shining above, but clothed with deciduous rufous tomentum on the veins beneath and on the corymb, which are dichotomous and interfoliaceous. t. S. Native of Java, on Mount Burangrang, in woods.

Tomentosa Gynopachys. Shrub cl.

3 G. coriodya (Blum. l. c.) leaves almost sessile, elliptic-oblong, bluntnash, glabrous; corymb trichotomous, interfoliaceous, divaricate. t. S. Native of Java, on Mount Salak, in woods. Opening of corolla beset with yellowish rufous bristles. Fruit globose, the size of a pea.

Coriodya flowered Gynopachys. Shrub cl.

Cult. See Muccsea'nda above for culture and propagation.

Lin. syst. Pentandria, Monogyinia. Calyx with a turbinate tube, and a very short 5-toothed limb. Corolla with a very
long tube, a naked dilated throat, and a 5-parted spreading limb; the lobes obtuse. Anthers rising from the throat of the corolla, exerted, linear-sagitate, furnished each with a blunt appendix at the base? Style filiform, fissiform at the apex; stigma clavate, bilamellate. Berry rather fleshy, 2-celled, crowned. Seeds numerous, roundish-ovate, imbedded in soft pulp.—Unarmed shrubs or undershrubs. Leaves opposite, on short petioles. Stipulas triangular or ovate. Flowers terminal, coriaceous.

1 T. Longiflora (Aubl. guian. 1. p. 131. t. 50.) stem tetragonal, quite simple; leaves lanceolate-oblong, acuminate at both ends, glabrous; flowers almost sessile, aggregate. ♂ S. Native of French Guiana, at Araura. Lam. ill. t. 163. f. 1. Ucriana speciosa, Willd. spec. 1. p. 961. Tocoyena longifolia, Poir. dict. 7. p. 602. but not of Kuntz. Leaves a foot long, and 4-5 inches broad. Corolla 8-9 lines long, with the tube yellow, and the limb white. Stipulas triangular.

Long-flowered Tocoyena. Clt. 1826. Shrub 3 to 6 feet.

Large-leaved Tocoyena. Shrub.

3 T. Longifolia (H. B. et Kuntz, nov. gen. amer. 3. p. 411. but not of Poir.) branches terete; leaves ovate-oblong, acute, glabrous, shining, with revolute margins; stipula ovate, acuminate; flowers racemose; teeth of calyx short, acute. ♂ S. Native of New Granada, in hot places. Ucriana Humboldtii, Spreng. syst. 1. p. 761.

Long-leaved Tocoyena. Shrub.

4 T. Mutisii (H. B. et Kuntz, nov. gen. amer. 3. p. 411.) branches terete; leaves oblong, acutish, glabrous, shining, with somewhat revolute margins; stipula ovate, acuminate; flowers terminal, coriaceous; teeth of calyx short. ♂ S. Native of New Granada, in hot places. Ucriana Mutisii, Spreng. syst. 1. p. 761.

Mutis's Tocoyena. Shrub.

5 T. Hirsuta (Moricand, herb. ex D. C. prod. 4. p. 375.) leaves elliptic, ending each in a short cuspidate point, clothed with villous down above, and with soft velvety hairs beneath. ♂ S. Native of Brazil. Tube of calyx 4 inches long.

Hairly Tocoyena. Shrub.

Cult. See Özythnus, p. 494; for culture and propagation.

Linn. syst. Pentándria, Monogynia. Calyx with an ovate tube, and a short 5-toothed limb. Corolla funnel-shaped, with a very long terete tube, a villous hardly dilated throat, and a 5-parted limb; the segments spreading, obtuse, and nearly equal; the alabastra gibbons on one side. Stamens 5, rising from the throat of the corolla, free, unequal, a little exserted. Style filiform, slender, and bifid at the apex; with the lobes unequal, rather papillose and acute. Berry ovate, crowned by the calyx, succulent, 2-celled, many-seeded. Seeds unknown.

—Glabrous shrubs or small trees, natives of Guiana. Branches terete. Leaves opposite, on short petioles, coriaceous. Stipulas oblong-triangular, at length falling off. Flowers white, very long, disposed in terminal corimbos.

1 P. Longiflora (Aubl. guian. 1. p. 134. t. 51.) leaves oblong, acuminate, acute at the base; stipula oblong; calyx bluntly 5-toothed; tube of corolla very much incurved, and nutate at the apex. ♂ S. Native of French Guiana, on the banks of rivers. Lam. ill. t. 163. Solena longiflora, Willd. spec. 1. p. 961. Kyranthus longiflorus, Gmel. syst. 1. p. 163. Corolla white, with the tube very long, and green at the base; and the hairs in the throat are very long. Berry yellow, about the size of a hen's egg. Seeds 15, imbedded in the red pulp, according to Aublet. The limb of the corolla is said to be regular. Corimbos composed of about 6 flowers; and the flowers are pedicellate and scaly at the base from bractes.

Long-flowered Posoqueria. Clt. 1820. Shrub 5 to 6 feet.

2 P. Latifolia (Rœm. et Schultes, syst. 5. p. 227.) leaves ovate, acuminate, obtuse at the base, or a little coriaceous; stipula broad, triangular; calyx bluntly 5-toothed; tube of corolla straight; and the limb irregular; alabastra gibbons on one side. ♂ S. Native of French Guiana and Brazil. Solena latifolia, Rudge, guian. 1. p. 26. t. 40. Tocoyena latifolia, Lam. ill. t. 163. f. 2. Poir. dict. 7. p. 692. Corolla white, with the tube 4 inches long.

Broad-leaved Posoqueria. Clt.? Shrub 5 to 6 feet.

3 P. Decora (D. C. prod. 4. p. 375.) leaves ovate, ending each in a short cuspidate point, obtuse and rather coriaceous at the base; stipula ovate, obtuse, large, foliaceous, and coriaceous; calyx bluntly 5-toothed; tube of corolla straight; alabastra rather gibbons on one side. ♂ S. Native of French Guiana. Allied to P. latifolia, but differs from all the species in the form of the stipula. Tube of corolla 5-4 inches long. Flowers terminal, coriaceous.

Nect Posoqueria. Shrub.

4 P. Trinitatis (D. C. prod. 4. p. 375.) leaves ovate, on short petioles, ending in short cuspidate points, obtuse and rather coriaceous at the base; stipula ovate, obtuse, large, foliaceous, and coriaceous; calyx bluntly 5-toothed; tube of corolla straight; alabastra rather gibbons on one side. ♂ S. Native of the Island of Trinidad. Sieb. f. trim. exsic. no. 215. without a name. Tube of corolla slender, ½ inches long. Corollas white.

Trinidad Posoqueria. Shrub 5 to 6 feet.

5 P. Havanensis (D. C. prod. 4. p. 375.) leaves ovate, acute, membranous, bluish at the base; stipula lanceolate, acute; calyx bluntly 5-toothed; tube of corolla straight; alabastra gibbons on one side. ♂ S. Native of Cuba, about the Havana. Tube of corolla slender, ⅜ inches long. Petioles 6 lines long.

Havanah Posoqueria. Shrub 5 to 6 feet.

6 P. Gracilis (Rœm. et Schultes, syst. 5. p. 277.) leaves oval-lanceolate; stipula oblong; calyx acutely 5-toothed; tube of corolla curved, and the limb irregular. ♂ S. Native of French Guiana, in remote woods, from the river Darapa to Kaw. Solena gracilis, Rudge, pl. guian. p. 27. t. 41. It differs from P. longiflora in the character given, and in the slender nerves of the leaves. Flowers white, 4-5 in a corymb.

Slender-flowered Posoqueria. Clt. 1825. Shrub 5 to 6 ft.

7 P. Revoluta (Nees in flora, 1821. p. 328. Schrad. gott. anzi. 1851. p. 714.) leaves elliptic-ovate, each ending in a short cuspidate point, with revolute margins; stipula deciduous; corimbous dense; tube of corolla straight; throat villous, and limb irregular. ♂ S. Native of Brazil. P. insignis, Neuw. in flora. 1821. p. 301. in reis. bras. with a figure. Flowers white.

Reed-leaved Posoqueria. Shrub 5 to 6 feet.
Cult. For culture and propagation see Oxyanthus below. All the species are very pretty and propagate very rapidly in flower.

**Pentandria, Monogynia.** Calyx with an obovate tube (f. 92. a.), and a short, acutely 5-toothed limb (f. 92. a.). Corolla with a very long tube (f. 92. c.), a glabrous throat, and a 5-parted regular limb (f. 92. d.): having the segments oblong and acuminated. Stamens 5, rising from the throat of the corolla, free, exserted (f. 92. b.). Anthers very acute. Style filiform, clavate at the apex (f. 92. e.), protruding beyond the anthers. Fruit 2-celled, and probably baccate.—

Shrubs, natives of Guinea. Leaves elliptic, acuminate, on short petioles. Stipulas oblong-triangular, falling off by slowly. Peduncles axillary, racemose, corymbose.—This genus comes very near *Posoqueria*, but differs from that genus in the limb of the corolla being regular, in the throat being glabrous, and its parts being acute, and in the clavate stigmatic filaments.

1. **O. speciosus** (D. C. L. c. e. and in diss. inc. with a figure) branches, leaves, and calyces quite glabrous; calyces teeth very much acuminated; racemes many-flowered; tube of corolla one half shorter than the leaves. 

2. **O. tubiflorus** (D. C. prod. 4, p. 376.) branches, leaves, and calyces glabrous; calyces teeth bluntish; racemes very short, 3-flowered; tube of corolla longer than the leaves. 

3. S. Native of Sierra Leone on the mountains, where it was collected by Smeathmann. Flowers about 20 in each raceme, apparently red, according to the dried specimens, but are probably white or milk-coloured in their recent state.

**Showy Oxyanthus.** Shrub 3 to 4 feet.

3. **O. marantif.** (D. C. prod. 4, p. 376.) branches, petioles, and nerves of leaves on the under side as well as the calyxes beset with hairy down; calyces teeth acute; racemes few-flowered; tube of corolla much longer than the leaves. 

**Tube-flowered Oxyanthus.** Fl. July. Ch. 1789. Sh. 3 to 4 ft.

3. **O. rupestris** (D. C. prod. 4, p. 376.) branches, petioles, and nerves of leaves on the under side as well as the calyxes beset with hairy down; calyces teeth acute; racemes few-flowered; tube of corolla much longer than the leaves. 

**Hairly Oxyanthus.** Fl. July. Ch. 1789. Shrub 2 to 3 ft.

4. **O. villosus**; villous all over; leaves petiolate, obovate, acute; flowers subcapitate, terminal; tube of corolla very long; style much exerted; stigma clavate. 

**Villosus Oxyanthus.** Shrub to 3 feet.

**Cult.** This genus is easily distinguished by its very long, slender, sweet-scented flowers. All the species thrive well in a mixture of loam, sand, and peat; and cuttings are easily rooted by planting them in a pot of sand, and placing it under a hand-glass, in heat.

XXXIV. STYLOCORNYA (from στύλος, stylos, a style, and κόρυνθος, corynhe, a club; in allusion to the stigma, which is clavate). Cav. icon. 4, p. 45. t. 368. Gaertn. [cf. carp. 3, p. 100, t. 197. Blum. bijdr. p. 982. D. C. prod. 4, p. 577.—Wahlenbergia, Blum. cat. hort. but. p. 14; but not of Schrad. and Cham.—Cerisius, Nees in flora, 1826, p. 116 and perhaps of Gaertn."

**Lin. syst. Pentandria, Monogynia.** Calyx with an oavate-globose tube, and a short, tubular, 5-toothed limb. Corolla salver-shaped, with a cylindrical tube, and a 5-parted limb. Stamens 5, inserted in the mouth of the tube of the corolla; anthers linear, very long. Style exerted; stigma clavate, undivided, or the lobes are closely conffeminated. Globes globose, crowned by the calyx, dry, 2-celled; placentas spongy, adnate to the middle dissociation. Seeds numerous, wingless, angular. Albumen rather cartilaginous. Embryo long.—Trees or unarmed shrubs. Leaves opposite, oval, or oblong, petiolate. Stipulas solitary on both sides, 1-nerved in the middle, broad at the base and acuminate at the apex. Peduncles axillary, and almost terminal, bearing many flowers disposed in corymbs or cymes.

1. **S. racemosa** (Cav. l. c. t. 368.) leaves elliptic-oblong, acute at the base, acuminate at the apex, glabrous; panicels axillary, dichotomous, loose, one-half shorter than the leaves; corolla salver-shaped, having the lobes longer than the tube. 

2. **S. racemosa** (Blum. bijdr. p. 982.) leaves oblong, acuminate at both ends, glabrous, beset with minute strigile on the veins beneath; corymbs terminal, fastigate, dense-flowered; corolla salver-shaped, with the segments shorter than the tube. 

**Frangrant** Styllocoryna. Shrub 5 to 6 feet.

3. **S. laniflora** (Blum. bijdr. p. 983.) leaves oblong, acuminate at both ends, strigate on the veins beneath; corymbs terminal, trichotomous, divaricate, loose-flowered; corolla salver-shaped. 

4. **S. lonicera**; leaves oblong, acuminate at both ends, strigate on the veins beneath; corymbs terminal, fastigate, dense-flowered; corolla salver-shaped, with the segments shorter than the tube.

5. **S. lonicera**; leaves oblong, acuminate at both ends, strigate on the veins beneath; corymbs terminal, fastigate, dense-flowered; corolla salver-shaped, 5-parted.

6. **S. lonicera**; leaves oblong, acuminate at both ends, and
are, as well as the branches, glabrous; panicel terminal, fasti-
giate; flowers and pedicels pubescent on the outside. t. S. Native of the island of Manillas, near Sorzogon.

Long-leaved Stylocoryna. Shrub or tree.

7 S.? PANDAKI (D. C. prod. 4. p. 377.) glabrous; spines scattered; leaves oblong, minutely apiculate at the apex; racemes axillary, short; pedicels in fascicles, 1-flowered; tube of corolla shorter than the lobes. t. S. Native of the East Indies. Gardénia Pandaki, Vahl, erb. ex Puer. Rândia Malabárica, Lam. Branches spineous on one side. Leaves coria-

cous, an inch long, and 4 lines broad. Pedicels axillary, very short, bearing the pedicels in an umbel. Stigma oblong, un-
divided. Fruit unknown. Perhaps sufficiently distinct from the following.

Pandaki Stylocoryna. Shrub.

8 S. MALABABA (D. C. prod. 4. p. 377.) spines opposite, 3 times shorter than the leaves; leaves oblong-obovate, obtuse, cuneate at the base, glabrous, beset with glandular pili in the axils of the veins beneath; umbels 8-10-flowered, almost termi-
nating the branches; flowers on short pedicels; limb of calyx 5-toothed. t. S. Native of Coromandel and Malabar near Cochin, in arid places. Gardénia frangrans, Roxb. corom. t. 197. Posoqueria frangrans, Roxb. fl. ind. 2. p. 167. Flowers small, white, sweet-scented. Berry globose, size of a cherry, red, 2-
celled. Seeds orange coloured. Perhaps G. frangrans, Roth, nov. spec. 150. is the same. The Benkâra of Rheed, mal. cited by Lam. for this species, is a distinct plant, from the flowers being said to be purple. The shrub is well adapted for making hedges, being very well armed with thorns.

Malabar Stylocoryna. Cht. 1820. Shrub 4 to 5 feet.

Cult. For culture and propagation see Oxyanthus, p. 494.

Lin. stat. Pentandria, Monogynia. Calyx with an ovate tube, and a tubular truncate or subdenticate limb. Corolla sal-
ver-shaped, not exceeding the tube of the calyx; limb large, 5-
parted; segments ovate, acute. Anthers linear, sessile in the

throat of the corolla, exerted. Stigma clavate, obtuse, un-
divided. Berry corticate, somewhat 4-celled, crowned by the tube of the calyx, attenuated at both ends. Seeds numerous, horizontal, nesting in the pulp. Allumens cartilaginous. Embryo with a common radicle, and foliaceous cotyledons.—Trees. Leaves opposite, oval or oblong. Stipulas interpectorat, oval, acuminate, deciduous. Flowers axillary or terminal, solitary or

two, white, at length yellow. Fruit when young yielding a black juice. Genipa agrees with Stylocoryna in the undivided stigma, and with Gardénia in habit; but from both it is easily distin-
guished by the truncate limb of the calyx and fruit.

1 G. Americana (Lin. spec. 251.) leaves oblong-lanceolate, quite glabrous on both surfaces; peduncles axillary, dichomo-
cous, coriaceous. t. S. Native of the Caribbean islands, as in St. Domingo, &c., and now cultivated in many parts for the sake of the fruit, especially in Brazil and Guiana. Plm. ed. Burm. t. 136. Gärtn. fil. carp. t. 190. Gardénia Genipa, Swartz, obs. p. 84.—Sanjuanà, Maregr. bras. p. 92. with a figure. Fis. bras. 159. with a figure. Flowers small, white. Fruit large, greenish-white, full of dark purple juice; pulp edible, rather acid.

American or Common Genipa. Cht. 1779. Tree 20 to 30 ft.

2 G. CARU'TO (H. B. et Knuth, nov. gen. amer. 3. p. 407.) leaves obovate, obtuse, glabrous above, clothed with velvety to-

tementum beneath; peduncles terminal, 2-3-flowered; pedicels longer than the peduncle. t. S. Native on the banks of the Orinoco and Rio Negro, and near Caraccas and Callagheana, where it is called Caruto by the natives. Corolla white, having the tube silky both inside and outside.

Caruto Genipa. Tree 20 feet.

3 G. PUBE'SCENS (D. C. prod. 4. p. 378.) leaves obovate, ob-
tuse, glabrous above, and clothed with velvety pubescent

be

neath; flowers by threes, almost terminal, on very short pedi-
cels. t. S. Native of Cuba, about the Havana. Flowers very like those of G. Americana, but are on shorter pedicels, and fewer in number; and the leaves are broader and blunter.

Downy Genipa. Tree 20 feet.

4 G. OBLONGIFOLIA (Ruiz et Pav. fl. per. 2. p. 67. t. 220. f. a.) leaves oblong-ovate, obtuse, shining above, and downy on the nerves beneath, with rather revolute margins; flowers crowded at the tops of the branches, on short pedicels, and disposed somewhat racemously. t. S. Native of Peru, on the Andes, in groves in hot places, and at Guayaquil. The corolla is said to be yellow, but is probably white in the recent state as in the rest of the species. Fruit size of a peach. The seeds and pulp of the fruit are used by the Indians to dye their face and hands of a permanent black colour.

5 G. striatia (D. C. prod. 4. p. 378.) leaves elliptic, membranous, acuminate at both ends, glabrous, on short pe-
dicels; stipulas small, deciduous; pedicels axillary, short, 1-
flowered; limb of calyx broadly truncate, ciliated, short; tube of corolla broad, conical, striated, borne on the inside at the base, and closed in the middle inside by a circle of hairs; stigma thick, 2-lobed. t. S. Native of Brazil. Perhaps a proper genus. Leaves somewhat sinuate from some cause.

Striped-flowered Genipa. Tree.

† Species not sufficiently known.

* American.

6 G. MERIANAE (Rich. act. soc. hist. nat. par. p. 107.) hairy; leaves oblong-obovate; flowers crowded at the tops of the branches; fruit globose, very villous, crowned by the tube of the calyx. t. S. Native of Cayenne and Surinam. Poir. suppl. 2. p. 708. Durôa eriôpila, Lin. fil. suppl. p. 30, and p. 200.—Merian, sur. t. 43. The tree has the habit of Iterinia coccinea. Flowers hexamero-

uous and hexandrous, nearly sessile, very like those of Jasminum Sambac. Berry hairy, about the size of the chenched flat, umbilicate. Seeds imbedded in the pulp, which is graceful and edible.

** Asiatic.

7 G.? BUFFALINA (Lour. cooh. p. 149.) prickles long, straight, opposite; leaves ovate, glabrous, in fascicles; flowers solitary; calyx bluntly 5-cleft; berry almost dry, roundish. t. S. Native of Cochinchina. Flowers greenish-white. Berry brownish. Perhaps a species of Rândia or Gardénia, but the

berry is said to be 2-celled. Corolla rotate, 5-cleft.

Buffalo's Genipa. Shrub 6 feet.

8 G.? ESCULESTA (Lour. l. c.) stem quite simple; spines long, straight, opposite; leaves opposite, hairy, in fascicles; flowers lateral, in fascicles; calyx acutely 5-cleft; berry fleshy, roundish, 1-celled. t. S. Native of Cochinchina. Flowers greenish-white. Segments of corolla oblong, acuminate. Berry size of a cherry, edible.

9 G.? FLAVA (Lour. l. c.) prickles few, scattered, straight; leaves broad-lanceolate, glabrous; flowers solitary, terminal; corolla rather hairy. t. S. Native of China, about Canton. Corolla yellow, rotate. Fruit unknown.

Yellow-flowered Genipa. Shrub 5 feet.
Cult. For culture and propagation see Gardenia, p. 499.

Lin. syst. Pentándria, Monogynia Calyx with an ovate, usually ribbed tube, and a tubular truncate, toothed (f. 93. a.), cleft, or parted limb. Corolla funnel-shaped (f. 93. b.), or salver-shaped, having the tube much longer than the calyx; and the limb twisted in section (f. 93. c.), but afterwards spreading, from 5-9-parted. Anthers 2-5, linear, almost sessile in the throat of the corolla or exerted (f. 93. c.). Stigma clavate, bifid or bidentate; lobes thick, erect. Ovaryum 1-celled, half divided by 2-5 incomplete dissectem. Berry fleshy, crowned by the calyx, chartaceous or nucileate, inside, incompletely 2-5-celled. Seed pieces immersed in the fleshy pericarp placenta. Embryo albuminous.—Unarmed or spinosected trees or shrubs. Leaves opposite, and sometimes, though rarely, in whorls, oval or ovate. Flowers axillary or terminal, usually solitary, white, and generally sweet-scented. The fruit of the greater number of the species not being sufficiently known, they cannot be divided into proper sections.

§ 1. Shrubs without prickles. Tube of calyx or ovarium ribbed. Tube of corolla cylindrical.

1 G. florida (Lin. spec. p. 305.) shrubby, unarmed, erect; leaves elliptic, acute at both ends; flowers solitary, almost terminal, sessile, salver-shaped; calycine segments vertical, lanceolate-subulate, equaling the tube of the corolla in length; berry elongated, turbinate, ribbed. ɣ. G. Native of China, and cultivated in Japan, East Indies, the Cape of Good Hope, &c. Ker, bot. reg. t. 449. G. jasminoides, Sol. phil. trans. 52. t. 20.—Phak. amal. t. 448. f. 4. Jasmínium Capense, Mill. dict. no. 7. fig. t. 180. Ehret. pict. t. 13. Flowers white, sweet-scented, 5-9-parted. Berry 5-6-angled, 5-6-celled at the base, and 1-celled at the apex, orange coloured, size of a pigeon's egg, and the pulp is used for dyeing yellow in China and Japan. ɣ. G. florida (Roxb. flor. p. 477.) flowers white, when fully blown about the size of the middle rose. ɣ. G. This variety is very frequent in gardens. G. jasminoides, Ellis in phil. trans. vol. 51. t. 23. Jasmínium Capense, Mill. fig. t. 180.—Rumph. ambi. t. 12. f. 2.

2 G. radicans (Thunb. diss. gard. no. 1. t. 1. f. 1.) shrubby, unarmed; stems radicant; leaves lanceolate; flowers solitary, almost terminal, and nearly sessile, salver-shaped; segments of the calyx vertical, linear-subulate, equal in length to the tube of the corolla. ɣ. G. Native of Japan, and cultivated in the East Indies, and at the Cape of Good Hope. Thumb. fl. jap. t. 290. Ker, bot. reg. t. 73. Andur. bot. rep. t. 491. Flowers white, very fragrant.

Rooting Gardenia or Cape Jasmine. Fl. March, June. Cult. 1804. Pl. 1 to 2 feet.

3 G. angustifolia (Lodd. bot. cab. 513.) very like G. florída, from which it chiefly differs in being smaller, with narrower leaves. ɣ. S. Native country unknown. Flowers white, sweet-scented.

4 G. tomentosa (Blumm. fl. ex D. C. prod. 4. p. 379.) unarmed; brachyléts, leaves, and calycines clothed with velvety tomentum; leaves obovate-cuneated; flowers terminal, sessile, solitary; tube of calyx angularly ribbed: calycine teeth 10, subulate, short. ɣ. S. Native of the island of Java. Lobes of corolla 10, obovate-oblong; tube hardly longer than the calyx. Flowers white, sweet-scented. Fruit unknown.

Tomentose Gardenia. Shrub.

5 G. calyculta (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves ovate, petiolate, acuminated, smooth; flowers terminal, solitary, sessile, involucrated; calycine segments ensiform; anthers inclosed within the tube of the corolla. ɣ. S. Native of the East Indies. Flowers large, white, fragrant, 5-parted.

Calyculate Gardenia. Tree.

6 G. costata (Roxb. fl. ind. 2. p. 550.) arboreous, unarmed; leaves cuneiform-oblong, smooth, ribbed; flowers terminal, salver-shaped; calycine segments resiniferous, caducous; berry drupaceous, oval, 5-ribbed, 1-celled, containing a 2-valved shell; placents 2, opposite. ɣ. S. Native of the mountainous parts of India; from those of Chittagong it has been introduced to the botanic garden of Calcutta. G coronaria, Hamilt. in Synes. emb. to Ava, p. 474. with a figure. Flowers large, white, sweet-scented, the tube being above 3 inches long, and the border above 4 in diameter; limb 5-parted. Berry yellow, containing a soft and rather fetid pulp.

Ribbed-fruited Gardenia. Tree 20 feet.

7 G. arántiá (Wall. in Roxb. fl. ind. 2. p. 560.) arboreous, unarmed, resiny on the younger leaves; leaves elliptic-oblate, ribbed, villous beneath; flowers terminal, solitary; limb of calyx truncate, broad, obscurely 3-lobed, and 5-keeled; tube of corolla very long; limb 6-8-lobed. ɣ. S. Native of Penang, where it grows on the hills. Flowers smaller than those of G. costata, at first snow white, but afterwards yellow, becoming when dry of a beautiful orange colour. Fruit precisely as in G. costata.

Kield-calycxed Gardenia. Tree.

8 G. grandiflora (Lour. coch. p. 147.) arboreous, unarmed; leaves lanceolate, shining; flowers solitary, lateral, and terminal, hexameron; segments of the calyx reflexedly-falcate; corolla salver-shaped, 6-parted; berry oblong, acute at both ends. ɣ. G. Native of Cochinchina, on the banks of rivers. Blumm. bijdr. p. 1013. Flowers large, white, sweet-scented. Berry hexagonal, 1-celled, glabrous, yellow. Seeds nesting in red pulp. Anthers 6, rarely 5-7.

Great-flowered Gardenia. Tree middle-sized.

9 G. Taíténés (D. C. prod. 4. p. 380.) unarmed, glabrous, resinous at the tops of the branches; leaves ovate, almost sessile; stipulas broad, connate, permanent, short-acuminated; flowers solitary, in the axils of the upper leaves, pedicellate; tube of calyx angular: limb 3-4-parted, with vertical-oblong foliaceous lobes; corolla with a long terete tube, and a 5-7-parted limb. ɣ. G. Native of the island of Tahiti, where it was collected by D'Urville. Lobes of calyx fewer by abortion than the lobes of the corolla. Stigma bifid, the lobes long, and acute. Fruit unknown.

Taihiti Gardenia. Shrub.

10 G. Martínkia (Siebold, in Blumm. bijdr. p. 1013.) unarmed; leaves opposite, or 3 in a whorl, obovate, coriaceous, glabrous; calyx angular, 5-cleft; segments subulate, spreading. ɣ. G. Native of Japan. The rest unknown.

Marúba Gardenia. Tree.

11 G. sulíá (Gartn. fil. carp. 3. p. 79. t. 194.) berry obovate or elliptic, attenuated at the base, angular from obtuse furrows, 1-celled; seeds imbedded in the pulp. ɣ. G. Native country unknown. Perhaps allied to G. florída.

Furrowed-fruited Gardenia. Shrub.

§ 2. Unarmed shrubs or trees. Tube of calyx or ovarium not
ribbed; having the limb equally toothed or parted, rarely truncate. Tube of corolla cylindrical.

12 G. mutabilis (Reinw. in Blum. bijdr. p. 1016.) unarmed? leaves oblong, acuminate, glabrous, but pubescent in the axis of the ribs on the under surface; flowers axillary, solitary; limb of calyx rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. \( \gamma, S. \) Native of the island of Ceb- lebes. Said to be allied to \( G. \) carinata and \( G. \) tubiflora.

*Changeable-flowered Gardenia.* Tree.

13 G. calycina; leaves oblong-lanceolate, rather coriaceous, glabrous, on short pedicels; flowers axillary, solitary, almost sessile; corolla with a long tube, and a 5-cleft equal border; calyx 5-cleft. \( \gamma, S. \) Native of Sierra Leone, on the edges of woods. Flowers pale red, pendentulous.

*Large-calyciflorus* Gardenia. Shrub.

14 G. Reinwardtiana (Blum. bijdr. p. 1913.) unarmed? leaves oblong, attenuated at both ends, bluntish at the apex, coriaceous, glabrous; corynbs axillary, trifid, shorter than the leaves; limb of calyx obliquely 5-toothed, rather truncate; corolla with an elongated glabrous tube, and a 5-cleft limb. \( \gamma, S. \) Native of the Moluccas. Ignatia, Reinw. herb. ex Blum. Ovarium half 2-celled, many seeded.

*Reinwardt’s* Gardenia. Shrub.

15 G. latifolia (Ait. Hort. Kew. 1. p. 294.) arboreous, unarmed; leaves almost sessile, ovate or obovate: in the axis of the veins beneath are hollow glands with hairy margins; flowers terminal, 1–4-together, almost sessile, salver-shaped, 7–11-parted; limb of calyx short, subdeterminate; berry drupaceous, round, 1-celled, 5-valved. \( \gamma, S. \) Native of the East Indies, on barren rocky hills, in the Cercars and Carnatic. Roxb. Cor. 2. p. 18. t. 134. fl. ind. 2. p. 552. G. enceina, Kon. Miss. ex Roxb. Flowers very large and very fragrant, when they first open in the morning white, gradually growing yellow before night. Berry size of a puller’s egg, crowned by a small part only of the tube of the calyx. Leaves opposite or 3 in a whorl.

—G. latifolia, Gärt. fr. 5. p. 78. t. 193. is a distinct species from the fruit being crowned by the whole of the calyx, not with part of it.

*Broad-leaved Gardenia.* Ct. 1757. Tree 10 feet.

16 G. lucida (Roxb. fl. ind. 2. p. 553.) subarboreous, unarmed; with resinous buds; leaves oblong, smooth, shining, with lateral simple parallel veins; flowers almost terminal, solitary, on short pedicels; lobes of calyx 5, subulate, 3 times shorter than the tube of the corolla; berry drupaceous, containing a 2-valved shell. \( \gamma, S. \) Native of Chtitagong, and various other parts of India; and of the island of Luzon. Leaves about 6 inches long and 3 broad. Pedicels clavate, 1 to \( \frac{1}{2} \) inch long. Flowers large, pure white, fragrant, 5-parted.

*Shining-leaved Gardenia.* Ct. 1819. Shrub or tree.

17 G. arborea (Roxb. fl. ind. 2. p. 554.) arboreous, unarmed; leaves ovate-oblong; flowers terminal, almost sessile, usually by threes; corolla with a filiform tube, and a 5-parted limb; berry drupaceous, smooth, containing a 4-5-valved shell. \( \gamma, S. \) Native of the East Indies, among the Cercars. The leaves are deciduous during the cold season, and the shrub continues naked till the hot season is pretty far advanced. From the buds and wounds made in the bark there exudes a very beautiful yellow resin, like that from \( G. \) cummifera. The size, number, fragrance, mutability, and beauty of the flowers of this species render it more deserving of a place in the garden than any other species. The natives eat the fruit when ripe.

*Arborescent Gardenia.* Tree.

18 G. gummifera (Lin. fil. suppl. 1. p. 164.) shrubby, unarmed, with resinous buds; leaves oblong, bluntly acuminate, (hairy, ex Lin.) flowers sessile, solitary, almost terminal; seg-

ments of the calyx ovate, acute, very short; tube of corolla equal in length to the limb. \( \gamma, S. \) Native of Ceylon and Coromandel. Thub. diss. gard. no. 4. t. 2. f. 3. Rotuli. and Wild. in act. bonn. 4. (1803) p. 198. G. inermis, Dietr. lex. 4. p. 285. Allied to \( G. \) arborea. Flowers white, sweet-scented. From the bark of this tree exudes a yellow resin, similar to gum cemli.

*Gum-bearing Gardenia.* Shrub 3 to 4 feet.

19 G. clusiaefolia (Jacq. coll. append. 37. t. 4. f. 3.) shrubby, unarmed, glabrous; leaves obovate, retuse, and somewhat emarginate, coriaceous, on short pedicels; peduncles almost terminal, racemose; flowers on long pedicels; limb of calyx short, 5-toothed; corolla salver-shaped, with 5 linear acute segments, which are about the length of the tube. \( \gamma, S. \) Native of the Bahamas islands, where it is called by the inhabitants *seven years apple*, ex Catesb. car. 1. p. 59. t. 59. Flowers white, sweet-scented, with a greenish tube. Berry large, oval. Seeds imbedded in the pulp. The internal structure of the berry is unknown. It differs from *Gardenia* in the shape of the stigma and disposition of the flowers.

*Clusia-leaved Gardenia.* Shrub 5 feet.

20 G.? tetrasperma (Roxb. fl. ind. 2. p. 555.) shrubby, unarmed; leaves obovate-cuneate, smooth; flowers axillary, solitary, on short pedicels, pendentand; calyx segments 5, subulate; limb of corolla 5-parted; berry round, 4-seeded. \( \gamma, S. \) Native of the East Indies, in the mountains near Shnee- rugur. Gardenia, no. 5. Hardw. in asint. res. 6. p. 364. Leaves on short pedicels. Flowers greenish yellow, sweet-scented, with a long tube, which widens upwards, and partly closed about the middle by a ring of silky down.

*Four-seeded Gardenia.* Shrub 2 feet.

21 G. tubifera (Wall. in Roxb. fl. ind. 2. p. 562.) subarboreous, unarmed; leaves cuneate-oblong, petiolate, slightly scabrous above, and pubescent beneath; drupe round, uneven, crowned by the very long truncate calypine tube. \( \gamma, S. \) Native of the East Indies, in Singapore. All the young parts of the tree are resinous. Leaves 5-6 inches long. Drupe containing a putamen, which is divisible into 8 valves. Flowers unknown.

*Tube-bearing Gardenia.* Tree or shrub.

22 G.? antisaphylla (Jack, in Roxb. fl. ind. 2. p. 561.) arboreous, unarmed; leaves elliptic, those opposite each other unequal, densely clothed with vill; stipules concrete at the base, bearded inside; corynbs axillary, villous; limb of calyx 5-toothed; tube of corolla short; drupe oval, villous. \( \gamma, S. \) Native of the islands of Pulo-Penang and Singapore, on the hills. Leaves tapering to the base, 6-12 inches long. Flowers rather small, white, by threes, villous outside: limb 5-parted. Stigma clavate, 2-lobed. Drupe size of a walnut, containing a 2-valved putamen. Perhaps a species of *Génesis* or *Posoquária*. 

*Unequal-leaved Gardenia.* Tree.

23 G. forsythia (Cham. et Schlcht. in Linnaea. 4. p. 200.) unarmed; leaves on short petioles, nearly orbicular, terminating in a very short acumen each, clothed with canescentomentum along the veins on the upper surface, but clothed with hoary tomentum underneath, as well as the petals, cymes, and flowers; calyx 5-toothed; stigma bilamellate. \( \gamma, S. \) Native of Brazil. Corolla white, having the tube about 4 inches long, and the throat an inch in diameter; limb 5-parted. Fruit unknown.

*Beautiful Gardenia.* Shrub.

24 G. holdomiana (Cham. et Schlcht. l. c. p. 198.) unarmed, glabrous; leaves broad-lanceolate, on short petioles, shining above; stipulas comitate between the petioles; cymes 3-5-flowered; calyx 5-toothed; stigma bilamellate. \( \gamma, S. \) Native of Equinozial Brazil. Corolla white, hairy; the tube about 3 inches long and coriaceous, and the limb 5-parted. Fruit spher-}

ical, smooth.
Sello’s Gardenia. Shrub.

25 G. hexandra (Willd. in Raim. et Schultes, syst. 5. p. 243.) unarmed; leaves obovate, pubescent beneath; flowers usually hexandrous; corolla hairy both inside and outside, with the tube very short. §. S. Native of South America, where it was collected by Humboldt and Bonpland. The rest unknown.

Hexandrous-flowered Gardenia. Shrub.

§ 3. Unarmed shrubs. Tube of calyx or ovarium not ribbed; but the limb is tubular and ribbed, 5-6-cleft, as well as being cleft laterally. Tube of corolla cylindrical.—Pirínga, Juss.

§ 4. Unarmed shrubs. Tube of calyx ribbed or angular from the decurrent segments. Tube of corolla with a dilated obconical throat. Berry 2-celled.—Rotthúnnia, Thumb.

27 G. rotthúnnia (Lin. fl. suppl. p. 165.) arboreous, unarmed; leaves oblong, acute, glabrous, on very short pedicels, having glandular hairs in the axils of the veins underneath; flowers axillary, and almost terminal, solitary, sessile, 5-parted, and pentandrous; calyx ribbed, having the segments subulate, terete, and erect; corolla with an obconical tube, a campanulate throat, and spreading acute segments. §. G. Native of the Cape of Good Hope. Thumb. diss. gard. no. 6. Sims, bot. mag. 690. Rotthúnnia Capénis, Thumb. act. holm. 1776. p. 65. f. 2. Flowers white, spotted with red, sweet-scented; tube of corolla glabrous. Young branches downy.

§ 5. Unarmed or spinose shrubs. Leaves 3 in a whorl.

28 G. ternifolia (Thonn. in Schum. pl. guin. p. 147.) unarmed, glabrous; leaves 3 in a whorl, obovate, cuneated at the base, almost sessile; flowers solitary, almost terminal, girded at the base by a short truncate involucel; calyx with a smooth tube, and a tubular short toothed limb; corolla with a long terete tube, and a 6-7-parted limb. §. S. Native of Guinea. Flowers 3 inches long, white; lobes of corolla ovate-oblong, acutish.

Tern-leaved Gardenia. Shrub 4 to 5 feet.

29 G. trialecta (D. C. prod. 4. p. 382.) glabrous; branches 3 in a whorl, spinosecent; leaves 3 in a whorl, obovate, cuneated at the base, almost sessile; flowers solitary, terminal, sessile; calyx with a smooth tube, and a tubular semi-5-cleft limb; lobes acute; corolla with a long almost terete tube, and a 5-parted limb: lobes thick, obovate. §. S. Native of the Gambia, in woods. Leaves hardly an inch long. Corolla 2 inches long. Berry ovate-globose. Fruit size of a walnut. Spines thick, short, conical, spreading.

Three-spined Gardenia. Shrub 4 to 5 feet.

30 G. medicinalis (Vahl, in Schum. pl. guin. p. 148.) glabrous; spines stell, stiff, leafy at the apex; leaves elliptic, glabrous; flowers terminal, sessile, solitary; limb of calyx bifid, with roundish recesses, and trifold segments; corolla with the tube dilated upwards, and the lobes obovate. §. S. Native of Guinea.

Medicinal Gardenia. Shrub 4 to 5 feet.

31 G. azegna (Sims, bot. mag. t. 1904.) shrubby; spines axillary, short, straight; leaves oval, acute, glabrous, on short pedicels; flowers almost terminal, solitary, sessile, 5-parted, and pentandrous; tube of calyx with short teeth; corolla salver-shaped, with a long terete tube. §. G. Native of China. Flowers white, having the lobes purple on the outside in that part, which is exposed to the air, while the corolla is in restoration; the tube greenish.

32 G. yungida (Roxb. fl. ind. 2. p. 557.) arboreous, with swollen mealy bark, and brancheate branches; spines opposite and terminal; leaves obovate, tapering into the pedicles at the base, smooth; flowers lateral, usually solitary; limb of calyx tubular, 5-toothed; corolla smooth, salver-shaped; anthers almost inclosed. §. S. Native of the East Indies, at Botham. Leaves 1-4 inches long, and 1-3 broad. Stipulas broad at the base, and subulate at the apex. Flowers 5-6-petalled. Berry oval, scarious outside, containing a hard 5-valved pustum. Seeds imbedded in the pulp. Stigma clavate, 5-grooved.

Swollen-barked Gardenia. Tree.

33 G. montana (Roxb. fl. ind. 2. p. 556.) arboreous; spines opposite, short, acute, stiff; leaves oblong, obtuse, almost sessile, downy beneath, with revolute edges; flowers rising 3-5 in a fascicle from the buds, on short pedicels; limb of calyx usually 5-toothed; corolla 5-7-cleft; stamens inclosed; berry drupaceous, roundish, containing a 5-6-valved pustum. §. S. Native of the East Indies, among the Circar mountains. Bark white, soft, and spongy. Leaves deciduous in December, 3 inches long, and 2 broad, smooth and shining above. Flowers pretty large, fragrant, when first open white, but soon becoming more or less yellow. Corolla with a somewhat gibbous tube, and a smooth throat. Nectary a moniliform fleshy ring, surrounding the insertion of the style. Berry the size of a pullet’s egg, ash coloured, and yellow mixed. Seeds imbedded in the pulp.

Mountain Gardenia. Clt. 1819. Tree or shrub.

34 G. campanulata (Roxb. fl. ind. 2. p. 557.) shrubby; branches short, spiny at the apex; spines solitary; leaves lanceolate, smooth, acuminate at both ends; flowers on short pedicels, in terminal and lateral fascicles; limb of calyx campanulate, with a short acutely 5-toothed border; corolla subcampanulate, 5-lobed; berry roundish-ovate. §. S. Native of the East Indies, in the forests of Chittagong. Thorns generally terminating the little lateral opposite branches. Leaves 2-5 inches long. Stipulas triangular, acute. Flowers small, of a pale yellow colour, crowded at the extremities of short stiff lateral spinose branches. Stigma somewhat 5-grooved. Anthers inclosed. Berry round, the size of a golden pippin apple, smooth, 1-celled; placenta 5, parietal. Seeds imbedded in the yellow pulp.

Campanulata-calyxed Gardenia. Clt. 1815. Sh. 5 to 10 ft.
32 G. Blumeana (D. C. prod. 4. p. 383.) shrubby, spinose; leaves lanceolate, glabrous; flowers axillary, and almost terminal, usually solitary; calyx segments ovate, bluntish; corolla somewhat campanulate. \( \text{\textcopyright} \). S. Native of Java, among bushes on the mountains. G. campamulata, Blum. bijdr. p. 1917. This differs from G. campamulata, Roxb. in the figure of the calyx.

Blume's Gardenia. Shrub 5 to 6 feet.

† Species not sufficiently known.

36 G.? volvuline (Lour. coeh. p. 148.) shrubby, unarmed, twining; leaves lanceolate, acuminate, glabrous, on short pedicels; peduncles long, axillary, many flowered; calyx segments 5, acute, erect; corolla funnel-shaped, with a dilated throat; berry roundish, 2-celled. G. Native of China beyond the suburbs of Canton. Flowers pale. Stigma thick, warty, subulate at the apex. Seeds coriaceous. This shrub should be excluded from Gardenia. Segments of calyx, long, repand.

Teiwin Gardenia. Shrub tv.

37 G.? pubescens (Roth. nov. spec. 151.) unarmed; leaves roundish-ovate, acuminate at both ends, clothed with brown tomentum beneath while young, as well as on the branchlets; corollas axillary, dichotomous, divaricate; calyx minutely 5-toothed; corolla funnel-shaped, tomentose. S. Native of the East Indies. Flowers the size of those of Rhodanu frondula. Berry the size of a cherry, roughened with dots, glabrous. Pubescent Gardenia. Clt. 1824. Shrub 4 to 6 feet.

38 G.? acuminata; shrubby, branched, unarmed; leaves broad-ovate, lanceolate, long, sessile; flowers terminal and axillary, small; fruit oval, acuminate. S. Native of Sierra Leone, on the mountains in the woods. Perhaps a species of Pomatiaum.

Acuminated-fruited Gardenia. Shrub 6 to 8 feet.

39 G.? Brasiileensis (Spreng. syst. 1. p. 763.) unarmed; leaves oblong, coriaceous, opaque; branchlets hairy; peduncles axillary, 3-4-flowered, shorter than the leaves; calyx segments subulate, shorter than the tube of the corolla. S. Native of Brazil.

Brazilian Gardenia. Shrub.

40 G.? longifolia; shrubby, branched, unarmed; leaves long, broad-lanceolate, acuminate, entire, membranous, petiolate; flowers terminal, solitary, sessile; fruit large, roundish, smooth. S. Native of Sierra Leone, in the woods on the mountains.

Long-leaved Gardenia. Shrub 5 to 6 feet.

* * Spinose shrubs.

41 G.? deansa (Wall. in Roxb. fl. ind. 2. p. 559.) shrubby, stiff; branches numerous, decussate, spinose at the apex; leaves in fascicles, obovate, almost sessile, smooth; flowers solitary, sessile, terminal; limb of calyx tubular, 5-toothed: teeth subulate; corolla with a 5-parted limb, and lanceolate acuminate lobes. G. Native of Nipaul, on the southern face of Shepole, above Thoka. Branches obscurely 4-cornered. While young the thorns are pubescent, and covered by a pair of approximate stipula-like scales. Flowers small, of a yellowish white colour, fragrant. Corolla pubescent within, and closed by a circle of silky hairs about the middle. Stigma obscurely 2-lobed. Very nearly allied to G. tetraspermá. Cells of ovary 3-seeded.

Dense Gardenia. Shrub 4 to 5 feet.

Climing Gardenia. Shrub cl.

43 G.? Patula (Horsf. ex Willd. in Röem. et Schultes. syst. 5. p. 241.) spines hooked, shorter than the pedicels; leaves ovate, acute; corollas axillary. S. Native of Java. The rest unknown.

Spreading Gardenia. Shrub.

44 G.? stipulifera (Rottl. et Willd. in act. bonn. 4. (1803.) p. 182.) spines setaceous; leaves elliptic, acute at both ends, short; flowers sessile, solitary, terminal; calyx segments obtuse, and are as well as the tube glabrous. S. Native of the East Indies. Spines very short. Leaves like those of G. spinosa. Corolla with a long slender tube. The spines, according to Rottler, are stipular; hence the name.

Stipular-spined Gardenia. Shrub.

45 G.? Facifólia (Willd. rel. ex Röem. et Schultes. syst. 5. p. 243.) branchlets terminated by 4 spines; flowers solitary; leaves roundish-ovate, downy beneath, stiff, plicately veined. S. Native of South America, where it was collected by Humboldt and Bonpland. Wildenow says the leaves are acute-angled, but this is probably a mistake.

Beach-leaved Gardenia. Shrub 5 to 6 feet.

46 G.? cornifólia (D. C. prod. 4. p. 384.) shrubby, spinose; branches glabrous; leaves acuminate, ovate, rather coriaceous, and are, as well as the branches, downy; flowers 6-8-together at the tops of the branches, sessile, subcorbymbose, each furnished with a bifid involucre; calyx 4-toothed; corolla villous on the outside, with a terete tube, and a spreading 4-parted limb. S. Native of the temperate parts of New Granada, near Guadua. Gardenia parvifolia, H. B. et Kunth, nov. gen. amer. 3. p. 408. t. 293. but not of Poir. Flowers white, sweet-scented. The ovary and fruit being unknown, it is doubtful whether it belongs to the genus.

Dogwood-leaved Gardenia. Shrub 5 feet.

47 G.? Microcôta (Bartr. in herb. Hænke ex D. C. prod. 4. p. 384.) spines few, short, straight; leaves oblong, coriaceous, shining above, quite glabrous on both surfaces, as well as the branchlets; stipulas subulate acuminate; flowers 1-3-toothed, terminal, pedicellate; limb of calyx short, tubular, with subulate teeth, which are much shorter than the corolla, which is glabrous; fruit ovate, crowned. S. Native of the Philippine islands, as in Luzon, &c. Perhaps a species of Ránuida.

Small-fruited Gardenia. Shrub 5 to 6 feet.

 Cult. All the species of Gardenia bear elegant sweet-scented flowers, which in most of the species are large. They are generally free flowerers. The soil best suited for them is a mixture of loam, peat, and sand. The stové species thrive best in a moist heat; and cuttings of all root readily if taken off while not too ripe, planted in a pot of sand, which should be plunged in a moist heat under a hood-glass. The double-flowered varieties of G. florída and G. radicanus are cultivated to a considerable extent, under the name of Cape jasmine, for the beauty and fragrance of their flowers; the best manner of getting these to bloom freely is to set them in a close frame, on a little bottom heat, in spring, but the pots should not be plunged; and in winter they may be set in the greenhouse.
RUBIACEÆ.  
XXXVII. RANDIA.

ceros, Lour. coch. p. 151.—Posoquêria and Rândia species, Roxb. fl. ind.

Lin. syst. Pentândria, Monogynia. Calyx with an obovate tube, and a 5-lobed limb. Corolla salver-shaped, with a short tube, which is hardly longer than the calycine lobes in the first section, but in the second section 2 or 3 times longer, always with a 5-parted limb, which is twisted in restitution. Anthers sessile within the tube of the corolla, inclosed. Stigmas 2, thick. Berry nearly dry, crowned by the calyx, corticate, 2-celled. Seeds many in each cell, fixed to a central placenta, wingless, imbedded in the pulp, or imbricated downwards. Albuñen carilaginous. Embryo straight, with a terete radicle, and orbicular flat cotyledons.—Much branched small trees or shrubs, with axillary opposite or subverticillate thorns. Leaves sessile or on very short petioles. Stipulas solitary on each side, sometimes evidently formed from 2 being combined. Flowers almost sessile, usually solitary, rising from the axis of the leaves.—This genus is nearly allied to Posoquêria, but differs in the dry fruit, and in its being truly 2-celled.

§ 1. Flowers axillary, solitary, on short pedicels.

1 R. latifolia (Lam. dict. 3. p. 24. ill. t. 156. f. 1.) branches glabrous; leaves obovate, quite glabrous, almost sessile, cuneated at the base; flowers axillary, sessile, solitary, salver-shaped; tube of corolla twice the length of the calycine teeth, with a pilose throat. ñ. S. Native of the West India islands, in arid places among bushes; and probably of Mexico. Rândia aculeata, Lin. spec. p. 214. Gardenia aculeata, Ait. hort. kew. Gard. Rândia, Swartz. ñ. fl. ind. occ. p. 526.—Brown, J. am. t. 8. f. 1. Sloane. hist. t. 2. f. 4. Spines axillary, opposite, spreading, forming a straight angle, 4-5 lines long. Corolla white, with the tube 4-5 lines long, and green. Berry the size of a small cherry, white or yellow. Seeds 6-8 in each cell, surrounded by pulp. Brown called this species Indigo berry, because the pulp of the fruit stains paper and linen of a fine fixed blue colour. The spines at the tops of the branches are usually solitary.

Var. ñ. mitis (D. C. prod. 4. p. 385.) the larger leaves are nearly oval; the thorns are few or wanting altogether, and the flowers are fewer and larger than in the species. ñ. S. Native along with the species, but in more moist situations. Rândia mitis, Lin. spec. 216. Gardenia Rândia ñ. mitis, Swartz. ñ. fl. ind. occ. p. 528. Gard. Rândia, Sims, bot. mag. t. 1811.—Sloane, hist. t. 161. f. 1. Flowers white. The juice of the fruit is deep blue.

2 R. obovata (H. B. et Kunth, nov. gen. amer. 3. p. 409. but not of Ruiz and Pav.) branches clothed with hairy tomentum; leaves obovate, glabrous; thorns straight, spreading; flowers solitary, sessile, almost terminal; tube of corolla twice the length of the calyx, with a silky throat? ñ. S. Native of New Granada, at the mouth of the river Sinu. Flowers small, white. Very like R. latifolia, but differs in the branches being tomentose, and in the flowers being smaller.

Obovate-leaved Randia. Shrub 5 to 8 feet.

3 R. pubescens (Ruiz et Pav. fl. per. 2. t. 120. f. b.) leaves obovate, acute, downy; thorns opposite, axillary, spreading, shorter than the leaves; flowers solitary, sessile, girdled at the base by numerous short adpressed bracteae; tube of corolla equal in length to the calycine lobes. ñ. S. Native of Peru, on the Andes, in hot places among broken rocks. R. obovata, Ruiz et Pav. fl. per. syst. 2. p. 68. Roxm. et Schultes, syst. 5. p. 246. but not of Kunth. Gardenia obovata, Dietr. Spreng. Floricorns branches spinose, the rest unarmed, spreading, and somewhat tetragonal; stipulas subulate. Leaves 4-5 inches long. Corolla white, twice the length of the calyx. Berry pubescent, of a greyish yellow colour, crowned by the lobes of the calyx, which are acuminate.

4 R. rotundifolia (Ruiz et Pav. fl. per. 2. p. 68.) thorns and branches somewhat verticillate; leaves roundish and ovate, downy on both surfaces, wrinkled; flowers solitary, sessile; corolla twice as long as the calyx. ñ. S. Native of Peru, in groves about Huassa-Huassi. Gardenia rotundifolia, Dietr. ex Roxm. et Schultes, syst. 5. p. 246. Stipulas ovate, acute. Flowers solitary in the centre of the leaves. Corolla white. Berry yellowish, 1-celled, size of a filbert, when young villous, crowned by the lobes of the calyx, which are elongated and linear. Seeds compressed, imbedded in the black pulp.

5 R. echinoarpa (Moq. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 385.) thorns 4 in a whorl, spreading; leaves ovate, acuminate, rather villous, crowded at the tops of the branches; flowers solitary, sessile, almost terminal; fruit globose, echinate. ñ. S. Native of Mexico. Flowers white. Limb of calyx 5-lobed; lobes linear-subulate. Allied to R. tetraëcitha, but differs in the calyx being 5-parted, not tubular and 5-toothed, and in the tube of the corolla being one-half shorter.

Hedgehog-fruited Randia. Shrub 4 to 6 feet.

6 R. dumetorum (Lam. ill. t. 156. f. 4.) thorns opposite; leaves oval, blanuish, cuneated at the base, glabrous; flowers sessile, solitary, almost terminal; limb of calyx 5-parted, with oblong lobes, which are a little shorter than the corolla, which is villous. ñ. S. Native of the East Indies, frequent on the sea shore. Câmmboon coronatum, Lam. dict. 1. p. 602. Gardenia dumetorum, Retz., obs. 2. p. 11. Roxb. cor. t. 136. Gardenia spinosa, Lin. fl. suppl. 161. Rândia spinosa, Blum. biijdr. p. 981. Posoquêria dumetorum, Roxb. fl. ind. 2. p. 564. Gardenia spinosa, Thumb. diss. gard. no. 7. t. 2. f. 4. Ceriscus Malabáricus, Gaertn. fr. 1. t. 28.—Plut. t. 98. f. 6. Flowers white, clothed on the outside with adpressed villi, sweet-scented. Branches downy while young, but afterwards glabrous. Berry almost globose, yellow, about the size of a small apple, 2-celled, and crowned; cells many seeded. This shrub is employed for fences in the places of its natural growth. The fruit bruised and thrown into ponds where fish are, they are soon intoxicated, and seen floating. Fishermen sometimes follow this mode to enable them to take the fish with more ease. They are not deemed less wholesome from the effects of the fruit. Cocculus Indicus does not grow in those parts, nor is it known or used there for this purpose.

7 R. uliginosa (D. C. prod. 4. p. 386.) thorns almost terminal, opposite; branches tetragonal; leaves oblong, somewhat cuneated, glabrous; flowers solitary, sessile, almost terminal; limb of calyx tubular, almost entire, a little shorter than the tube of the corolla, which is villous in the throat. ñ. S. Native of the East Indies, delighting in moist places, such as the banks of rivers, low lands, &c. Gardenia uliginosa, Retz., obs. 2. p. 14. Roxb. cor. t. 135. Posoquêria uliginosa, Roxb. fl. ind. 2. p. 563. Thorns 1-2 or 3 at the extremities of the branchlets. Leaves 2-3 inches long, and 1 1/2 broad. Flowers 1-2 or 3 at the tops of the branchlets, large, white, and fragrant. Berry size and shape of a pullet’s egg, ash coloured, or olive grey, 5-celled.
Seeds flattish, nesting in the pulp. The flowers of this species render it deserving of a conspicuous place in a hot-house. The uncommon appearance of the plant is also in its favour.

8. *R. longiflora* (D. C. prod. 4. p. 386.) thorns opposite or alternate, horizontal; branches long, dependent; leaves obovate-cuneated, smooth; flowers axillary, and almost terminal, solitary on short pedicles; tube of calyx cylindrical, 5-lobed; lobes ovate-cordate, permanent; corolla villous on the outside; berry obovate, smooth. H. S. Native of the coast of Coromandel. Posoquêria longiflora, Roxb. fl. ind. 2. p. 566. Link, Enum. hort. berol. 225. Thorns sharp, from 1 to 2 inches long. Leaves on the young shoots opposite, on the old ones in fascicles. Stipulas subulate. Flowers pretty large, pure white, and fragrant. Tube of corolla as long as the calyx, with a villous throat. Berry size of a nutmeg. Seeds immersed in the pulp.

9. *R. nutans* (D. C. prod. 4. p. 386.) thorns slender, opposite, spreading; branches long, dependent, pubescent while young; leaves narrow-obovate-oblong; flowers axillary, solitary, on short pedicels; corolla silky on the outside; berry globose, crowned by the tube of the calyx, which is entire. H. S. Native of the East Indies. Posoquêria nutans, Roxb. fl. ind. 2. p. 565. Ceriscus Malabaricus, Gartn. fr. 1. t. 28. Leaves on short pedicels, opposite on the young shoots, but fascicled on the old ones, from 1 to 2 inches long, by about 1 broad. Flowers solitary, under the spine, middle-sized, white, and fragrant; throat of corolla villous. Berry size of a nutmeg, 2-celled.

§ 2. *Flowers in fascicles or racemes, in the axils of the leaves, or extremities of the branches.*

10. *R. parviflora* (Lam. dict. 3. p. 25.) thorns opposite very short; leaves ovate, petiolate, glabrous; racemes villous; flowers axillary, disposed in fascicles, on short pedicels; limb of calyx with 5 short teeth. H. S. Native of the East Indies. The thorns, according to Lamareck, are arched. Gardenia Sonnerati, Spreng. syst. 1. p. 762. Perhaps Gardénia macránta, Thumb. diss. gard. no. 8. t. 1. f. 2, is referrible to this species, but the spines are said to be straight; but the fruit in both are unknown, therefore the genus to which they belong is doubtful. Flowers small, 3-together.

Small-flowered *Randia.* Fl. April, June. Ct. 1818. Shrub 4 to 5 feet.

11. *R. floribunda* (D. C. prod. 4. p. 386.) thorns axillary, stiff; leaves opposite and in fascicles, obovate-cuneated, smooth; flowers disposed in lateral fascicles, on short pedicels; tube of calyx longer than the lobes, which are lanceolate; corolla silky outside; berry ovate, cordate, polished. H. S. Native of the coast of Coromandel. Posoquêria floribunda, Roxb. fl. ind. 2. p. 569. A large stiff branched shrub, in a good soil growing to a small tree. Flowers middle-sized, white at first, but soon becoming yellow, and fragrant, produced in fascicles, from short scaly spurs. Segments of corolla obvolute. Berry size of a prune, 2-celled, many seeded, crowned.

Buddle-flowered *Randia.* Shrub or small tree.

12. *R. longiflora* (Lam. dict. 3. p. 26. ill. t. 156. f. 3, but not of Salish.) arborescent; thorns opposite, recurved; leaves lanceolate-oblong, smooth; corymbs terminal and axillary, 11-13 flowered; limb of calyx tubular, 5-lobed; lobes semilunar; tube of corolla long and slender. H. S. Native of Chitaigong, in the East Indies, where it grows to a pretty large tree. Posoquêria longiflora, Wall. in Roxb. fl. ind. 2. p. 568. Gardenia multiflora, Willd. spec. 1. p. 1231. Posoquêria multiflora, Blum. bijdr. p. 980. Branches terete, smooth. Leaves 6 inches long, and 1½ or 2 broad. Flowers large, pale, or nearly white when they first expand, becoming yellow by the second day, fragrant. Berry the size of the cherry, yellow when ripe, smooth, fleshy.

Fascicled-flowered *Randia.* Shrub 4 to 5 feet.

14. *R. nigida* (D. C. prod. 4. p. 386.) thorns opposite, supra-axillary, each having an annular joint, rarely 2 above the middle, the lower half downy, the upper smooth and shining; branches tetragonal, and, as well as the calyces, villous; leaves ovate, smooth, on short pedioles; flowers by threes, axillary, and almost terminal; tube of corolla long, slender; berry downy. H. S. Native of the valley of Nipaul, and the surrounding mountains; and also in Noakote. Posoquêria nigida, Roxb. fl. ind. 2. p. 570. A strong rigid branchy shrub. Leaves in approximate fascicles, ending each in a cuspidate point. Flowers white and fragrant. Leaves shining above, but with a few short hairs along the nerves beneath. Corolla smooth on the outside. Berry purple, 2-celled, many seeded. Perhaps a true species of Posoquêria. Said to be allied to *R. fasciculata.*

Stiff *Randia.* Shrub 6 feet.

Straight *Randia.* Shrub 5 to 10 feet.

Climbing *Randia.* Shrub cl.

17. *G. tetraëdria* (D. C. l. c.) thorns scattered, straight; leaves ovate, acuminate, narrowed at the base, rather coriaceous, and as well as the branchlets downy; stipulas ovate, acuminate; flowers 6-8 in a fascicle at the tops of the branches, sessile, tetrandrous; bracteas connate; teeth of calyx 4, subulate; corolla clothed with silky hairs outside. H. S. Native of New Granada, in temperate places near Guadua. Gardenia parviflora, H. B. et Knuth, nov. gen. amer. 3. p. 408. t. 293. Flowers small, white.

Tetrandrous-flowered *Randia.* Shrub 5 feet.

18. *R. armata* (D. C. prod. 4. p. 387.) thorns 4 together at the tops of the branchlets, short, spreading; leaves ovate, acute at both ends; flowers usually 4 on the tops of the branchlets, on short pedicels; lobes of calyx linear-cuneiform; tube of corolla long, cylindrical, glabrous. H. S. Native of Caritha.
RUBIACEÆ. XXXVII. Randia.

**Armed Randia.** Cl. 1813. Shrub 5 to 10 feet.

19 R. febric (D. C. l. c.) thorns decussate, spreading, acute; leaves ovate, or oval, glabrous above and pubescent beneath; stipulas pedicellate; flowers covered in cymose fascicles; tube of calyx tubular, but the limb is acute and 5-cleft beyond the middle; segments of corolla almost orbicular. \( \gamma \). S. Native of Brazil, at Rio Padre. Gardénia ferox, Cham. et Schlecht. in Linnæa. 4. p. 198. Flowers white, sweet-scented.

**Fierce Randia.** Shrub 4 to 5 feet.

20 R. capitata (D. C. l. c.) thorns stiff, short, 4 at the top of each branchlet; leaves ovate, acute, hairy on both surfaces as well as on the branchlets; flowers sessile, 6-8 in a capitate fascicle at the tops of the branchlets; limb of calyx tubular, with stiff, subulate teeth; tube of corolla 5 times longer than the segments, villous on the outside. \( \gamma \). G. Native of Mexico. Flowers white, sweet-scented.

**Capitate-flowered Randia.** Shrub 4 to 6 feet.

21 R. tetracantha (D. C. l. c.) branches opposite, horizontal, bearing each 4 thorns at the apex; leaves lanceolate, acuminate, tomentose; flowers sessile, 4 at the top of each branch; limb of calyx tubular, terminating in 5 subulate teeth; tube of corolla long, villous. \( \gamma \). S. Native of Mexico, about Acapulco and Regionontii. Mussae'nda tetracantha, Cav. icon. hort. 5. p. 20. t. 349. Gardénia armata, Bartl. but not of Swartz. Corolla pale yellow. Berry size of a pigeon's egg, not crowned by the calyx.

**Four-spired Randia.** Fl. Ju. Aug. Cl. 1820. Sh. 5 to 10 ft.

22 R. prophyra; branches slightly downy, armed with 4 spines at the apex, placed crosswise; leaves ovate, cordate, subulate, acuminate, downy, petiolate; flowers in terminal fascicles. \( \gamma \). S. Native country unknown. Gardénia prophyra, Lindl. bot. nov. t. 975. Thorns straight, infra-axillary. Leaves clustered at the ends of the branchlets, rather longer than the flowers. Corolla with a long cylindrical tube, and a 5-parted, spreading limb, with cordate, ovate, acute, flat segments, which are rather longer than the tube. Anthers semi-exserted, Flowers large, white.

**Alied Randia.** Fl. July. Cl. 1823. Shrub 6 to 8 feet.

23 R. Humboldtiana (D. C. l. c.) branches nearly terete, glabrous, furnished each with 2 spines at the apex; leaves elliptic, short-acuminate, pubescent, membranous; flowers 5-5 together; terminal, pedunculate; corollas pubescent. \( \gamma \). S. Native on the shores of the Pacific near Guayquil. Mussae'nda pubescens, H. B. et Kuntth. nov. gen. amer. t. 3. p. 410. Gardénia Humboldtiana, Roem. et Schultes, syst. 5. p. 243. Mussae'nda Humboldtiana, Streul. nom. Gardénia pubescens, Bartl. in herb. Haenke, but not of Roth. Flowers white, sweet-scented. Allied to R. armata. Fruit unknown.

**Humboldt's Randia.** Shrub 5 to 10 feet.

24 R. nitida (D. C. l. c.) branchlets rather angular, furnished with 2 spines at the apex; leaves ovate-elliptic, acute, glabrous; shining; flowers terminal, single, or by threes or fours, sessile; corollas glabrous. \( \gamma \). S. Native of New Granada, near Turbaco. Mussae'nda nitida, H. B. et Kuntth, nov. gen. amer. 3. p. 410. Flowers white, sweet-scented. Fruit unknown.

**Shining-leaved Randia.** Shrub 5 to 8 feet.

25 R. triefol'ta (Hamil. in D. Don. fl. rep. p. 138.) thorns opposite, subulate, adnate to the branchlets. Flowers opposite, subulate, adnate to the branches above the petioles; petioles and branchlets hairy; stipulas ovate, cuspidate; leaves ovate; peduncules axillary, 3-flowered; calyx campanulate: having the lobes ovate at the base, and linear-subulate at the apex. \( \gamma \). G. Native of Niquita, at Hetaaura. Peduncles solitary, very short, usually 3, sometimes 4-flowered. Flowers usually 6-cleft and hexandrous. Anthers semi-exserted.

**Three-flowered Randia.** Shrub.

26 R. hórida (Roem. et Schultes, syst. 5. p. 248.) branches reclinate; branchlets decussate; thorns opposite, horn-formed; leaves ovate-lanceolate, glabrous; racemes trichotomous, almost terminal. \( \gamma \). G. Native of Cochin-china, in woods. Oxýcerus hórida, Lour. coch. p. 151. Spines large, acute. Flowers white. Berry black.

**Horrid Randia.** Shrub 8 feet.

27 R. sique'ssae (Roem. et Schultes, l. c.) thorns short, opposite, rather recurved; leaves lanceolate (Lour.): superior ones ovate, nerves, glabrous; corymbs small, terminal, few-flowered; limb of calyx tubular, 3-lobed; tube of corolla long, glabrous: having the throat hardly inflated: anthers linear, exserted, about equal in length to the lobes, which are spreading. \( \gamma \). G. Native of China, about Canton. Oxýcerus Sique'ssae, Lour. coch. p. 151. Randia Chínensis, Spreng. syst. 1. p. 768. R. longifóra, Lam. ill. 156. f. 8.? Flowers white, salver-shaped, with a very long tube. Berry small, roundish, 2-celled, many-seeded.

28 R. Afri'cana; shrub spinose; fruit woody, oblong, or roundish. \( \gamma \). S. Native of Sierra Leone. Flowers small, greenish yellow.

**African Randia.** Shrub 3 to 4 feet.

Sect. II. Euclínia (from ev, eu, well, and klíno, to bend; the segments of the corolla are well bent over each other before expansion). D. C. prod. 4. p. 388. Unarmed shrubs. Tube of corolla usually dilated and obconical at the throat. Perhaps a proper genus.

29 R. Macela'na (D. C. prod. 4. p. 388.) shrubby, unarmed; branchlets rather downy; leaves oval, smooth, glandular in the axis of the nerves beneath, not pilose; flowers terminal, solitary from the axis on the ultimate leaves; tube of corolla very long, dilated at the apex. \( \gamma \). S. Native of Guinea. Rothánchezia longiflora, Salisb. par. t. 65. Limb of calyx rather villous, 5-toothed. Corolla 5 inches long, white, spotted with purple at the throat; segments ovate, spreading. Ovarium 2-celled.

**Spotted-flowered Randia.** Fl. Jul. Sept. Cl. 1696. Shrub 5 to 6 feet.

30 R. specio'sa (D. C. prod. 4. p. 388.) shrubby, unarmed, glabrous; leaves elliptic-oblong, shining above; flowers from the tops of the branchlets, solitary in the axis of the ultimate leaves; tube of corolla very long, clothed with adpressed down on the outside; the segments acuminate. \( \gamma \). S. Native of Cayenne, where it was collected by Patris. Tube of corolla 9 inches long, hardly dilated at the apex. Genitals inclosed. Berry ovate. Tube of calyx cylindrical, semi-quinquelobed; lobes subulate, erect.

**Elegant Randia.** Shrub.

31 R. Mussæ'nda (D. C. l. c.) shrubby, unarmed; leaves ovate or lanceolate, acute, downy on the veins underneath; flowers solitary, sessile, terminating the branchlets; tube of calyx semi-quinquelobed: the lobes subulate; corolla villous on the outside, with a long tube, and acuminate segments. \( \gamma \). S. Native of Carthagenia in woods (Jacquin); on the banks of the river Magdalena, near Honda (H. B. et Kuntth, nov. gen. amer. 5. p. 408.); Dutch Guiana (Meyer, esssq. p. 128.); Mexico, Demerara, French Guiana, and probably of Tobago. Mussae'nda formossa,
Jaq. Amer. p. 70. t. 48. Gardênia maritima, Vahl, herb. Gardênia Musca'nda, Thumb, diss. no. 5. Perhaps 2 or 3 allied species are here confused. The branches are glabrous in Jacquin's and De Candolle's specimens, but hairy in those of Kunth and Thunberg. Corolla with an incurved or straight tube, villous and green on the outside (ex Jacq.), but the segments are white within. Berry coriaceous, ovate, crowned by the calyx, 2-celled. Stigmas 2, acute, revolute.

**Mussonenda**-like Randia. Cit. 1829. Shrub 5 to 6 feet?

32. R. **Ruzia**'s (D. C. prod. 4. p. 358.) shrubby, unarmed; leaves lanceolate, acute, on short petioles, glabrous above, rather hairy on the veins underneath; flowers terminal, solitary, sessile; calyx hairy, with subulate, erect segments; corolla hairy on the outside, with a very long tube, an obconical villous throat, and spreading acute segments. h. S. Native of Peru, on the Andes, in groves at Pozuozu. Gardênia longiflora, Ruiz et Pav. bl. 2. t. 219. but not of Ait. Branches very long, when young rather tetragonal. Berry cylindrical, large, yellowish, striated longitudinally by 10 brown nerves, 2-celled, containing a sweet edible pulp. Flowers white. Stigmas 2, thick, reflexed.

Ruzia's Randia. Shrub 10 to 12 feet?

33. R. **Macra's** (D. C. l. c.) shrubby, unarmed; leaves oval, villous above, but villous tomentose beneath, as well as the petiole; stipules ovate, glabrous, scarious, deciduous; flowers almost terminal, in corymb, disposed in cortyosbaceous fascicles; lobes of calyx parted to the base of the limb, erect, lanceolate, ciliated. h. S. Native of Sierra Leone. Rândia longiflora, Salisb. par. t. 93. but not of Lam. Gardênia longiflora, Ait. hort. kew. ed. 2. vol. 1. p. 368. but not fl. per. Gardênia macrantha, Röm. et Schultes. syst. 5. p. 235. Flowers 6-7 inches long, cream-coloured, fragrant. Stigmas 2, thick, obtuse, flat inside and convex outside. Ovaryum 2-celled. According to Salisbury, this with others he proposes to separate into a distinct genus to be called Eunelia.

34. R. **Longôstila** (D. C. l. c.) shrubby, unarmed; leaves oval, villous above, but villous tomentose beneath, as well as the petiole; stipules ovate, glabrous, scarious, deciduous; flowers almost terminal, in corymb, disposed in cortyosbaceous fascicles; lobes of calyx parted to the base of the limb, erect, lanceolate, ciliated. h. S. Native of Guinea, on the Gambia at Albara, where it was collected by Leprieur and Perret. Flowers black, in the dried state, but probably white when recent; 1% inch long. Style much exserted; stigma thick, bipartite. Fruit nearly globose, about an inch in diameter. Seeds compressed, separated by glutinous partitions.

Long-styled Randia. Shrub 5 to 6 feet.

35. R. **Madagascariensis** (D. C. prod. 4. p. 359.) shrubby, unarmed; leaves ovate, acute, on short petioles, glabrous, coriaceous; flowers axillary, sessile, bicrateate at the base; limb of calyx 5-lobed, obtuse; corolla velutine outside from tomentum, with a terete tube, and 5 oblong obtuse lobes; petals inclosed. h. S. Native of Madagascar. Gardênia Mada- gascariensis. Lam. diss. 2. p. 608. Flowers about 3 inches long. (ex Lam.) Tube of corolla 15 lines long. (ex D. C.)

**Madagascar** Randia. Shrub 5 to 18 feet.

36. R. **Genipe**föra (D. C. l. c.) shrubby, unarmed; leaves oval-oblong, acuminate at both ends, coriaceous, glabrous, on short petioles; stipulas lanceolate; peduncles axillary, very short, divided at top into many 1-flowered pedicels, which are disposed in a corymb; limb of calyx tubular, permanent, 5-toothed, a little shorter than the corolla. h. S. Native of Sierra Leone, where it was collected by Smeathman. Tube of corolla cylindrical, hardly longer than its lobes. Anthers long, linear. Stigmas 2, slender, acute. Berry dry, 2-celled, crowned by the tubular limb of the calyx; placenta scarcely exerted. Seeds horizontal.

**Genipa**-flowered Randia. Shrub 5 to 8 feet.

37. R. **Talanogenesis** (D. C. l. c.) leaves oval-oblong, acute at the base, obtuse at the apex, coriaceous, glabrous; stipulas short, undivided; flowers axillary, solitary, a little shorter than the leaves; calyx long and tubular beyond the ovarium, with 5 short, acute teeth at the apex; corolla with a long terete tube, and is as well as the segments clothed with velvety hairs on the outside. h. S. Native of Madagascar, on the east coast, where it was collected by Chapelier, and called by him Talangninia. Berry dry, ovate, rather acuminate.

Talangninia's Randia. Shrub.

† Doubtful species.

38. R. ? **Drupa**ce (D. C. l. c.) berry ovate, drupaceous, containing a bony putamen. h. S. Native of Java. Posoquêria drupacea, Gaurin. fil. carp. 3. p. 77. t. 193. f. 1. The rest unknown.

Drupaceous-fruited Randia. Tree or shrub.

39. R. ? **Polysperma** (Roxb. bl. ind. 2. p. 146.) shrub bushy and much branched; leaves oblong, acuminate, smooth; stipulas subulate; spikes panicked, axillary. h. S. Native of the East Indies, about Chittagong.

Many-seeded Randia. Shrub 5 to 6 feet.

Cult. For culture and propagation see Gardênia, p. 499. All the species being very showy, usually bearing large, white, fragrant flowers, are therefore worth cultivating in every collection of stave plants.

**Lin. syst.** Pentandria, Monogynia. Calyx with a 5-parted limb, and erect, acute, permanent lobes. Corolla with a slender tube and a 5-parted limb: rather oblique, spreading, lanceolate, acute segments, and a villous throat. Stamens 5, almost sessile, inclosed, inserted in the middle of the tube. Style short, inclosed; stigma oblong, bipartite, with the lobes approximate. Fruit egg-shaped, fleshy, coriaceous, 2-celled, crowned by the large erect limb of the calyx; cells many-seeded. Seeds distinct, many-sided, of a golden yellow colour, and clothed with adpressed, silky down. Embryo linear, terete, in the center of a horny albumen.—A shrub. Leaves opposite, coriaceous, elliptic, acute, quite glabrous. Stipulas entire, caducous, interpetiolar. Flowers on short pedicels, crowded in the axils of the leaves. Habit almost of an apocynous plant.

1 C. **Madagascariensis** (A. Rich. l. c.). h. S. Native of Madagascar.

Madagascar Chapelieria. Shrub 2 to 4 feet.

Cult. For culture and propagation see Gardênia, p. 499.

**XXXIX. HEINSIA** (named in memory of the famous philologist Heinsius, the translator of Theophrastus's works). D. C. prod. 4. p. 390.

**Lin. syst.** Pentandria, Monogynia. Calyx with an obovate tube and a 5-parted limb; and oblong, foliaceous, permanent lobes. Corolla salver-shaped, with a terete tube, which is longer than the calycine lobes, very hairy inside in the upper part, and 5, oval, acute undulate lobes. Anthers 5, linear, acute, sessile towards the top of the tube, inclosed and hidden among the hairs. Style filiform, shorter than the tube of the corolla; stigmas 2, linear. Fruit globose, crowned by the calyx, dry, hard, indehiscent, 2-celled; placenta 2, thick, adnate to the
RUBIACEÆ. XL. Menestoria. XLI. Helospora. XLII. Hippotis. XLIII. Pomatum.

dissemped. Seeds numerous, wingless, nesting on the super-
cies of the placenta.—A much-branched, unarmled, glabrous
shrub or small tree, but there are small permanent spurs,
which look like spines. Leaves opposite, oval-oblong or ovate,
acuminated, on short petioles. Stipulas twin on each side, small,
acute. Flowers 3–4 together at the tops of the branches, ped-
dicellate, and disposed in somehing like racemes, white, about
the size of those of Ficca röse, and very similar to those of
Gardénia and Réginda.

1. H. Jasmínföa. (D. C. prod. 4. p. 290.) f. S. Native
of Sierra Leone, where it was collected by Smeetham, Afze-
lus, and G. Don. The plant we have seen at Sierra Leone
has numerous 1-flowered, terminal, and axillary pedicels; the
tube of the corolla clothed with yellow hairs; and the segments of
the corolla hispid. The shrub bears nothing like spurs or spines
that we recollect.

Cult. See Gardénia, p. 499, for culture and propagation. A
beautiful shrub, clothed with Numerous white flowers.

XL. Menestoria (Menestor was a physiologist cited by

Linn. syst. Pentandria, Monognýa. Calyx with a globose
tube, a 5-parted limb: and linear, almost subulate, acute, distant
segments. Corolla with a long terete tube, 5 oval acute short
lobes, and an almost naked throat. Anthers 5, oblong, sessile
within the tube of the corolla. Style filiform; stigma bifid,
inclosed: lobes linear. Ovarian 2-celled; placental many-
seeded, adnate to the dissemped. Fruit baccate, almost dry,
areolate at the apex, never crowned, from the lobes of the calyx
being deciduous. Seeds very small, wingless.—Unarmed shrubs,
natives of Nipaull. Leaves opposite. Stipulas solitary on each
side, at length deciduous. Corymb of flowers terminal. This
is rather a doubtful genus, differing from Muscænda in the tube
of the calyx or ovary being globose, not turbinate, and in
the stipulas being solitary on each side, not twin; and from Tocoyöna
in the limb of the calyx being parted to the base.

1. M. Tocoyöna. (D. C. prod. 4. p. 390.) leaves obvate,
obtuse, cuneated at the base, almost sessile, glabrous above, pale
beneath, and beset with adpressed villi along the nerves.

f. G. Native of Nipaull. Branches terete. Stipulas broad, short,
very blunt, membranous. Corymb terminal, trichotomous, on
short peduncles; pedicels puberulous. Corolla 15 lines long,
puberulous on the outside; segments ciliated, apiculate, clothed
with adpressed down on the outside, as well as the tube. Style
about equal in length to the tube of the corolla; stigmas 2,
linear, applied to each other in the dried state.

Tocoyöna-like Menestoria. Shrub 5 to 6 feet.

2. M. Hamélille. (D. C. l. c.) leaves ovate, acuminated
at both ends, on long petioles, rather scabrous from scattered hairs
above, and along the nerves underneath. f. G. Native of
Nipaull. Branches compressed. Leaves along with the peti-
\(\text{o} \)les an inch and more in length. Stipulas ovate, broad, short,
acutish. Peduncles numerous, spreading, disposed in loose
cymes, rising from the top of the stem and forks of the branches.
Corolla 6 lines long, scarcely puberulous. Style very short, in-
closed, hardly attaining the height of the anthers.

Hamélille-like Menestoria. Shrub 5 to 6 feet.

3. M. Musseönde. (D. C. l. c.) leaves ovate, acute, on short
petioles, pale beneath, and downy on both surfaces; petioles,
stipulas and middle nerve of the leaves clothed with rufous
hairs. f. G. Native of Nipaull. Branches rather hispid and
rufulous. Stipulas ovate. Stigmas dichotomous, with some of
the flowers sessile and solitary in the forks, and others terminal.
Calyx hispid; lobes deciduous. Berry ovate-globose, smoothish.

Musseönde-like Menestoria. Shrub 5 to 6 feet.

4. M. ? Rígida (D. C. l. c.) leaves cuneated, retuse, and mu-
cronulate, glabrous; stipulas ovate, acute. f. G. Native of
Nipaull, at Suenbu. Gardénia rigida, Hamilt. ex D. Don, prod.
fl. nep. p. 138. A much-branched depressed rigid shrub. Seg-
ments of the calyx subulate. Limb of corolla 5-lobed; lobes
attenuated at the apex.

Stiff Menestoria. Shrub 3 to 4 feet.

Cult. For culture and propagation see Gardénia, p. 499.

XLI. Helospora (from ἥλεος, helios, the sun, and σπορά, 
spora, a seed; in reference to the disposition of the seeds).
p. 391.

Linn. syst. Tetrándria, Monognýa. Calyx with a globose
terete tube, and a somewhat campanulate 4-toothed, erect,
permanent limb. Corolla tubular, much longer than the calycine
limb, with a naked throat, and 4 oblong spreading lobes, which
are valvate in restitution. Anthers 4, linear, inclosed. Style
4-furrowed, and 4-cleft at the apex; stigmas short, spreading.
Berry crowned by the calyx, tetragonal, not divided into cells
inside, but bearing the seeds disposed crosswise, in 4 double
series, immersed in pulp. Seeds linear, curved a little.—A
smoothish shrub. Leaves opposite, on short pedicels, ovate-
lanceolate. Stipulas deciduous, bearing a row of ciliate inside.
Peduncles axillary, 1-flowered, shorter than the leaves. Brac-
tecoles 2, under each ovarium.—This genus is perhaps allied to
Guettardia or Gardénia.

1. H. flaveöscens (Jack, l. c.). f. S. Native of Sinaiurr.
Leaves 3–5 inches long. Corolla yellowish, 3–4 lines long.
Yellowish-flowered Helospora. Tree small.

Cult. For culture and propagation see Gardénia, p. 499.

XLII. Hippotis (from ἰππός, hippos, a horse, and ὄνεως, 
ǒνις, oes, an ear; the form of the calyx has been compared to
hist. nat. par. 5. p. 255.

Linn. syst. Pentándria, Monognýa. Calyx with an ovate tube
and a spati-formed limb, which is cleft on one side, and drawn
out into a mucronate auricle on the other. Corolla a little longer
than the calyx, funnel-shaped, with a somewhat incurved tube,
and a bluntly 5-lobed limb. Stamens 5, inserted in the middle
of the tube; anthers ovate, inclosed. Urecolus 5-crate, seated
on the ovarium. Stigma of 2 adpressed lobes. Berry ovate,
crowned by the calyx, 2-celled. Seeds numerous, minute.—
An unarmed villous shrub. Leaves obovate-oblong, acuminated,
peloteate. Stipulas ovate, acute, caducous, villous on the out-
side and solitary on each side. Peduncles axillary, hardly one
half shorter than the leaves, 3-flowered at the apex. Corolla
and berries villous, purplish red.

1. H. trifóla (Kruiz et Pav. l. c.). f. S. Native of Peru,
in forests about Cuchero, Magora, and Marimachama. Pe-
duncles furnished with small, subulate, deciduous bractes.
Calyx reddish purple. Corolla crimson, greenish at the base:
having the tube yellowish inside.

Three-flowered Hippotis. Shrub 10 to 12 feet.

Cult. For culture and propagation see Gardénia, p. 499.

XLIII. Pomatum (from pomum, an apple; shape of

Linn. syst. Pentándria, Monognýa. Calyx with a sub-
globose tube, and a 5-toothed limb; teeth short, obtuse, deci-
uous, leaving only a membranous circle behind. Corolla small,
with a terete tube and a 5-parted limb. Anthers ovate, sessile
in the throat of the corolla, inclosed. Stigma bifid, with oblong
lobes. Berry almost dry, globose, somewhat didymous, crowned by an areola formed by the falling of the calyx, 2-celled, many-seeded. Placentas rather timid. Seeds angular. Embryo straight, in fleshy albumen, with a centripetal radicle, and flat ovate-roundish cotyledons.—African shrub. Branches terete, hispid in the young state, and glabrous in the adult state. Leaves opposite, almost sessile, oblong-lanceolate, acuminate. Stipulas foliaceous, solitary on each side, oblong, acuminated, almost an inch long. Thyrs spike-formed, terminal.—Habit of Bertiera.

1 P. speciilum (Gaertn. L. c. D. C. diss. ined. with a figure). 7. S. Native of Sierra Leone, where it was collected by Smeathman and G. Don; and in the woods of Casamancia at Iton by Perrottet and Lepicier. C. Géнька labiata, Smeathm. in herb. Lher. Flowers small, white. 

Scape-flowered Pomatum. Shrub 6 to 8 feet. 2 P. dcnum; leaves broad-lanceolate, long-acuminated, rather cordate at the base, sessile; flowers panicked, axillary, and terminal. 7. S. Native of Sierra Leone, on the mountains, in woods. Flowers small, white. 

Lin. syst. Pentandria, Monogynia. Calyx with a sub-globose tube, and a very short permanent 5-toothed limb. Corolla funnel-shaped, with a terete tube, and a 3-parted spreading limb; segments oval, very acute. Anthers 5, sessile within the throat of the corolla. Stigma bifid; the lobes acute. Berry almost dry, crowned by the calyx, umbilicate, roundish, 2-celled, many-seeded. Seeds fixed to the central placentas, angular, muricate.—Shrubs. Leaves oval-oblong, acuminate, pediote, villous. Stipulas solitary on both sides, combined at the base, acuminated. Thyrs terminal, racemosely panicked, bracteolate. Flowers small, white, and sometimes red.—Habit of Lygostatom, but differs in the flowers being 5-parted.—This genus is probably divisible into several.

Sect. I. Bertiera (see genus for derivation). D. C. prod. 4. p. 392.—Bertiera, Anb. Fruit usually striated, crowned by the calyce teeth, which are erectly convivnt and subulate. Inflorince terminal. 1 B. Guiana (Anb. guian. 1. p. 180. t. 69.) leaves ovate-oblong or elliptic, acute, with distant villous nerves; stipulas undivided on both sides, acuminated; flowers disposed in a racemose thyrs; fruit sessile, striated, hairy, disposed along the branches of the panicle, crowned by the erect subulate calyce teeth. 7. S. Native of French Guiana, in woods; and of Cayenne. Vahl, symb. 3. p. 35. Lam. ill. t. 165. Spreng. syst. 1. p. 708. exclusive of some synonomy. Branches villous. Stipulas broad at the base, and rather connate. Leaves 3-4 inches long. Flowers small, white. 

Guiana Bertiera. Shrub 6 to 7 feet. 2 B. Macronata (Gaert. fil. carp. 3. p. 71. t. 192. f. 7.) leaves and flowers unknown; fruit striated, crowned by the erectly convivnt calyce teeth, pediote, disposed along the branches of the panicle. 7. S. Native country unknown. Perhaps the same as B. Guiana. 

Macronata Bertiera. Shrub. 3 B. Psllus (A. Rich. in mem. soc. hist. nat. par. 5. p. 245.) leaves elliptic-oblong, acute, hairy, with approximate nerves; stipulas bifid on both sides; flowers almost cymose; fruit not striated, hairy, crowned by the subulate teeth of the calyx. 7. S. Native of Guiana, in marshy parts of woods. A small sub-herbaceous erect shrub, clothed with rusty down. Leaves soft, usually tapering gradually to the base. 

Marsh Bertiera. Shrub 1 to 2 feet? 

Sect. II. Zaluza (altered from Zuluzañius, an obscure Polish botanist). D. C. prod. 4. p. 392.—Zaluza, Comm. Fruits. Fruit smooth, crowned by the calyce teeth, which are spreading or erect, but not convivnt. Embryo transverse, ovate-cylindrical, in the albumen.—Inflorince terminal, racemosely thyrsid.

4 B. Boreonica (A. Rich. l. c.) smoothish; leaves elliptic-lanceolate, acuminated, pediote; stipulas undivided, drawn out into a setaceous point each, length of pedicels; racemes thyrsid, terminal; fruit glabrous, not striated, crowned by the teeth of the calyx, which are permanent, acute, and straight, but not convivnt. 7. S. Native of the Island of Bourbon. Peduncles angular. Bracteas subulate. 

Bourbon Bertiera. Shrub 3 to 4 feet.

5 B. Neutrala (A. Rich. l. c.) leaves elliptic, acute, on very short pedicels, clothed with rufous silky down; stipulas broad, connate, acute, silky inside, and smoothish on the outside; racemes elongated; pedicels silky; fruit globose and villous, crowned by the erect calyce teeth. 7. S. Native of the Island of Bourbon. 

Rufosa Bertiera. Shrub. 

6 B. Zaluza (Gaert. fil. carp. 3. p. 74. t. 192.) smoothish; leaves rather coriaceous, lanceolate-elliptic, acuminated, on short pedicels, ciliated on the edges; stipulas undivided, drawn out into an acumen, length of pedicels; racemes thyrsid, terminal, and are as well as the flowers downy; branches of racemes dichotomous, with a sessile flower in each fork; fruit crowned by the limb of the calyx, which is hardly toothed; teeth spreading. 7. S. Native of the Mauritius. Mus-saenda racemosa, Sieb. fil. manu. 3. no. 362. Stipulas short, broad, concrete. Racemes apparently drooping. Bracteas small, acute. Flowers sessile. Anthers mucronate. Calyx truncate. Corolla widening from the base, with acute segments. 

Zaluza's Bertiera. Shrub 3 to 4 feet. 

Sect. III. Mycketia (apparently after some botanist of the name of Mycket). Reinwardt. Fruits. D. C. prod. 4. p. 392.—Bertiera, Blum. bijdr. p. 987. Tube of calyx obvate or turbinate. Berry crustaceous inside, crowned by the calyce teeth, which are spreading. Racemules axillary, somewhat coribose. 

7 B. Java (Blum. bijdr. p. 987.) stem simple; leaves petiolate, cuneate-oblong, acuminated, with a few scattered hairs above, and more so on the nerves beneath; corymbs divaricate, axillary, and terminal, trichotomous, solitary, drooping; tube of corolla short. 7. S. Native of Java, in shady parts of woods. 

Java Bertiera. Shrub 2 to 3 feet. 

8 B. Fasciculata (Blum. bijdr. p. 987.) stem a little branched; leaves cuneate-oblong, acuminated, glabrous above, but somewhat strigose on the veins beneath; corymbs short, axillary, trichotomous, erect; pedicels in fascicles; tube of corolla elongated. 7. S. Native of Java, on Mount Salak, in humid places. Corymbs often lateral, hardly longer than the pedicels. Throat of corolla velvety. 

Java Bertiera. Shrub. 

9 T. macrophylla (Blum. l. c.) leaves obovate, acute. 7. S. Native of Java, on Mount Bonkok, in the province of Bantam. 

Fascicled-pedicelled Bertiera. Shrub. 

3 T.
XLIV. POUCHEDIA. Shrub 4 to 5 feet?

† A species not sufficiently known.

10 B. cocinea: shrub rambling, villous; leaves opposite, ovate, acuminate, quite entire, petiole; corymb panicked, terminal; calyx 5-cleft, hairy, with linear segments; corolla tubular, salver-shaped, with a spreading 5-cleft border, and a villous throat; stamens 5, inclosed.  h. S. Native of Sierra Leone, among bushes, in the lowlands about Freetown. Flowers about the size and form of those of lucea rosea, of a deep scarlet colour, and very showy. Scarlet Berntia. Shrub rambling.

Cult. See Musse’nda, p. 492, for culture and propagation.

LIN. SYST. Pentadria, Monogynia. Calyx with an ovate tube, and a small 5-toothed limb. Corolla with a short obconical tube, a glabrous throat, and a 5-lobed limb; lobes ovate-oblong, twisted in activation. Anthers 5, linear, sessile in the throat of the corolla. Style filiform. Stigmas 2, linear, acute, diverging a little at the apex, hardly exserted. Berry dry, closely crowned by the connivent teeth of the calyx, obovate, 5-celled. Seeds 4-6 in each cell, oblong, deformed from being pressed against each other, and clothed with adpressed silky villi. Albumen fleshy, Embryo unknown.—A glabrous African shrub, with roundish branches. Leaves ovate, acuminate, on short petioles. Stipulas solitary on both sides, ovate, ending each in a short cuspitate point. Peduncles opposite, panicked, few-flowered, axillary; but the upper ones are disposed in a terminal panicle from the leaves being gradually diminished and changed into bracteas. Flowers small, glabrous, white!—This genus differs from Gardénia in habit, in the 5-toothed calyx, in the dry 2-celled fruit, and in the cells being few-seeded; in these last characters it agrees with Cupia, but differs from it in the connivent calyx, and in the velvety seeds, and in habit.

1 P. africana (D. C. prod. 4, p. 393).  h. S. Native of Sierra Leone, where it was collected by Smeathmann; and in the woods of the Gambia, Casamance, & Ceylon, where it was collected by Leprieur and Perrottet. Gardénia parviflora, Smeathmann, but not of Poir. diet. suppl. 2, p. 708, which is according to A. Rich. Pajdrax diocéco.

African Pouchedia. Shrub 5 to 6 feet.

Cult. For culture and propagation see Musse’nda, p. 492.

Canthium, sect. Cupia, Reem. et Schultes, syst. 4, p. 306.—Zamária, Rafiu. ann. gen. sc. phys. 6, p. 85?

LIN. SYST. Pentadria, Monogynia. Calyx with a tubine tube, and a 5-parted limb; lobes erect, acute, palmate. Corolla funnel-shaped, with a terete tube, which is longer than the calyx, a gradually widened throat, and a 5-parted limb; segments ovate-oblong, recurved. Filaments very short. Anthers oblong, dehiscing at the side in the upper part of the cells. Style clavate, 10-angular or 2-lobed. Berry globose, crowned by the calyx, 2-celled. Placentas spongy, central. Seeds wrinkled at the hylum. Albenum cheesy. Embryo centripetal.—Asiatic glabrous shrubs. Leaves oblong-lanceolate. Stipulas intrafoliaceous, broad, ending each in a short acumen. Corymbs or panicles trichotomous, terminal, axillary, or opposite the leaves. Flowers white, fragrant.

§ 1. Stigma undivided.

1 C. corombbosa (D. C. prod. 4, p. 394) shrubby; leaves lanceolate-oblong, with revolute margins, shining; corynbs terminal; lobes of calyx 5, about equal in length to the tube of the corolla; mature capsule 4-seeded.  h. S. Native of the coast of Coromandel, frequent: Malabar; Pulo Penang, on hills; Ceylon, China, &c. Cupi, Rheed. Rhod. 2, p. 37, t. 23. Rondeletia Asiatica, Lin. spec. 244. Webéra corombbaya, Willd. spec. 1, p. 1224. Ker. bot. reg. t. 126. Canthium corombbosum, Pers. ench. 1, p. 200. Roxb. fl. ind. 2, p. 533. Stylocorys Cupia, A. Rich. mem. soc. hist. nat. par. 5, p. 248. Leaves 6-7 inches long and 2½ broad; having hairy glands in the axis of the large veins. Corymbs terminal. Flowers small, very numerous, at first white, but finally yellowish, faintly fragrant. Berry size of a large pea, black when ripe. Seeds 4-8 in each cell. The extremities of the young shoots are often found covered with a white resinos matter, like that on the genus of most species of Gardénia.

Corymbos—aflowered Cupia. Ct. 1759. Shrub 5 to 6 ft.

2 C. macropylla (D. C. prod. 4, p. 394) leaves broad-lanceolate, acuminate; panicle terminal, villous; tube of corolla long, slender, villous; berries 5-12-seeded.  h. S. Native of the Prince of Wales Island. Webéra macrophylla, Wall. in Roxb. fl. ind. 2, p. 534. Young shoots villous. Leaves 6-8 inches long, and from 4-5 broad. Panicle large. Flowers large, white. Anthers as long as the segments of the corolla.

Long-leaved Cupia. Shrub.

3 C. densifloра (D. C. prod. 1, c.) sub-arborescent; leaves oblong-lanceolate, acute at the base; panicle rounded, lateral, almost sessile, occupying the place of a leaf or branch, trichotomous, dense-flowered; throat of corolla bearded; ovarium many-seeded.  h. S. Native of Pulo-Penang, on hills. Webéra densiflora, Wall. in Roxb. fl. ind. 2, p. 636. Leaves coriaceous, acuminate, shining above, 5-6 inches long. Flowers numerous, by threes, white. Bracteas lanceolate, ciliated. Anthers very long.

Dense-flowered Cupia. Shrub large.

4 C. mollissima (Hook. et Arn. in Beech. bot. p. 192) leaves lanceolate, clothed with soft dense hairs on both surfaces; lobes of calyx short, very blunt; fruit pubescent, many-seeded.  h. G. Native of China. The hairs, which clothe every part of the plant are of a rusty colour. Stigma unknown.

Very-soft Cupia. Shrub.

5 C. oppostostrófia (D. C. l. c.) shrubby; leaves lanceolate-oblong, firm, and glossy; petioles opposite the leaves, composed of a few still jointed, sub-recurved spikes; corolla with a short tube and a woolly throat; stigma clavate.  h. S. Native of Chittagong. Webéra oppositostrophia, Roxb. fl. ind. 2, p. 535. Flowers white.

Opposite-leaved Cupia. Shrub.
6. C. odora'ta (D. C. l. c.) shrubby; leaves lanceolate, acuminate, polished; corymbs terminal, and are as well as the bracteas villous; calyx 5-toothed; teeth one half shorter than the tube of the corolla; cells of berries 3-4-seeded.  \( \text{S.}\) Native of Silhet, where it is called Patugrooja. Webéra odoráta, Roxb. fl. ind. 2. p. 535. Leaves 4-6 inches long and 1-2 broad. Stipulas triangular. Flowers numerous, middle-sized, white, very fragrant. Anthers about as long as the segments of the corolla.

Sweet-scented-flowered Cupia. Shrub large.

§ 2. Stigma 2-lobed.

7. C. aërículos'ta (D. C. l. c.) arboreose, smooth; leaves ovate-oblong, emarginate, and unequally 2-lobed at the base, acuminate, almost sessile, the axis of the veins glandular beneath; pedicels terminal and lateral, bractiate, on flattened peduncles; throat of corolla swollen, elevated, and bearded; ovarium many-seeded.  \( \text{S.}\) Native of Pulo-Penang. Webéra aëriculáta, Wall. in Roxb. fl. ind. 2. p. 537. Leaves contracted towards the coriaceous base, 7 inches long. Flowers white, fragrant.

Auricled-leaved Cupia. Shrub large.

8. C. trunci'ca (D. C. l. c.) shrub twining; leaves ovate, acute; pedicels terminal, on flattened peduncles; corolla with a naked throat; ovarium 4-ovulate.  \( \text{S.}\) Native of Pulo-Penang, on hills. We'bera truncića, Wall. in Roxb. fl. ind. 2. p. 538. Leaves 3-4 inches long, acute at the base, dark and shining above, coriaceous. Bracteas lanceolate, deciduous. Flowers white, fragrant, on short pedicels by threes, or in fasicles. Anthers very long.

Truncate Cupia. Shrub tw.

† Species not sufficiently known.

11. C. thyrsóidea (D. C. l. c.) branches woody, clothed with brown pubescence; leaves oblong-ovate, acuminate at both ends; thrysse dense, terminal; corolla glabrous outside and pilose inside; stigma bifid.  \( \text{S.}\) Native of the East Indies. We'bera thyrsóidea, Roth. nov. spec. p. 149. Cánthium thyrsóideum, Roem. et Schultes, syst. 6. p. 207. Flowers white. Fruit unknown.

Thyrsus-flowered Cupia. Shrub.

Cult. For culture and propagation see Ron'dellia, p. 517. All the species are very elegant when in blossom, and the flowers are very fragrant.

LIN. SYST. Pentándria, Monógynyía. Calyx with a globose tube, and a 5-parted limb; lobes linear-oblong, reflexed, permanent. Corolla, stamens, and stigma unknown. Berry globose, with 8 stripes, crowned by the limb of the calyx, 2-celled; pulp thin. Placenta central, spongy. Seeds 4-6 in each cell, horizontal, semi-immune, cuneated, compressed, wrinkled. Albumen fleshy. Embryo dorsal, with the radicle directed to the periphery, and foliaceous coryledons. This genus appears to be allied to Cupía, but the flowers and all other particulars besides those mentioned are unknown.

1. T. ZEYLÁNCIA (Gaertn. l. c.).  \( \text{S.}\) Native of Ceylon. Ceylon Tarennia. Tree or shrub.

Cult. For culture and propagation, see Ron'dellia, p. 517.

LIN. SYST. Tetra-Pentándria, Monógynyía. Calyx with a roundish tube, and a short, 4-5-toothed limb. Corolla funnel-shaped, with an equal 4-5-cleft limb. Stamens 4-5, within the tube. Berry almost globose, naked at the apex, 2-celled, many-seeded. Seeds numerous, rather angular, crustaceous.—Trees and shrubs. Leaves opposite, or 3 in a whorl, on short petioles, often coriaceous. Stipulas intrapetiolar, undivided, solitary, on both sides. Peduncales axillary, shorter than the leaves, bearing each a few flowered corymbs or cyme; rarely terminal, except in the more doubtfull species.—Petesia of Gaertn. is Emakëbia, D. C. a genus among the tribe Cofféacées. The character given by P. Browne agrees with this genus, but the species given are probably true species of Ron'dellia. Petesia of Jacq. and Swartz is very doubtful, and will probably constitute a new genus, according to Bartling.

* Flowers axillary.

1. P. CRA'N'DS (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 395.) leaves opposite, rhomboid-ovate, acuminate at both ends, villous on both surfaces while young, but in the adult state they are beset with a little scattered down above, and rather villous on the nerves and veins beneath, reticulated and radiately striated between the veins; corymbos few-flowered.  \( \text{S.}\) Native of Mexico. Limb of calyx 5-cleft, deciduous. Seeds scrobiculate. Great Petesia. Tree.

2. P. sítida (Bartl. in herb. Hænke, ex D. C. l. c.) leaves opposite, oblong, attenuated at both ends, glabrous, reticulately veined beneath, and radiately striated between the veins; peduncles axillary, 3-5-flowered, but only bearing one fruit each.  \( \text{S.}\) Native of the Philippine Islands and Marianne Island. Calyx simutely 4-toothed. Corolla tomentose, small. Berry globose, hardly the size of a pea. Seed sub-cylindrical. The leaves are striated, almost like those of the first species.

Shining-leaved Petesia. Tree.

3. P. ŕIYÍFÓILA (Bartl. in herb. Hænke, ex D. C. l. c.) leaves in a whorl, obvate-oblong and oblong, acute at both ends; peduncales axillary, bifid, 5-7-flowered, but bearing only 1 fruit each.  \( \text{S.}\) Native of the Island of Luzon.

Three-leaved Petesia. Tree.

4. P. CARNOSA (Hook et Arn. in Beech, voy. pt. bot. p. 64.) leaves opposite, oblong-obovate, obtuse, attenuated at the base, glabrous, fleshy; peduncles axillary, 1-flowered.  \( \text{S.}\) Native of the Society Islands. Corolla funnel-shaped, 4-lobed: having the anthers sessile in the throat. It differs from most Rubiaceous plants in the fleshy leaves.

Fleshy-leaved Petesia. Tree or shrub.

3 T 2
** Flowers terminal.**

5 P.? /hibition (Barl. in herb. Haenke, ex D. C. Lc. c.) leaves opposite, membranous, ovate-oblong, acuminate at both ends, having the middle nerve on both surfaces, and the veins beneath hispid from bristles; corollas terminal, short. 97. S. Native of the island of Luzon.

**Hispid-leaved Petesia.** Tree or shrub.

6 P.? /emperature (Jacq. amer. p. 18.) leaves oblong, attenuated at both ends, very soft on both surfaces from hardly conspicuous tomentum; corollas lateral and terminal. 97. S. Native of New Spain, in woods about Cartagena. Flowers tetramerous. Fruit unknown. Perhaps a species of **Rondeletia.**

**Rondeletia** Petesia. Tree.

7 P.? /pica (Swartz, fl. ind. occ. 3. p. 1945.) leaves elliptic, attenuated, glabrous, pubescent on the nerves beneath; petals hairy; racemes terminal, spicate. 97. S. Native of the south of Jamaica, among bushes. Flowers small, white, 4-parted. Berry crowned by the very minute calyx.

**Spicate**-flowered Petesia. Shrub 5 to 6 feet.

8 P.? /imple (Lour. coch. p. 77.) stem herbaceous, quite simple, tetragonal; leaves lanceolate-linear, glabrous; racemes erect, almost terminal; calyx 5-toothed. 2. G. Native of Cochinchina. The fruit is said to be baccate, 8-celled, and many seeded. Flowers white.

**Quite**-simple-stemmed Petesia. Pl. 1 foot.

9 P.? /teminalis (Hook. et Arn. in Beech, voy. pt. bot. p. 85.) leaves oblong, obtuse at the base, acutish at the apex, membranous, glabrous; panicles terminal, racemose, one-half shorter than the leaves; corolla salver-shaped, having the lobes shorter than the tube. 97. S. Native of the Sandwich Islands. Stem dichotomously branched. Leaves 6 inches long, and 1½ inch broad. Corolla funnel-shaped, 4-lobed, inclosing the anthers. Much the habit of **Stylocoryna** racemosa, Cav.

**Terminal**-flowered Petesia. Tree or shrub.

10 P.? /siana (Hook. et Arn. in Beech, voy. pt. bot. p. 85.) leaves oblong, acute at the base, and obtuse at the apex, coriaceous, glabrous; corollas terminal, dense, few-flowered, much shorter than the leaves. 97. S. Native of the Sandwich Islands.

**Coriaceous**-leaved Petesia. Tree or shrub.

**Cult.** For culture and propagation see **Rondeletia,** p. 517.

**Lin. syl.** Tetraphylla, Monoginia. Calyx with an ovate tube, and a 4-parted permanent limb (f. 94. a. b); lobes narrow. Corolla funnel-shaped (f. 94. b), with a 4-parted limb (f. 94. b.), and a glabrous throat. Stamens 4, inserted in the tube of the corolla, included (f. 94. b.); anthers oblong-heart-shaped. Stigma bident. Berry ovate, crowned (f. 94. d. c.), 2-celled (f. 94. c.); cells many-seeded. Seeds lenticularly angular, wingless. —Creeping herbs. Leaves opposite, on short petioles. Stipules subulate, solitary on both sides. Pedicels axillary, solitary, and in the alternate axes, bearing each a few-flowered head, surrounded by a short involucrem. Corollas and berries blue or purple.

1 C. repens (Swartz, fl. ind. occ. 1. p. 245.) plant prostrate, creeping; leaves ovate, pubescent on Keilis surfaces; petals very short while bearing the flowers, but afterwards becoming more elongated; heads few-flowered; bracteas subulate. 97. S. Native of Jamaica and St. Domingo, in temperate parts on the mountains. Browne, jum. 144. 6. C. herbaceum, Lam. dict. 2. p. 56. ill. t. 64. Flowers almost sessile, collected in the axils of the leaves, blue. Fruit seated on peduncles, 4-5 lines long, blue, inflated. (f. 94.)

**Creeping Coccocypseum.** Fl. May. Cit. 1793. Pl. cr.

**Umbellate**-flowered Coccocypseum. Pl. creeping.

3 C. ovatum (Cham. et Schlecht. in Linnaea. 4. p. 141.) plant ascending, rooting at the base; leaves ovate, very blunt at the base, and acute at the apex, beset with minute adpressed teeth; peduncles alternate, shorter than the leaves, clothed with strigose leaves. —Native of Brazil. Allied to C. umbellatum and C. lanceolatum.

**Ovate**-leaved Coccocypseum. Pl. cr.

4 C. lanceolatum (Pers. ench. 1. p. 132.) plant densely clothed with down; leaves lanceolate, acute; heads many flowered, pubedunculate; bracteas lanceolate; berries ovate-oblong. 2. S. Native of Peru, in shady groves at Cuchero and Chinchao, ex Ruiz et Pav.; and on the mountains about the Orieno, ex Haenke; and at Caracas, ex Vargas. Condalia lanceolata, Ruiz et Pav. fl. per. 1. p. 54. Corolla of a pale violaceous colour. Berries blue.

**Lanceolate**-leaved Coccocypseum. Pl. cr.

5 C. hispidum (Barl. in herb. Haenke, ex D. C. prod. 4. p. 386.) plant ascending, very hairy in every part; leaves ovate, acute; heads axillary when in flower, almost sessile; peduncles a little elongated when in fruit, and recurved. 2. S. Native country unknown.

**Hairy** Coccocypseum. Pl. ascending.

6 C. cunei (Wild. herb. ex Cham. et Schlecht. in Linnaea. 4. p. 139.) plant prostrate, creeping; leaves ovate, clothed with silky yellow down on both surfaces; heads axillary, and almost terminal on long peduncles; bracteas of heads 5-6, oblong, acute. 2. S. Native of South America, in temperate shady places, near Buenavista, Caracas, Popayan, and of tropical and extra-tropical Brazil. C. repens, H. B. et Kunth, nov. gen. amer. p. 465. exclusive of the synonyms. Schwienkefia astra, Spreng. neu. entd. 1. p. 288. but not of Willd. Bellardia mollis, Willd. pl. b.; ex Cham. et Schlecht. in Linnaea. vol. 4. Corolla bluish or red. Berries blue.

**Canescent** Coccocypseum. Pl. cr.

7 C. aureum (Cham. et Schlecht. in Linnaea. 4. p. 139.) leaves oblong, acute, with parallel veins, clothed with golden silky down; heads axillary, sessile, few-flowered; bracteas 4-5, narrow, acute. 2. S. Native of tropical Brazil. Schwienklefia aurea, Spreng. neu. entd. 1. p. 280. syst. 1. p. 764.
Allied to *C. canescens*, but differs in the above characters, and in the flowers being larger and slenderer, and less hairy; and in the leaves being more acute and longer.

**Golden Coccocypselum.** Pl. cr.

5. *C. kummelariifolium* (Cham. et Schlcht. in Linnaea, 4. p. 397.) plant very hairy, prostrate, creeping; leaves ovate-rotundish, very blunt at the base, obtuse at the apex, and somewhat muricate; heads on short peduncles; bracteae linear. *2.* S. Native of equinoxyal Brazil. Corolla violaceous, beset with spreading pilis at the top of the lobes. Allied to *C. campaunyliferum* and *C. cordifolium*.

**Money-wort-leaved Coccocypselum.** Pl. cr.

9. *C. cordifolium* (Nees et Mart. in nov. act. bonn. 12. p. 14.) plant creeping; leaves cordate, obtuse, hairy; peduncles at length equal in length to the pedioles; heads of flowers almost glabrous; calyces and pedioles very villous. *2.* S. Native of Brazil, on the road to Felisbert and of St. Catharine. Corolla white, pubescent. Berries glabrous, blue. Habit of *Geophila*.

**Heart-leaved Coccocypselum.** Pl. cr.

10. *C.? erythrocypelium* (Cham. et Schlcht. in Linnaea, 4. p. 144.) branches or stems simple, hairy; leaves ovate, acute, obtuse at the base, hairy on both surfaces, often puberulous beneath; heads on short peduncles, beset with purplish hairs. *2.* S. Native of equinocial Brazil. Flowers and fruit unknown.

**Red-headed Coccocypselum.** Pl. cr.

11. *C. pedunculatae* (Cham. et Schlcht. in Linnaea, 4. p. 142.) plant ascending, clothed with adpressed stirageous hairs; leaves lanceolate-oblong, with revolute edges; peduncles alternate, longer than the leaves, usually reflexed after flowering; heads 10-12-flowered. *2.* S. Native of equinoxyal Brazil.

**Peduncular Coccocypselum.** Pl. cr.

**Tontanea Coccocypselum.** Pl. cr.

13. C. glabrum (Barl. in herb. Henke, ex D. C. prod. 4. p. 397.) plant creeping, quite glabrous; leaves ovate, subcordate, acutish; heads few-flowered, axillary, when bearing the fruit on longer peduncles, which are deflexed. *2.* S. Native of Panama. Very nearly allied to *C. Tontanea*, and probably only a glabrous variety of that species, but the flowers are unknown.

**Glabrous Coccocypselum.** Pl. cr.

14. C. cauletem (Cham. et Schlcht. in Linnaea, 6. p. 414.) leaves roundish-ovate, ciliated, as well as the petioles, having the nerves furnished with long hairs on the upper surface; heads of flowers equal to about half the length of the leaves. *2.* S. Native of Mexico, between Huilulamalco and Cuapa. Very like C. umbellata. Leaves an inch and a half long and 14 lines broad.

**Ciliated Coccocypselum.** Pl. creeping.

† The generic character of the two following species is doubtful, and according to Kunth, syn. should probably be excluded from the present genus.—*Erect suffruticosus glabrous plants.*

**Obovate-leaved Coccocypselum.** Shrub 3 feet.

**Sessile-leaved Coccocypselum.** Shrub 2 to 3 feet.

**Cult.** A mixture of pot and sand is the best soil for the species; and they will be easily increased by separating the creeping stems from the main plant.

**Lin. syst. Tetradriaria, Monogynea.** Calyx with an obovate tube, and a 4-cleft limb; lobes subulate at the apex. Corolla small, with a short tube, and a 4-lobed spreading limb. Stamens 4, inserted in the tube of the corolla, tetosed, or a little exserted. Stigma bifid. Berry crowned by the limb of the calyx, 2-celled, having the dissepiment incomplete and semilunar, and elliptic. Seeds numerous, somewhat compressed. Albumen carcinogenous. Embryo almost dorsal, with a centripetal radicle, and flat roundish cotyledons.—Small glabrous branched trees, having much the habit of box. Leaves obovate, stiillis. Stipulas short, acute, solitary on each side. Pedicels axillar, very short, bracteolate, 1-flowered.

1 F. buxifolia (Lam. ill. no. 1478. but not of Gaertn.) lobes of corolla obtuse; berry obovate, crowned by the subulate lobes of the calyx. *F.* S. Native of the Mauritius, where it is called *bois de biais*. F. obovata, Gaertn. fil. carp. 3. p. 62. t. 191. but not of Lam. Coccocypselum buxifolium, Spreng. syst. 1. p. 416. Leaves 5-6 lines long, and 3-4 broad.

**Buxaceous Fernaldia.** Ch. 1816. Shrub.

2 F. obovata (Lam. ill. t. 67. f. 1.) lobes of corolla acuminate; berries nearly globose, crowned by the lobes of the calyx, which are blutnish and velvety inside. *F.* S. Native of the Mauritius, where it is called *bois Malabare and bois de ronde*. F. buxifólia, Gaertn. fil. carp. 3. p. 63. t. 197. f. 6. Coccocypselum unifólium, Willd. spec. 1. p. 618. Sieb. fl. maur. exsic. 2. no. 100. Leaves 8-10 lines long, and 6-7 broad.

**Obovate-leaved Fernaldia.** Ch. 1816. Shrub.

3 F. pedunculata (Gaertn. fil. carp. 3. p. 191. f. 3.) lobes of corolla unknown; berry obovate, tapering a long way into the stipe at the base, crowned by the lobes of the calyx, which are blutnish. *F.* S. Native of the Mauritius. Shrub and flowers unknown.

**Pedunculate-fruited Fernaldia.** Shrub.

**Cult.** For culture and propagation, see *Ruehelia*, p. 517.

**L. PETUNIA** (Peetunga is the name of *P. Roxbázhghi in the Bengalee language*). D. C. prod. 4. p. 398.—*Rándia species,* Roxb.—Higgina, Blum. bidjdr. p. 988. but not of Pers.

**Lin. syst. Tetradriaria, Monogynea.** Calyx with an ovate tube, and a permanent 4-toothed limb. Corolla funnel-shaped, with a short obconical tube, a 4-parted limb, and a very vison throat. Stamens 4; anthers a little exserted. Style filiform, villous; stigma bidentate, a little exserted. Berry globose, depressed and umbilicate at the apex, 2-celled. Seeds 2-4 in each cell, fixed to the upper part of the dissepiment, ex Roxb., scale-formd, and imbricated downwards, ex Blum. Albumen carcinogenous. Embryo inverted, with linear cotyledons.—Unarmed erect glabrous shrubs, with decussate horizontal branches. Leaves opposite, oblong, attenuated at both ends. Stipulas long-acuminated, deciduous. Spikes axillary, solitary or twi,
simple, many flowered, 3 times shorter than the leaves. Bracteas short, 1-flowered. Flowers disposed in 2 or 4 rows, sessile along the rachis of the spike, small, greenish white. This genus differs from Rândia in the flowers being tetramerous, and very much bearded in the throat, and in the spicate inflorescence and whole habit; and from Higginsia in the throat of the corolla being bearded, in the genitals being a little exerted, and in the globose depressed fruit, &c.

1 P. Raxterham (D. C. prod. 4. p. 399.) leaves elliptic-oblong, glabrous, acuminate at both ends; spikes axillary; bracteas and calyces glabrous. ꞌꞌ. S. Native of the East Indies, about Lukumscepoora, where it is called Petungia by the natives. Rândia racemosa, Roxb. fl. ind. 2. p. 144. Branches almost horizontal. Leaves drooping, 3½ inches long, and about 1 broad. Stipulas large, caducous. Spikes about one-half or one-third shorter than the leaves. Flowers small, pale, greenish white. Berries round, smooth, shining, straw-coloured, size of a pea.

Roxburgh’s Petunga. Cult. 1820. Shrub 3 to 4 feet.

2 P. Longifolia (D. C. l. c.) leaves elliptic-oblong, acuminate at both ends; branches terete; bracteas and calyces downy. ꞌꞌ. S. Native of Java. Higginsia longifolia, Blum. bijdr. p. 988. Leaves 6½ inches long, and 2 broad. Spikes about 2 inches long. Flowers small, greenish white.

Long-leaved Petunga. Shrub 3 to 4 feet.

3 P. Microcarpa (D. C. l. c.) leaves oblong-lanceolate, acuminate, finely veined; spikes short, quadriflorously imbricated; tube of corolla very short. ꞌꞌ. S. Native of Java, where it is called Ki-Ajiet by the natives. Higginsia microcarpa, Blum. bijdr. p. 988. Leaves 3 inches long, and 9½ inches broad. Spikes 5½ inches long. Flowers small, greenish white.

Small-leaved Petunga. Shrub 3 to 4 feet.

4 P. Glomerulata (D. C. prod. 4. p. 399.) leaves oblong-lanceolate, veiny; spikes densely glomerulated. ꞌꞌ. S. Native of Java, on mount Salak, and in woods on the island of Nusa-Kambangia.

L. sst. Tetrandria, Monogyânia. Calyx with a short obovate tube, and a 4-toothed limb; teeth erect, acute. Corolla salver-shaped, with a very short tube, and a 4-parted spreading limb; segments lanceolate. Anthers 4, sessile upon the tube, erectly connivent, linear, acute. Stamina obtuse, hardly emarginate. Capsule baccate, indehiscent, crowned by the calyx, 2-celled, slightly tetragonal. Placentas ovate, distinct in the cells of the fruit. Seeds numerous, minute, roundish.—A herb, which is suffruticose, and branched at the base, having the branches hairy. Leaves ovate, acuminate, rough from dots above, and hairy beneath. Stipulas very short, acute. Peduncles axillary, longer than the pediols, many flowered.

1 H. Pedunculata (Swartz. l. c.) ꞌꞌ. S. Native of the higher mountains of Jamaica, in rather humid shady places. H. Jamiacânésis, Spreng. sst. 1. p. 416. Corolla with a red tube, and the segments of the limb striped with blood-colour at the base, but they are yellow at the apex. Berries scarlet.

Pedunculata Hoffmannia. Shrub 2 to 3 feet.

Cult. See Catesbœa, p. 511. for culture and propagation.

L. sst. Tetrandria, Monogyânia. Calyx with an obovate tube, and a 4-toothed or 4-parted limb. Corolla funnel-shaped, with a very long tube, gradually widening and dilated to the throat, and a 4-parted limb. Stamens 4; filaments inserted at the base of the tube of the corolla; anthers linear, exserted. Stigma bidentate, from the lamellae being combined. Berry globose or oblong, 2-celled, crowned by the limb of the calyx; having the disseipment perforated according to Jussieu, but according to Gervatin, it is entire. Placentas spongy, fixed to the upper part of the disseipment on both sides. Seeds numerous, scale-formed, invected, imbricated downwards, collected in 2 bundles in each cell. Albumen fleshy. Embryo minute, invected.—Glabrous shrubs, bearing supra-axillary simple spines. Leaves small, oval, usually in fascicles. Stipulas solitary on each side, deciduous. Pedicels axillary. Flowers whitish, elongated,
bractless.—This genus comes very near to *Scolosánthus*, but differs in the cells of the fruit being many seeded.

1 C. *latifolia* (Lindl. bot. reg. 858.) leaves obovate, shining, convex, rather shorter than the spines; teeth of calyx subulate; tube of corolla very long, obconical at the apex. ♀. S. Native of the West Indies, particularly in Cuba near the Han- vannah. Corolla pale yellow, 4 inches long. Fruit ovate, crowned by the 4 subulate calyceal teeth.

2 C. *spinosa* (Lam. spec. p. 159.) leaves ovate, acutish at both ends, rather longer than the spines; teeth of calyx short, acute; berry oval; tube of corolla very long, cylindrical, widening at the apex. ♀. S. Native of the Bahamas Islands, but particularly of Providence, near Nassau. Lam. ill. 67. f. 1. Curt. bot. mag. t. 131. Tratt. tab. t. 259. C. longiflora, Swartz, prod. p. 30.—Catesb. ear. 2. t. 100. Corolla pale yellow, 3-6 inches long. Leaves like those of box, roundish, rising in fascicles. Berry about the size of a middling plum, yellowish, with rather tart pulp.

§ 2. *Erectiflora* (from *erectus*, erect, and *flora*; a flower; the flowers are erect, not drooping as in the first section). D. C. prod. 4. p. 401. Pedicels 1-flowered. Flowers erect, glabrous. Stamens included.—Perhaps all are species of *Catesbea*.

*Vavasseur's Lily-thorn.* Shrub 4 to 6 feet.

§ 2. *Erectiflora* (from *erectus*, erect, and *flora*; a flower; the flowers are erect, not drooping as in the first section). D. C. prod. 4. p. 401. Pedicels 1-flowered. Flowers erect, glabrous. Stamens included.—Perhaps all are species of the genus *Rúdia*.

4 C. *Parietiflora* (Swartz, prod. 20. fl. ind. occ. 1. p. 236.) leaves ovate, rather than ovate, revolute margins, mucronate, and are, as well as the branches, glabrous; teeth of calyx short, acute; flowers sessile among the leaves; tube of corolla short, tetragona; berries roundish. ♀. S. Native of the north of Ja-maica, among bushes by the sea side. Vahl, symb. 2. p. 31. eclog. 1. p. 12. t. 10. f. 1. but not of Lam. Gaertn. fil. carp. t. 192. f. 3. C. parviflora, ex Jamaica, Spreng. prod. 1. p. 416. exclusive of the diagnosis and synonyms.—Sloam. hist. t. 207. f. 1. Corolla white, with a tetragonal tube, about 4 lines long.

5 C. *Campanulata* (La Sagra, in litt. ex D. C. prod. 4. p. 401.) leaves ovate-roundish, coriaceous, and are, as well as the branches, quite glabrous; spines opposite, longer than the leaves; flowers erect, short, sessile in the axils of the leaves. ♀. S. Native of Cuba, near the Hanvannah, where it was collected by Ramón de la Sagra. Perhaps sufficiently distinct from *C. parviflora*.

*Campanulata-flowered Lily-thorn.* Shrub 4 to 5 feet.

6 C. *Parviflóia* (D. C. prod. 4. p. 401.) leaves ovate-roundish, mucronate, glabrous; spines axillary, subulate, a little longer than the leaves; branches hairy; flowers short, usually twin, axillary, on very short pedicels. ♀. S. Native of St. Domingo. *Catesbæa* parviflóra var. Dominénsis, Spreng. prod. 1. p. 416. Gardínia parviflóra, Dietr. suppl. gart. lex. 3. p. 411. ex Rem. et Schultes, syst. 5. p. 247. Rândia parviflóra, Lam. dict. 3. p. 25. (exclusive of the syn. of Sloane) ill. t. 156. f. 2. but the flowers in the figure are drawn 5-leaflet. Spines opposite, straight, about 5 lines long. Leaves like those of box, in fascicles. Berries globose, almost sessile. Flowers white, changing to yellowish.

7 C. *erecta* (Moc. et Sesse, fl. mex. icon. exed. D. C. prod. 4. p. 401.) leaves oval-oblong, acute; branches opposite, spreading, unarmed; flowers almost terminal, nearly sessile, solitary, erect; tube of corolla very long. ♀. S. Native of Mexico. Flowers white, almost like those of *C. spinosa*, but erect. Spines none in the figure given.

*Erect Lily-thorn.* Shrub 4 to 5 feet.

Cult. All the species of *Catesbæa* are very ornamental while in bloom. They grow best in a mixture of light turf or loam and peat; and cuttings will root if planted in sand plunged in heat, with a bell-glass placed over them. The plants being apt to be infested with insects, they should be kept clean or they will not thrive.

Tribe III.

**HEDYOTTIDEÆ** (this tribe contains plants agreeing with the genus *Hedyótis* in particular characters). Cham. et Schlecht. in Linnaea. 4. p. 150. D. C. prod. 4. p. 401. Fruit caperular, 2-celled, dehiscing in the middle of the cells: or rather membranous and indehiscent; cells many seeded. Seeds not winged. Albumen fleshy.—Shrubs and herbs, with opposite leaves, and interpetiolar stipulas.

Subtribe I. *Ronelleítæ* (plants agreeing with the genus *Rondeléttia* in important characters). D. C. prod. 4. p. 401. Stipulas twin on both sides, combined or distinct, neither sheathed nor ending in bristles.

**L.V. CONDAMI NÆA** (in honour of — La Condamine, a famous astronomer, and traveller in South America, and who was the first who described and figured *Cinchóna lancéolata*). D. C. prod. 4. p. 402.—Macroenénnum, Ruiz et Pav. fl. per. 2. p. 48. but not of Browne.—Macroenénnum, sect. 2. Kunth, and A. Rich.

**LY. Syst.** *Pentadviria, Monogénia*. Calyx with a cup-shaped tube, and a 5-crenated or 5-toothed limb (f. 95. a.), which at length becomes circumsiced at the base, and falls off. Corolla funnel-shaped, with a somewhat curved tube (f. 95. b.), which is a little longer than the calyx, a dilated throat, and a 5-parted limb (f. 95. c.); the segments ovate, acute, spreading, and thickened at the apex (f. 95. e.). Stamens 5, inserted above the middle of the corolline tube (f. 95. b.), or near its throat; filaments shorter than the corolla; anthers oblong-linear, bifid at the base, length of corolla. Stigmas 2-lobed (f. 95. f.). Capsule turbinate (f. 95. g.), rather compressed, truncate, umbilicate, 2-celled, dehiscing in the middle of the cells (f. 95. e.). Seeds small, numerous, cuneiform, not winged.—South American shrubs. Leaves large, opposite, on short petioles. Stipulas intrafolia- ceous, bipartite, acuminate, adpressed, usually connate. Co- rymbus or racemes terminal, many flowered.—This genus differs from *Macroenénnum* in the form of the calyx, in the stamens being inserted above the middle of the corolline tube, not at its base, as in that genus, and in the seeds being wingless; and from *Sickingia* in the stigma being double, not simple, and in the seeds not being winged, &c.

1 C. *Corimbósa* (D. C. prod. 4. p. 402.) leaves ovate-oblong,
RUBIACEÆ. LV. Condaminea.

acuminated, coriaceous, opposite; corollas large, bracteate, trichotomous; teeth of calyx broad, short, blunt. ½. S. Native of Peru, on hills towards Chinchao, Acomayo, Pilano, and Muna; ex Ruiz et Pav. and on mountains about the Guanoaco river, ex Heeneke; also as of New Granada about Marinqui, and Santa Anna, ex H. B. et Kunth. Macrocnêmum corymbosum, Ruiz et Pav. fl. per. 2. p. 48. t. 189. H. B. et Kunth, nov. gen. amer. 3. p. 399. Leaves a foot long. Calyx purple, fleshy. Corolla white inside and purplish on the outside, with a naked throat. Capsule at first purplish, but at length almost black. Seeds yellow. 

Corollas of flowers—abruptly tubular, 5-valved. 

Corynbese-flowered Condamines. 

1. Corynbese-flowered Condaminea. Tree 40 to 50 feet.

2. Corynbese-flowered Condaminea. Tree 20 to 30 feet.

5. Corynbese-flowered Condaminea. Tree 10 feet.

6. Corynbese-flowered Condaminea. Shrub with both stalks 10 feet.

LVII. Alseis. LVII. Macrocnênum.

—A middle-sized tree. Leaves oblong, acuminate, rather pilose on both surfaces. Spurs branched, terminal. Flowers small, cream-coloured.—This genus is allied to Macrocnênum and Muchunina according to the author.

1. A. floribunda (Schott, l. c.) ½. S. Native of Brazil, in groves. 

Buddle-flowered Alseis. Tree. 

Cult. For culture and propagation see Rondeléia, p. 517.

—Macrocnênum species of authors.

Lin. syst. Pentàndria, Monogynia. Calyx with a turbinate tube, and a small 5-toothed persistent limb. Corolla tubular, with a wide throat; the tube pentagonal before expansion; and the segments 5, acute, and eretic. Capsule 2-celled, 2-valved; valves deshing at the sides (see Swartz). Seeds numerous, imbricated, acute.—Small glabrous trees. Leaves approximate, oblong, short-acuminated. Stipules solitary on both sides. Pendicula terminal and subaxillary, solitary, trichotomously coriaceous above. Flowers rather large, yellowish green.

1. M. Jâmaicae (Lin. amen. 5. p. 413.) arboreous; leaves oblong-oval, petiolate, polished; stipulas ovate-triangular, much shorter than the pedicles; corollas on long peduncles. ½. S. Native of the south of Jamaica, in shady places on the banks of rivulets. Swartz, obs. p. 68, t. 3. f. 1. Lam. dict. 3. p. 670. 

Jamaica Macrocnênum. Ch. 1806. Tree 12 to 14 feet. 

4. Species not sufficiently known, and do not probably belong to the present genus. 

2. M.?? stipulae (Roxb. fl. ind. 2. p. 144.) leaves almost sessile, lanceolate, smooth; stipulas oval, very large; corollas terminal, suprarecumbent. ½. S. Native of the Moluccas. 

The mouth of the corolla is uncommonly woolly, almost hiding the stamens.

Stipulae-flowered Macrocnênum. Tree. 

3. M.?? parviflorum (Roxb. fl. ind. 2. p. 144.) shrubby; leaves on short petioles, lanceolate, entire, smooth; stipulas angular, truncate; peduncles axillary, many-flowered; corolla acutabuliform. ½. S. Native of the Moluccas. 

Small-flowered Macrocnênum. Tree. 

4. M.?? tetraénum (A. Rich. mem. soc. hist. nat. Par. 5. p. 279.) leaves elliptic-oblong, acute at both ends, discoloured, cornutose below; flowers subracemose, terminal, small, tetramerous; calyx woolly; corolla short; stamens exerted; capsule dehiscing at the discineum. ½. S. Native of Brazil. 

Tetraénum Macrocnênum. Shrub or tree. 

5. M.?? tubuliferum (A. Rich. l. c.) leaves broad-ovate, acuminate at the apex, dimidiate at the base, petiolate, downy; flowers subnervose, terminal; one of the teeth of the calyx is expanded into a large, broad, somewhat heart-shaped petiolate leaf; corolla with a long tube, and a 5-lobed limb; stamens exerted; capsule dehiscing in the middle of the cells. ½. S. Native of Brazil. 

This is probably a species of Calceolus. 

Tubular-flowered Macrocnênum. Tree or shrub. 

Cult. For culture and propagation see Catesbea, p. 511.

LIX. syl. Pentándria, Monogyinia. Calyx with an obovate or turbinate tube, and an almost obsolete entire limb. Corolla with a short tube, and a 5-cleft spreading limb; segments hairy in the middle outside. Stamens 5, inserted in the upper part of the corolline tube; filaments hairy at the base; anthers oval. Capsule obovate or turbinate, ligneous, coriaceous, crowned by the marginal limb of the calyx, 2-celled; cells dehiscing from the base to the apex, ex A. Richard, many-seeded; valves semi-bifid. Seeds pendulous.—American glabrous trees. Leaves opposite, on short petioles. Stipulas interpetiolar, solitary on both sides. Coryms or cymes terminal. Flowers white.—This genus is nearly allied to *Machairia*.

1 C. cymosa (Jacq. amer. p. 61.) leaves ovate, acuminate at both ends; branches of corymb alternate; capsules obovate, very short. \( p. S. \) Native of Martinico, along the sides of mountain streams or torrents where it is commonly called *bois de rivières*, or river woof. Macrocentrum longifolium, A. Rich. men. soc. hist. nat. Par. 5. p. 279. A lofty tree, with a handsome head. Leaves a foot long, shining, commonly 8 or 10 at the top of each branch. Flowers small, disposed in race- mose coryms, white. Capsules small. The wood is white, and used for beams and rafters.

*Cympose-flowered River-wood. Tree lofty.*

2 C. turbinata (D. C. prod. 4. p. 404.) leaves oval, obtuse at the apex, and acute at the base; branches of corymb opposite; capsules turbinate. \( p. S. \) Native of Cayenue, where it was collected by Patris. Upper leaves 3 inches long and 1½ broad, on short petioles. Stipulas triangular, acuminate. Peduncles and capsules downy.

*Turbinate-fruited River-wood. Tree.*

*Cult. For culture and propagation see Rondelétia, p. 517.*

LIX. AUGUSTEA (named in compliment to the present empress of Austria, princess Caroline Auguste of Bavaria). D. C. prod. 4. p. 404.—*Augusta, Poli. fl. bras. 2. p. 1 but not of Leand.*

LIN. Syl. Pentándria, Monogyinia. Calyx 5-cleft, with folia cousmous permanent segments. Corolla very long, tubular, incurved, 10-straited, with a spreading limb, which is valvate in aestivation. Anthers sessile, exerted. Stigma lens. Capsule 2-celled, dehiscing at the apex, 4-cleft. Seeds angular, matted, truncate at the apex, fixed to a transverse receptacle.—Middle-sized trees. Leaves on short petioles, simple, dentate, entire, oblong, stipulate. Flowers showy, bracteate, in terminal fascicles, deep red or crimson. This genus differs from *Exostemma* by the funnel-shaped corolla, with broad short segments, by the foliaceous calyce lobes, and by the angular seeds.

1 A. lanceolata (Pohl, fl. bras. 2. p. 2. t. 101.) leaves lanceolate, and are, as well as the stipulas, glabrous; flowers terminal, 3 in a fascicle; bracteas lanceolate, flat, ciliated. \( p. S. \) Native of Brazil, in the province of Goyaz, in shady places, on the banks of rivers and ditches, in Serra de Cristaes. Flowers crimson or deep red. Stem bluish red.

*Lanceolate-leaved Augusta. Shrub.*

2 A. farfífolia (Pohl, fl. bras. 2. p. 3. t. 102.) leaves lanceolate, equal at the base and apex, acutish; stipulas and brac- teas glabrous; flowers terminal, twin; calyxine segments oblong, bluish, retuse at the base, and pilose inside. \( p. S. \) Native of Brazil, in the province of Rio Janeiro, in shady places on the banks of rivers and rivulets on the road from Engenho da Varge to Agon de Serra. Stem of a greyish brown colour. Flowers bluish red.

*Small-leaved Augusta. Shrub.*

3 A. oblongifolia (Pohl, fl. bras. 2. p. 4. t. 103.) leaves oblong, acuminate at the base and apex, glabrous above, and rather pilose beneath; stipulas, bracteas, and peduncles pilously ciliate; fascicles first ternate, then bifid. \( p. S. \) Native of Brazil, in the province of Goyaz, on the mountains among bushes on the banks of rivers and rivulets. Stem greyish black. Flowers deep red or crimson. Peduncles terminal, trifid, then bifid, each ultimate division bearing 1 flower.

*Oblong-leaved Augusta. Shrub.*

4 A. attenuata (Pohl, pl. bras. 2. p. 6. t. 104.) leaves oblong, tapering into the petioles at the base, ciliate when examined by a lens, glabrous; stipulas glabrous on the outside, and pilose inside; fascicles of flowers terminal, first ternate, then bifid; bracteas lanceolate, channelled, villous inside. \( p. S. \) Native of Brazil, in the province of Rio Janeiro, on the margin of rivers and rivulets, in Serra Tinguai. Stem greyish brown. Corolla bluish red. Peduncles of flowers divided like that of the last.

*Attenuated-leaved Augusta. Shrub.*

5 A. glaucescens (Pohl, fl. bras. 2. p. 7. t. 105.) leaves crowded, oblong, tapering to both ends, therefore acute, quite glabrous; stipulas triangular, cuspidate, glabrous; fascicles of flowers terminal, trifid; bracteas lanceolate, acuminate, pilose inside. \( p. S. \) Native of Brazil, in the province of Goyaz, in shady places on the banks of rivers and rivulets at Riveira Bateiro. Stem bluish black. Corolla deep red or crimson.

*Glaucescent Augusta. Shrub.*

*Cult. The species of *Augustea* are very ornamental; the flowers being long and tubular, of a deep red or crimson colour. Their culture and propagation is the same as that recommended for *Catechu*, p. 511.*

1 P. grandiflora (Lin. spec. 244.) leaves elliptic-lanceolate; flowers axillary, pedicellate, solitary, 4 times the length of the breadth. \( p. S. \) Native of Jamaica, St. Thomas, &c. among rocks at the foot of the mountains. Smith. icon. pict. 1. t. 6. Curt. bot. mag. 286. Jacq. amer. t. 44. pict. t. 64. Flowers almost like those of *Brugmansia arborea*, white, reddish inside at the throat, 5 inches long and 1½ broad, very fragrant at night; but in the bud state they are yellowish, tipped with red. Tube with 5 hairy angles.

*Var. \( \beta \); leaves ovate, acute. \( p. S. \) Growing along with the species.*

2 P. cocinea (Swartz, fl. ind. occ. 1. p. 384.) leaves ovate-roundish, coriaceous; flowers axillary, pedicellate, solitary, hardly twice the length of the breadth. \( p. S. \) Native of the west of Jamaica, on the precipices of mountains, but rare. P. 3 U

Scardel-flowered Portlandia. Cult. 1812. Shrub 2 to 3 feet.

† A species hardly known.

3 P. acuminita (Willd. rel. in Roem. et Schultes, syst. 5. p. 23.) leaves ovate, acuminated. † S. Native of New Spain, at Caraccas. Perhaps the same as P. grandiflora. Acuminated-leaved Portlandia. Shrub.

Cult. The species of Portlända are deserving of a place in every collection of stone plants, for their large showy flowers. They thrive best in a mixture of sand loam and peat; and cuttings, not having their leaves shortened, will root freely if planted in a pot of sand, planted in, with a hand-glass over them. A strong heat is necessary for flowering the species, and without it they will not even grow freely.

LIN. SYST. Tetradria, Monogynia. Calyx with a turbinate oblong tube, which is angular from 8 filiform ribs, 4 of which are carinal, and 4 sutured: and a 4-parted limb; lobes linear-lanceolate. Corolla clavate, tetragonal, with a 4-parted limb. Anthers 4, linear, not exceeding the limb of the corolla. Stigma unknown. Capsule ovoid, dehiscing at the apex, separable from the calyx, and therefore at length becoming naked, 2-celled, but almost 4-celled from the margins of the valves being involute: valves bifid at the apex. Placentae narrow, rather prominent. Seeds innumerable, small, compressed, not winged, but ciliated along the margins from membranous crests. Albumen fleshy. — A glabrous shrub. Leaves opposite, ovate, bluntish, cuneated at the base, petioleless, veined, with the exception of the middle nerve. Stipules short, truncate, combined. Pedicles axillary, solitary, 1-flowered, naked. Flowers white.

Var. a, Forsterrhiana. † S. Native of Savage Island and Weggio in the Pacific. Leaves obovate, coriaceous, obtuse, cuneated at the base, on short petioles, 2 inches long. Corolla tubular, rather dilated at the apex; with 4 short triangular lobes, which are each terminated by a mucrone. Anthers a little longer than the corolla. Perhaps the flowers are monocious.

Var. β, Commermisiona. † S. Native at Port Prasin. Leaves broad-oboavate, very blunt, hardly coriaceous, cuneated at the base, on short petioles, 3-4 inches long and 2 or more broad. Corolla more than 2 inches long, with an oboconical tube, and ovate lobes, which are apiculated by a mucrone at the apex. Anthers shorter than the lobes of the corolla.

Var. γ, Gaudechadonia. † S. Native of the Island of Ravak. Intermediate between the two preceding varieties. Lobes of corolla triangular, acute, with the recesses broad and obtuse. Anthers equal in length to the corolla.

Southern Bikkia. Tree or shrub.

Cult. For culture and propagation see Portlända above.

LXII. ISIDOREA (isidos is the Latin name of a shrub like coral; the name has been applied to this genus because it is stiff and dry, and grows by the sea side). A. Rich. in mem. soc. hist. nat. par. 5. p. 284. t. 25. f. 1. D. C. prod. 4. p. 405.

LIN. SYST. Pentändria, Monogynia. Calyx with a turbinate pentagonal tube, and a 5-parted limb; lobes erect, keeled, lanceolate-subulate. Corolla tubular, pentagonal, with a naked throat, and a 5-cleft limb; segments triangular, acute, short. Stamens inserted in the bottom of the tube of the corolla, and about its length; filaments capillary, villous at the base, and combined together in a monadelphous manner; anthers oblong; obtuse at the apex. Style slender, length of corolla; stigma bilamellate; lamellae oblong, obtuse. Capsule almost globose, pentagonal, truncate at the apex, crowned by the segments of the calyx, 2-celled; cells dehiscnt, many-seeded. Seed angled, from being pressed against each other, girdled by a cup-shaped memhrane at the base.—A stiff shrub, with the habitat of Ereñöd. Leaves opposite, linear, stiff, with revolute margins. Stipules on the younger branches entire and subulate, but those on the older branches are bipartite. Flowers almost terminal, solitary, nearly sessile, often hexamernous.

1 I. amoena (Rich. l.c.). † S. Native of the West India Islands. Ereñöd pedunculatis, Poir. suppl. 2. p. 581. and Ereñöd pangens, Lam. ill. 1. p. 276. ex Rich. But the descriptions given do not agree.

Pleasant Isidorea. Shrub.

Cult. See Rondelétia, p. 517. for culture and propagation.

LXIII. SPALLANZANIA (named in honour of Abbe Spallanzani, an Italian celebrated for his researches in natural history, particularly in zoology). D. C. prod. 4. p. 406. but not of Neck, nor Pall.

LIN. SYST. Pentändria, Monogynia. Calyx with an obvously pyramidal tube, a 5-parted limb, and foliaceous, linear, distant, acute, erect, permanent lobes, which are longer than the tube. Corolla with a slender, terete tube, which is longer than the segments of the limb, a naked throat, and 5 oval spreading segments. Stamens 5; filaments free from the throat, exserted; anthers oblong. Style filiform; stigmas 2, slender, elongated. Capsule ovate-globose, ribbed by nerves, and crowned by the calycine lobes, 2-celled, obscurely dehiscent: having semi-bilid carpels. Placentae adnate to the dissepiment. Seeds ovate, tubercular.—A smooth shrub. Branches terete, but compressed at the apex. Leaves obovate or oval, rather coriaceous. Sti- pules solitary on both sides, ovate, bifid at the apex. Corymbs terminal, many-flowered, with angular branches, which are bracteate at the base.—Very nearly allied to Ñádiä a section of Muscæta.

1 S. Corymbosa (D. C. l. c.). † S. Native of Madagascara, where it is called Tamburach'aka by the natives.

Corymbosus-flowered Spallanzania. Shrub.

Cult. For culture and propagation see Rondelétia, p. 517.

LIN. SYST. Tetra-Pentändria, Monogynia. Calyx with a subglobose tube, and a 4-5-parted limb; lobes oblong-linear, acute, permanent. Corolla with a cylindrical tube, which is hardly ventricose at the apex, and a 4-5-lobed spreading limb; lobes roundish. Anthers 4-5, sessile at the top of the tube, inclosed. Stigma bifid. Capsule globose, crowned by the calyx, 2-celled, dehiscent from the apex into 2 valves, which
are usually chief at the apex, whence it sometimes appears 4-valved; but usually debasing at the cells, rarely at the disposition. Placentas central. Seeds numerous, small, ovate, angular, usually only 2 in each cell at maturity.—Small trees or shrubs, mostly natives of America. Leaves almost sessile, or more or less petiolate. Stipulas deltoid, or linear-lanceolate, solitary on both sides, undivided, sometimes hairy inside. Peduncles axillary, usually trichotomous, sometimes disposed in a terminal corymbose panicule, rarely 3 or 1-flowered.—All the Asiatic plants referred to this genus are species of *Wendlandia*.

* Tube of corolla hardly longer than the calyx.

1 R. *laurifólia* (Swartz, fl. ind. occ. p. 363.) leaves lanceolate-oblong, acute, glabrous on both surfaces; stipulas deltoid, glabrous on the outside, with ciliate margins, and villous at top; racemes compound, axillary, erect; tube of corolla very short, clothed with adpressed villi. Ἡ. S. Native of Jamaica and Guadaloupe, among bushes. Petésia, no. 2. P. Browne, jam. p. 143, t. 2, f. 2. Tube of calyx turbinate, clothed with adpressed down; limb 5-parted, smoothish; lobes acute, about equal in length to the tube of the corolla. Flowers small, dusky yellow. Capsules about the size of hemp-seed. Leaves 3-4 inches long, on petioles about an inch long.

2 R. *racemósa* (Swartz, fl. ind. occ. p. 360.) leaves lanceolate-ovate, acuminate, petiolate, glabrous on both surfaces; stipulas almost deltoid, with somewhat ciliate margins; racemes axillary, trichotomous, spreading. Ἡ. S. Native of Jamaica, in woods on the mountains. Petésia, P. Browne, jam. p. 143, t. 2, f. 3. Leaves opposite and 3 in a whorl. Tube of corolla short, clothed with silky hairy down on the outside, a little longer than the calycine teeth, which are very short. Very nearly allied to R. laurifólia, but the petioles are longer, the racemes shorter, the calycine teeth shorter, and probably the stigma is undivided, as mentioned by Swartz. Branches covered with hoary bark: branchlets tetragonal. Corolla hoary.

* * Tube of corolla cylindrical, 2-3 or 4 times longer than the calycine lobes.

3 R. *thrysóidea* (Swartz, prod. p. 41. fl. ind. occ. 1. p. 358.) leaves oblong, acute, petiolate, membranous, glabrous on the upper surface as well as the branches, but downy beneath; stipulas broad ovate, acute, glabrous, stiff; thyrses axillary, shorter than the leaves. Ἡ. S. Native of Jamaica, on the driest hills in the western parts of the island. Branches bluntly tetragonal. Leaves 3 inches long. Calyx minute, 5-toothed. Flowers small, dull whitish yellow or rust-coloured, with an elongated tube, which swells below the limb, and clothed with silky pubescence on the outside. Capsules roundish, size of coriander seeds. Seeds 2 in each cell at maturity.

4 R. *umbelluláta* (Swartz, prod. p. 41. fl. ind. occ. 1. p. 367.) leaves lanceolate-ovate, acute, rather hairy, petiolate; stipulas hairy, ending each in a bristly acumen; peduncles axillary, trichotomous at the apex, somewhat umbelliferous, shorter than the leaves. Ἡ. S. Native of Jamaica, on rocks near streams. Petésia, no. 3. P. Browne, jam. p. 144, & there-fore Petésia villósa, Smith, in Rees’s cyclo. no. 4. Calyx very villous, with linear teeth. Corolla larger than in the rest of the species, downy, of a dusky yellow colour; tube elongated. Capsule roundish; having 2 seeds in each cell at maturity.

* Umbellate-flowered Rondeletia. Shrub 2 feet.

5 R. *tomentósá* (Swartz, prod. p. 41. fl. ind. occ. 1. p. 365.) leaves ovate, acuminated, petiolate, membranous, hairy above, but clothed with hoary villous tomentum beneath; peduncles axillary, tripartite, short. Ἡ. S. Native of Jamaica, near Spanish Town, on rocky hills. Petésia stipuláris, Lin. spec. p. 160. Ἡ ex Swartz. Stipulas ovate, downy, with a short point. Branchlets villous at the ends. Flowers small, whitish, or dusky yellow, villous outside. Capsules roundish, size of coriander seeds, containing 1 seed in each cell at maturity.

Var. ß, *Dominígésis* (D. C. prod. p. 407.) leaves oval-oblong, cuneated at the base, downy or villous above, but clothed with soft hoary tomentum beneath. Ἡ. S. Native of St. Domingo, where it was collected by Bertero. R. tomentósa, ex Hispaniola, Spreng. syst. 1. p. 708. This plant is probably referrible to *Petésia tomentósa*.

* Hoary* Rondeletia. Shrub 2 to 3 feet.

Var. p, *atlántica* (C. C. prod. p. 408.) leaves ovate-oblong, acute, pilose; capsules many-seeded. Ἡ. S. Native of Jamaica. Rondeletia hírta, Ait. hort. kew. 1. p. 227. This differs from the plant of Swartz, in the leaves being shorter, broader, and less acuminated, and in the fruit being dehiscent, and containing a great number of small seeds.

8 R. *panaménésia* (D. C. prod. p. 408.) leaves oval-oblong, acuminated at both ends, glabrous above, white beneath, and villous on the nerves and veins; stipulas triangular, acute, villous outside; peduncles axillary, opposite, shorter than the leaves, trifid and densely corymbose at the apex; ultimate ones collected into a short thyrsè; calyx villous, with lanceolate segments. Ἡ. S. Native of Panama. R. hírta, Bartl. in herb. Hanke. Tube of corolla villous; limb of 5 roundish lobes. Capsules almost globose. Seeds numerous, and of 2 forms, appendiculate.

Panama Rondeletia. Shrub 4 to 5 feet.

9 R. *hirsúta* (Swartz, prod. p. 41. fl. ind. occ. 1. p. 371.) leaves oblong, acuminated, hairy on both surfaces, pale beneath, on short petioles; stipulas ovate-lanceolate, hairy; branchlets, peduncles, and flowers hairy; peduncles axillary, trichotomous, loose, about the length of the leaves. Ἡ. S. Native of the south of Jamaica, among bushes on the mountains near Bath.
Petioles clothed with rufescent villi. Calyx villos. Corolla yellowish, tomentose outside, with a narrow throat. Seeds girded by a wing, according to A. Rich: if this be the case it is referrible to the genus Bowdaria.

Rubiaceæ. LXIV. Rondeletia.

10 R. trifoliata (Jacq. amer. p. 60. t. 43. pict. t. 62.) leaves oblong-lanceolate, 3 in a whorl, on short petioles, glabrous above but tomentose beneath; pedicels and branches hairy; pedicels axillary, shorter than the leaves. ½ S. Native of Jamaica, at the foot of the mountains. Flowers reddish, small. Leaves 3 inches long. Teeth of calyx acuminate. Corolla with a very long tube. Capsule many-seeded.

Trifoliate Rondeletia. Tree 12 to 14 feet.
11 R. levigata (Alt. hort. Kew. ed. 2. vol. 1. p. 366.) leaves oblong or elliptic, acuminate at both ends, glabrous, paler beneath, petiole, stipulas deltoid, glabrous on the outside, but bearded inside; pedicels axillary, trichotomous, rather panicked, 3 times longer than the petiole, but one half shorter than the leaves. ½ S. Native of Cuba, about the Havana; and of Trinidad. Anonyma, Sicib. fl. trin. no. 574. Tube of calyx downy; limb of 3-5 linear lobes, which 3-5 times shorter than the tube of the corolla. Capsule downy, smaller than a pea.

12 R. americana (Lin. spec. 243.) leaves lanceolate or elliptic, acuminate at both ends, glabrous, hardly petiolate, paler beneath; stipulas deltoid, downy; pedicels opposite, axillary, a little longer than the leaves, dichotomously cymose at the apex. ½ S. Native of Cuba, about the Havana; and many other West India islands, ex Plum. ed. Burm. t. 242. f. 1. Flowers white, hibracteolate, with a little scent. Tube of calyx clothed with adpressed villi; lobes of limb oblong-linear, 4 times shorter than the tube of the corolla. Capsule many-seeded.

13 R. cumanaeensis (H. B. et Kunth, nov. gen. amer. 3. p. 394.) leaves oblong, acuminate, almost sessile, glabrous, paler beneath; stipulas rather deltoid, with dilated silky margins; petals terminal, sessile. ½ S. Native of New Andalusia, near Cumana. Panicle sessile, and the peduncles opposite, dichotomously cymose, and 1-flowered, ex Kunth. Lobes of calyx ovate-oblong. Flowers white.

Cumana Rondeletia. Shrub 8 to 10 feet.
14 R. microdon (D. C. prod. 4. p. 408.) glabrous; leaves oval or oblong, acute at both ends, on very short petioles; stipulas bipartite, obtuse, permanent; corollas pedunculate, rising from the forks of the branches; calyx truncate, with 5 very short teeth. ½ S. Native of Cuba, about the Havana, where it was collected by De la Ossa. Flowers white in the dried state, form of those of the other pentameric species of Rondeletia, but the calyx is hardly 5-toothed.

Small-toothed-calyx Rondeletia. Shrub.
15 R. ozonisata (Jacq. amer. p. 59. t. 42. pict. t. 61.) leaves hardly petiolate, ovate, or subcordate, acutish, subcaurorous, abovely and beneath rather scabrous on the nerves; corollas terminal. ½ S. Native of Cuba, on rocks by the sea-side, at the Havana; and of Mexico. Lin. spec. 1671. H. B. et Kunth, nov. gen. amer. 3. p. 394. R. coccinca, Moc. et Sesse, fl. mex. icon. ined. R. obovata, Lin. syst. veg. Branchlets villos. Stipulas wide, acute. Peduncles triechotomous. Flowers handsome scarlet, with the projecting rim of the tube orangecoloured, having the scent of violets, downy on the outside, either pentameric or hexameric. Lobes of calyx linear, erect, one half shorter than the tube of the corolla. Capsule containing many angular seeds.

Sweet-scented Rondeletia. Shrub 5 to 6 feet.

* * * African species, with pentameric flowers.

16 R. ferrugina (Ait.) leaves oval coriaceous, deep green, glabrous, petiole; corollas terminal. ½ S. Native of Sierra Leone, in the low lands about Freetown. A branched spreading shrub, with the habit of Lauristina. Flowers pale red. Stamens 5, a little longer than the tube of the corolla. Calyx 5-cleft.

Febrifugal Rondeletia. Shrub 4 to 5 feet.
17 R. floribunda; leaves ovate, acuminate, membranous, petiole; corollas lateral and terminal, numerous; stamens 5, exerted. ½ S. Native of Sierra Leone, in woods on the mountains. Corolla tubular, 5-cleft, white. Calyx 5-cleft.

Bunodel-flowered Rondeletia. Shrub 5 to 6 feet.
18 R. loniceroides; shrub twining; leaves roundish, ovate, coriaceous, glabrous, petiole; corollas panicked; corolla with a long tube and a 5-cleft border; stamens 5, longer than the tube. ½ S. Native of Sierra Leone, among bushes in the low lands. A branched twining shrub.

Honey-suckle-like Rondeletia. Shrub tw.

* Unarmed. Panièles terminal.

Twiggy Rondeletia. Shrub 5 to 6 feet.
20 R. discolor (H. B. et Kunth, nov. gen. amer. 3. p. 396. t. 291.) leaves ovate-oblong, acuminate, petiolate, with revolute edges, glabrous above and on the branches, but clothed with white tomentum beneath; stipulas linear-subulate; panièles terminal, sessile. ½ S. Native of New Granada, between Maraquito and Honda. Hedyotis discolor, Spreng. syst. 1. p. 411. Flowers pedicellate, sweet-scented, red on the outside. Lobes of calyx ovate-lanceolate. Capsule dehiscing at the dissepiment; valves bifid at the apex.

Discoloured-leaved Rondeletia. Shrub 4 to 6 feet.
21 R. pubescens (H. B. et Kunth, nov. gen. amer. 3. p. 396. t. 291.) leaves oblong, acute, petiolate, clothed with fine down above, and with canescent pubescence beneath, as well as on the branches; stipulas lanceolate-subulate; panièles terminal, sessile, triplicate. ½ S. Native of New Granada, between Maraquito and Honda. Lobes of calyx lanceolate, 5-times shorter than the tube of the corolla. Corolla tomentose, outside. Fruit unknown.

Downy Rondeletia. Shrub 4 to 6 feet.
22 R. elongata (Bartl. in herb. Henke, ex D. C. prod. 4. p. 409.) leaves elliptic-oblong, acuminate at both ends, pubescent above, but clothed with white tomentum beneath, but they at length become glabrous from the down being deciduous; stipulas lanceolate, equal in length to the petals; panièles terminal, on long pedicels; flowers crowded; lobes of calyx linear, 3 times shorter than the tube of the corolla. ½ S. Native of Mexico, about Acapulco. An intermediate species, between R. pubescens and R. leucophyllum.

Elongate Rondeletia. Shrub.
23 R. leucophyllum (H. B. et Kunth, nov. gen. amer. 3.
p. 395. t. 290.) leaves linear-lanceolate, acuminate, almost sessile; pubescent above; white from woollyomentum beneath as well as the branches; panicles terminal, on long peduncles, usually formed into a kind of capitulum. 1. S. Na-

tive of Mexico, between Alto del Peregrino, and the river Papagallo. 

Hedyotis leucophylla, Spreng. syst. 1. p. 411. Flowers red, sessile, or on short pedicles. Lobes of calyx linear-lanceolate, 3 times shorter than the tube of the corolla. 

**White-leaved Rondeletia.** Shrub 3 to 4 feet.

24. R. Berteriana (D. C. prod. 4. p. 409.) leaves oval, acute, somewhat cuneate at the base, petiolate, clothed with villous pubescence above, but hoary from soft villousomentum beneath; branches clothed with velvety tomentum; stipulas lanceolate, acuminate, villous; racemes axillary, shorter than the leaves, many-flowered. 2. S. Native of St. Domingo, where it was collected by Bertero. R. hirsuta, Spreng, in herb. Balb. but not of Swartz. Calyx villous; lobes linear, 3 times shorter than the tube of the corolla, which is clothed with adpressed villi on the outside. 

**Pilose Rondeletia.** Shrub 4 to 6 feet.

25. R. pilosa (Swartz, prod. p. 41. fl. ind. occ. 1. p. 356.) leaves ovate-lanceolate, or oblance, almost sessile, veiny, roughish above, pale and villous beneath; stipulas deltoid, broad, villous; peduncles axillary, 3-flowered; almost the length of the leaves, and are as well as the calyxes pilose. 3. S. Native of the West India islands, as in Santa Cruz, Montserrat, and Martinico. 

Leaves 2-3 inches long. Lobes of calyx length of the tube of the corolla. Capsule many-seeded. Tube of corolla silky outside.

**Unarmed. Pedicels axillary, 1-flowered.**

26. R. buxifolia (Vahl. eel. amer. 2. p. 11. t. 12.) leaves obovate-oblong, on very short petioles, mucronate at the apex, glibrous on both surfaces, and shining above; stipulas small, deltoid; pedicels axillary, very short, 1-flowered. 4. S. Native of the islands of Montserrat and Porto-Rico. 

**Box-leaved Rondeletia.** Shrub 3 to 3 feet?

27. R. Royenii (D. C. prod. 4. p. 410.) leaves obovate-oblong, obtuse, on very short petioles, somewhat mucronate, hoary on both surfaces from short down; stipulas lanceolate, acute; pedicels axillary, very short, 1-flowered. 5. S. Native of St. Domingo, where it was collected by Bertero. R. incana, ex Hispaniola, Spreng. syst. 1. p. 707. ex herb. Balb. Allied to R. buxifolia, but quite distinct from R. incana.

Royena-leaved Rondeletia. Shrub.

**Shrubs with axillary thorns. Perhaps the spines are either rameal or peduncular. Fruit unknown, and therefore the genus to which they properly belong.**

28. R. Leptaca'ntha (D. C. prod. 4. p. 410.) spines opposiute; leaves broad-oval, acutish, glibrous on both surfaces, but rather pilose when young as well as the branches; peduncles slender, equal in length to the leaves, or longer than them, bearing 3-5 flowers at the apex. 6. S. Native of Cuba, about the Havana, where it was collected by De la Osa. Branches slender, glabrous. Spines axillary, long, bearing rudiments of leaves on one side. Peduncles an inch long. Segments of the calyx subulate. Corolla 5 lines long.

**Pilose Rondeletia.** Shrub.

29. R. brachiaca'ntha (D. C. L. c.) spines opposite; leaves elliptic-oblong, acute at the base, and acuminate at the apex, glabrous above, but villous beneath, as well as the branchlets, peduncles, and flowers; peduncles one half shorter than the leaves, 3-4-flowered at the apex. 7. S. Native of Brazil. 

Branches dotted by linear-oblong crowded warts. Spines conical, stiff, forming a straight angle, spreading, 4-5 lines long. Segments of the calyx subulate. Antlers inserted at the throat.

**Short-flowered Rondeletia.** Shrub.

† Species not sufficiently known.

**Two-seeded Rondeletia.** Tree 15 feet.

33. R. ? coriacea (Spreng. syst. 1. p. 707. but not of Wall.) leaves oval-oblong, coriaceous, shining above, but clothed with very short velvety down beneath as well as on the branchlets; stipulas semi-orbicular, furnished with a pungent tooth in the middle; cymes terminal; calyxes and corollas 5-parted, rather hispid; stamens exerted. 9. S. Native of equinoval Brazil. Mosa'nda coriaceae, Spreng. nev. entd. 2. p. 113. It is probable that the plant is neither a Mosa'nda nor a Rondeletia, according to Cham. et Schlecht. in Linneua. vol. 4. p. 165., but the structure of the fruit is entirely unknown. 

**Coriaceous-leaved Rondeletia.** Shrub.

Cult. The species thrive well in a mixture of sand, loam, and peat; and cuttings of them are easily rooted if planted in a pot of sand, plunged in heat under a hand-glass. All are shrubs of very little beauty or interest.

LXV. WENDLANDIA (Henry Ludov. Wendland, Curator of the botanical garden at Hanover, and author of Commentario de Accasis Aphyllis). Bartl, ined. ex D. C. prod. 4. p. 411.
RUBIACEÆ.  LXV. WENDLANDIA.

not of Willd.  Rondelletia, Roxb. and Wall. fl. ind. 2. p. 133. but not of Plummer.

LIN. SYST.  *Tetra-Pentandra*, *Monogynia*. Calyx with an almost globose tube, which is often striated, and a very short permanent limb, which is 4-5-toothed to the base. Corolla with a terete tube, which is longer than the calyx, and a spreading 4-5-lobed limb; lobes ovate, acutish. Stamens 4-5; filaments rising from the top of the tube; anthers oblong, exserted. Style exerted; stigma bifid, with the lobes thickish. Capsule ovate-globose, 2-celled, crowned by the calyx, dehiscing at the cells into 2 valves at the apex. Seeds small, numerous in each cell.—Trees and shrubs, all natives of the East Indies. Leaves opposite, coriaceous, oval, petiolate. Stipulas broad at the base, acuminate. Panicles axillary and terminal, many-flowered. Flowers small.—This genus differs from *Rondelletia* as *Exostémena* does from *Cinchona*.

* Indian species.

2 W. tinctória (D. C. l. c.) arboreous; leaves petiolate, oblong-lanceolate, smooth above, but pubescent on the nerves beneath, as well as on the branches, petioles, peduncles, and calyxes; stipulas triangular, cuspidate; panicles terminal, decussate; flowers by threes.  *Rondeletia tinctória*, Roxb. fl. ind. 2. p. 134. Leaves 4-6 inches long and 1-2 broad, Branches of panicule 4-sided, hairy. Bracteas numerous, hairy, those of the ultimate divisions of the panicule eniform, with a hastate base. Flowers numerous, small, white, almost sessile, fascicled. Segments of corolla spreading. The bark is employed as a dye by the natives in some of their dyes, and is called by them Teela-ladh.

Dyers' Wendlandia.  Tree.

3 W. notoniána (Wall. cat. no. 2673.) shrub downy in every part, except the corollas; leaves elliptic or obovate-oblong, acuminate, pale beneath; peduncles axillary and terminal, disposed in terminal racemose thyrsoid panicles; corolla with a slender tube, much longer than the calyx, which is woolly; stipulas broad, rounded at the apex.  *Rondeletia notoniána*, Roxb. Cat. no. 3. Flowers white, in clusters? Leaves numerous.

Note:*s Wendlandia.  Shrub or tree.

4 W. glibra*ta* (D. C. l. c.) arboreous; leaves petiolate, oblong-lanceolate, glabrous on both surfaces, as well as the petioles, branches, peduncles, and calyxes; stipulas triangular, cuspidate; panicles terminal, decussate; flowers by threes.  *Rondeletia glibra*ta, Roxb. Cat. no. 139. Native of Java, on the mountains in woods.  *Calyx* reniform, Blum. bijdr. p. 974. but differs from the plant under the same name by Roxburgh, in its smoothness, and by the flowers being distinctly pedicellate.

Glabrous Wendlandia.  Tree.

5 W. nítens (Wall. cat. no. 6271.) branches downy; leaves glabrous, elliptic-lanceolate, tapering to both ends, pale beneath; stipulas broad at the base, and cuspidate at the apex; panicles terminal, downy; flowers almost sessile, in fascicules.  *Rondeletia* Native of Martaban, on the banks of the Attram. Flowers very small.

Shining Wendlandia.  Shrub or tree.

Exserted-stamen Wendlandia.  Tree 20 to 30 feet.

7 W. próxia (D. C. l. c.) arboreous; leaves elliptic, acuminate, clothed with tomentum beneath, as well as on the branchlets; panicles very hairy; flowers very much crowded; limb of corolla one half shorter than the tube; calycine teeth obtuse, pilose.  *Rondeletia próxia*, D. Don, prod. fl. nep. p. 150. Nearly allied to *W. exsé*ka, but in that species the leaves are silky beneath, and the branchlets are more conicent; the limb of the corolla is about equal in length to the tube; the stigma is bipartite, and the calycine teeth are ovate and acute.

Allied Wendlandia.  Tree.

8 W. ilustrína (Wall. cat. no. 6272.) shrub glabrous in every part; leaves elliptic, tapering to both ends, shining above; stipulas broad at the base, and cuspidate at the apex; teeth of calyx subulate, much shorter than the tube, which is terete and slender; bracteas to the flowers linear.  *Rondeletia ilustrína*, Roxb. Cat. no. 3. Native of the Burmese empire, on Mount Taong-Dong. Flowers pedicellate, white, disposed in terminal racemose panicles; pedicels solitary. Capsules hardly the size of coriander seeds.

Privet-like Wendlandia.  Tree.

10 W. cine*rea* (D. C. prod. 4. p. 412.) arboreous; the upper parts clothed with ash-coloured dense tomentum; leaves lanceolate, petiolate, villous above and tomentose beneath; stipulas recurved at the apex; panicles terminal, much branched, tomentose; flowers in dense fascicles; corolla with a very short tube.  *Rondeletia cine*reus, Roxb. Cat. no. 3. and from Noakote and Shreenagar; and is called in the Newar language *Gothina*.  *Rondeletia cinerea*, Wall. in Roxb. fl. ind. 2. p. 141. Branches quadrangular, with rounded corners. Leaves 4-6 inches long, smooth above, glabrous beneath. Stipulas reniform, emarginate. Bracteas oblong, caducous, sometimes lobed or sub-hastate at the base. the lowermost ones very long, linear. Flowers numerous, small, white. Teests of calyx small, triangular. Segments of corolla spreading; throat furnished with 5 tubercles. Capsule globular, villous. The wood is brownish, close-grained, and seems well adapted for furniture.

Grey Wendlandia.  Tree 12 to 14 feet.

11 W. luzeoni*sis* (D. C. l. c.) branches, petioles, and
nerves of leaves hairy; leaves oval-oblong, acuminate at both ends; stipular semi-elliptic, obtuse, permanent, coriaceous; panicle much branched, many-flowered, rather villous; anthers hardly exerted; stigma bifid. S. Native of the island of Luzon. Wendlandia multiflora, Bartl. in Herb. Hance. Allied to R. puberula. Fruit hardly larger than turnip seed. Flowers small, white. 

**Wendlandia. Tree.**

12 W. coriacea (D. C. I. c.) arborescent, smooth in every part; leaves oblong-lanceolate, acuminate, tapering at the base, petiolate, coriaceous, shining; stipulas broad, short, rounded, ending each in a cuspidate point; panicles dense, terminal, many-flowered; flowers opposite, very numerous. S. Native of Nipaul, in the valley, common in the forest of Thoka, and other places; and from Noakote. The tree is called Kongeera in the Parbatteeyan language, and Jalsi in that of Newar. Rondelia coriacea, Wall. in Roxb. fl. ind. 2, p. 142. D. Don, fl. nep. p. 138. Leaves 5-7 inches long. Flowers white, fragrant. Bracteas lanceolate, coriaceous, those of the flowers capillary. Corolla with a cylindrical tube, and a spreading border. The inhabitants of Nipaul use the wood of this tree for various purposes, such as rafters, tools, &c.; it is close grained, and becomes of a brownish colour soon after being cut, not unlike mahogany. A red dye is likewise prepared from it. The leaves and flowers attain a bluish colour on being dried.

**Coriaceous-leaved Wendlandia. Tree.**

13 W. puberula (D. C. I. c.) branches, petioles, nerves of leaves underneat, and panicles hairy; leaves petiolate, oval-oblong, acute at both ends, glabrous above; stipulas adpressed, broad at the base, cuspidate at the apex; panicle terminal, branched, many-flowered; corollas glabrous; stigma clavate. S. Native of Nipaul. Allied to W. pendula, but differs in the stipules being 4 times shorter, in the corolla being glabrous, &c.

**Puberula Wendlandia. Tree.**

14 W. pendula (D. C. I. c.) fruticeae; branches pendulous; leaves lanceolate-ovate, acuminated, smooth above and rough underneath; stipulas lanceolate, adpressed, deciduous, rather shorter than the petioles; corymb terminal, oblong, panicked; tube of corolla filiform, smooth without and pubescent within; segments of corolla recurved. S. Native of Nipaul, between Hetaura and Rheumphdi, also on Shepole, Rondelia pendula, Wall. in Roxb. fl. ind. 2, p. 140. A very elegant shrub. Branches obscurely quadrangular; new shoots downy. Leaves 3-5 inches long, and disposed 3 in a whorl on the robust shoots. Peduncles villous. Flowers fascicled, green, fragrant. Stigma clavate.

**Pendulous-branched Wendlandia. Shrub.**

5 to 6 feet.

15 W. malaya; branches somewhat tetragonal; leaves elliptic-lanceolate, acuminated, downy on the nerves, tapering to the base, membranous; stipulas broad; calyx with a roundish tube and a 5-cleft rib; corolla with a very slender tube, and a spreading border; panicles terminal, coriaceous, hardly longer than the petioles. S. Native of the Malay islands. Anderosacme Malayana, Wall. cat. no. 6282.

**Malay Wendlandia. Shrub or tree.**

16 W. longifolia (D. C. I. c.) fruticoae; epidermis falling from the branches; leaves elliptic-oblong, acuminated, tapering at the base, villous underneath; stipulas lanceolate, erect, acute, often bidentate, furnished within their broad base with a series of subulate glands; panicle many times trichotomous, downy; calyx downy, with a yellow gland on each margin of the segments, and sometimes at the points; bracteas villous, glandular. S. Native of Hille; and of Nipaul, on Chun dagiri, Nagurjoun, and at the foot of Shepole near Thoka. The Bengalie name of the plant is Soopari. Rondelia longifolia Wall. in Roxb. fl. ind. 2, p. 137. D. Don, prod. fl. nep. p. 138. Anderosacme longifolia, Wall. cat. no. 6280. Leaves 6-14 inches long, dark green above. Bracteas with an entire or 3-lobed base, their margins marked with yellow subulate fleshy glands. Flowers large, fleshy, yellow, scentless, with a valvate stivation. Segments of corolla spreading. Stamens inserted in the bottom of the tube. Capsules round, smooth. All the species of this genus vary considerably in the size of the leaves, the degree of their pubescence, and in their inflorescence, which renders their specific discrimination difficult.

**Long-leaved Wendlandia. Shrub.**

**Afican species, not sufficiently known.**

17 W. sulcata; leaves oblong-lanceolate, acuminated, glabrous, on short petioles; stipulas sheathed-formed, supra-foliaceous; racemes panicled, terminal; capsule round, sulcate. S. Native of Sierra Leone, in woods on the margins of rivers. Shrub branched.

**Furrowed-flowered Wendlandia. Shrub.**

5 to 6 feet.

18 W. pilea; leaves broad, ovate-lanceolate, acuminated, cordate at the base, almost sessile; stipulas large, sheath-formed, supra-foliaceous, and are as well as the leaves plose; racemes panicled, terminal; capsules round. S. Native of Sierra Leone, in woods on the banks of rivulets.

**Hairly Wendlandia. Shrub.**

5 to 6 feet.

19 W. racemo-sa; glabrous in every part; leaves elliptic, very long, acuminated, coriaceous, on short petioles; stipulas large, sheath-formed, supra-foliaceous; racemes panicled, terminal; capsules ovate. S. Native of Sierra Leone, in woods on the banks of rivulets.

**Racemose-flowered Wendlandia. Shrub.**

20 W. virgata; leaves oval, acuminated, petiolated; panicles axillary and terminal. S. Native of Sierra Leone, on the edges of woods. A branched twiggy shrub. Stamens 5, longer than the corolla. Capsule 1-celled, many-seeded. Corolla funnel-shaped.

**Twigg Wendlandia. Shrub.**

21 W. spicata (D. C. prod. 4, p. 412.) leaves elliptic, tapering downwards, villous, as also the panicle; stipulas oblong, acute, smooth, except the elevated rib, which is villous; panicle large, terminal, almost sessile, with opposite compressed peduncles; the secondary divisions of the penduncle dichotomous, terminating in cylindrical slender, twin, or ternate spikes, which are 2 inches long; flowers disposed in one row along one side of the rachis of the spike; corolla pubescent, with a slender tube, widening at the apex; stigma of 2 recurved lobes. S. Native of Pulo-Penang. Rondelia spicata, Wall. in Roxb. fl. ind. 2, p. 139. Leaves 6-12 inches long. Bracteas lanceolate, sub-hastate, acute. Flowers small. Capsule small, round, villous. Seeds angular. Inflorescence like that of Tournerforla. Perhaps a proper genus.

**Spicate-flowered Wendlandia. Shrub or tree.**

**Tetrandrous-flowered Wendlandia. Shrub.**
23 W. corymbosa (D. C. prod. 4. p. 413.) leaves obovate-lanceolate; peduncles for the most part terminal, dichotomously corymbose; flowers unilateral, tetrandrous. ♀. S. Native of Pulo-Penang. Rondelitia corymbosa, Jack, in mal. misc. 1. no. 1. p. 4. Corolla white, tinged with red. Perhaps a separate genus.

Corymbose-flowered Wendlandia. Tree.

24 W. Wightiana (Wall. cat. no. 6277.) young branches downy; leaves obovate-oblong, rather acuminate at the apex, tapering much to the base, glabrous; panicle trichotomous; flowers small, with pedicels, filaments native, segments lobes X. valves S. flowers bearded flowers capsules ovate to brachiate corymbosa. Genus. Mément, of the Indies. Wendlandia. Shrubby Raceme, herb. Wight. Leaves 1 to 1 ½ foot long. Stipulas broad, membranous. Very like W. corymbosa.

Wight's Wendlandia. Shrub or tree.

25 W. ? Lawsonii (D. C. l. c.) sub-arborescent; branchlets quadrangular; leaves lanceolate, acuminate, glabrous; corymb terminal, trichotomous; fruit oblong. ♀. S. Native of Madag. Poultatejle, Rheed. mal. 4. t. 57. Petesia species, ex Juss. Ligustrium species, ex Comm. Lawsonia purpurea, Lam. dict. 5. p. 107. Barroti, anc. encylcl, where the fruit is said to be baccate, but in the figure the fruit is drawn capular and many-seeded, it is therefore more likely to be a species of Wendlandia than Petesia. Lawson's Wendlandia. Tree.

* A species hardly known.

26 W. ? scandens; shrubby, scandent, smooth; leaves opposite, petiolate, oblong, entire; panicles axillar, small, brachiate; capsules globular; seeds small, numerous. ♀. S. Native of the Mauritius. Rondelitia scandens, Roxb. fl. ind. 2. p. 137.

Climbing Wendlandia. Shrub cl.

 Cult. See Rondelitia, p. 517, for culture and propagation.

LVXI. XANTHOPHYTUM (from ἕλαιος, xanthos, yellow, and φύτων, phyton, a plant; so called from the first species being clothed with rufous villi.) Blum. bipdr. p. 989. A. Rich. mem. soc. hist. nat. par. 5. p. 275. D. C. prod. 4. p. 413.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an ovate tube and a 4-5-cleft limb. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft limb. Stamens 4-5, exserted; filaments inserted in the throat, connivent. Style sub-clavate, perforating the disk of the ovarium; stigma thick, 2-lobeid, in the throat. Drupe diodymous, crowned by the calyx, divisible into 2 many-seeded parts or cells. Placenta prominent, fixed to the middle discinnipment on both sides. Seeds minute, angular, wingless.—This genus is nearly allied to Wendlandia, but differs in the fruit not being dehiscent.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an ovate tube and a 4-5-cleft limb. Corolla funnel-shaped, with a short tube, a villous throat, and a 4-5-cleft limb. Stamens 4-5, exserted; filaments inserted in the throat, connivent. Style sub-clavate, perforating the disk of the ovarium; stigma thick, 2-lobeid, in the throat. Drupe diodymous, crowned by the calyx, divisible into 2 many-seeded parts or cells. Placenta prominent, fixed to the middle discinnipment on both sides. Seeds minute, angular, wingless.—This genus is nearly allied to Wendlandia, but differs in the fruit not being dehiscent.

Sphyric-flowered Xanthophyllum. Shrub.

2 X. spicatum (Blum. in latt. ex D. C. prod. 4. p. 413.) suffrutescent, glabrous, erect; leaves oblong, acuminate at both ends; spikes axillary and terminal, nutant; flowers in heads. ♀. S. Native of Java, especially on calcareous mountains. Chiococca spicata, Blum. bipdr. p. 988. Berries small, indehiscent, dry, didymous, striated. Seeds small, not winged. Stipulas twin on both sides, subulate at the apex, combined into a short sheath at the base. Spikes slender, elongated.
3 S. glomerata (H. B. et K. nov., gen. anec. 3. p. 398.) stems unknown; leaves oblong-lanceolate, clothed with silky tomentum on both surfaces, with undulated margins; flowers glomerate, terminal, and axillary. ½. S. Native on the banks of the Orinoco, between Atures and Carichana, in inundated places. Viireta glomerata, Spreng. syst. 1. p. 702. Psychodora sessiliflora, Willd. herb. ex Cham. et Schlecht. L. c. Corolla yellow, with a silky tube, which is 4 times longer than the calyx.

Glomerate-flowered Sipanea. Pl. creeping?

4 S. biflora (Lin. fil. suppl. p. 154.) stem creeping; leaves ovate, obtuse; peduncles terminal, rising from the forks of the branches, 2-flowered. ½. S. Native of Surinam and Brazil, in humid places. Cham. et Schlecht. in Linneâs. 4. p. 168. Rondédéa biflora, Rottb. pl. sur. 7. t. 2. f. 2. A. Rich. mem. soc. hist. nat. par. 5. p. 271. Viireta virens, Vahl. symb. 2. p. 28. Gertrn. fil. carp. t. 184. There is a tooth between each of the calyce line tubes, according to Lin. fil., but according to Gertrn. there are none; but in the specimens examined there are 3 subulate teeth, and 5 minute ones between these.

Two-flowered Sipanea. Pl. creeping.

Cult. The species of this genus possess no beauty, and are therefore only worth cultivating in botanical gardens. The seeds should be sown in spring, on a hot-bed, and the plants, when of sufficient size, should be planted into separate pots, and shifted from size to size of pots as they grow.

LXIX. VIRECTA (from viréctum, a green place; from the agreeable greenness of the leaves). D. C. prod. 4. p. 414.—Viireta species, Smith, but not of Lin. fil.—Sipanea species, A. Rich.—Phytemulodes, Smeathm., in herb. L'Herr.

Lin. syst. Pentándria, Monogynia. Calyx with an ovate short tube, and 5 linear-sectaceous lobes. Corolla funnel-shaped, with an obconical tube, about equal in length to the lobes of the calyx, a naked throat, and 5 linear-oblong ciliated lobes. Stamina 5: having the filaments much exserted beyond the throat; anthers linear, oscillatory, bifid at the base. Style filiform, equal in length to the stamens. Stigma hardly thickened, undivided. Capsule globose, crowned by the calyce line lobes in the young state, but almost naked in the adult state, 2-celled, and at length decieving at the cells. Seeds innumerable, 4-5-sided, and a little carinated.—Hairy herbs, with opposite branches. Leaves opposite, oval-oblong. Stipulas twin on each side, lanceolate. Flowers white or yellow, disposed in dense cymose corymbs; branchlets of cyme elongated after flowering.

This genus is nearly allied to Sipâneac, but differs in the genitals being exserted; it differs also from Hedysélinus in the quinary number of the floral parts, and in the exserted stamens, &c.

1 V. multiflora (Smith, in Rees's cyc. no. 4.) stem erect; leaves ovate-lanceolate, almost sessile.—Native of Sierra Leone, where it was collected by Smeatmth. Phyteumulodes hirsuta, Smeathm. in herb. L'Herr. Perhaps Sipanea angustifolia, A. Rich. mem. soc. hist. nat. par. 5. p. 276. is the same as the present plant. Flowers white.

Many-flowered Viireta. Pl. 2 to 3 feet.

2 V. procumbens (Smith, l. c. no. 2.) stem procumbent; leaves ovate, 3 times longer than the petioles. ½. S. Native of Sierra Leone.

Procumbent Viireta. Pl. procumbent.

3 V. lutea; leaves ovate-lanceolate, acuminated, hairy; pedicles aggregate; axillary; calyx 5-toothed; corolla tubular, 5-cleft, hairy. ½. S. Native of Sierra Leone, in cultivated places. Flowers yellow. Habit of Lithopsérmum. Perhaps the same as V. procumbens.

Yellow-flowered Viireta. Pl. rambling.

5 V. paniculata; suffruticose, branched, clothed with brown or copper-coloured hairs; leaves oval-lanceolate; corollas panicked, axillary, and terminal. ½. S. Native of Sierra Leone, on the mountains. Flowers small, greenish.

Panicolâ-flowered Viireta. Shrub.

Cult. For culture and propagation see Sipanea above.

Lin. syst. Pentándria, Monogynia. Calyx with a short tubinate tube, which is adrate to the ovary at the base, and a 5-cleft permanent limb. Corolla tubularly funnel-shaped, 5-times longer than the limb of the calyx, hairy inside; with 5 ovate segments. Stamina 5, inclosed. Style filiform, girded by an urceolus at the base; stigma 2-lobed, shorter than the corolla. Capsule broad, compressed, 2-lobed, almost mitre-formed, crowned by the calyce line teeth, internally divided into 2 cells by a transverse partition, opening between the remains of the 2 fleshy nectarlips, or by a transverse chink round the apex. Seeds numerous, small, hexagonal. Embryo straight, slender, in fleshy or rather horny albumen.—Dwarf perennial herbs, natives of the East Indies. Leaves opposite, petiolate, membranous, those opposite each other often unequal in size. Stipulas twin on each side, small. Peduncles axillary and terminal, solitary, cymose at the apex, with sub-umbellate branches. Flowers disposed along the branches of the peduncles in a single unilateral row.

1 O. Mû′noos (Lin. amem. 2. p. 117. spec. 213. mat. med. 27. with a bad figure, but not of Bum.) suffruticose; leaves elliptic-lanceolate, acuminiated at both ends, glabrous, papyry; stipulas small, truncate; cymes pedunculate, terminal, branched; tube of corolla short, funnel-shaped. ½. S. Native of Java, Ceylon, Sumatra, Palo Penang, &c. Blum. bijdr. p. 976. Roxb. fl. ind. 2. p. 544. Gertrn. fr. 1. t. 55.? A. Rich. l. c. t. 2. Radix. Mungo. Kommp. amem. 573. and 577. Stipulas a slight connecting membrane. Nectary a 2-terminated body, surrounding the base of the style. Flowers white. The root is very bitter, and is celebrated as an alexiteric, the trunk of which is horizontal, and the fibres perpendicular. The plant is called in Ceylon Ekanerta and Naghowalla, from nagha, the riband snake, for the bite of which it is accounted a specific.

2 O. bracteolâta (Wall. cat. no. 6228.) stem ascending, villous above, simple, or a little branched; leaves unequal in size in each pair, as is the case in most of the species; stipulas ensiform, pubescent; common peduncles slender, villous, from 3-5 inches long. ½. S. Native of the valley of Nipanl, in damp moist situations.

Bracteolate Snake-root. Pl. 1 foot.

3 O. olibongófolia (D. C. prod. 4. p. 415.) suffruticose, downy at the apex as well as on the peduncles; leaves oblong, bluish, attenuated at the base, glabrous above, pale and rather velvety beneath; stipulas small, triangular, acute; cymes pedunculate, branched; tube of corolla short. ½. S. 27 X
Native of the Island of Luzon, one of the Philippines. O. Míngos, Bartl. in herb. Hanke. Herb hardly a hand high, erect, suffrutescent at the base, and throwing out a few roots from the lower part.

**Oblong-lobed Snake-root.** Shrub $\frac{1}{2}$ foot. 4 O. *Villosa* (Roxb. fl. ind. 2. p. 546.) stem suffrutescent, erect, villous; leaves oblong-oblongate, villous on the veins beneath; stipulas eniform, villous; cymes or corymbs terminal, on long peduncles, villous; corolla funnel-shaped. 2. S. Native of Chittagong and Silhet, on the hills in shaded moist places. O. Míngos, Gaertn. fruct. 1. p. 264. t. 53.? ex Roxb. Corymbs almost globular, with numerous white almost sessile flowers, and recurved branches. Urecolus bilabiatus, surrounding the base of the style. Capsule opening round the apex.

**Villos Snake-root.** Pl. $\frac{1}{2}$ foot. 5 O. *Argentea* (Wall. cat. no. 6239.) suffrutescent; stem liliaceous; leaves ovate, acuminate, tapering at the base, glabrous, green above and white beneath; peduncles axillary and terminal, trichotomously at the apex; tube of corolla longer than in *O. villosa*. 1. S. Native of Silhet and Chittagong. O. villoso Wall. but not of Roxb. Peduncles downy.

**Silvery Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 6 O. *Marginata* (Blum. bijdr. p. 976.) stem suffrutescent, erect; leaves lanceolate, acuminate at both ends, glabrous, except the margins, which are scabrous; stipulas semi-lanceolate, small, acuminate; cymes or corymbs pedunculate, terminal, almost trifid; corolla funnel-shaped, with an angular tube. 2. S. Native of Java, on Mount Tjeriman. Allied to *O. Míngos*, but differs in the flowers being larger and in the stipulas being subulate at the apex.

**Margined-leaved Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 7 O. *Fasciculata* (D. Don. prod. fl. nep. p. 136.) stem suffrutescent, erect, branched; leaves elliptic, acuminate, glabrous above and downy beneath; flowers in terminal fascicles; calyces (segments ovate, acute. 1. S. Native of Nipal, in moist shaded places, near Suembu. Virécta fasciculata, and O. suffrutescens, Hamilt. nss. Differs from O. Míngos in the leaves being downy beneath, and in the flowers being in terminal fascicles.

**Fascicled-flowed Snake-root.** Pl. $\frac{1}{2}$ foot. 8 O. *Rugosa* (Wall. in Roxb. fl. ind. 2. p. 547.) stems herbaceous, creeping at the base, and ascending at the apex, villous; leaves elliptic-lanceolate, attenuated at both ends, shining, rugose and rather scabrous above, paler beneath and rather downy along the veins; stipulas semi-lanceolate, acuminate; cymes or terminal corymbs pedunculate, bifid or trifid, equalling the uppermost pair of leaves. 2. S. Native of Nipal, in forests, on Shivaopore and other high mountains near the valley; and of Java, on Mount Gede in woods. Blum. bijdr. p. 976. Root consisting of a number of long pink-coloured fibres. Petioles villous. Peduncles furnished with 2 subulate bracteas about the middle, villous. Flowers white, downy, twin, the one sessile, and the other pedicellate. Urecolus 2-lobed.

**Wrinkled-leaved Ophiobiza.** Pl. $\frac{1}{2}$ to 2 feet. 9 O. *Discolor* (R. Br. in Wall. cat. no. 6332.) leaves elliptic-oblong, much acuminated, tapering to the base, glabrous, green above, and reddish beneath; stems and peduncles downy; peduncles terminal, corolla base, trichotomously branched. 1. S. Native of Penang. O. Míngos, Wall. in Roxb. fl. ind. 2. p. 547. O. corymbosa, Hamilt. herb.

**Discoloured-leaved Snake-root.** Shrub 1 to 2 feet. 10 O. *Canescens* (Blum. bijdr. p. 977.) stems herbaceous; leaves oblong-lanceolate, attenuated at both ends, whitish beneath, and rather downy along the veins; stipulas broad, short, subulate at the apex; cymes on short peduncles, terminal, and

axillary, naked, usually quadrand; stamens about equal in length to the tube of the corolla. 2. S. Native of Java, on the mountains of Seribu, in shady places. Allied to *O. rugosa*, but is distinguished from it in the cymes being naked.

**Caneck Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 11 O. *Trichoera* (Blum. bijdr. p. 977.) stems herbaceous, tomentose; leaves on short petioles, ovate-lanceolate, acutish, rather downy on the veins beneath; stipulas downy; cymes subulate; cymes pedunculate, axillary, and terminal, dichotomous. 2. H. Native of the islands of Java and Nusa-Kambanga. Said to be nearly allied to *O. villosa*.

**Hair-fretted Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 12 O. *Longiflora* (Blum. bijdr. p. 977.) stem suffrutescent; leaves oblong-lanceolate, acuminated at both ends, hairy beneath; stipulas semi-lanceolate, acuminiated; cymes pedunculate, terminal, loose-flowered; tube of corolla very long, velvety. 1. S. Native of Java, on Mount Gede, in woods near the top.

**Long-flowered Snake-root.** Shrub $\frac{1}{2}$ to 1 foot. 13 O. *Sanguinea* (Blum. bijdr. p. 977.) stem herbaceous; leaves ovate or elliptic-lanceolate, acuminated, rather oblique at the base, glabrous; stipulas foliaceous, ovate-oblong, bifid; cymes pedunculate, terminal. 2. S. Native of Java, on the mountains in shady places. Leaves reticulately veined in the dry state; the veins blood-coloured.

**Bridy-veined Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 14 O. *Nelleggra* (Blum. herb. ex D. C. prod. 4. p. 416.) stem herbaceous, erect, dark purple, glabrous; leaves oblong-lanceolate, acuminated, pale beneath; peduncles axillary, clothed with rusty down; cymes bifid or quadrijrid, having the bractlets elongated. 2.? S. Native of Java. Nerves of leaves purplish beneath. Stipulas deciduous.

**Neglected Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 15 O. *Quadrifida* (Blum. bijdr. p. 977.) stem herbaceous; leaves ovate or oblong, acute at both ends, smooth, with simple veins; stipulas linear, obtuse; cymes pedunculate, axillary, and terminal, usually quadrijrid. 2.? S. Native of Java, in shady mountain woods.

**Quadrijrid-cymed Snake-root.** Pl. $\frac{1}{2}$ to 1 foot. 16 O. *Japanica* (Blum. bijdr. p. 977.) stem herbaceous, radiant; leaves ovate or oblong-lanceolate, roughish above, and downy on the veins beneath; corymbs terminal, pedunculate, dichotomous; corolla funnel-shaped, with a very long tube, and having the segments hairy inside. 2. G. Native of Japan, where it was collected by Siebold. 17 O. *Prostrata* (D. Don. prod. fl. nep. p. 136.) stem prostrate, radiant, downy; leaves ovate or elliptic, rough above, and downy beneath; calyces segments oblong. 2. G. Native of Nipal, at Narainhetty. Virécta? prostrata, Hamilt. nss. Differs from O. Míngos in the plant being smaller, and more pubescent, and in the stems being radiant.

**Prostrate Snake-root.** Pl. prostrate. 18 O. *Tomentosa* (Jack, in Roxb. fl. ind. 2. p. 546.) the whole plant is clothed with very soft villi; stem herbaceous, erect, branched; leaves lanceolate-oblong, finely acuminated, on longish petioles, villous and hoary underneath, with reddish veins; stipulas subulate; cymes pedunculate, terminal. 1. S. Native of the islands of Pulo-Penang and Sumatra, on the hills. Stem reddish. Petioles villous. Flowers almost sessile. Peduncles and calyces tomentose. Corollas white. Urecolus bilabiatus, glandular. Very like O. bracteolata.

**Tomentose Snake-root.** Pl. 1 foot. 19 O. *Erubescens* (Wall. cat. no. 6233.) stem clothed with rusty down at the top; leaves elliptic-lanceolate, acuminated, tapering at the base, glabrous above, and downy beneath; stipulas broad at the base, and cuspidate at the apex; flowers ter-
minal, coriaceous. ½ S. Native of the East Indies, at Cheppadong.

Reddish Snake-root. Shrub 1 foot.

20 O. hispidula (Wall. cat. no. 6234.) stem and petioles downy; leaves elliptic, tapering to both ends; peduncles terminal, downy, coriaceous, dichotomously branched; capsules downy. ½ S. Native of the East Indies, at Tajovy.

Hispid Snake-root. Shrub ½ to 2 foot.

21 O. heterophylla (Jack, mal. misc. 2. no. 7. p. 85. Wall. in Roxb. fl. ind. 2. p. 547.) stem erect, tomentose; leaves roundish-ovate, those opposite each other very unequal in size; cymes small, terminal. ½ S. Native of Sumatra, in the interior of the island. Leaves with a bluntish acumens, smooth, pale, and whitish beneath. Capsules compressed, obcordate.

Variable-leaved Snake-root. Pl. ½ to 1 foot.

22 O. acumina ta (D. C. prod. 4. p. 416.) stem suffruticosum, clothed with rufous velvety down, as well as the pedicels; leaves lanceolate, acuminated, glabrous, velvety on the nerves beneath; stipulas broad at the base, and awned by a bristle at the apex; cymes pedunculate, of 5 velvety branches. ½ S. Native of the island of Luzon, at Sorzogon. O. subumbellata, Baril. in herb. Hamke. Perhaps the same as O. subumbellata, Forst.

Acuminated-leaved Snake-root. Shrub.

23 O. Richar'diana (Gaud. in Freyc. voy. p. 473. t. 97.) plant suffruticosum, quite glabrous; leaves oblong, much acuminate at both ends, petiolate, with smooth margins; corymbs terminal, on short peduncles, trifid or quadrifid; tube of corolla short; calyces teeth very short. ½ S. Native of the Moluccas.

Richard's Snake-root. Shrub ½ to 1 foot.

24 O. festu'cilla (Blum. herb. ex D. C. prod. 4. p. 417.) stem erect, dwarf, simple; leaves elliptic, glabrous; flower terminal, solitary, nutant, on a short pedicel; corolla funnel-shaped, glabrous; calyces teeth obsolete. ½ S. Native of Java. Herb hardly an inch long. Fruit unknown.

Smallest Snake-root. Pl. 1 inch.

25 O. Ha'risonii (Heyne, ex Wall. cat. no. 6236.) stem, petioles, peduncles, and nerves of leaves on the under side downy; leaves ovate or roundish-ovate, acutish, glabrous and green above, and pale beneath; peduncles terminal, coriaceous, and dichotomously branched at the apex. ½ S. Native of the East Indies. Root creeping much.

Harrison's Snake-root. Pl. ½ to 1 foot.

26 O. ? geminata (Wall. cat. no. 6237.) stem, petioles, peduncles, and nerves on the under surface of the leaves, downy; leaves large, obovate-oblanceolate, tapering much at the base, and running down the pedicels, and acute at the apex, glabrous and green above, but pale or reddish beneath; peduncles long, terminal, racemose. ½ S. Native of the East Indies, in Silhet and Gualpara. Dentella? geminata, Herb. Ham. Root creeping. Stem dwarf. Racemes numerous, crowded, secund, alternate, short, recurved, on each peduncle. Perhaps a proper genus.

Twin Snake-root. Pl. ½ to 1 foot.

† A doubtful species.

27 O. ? subumbellata (Forst. prod. no. 66.) stem shrubby; leaves lanceolate, acute; umbels axillary, trifid. ½ S. Native of the island of Otabhi.

Subumbellata-flowered Snake-root. Shrub.

Cult. The species of Snake-root will grow in a mixture of loam, sand, and peat; and they may either be increased by cuttings under a hand-glass in heat, or by seeds.

LXXI. ARGSTOME MAMA (from argos, argos, white, and στώμα, stoma, a crown; in reference to the terminal racemes or umbels of snow white flowers). Wall. in Roxb. fl. ind. 2. p. 324. Blum. misc. ex D. C. prod. 4. p. 417. —Pomagnium, Reinw. ex Blum.

LIN. SYST. Tri-Pentándria, Monogynia. Calyx with a short obconical tube, and a 3-4-5-cleft limb: lobes acute, valvate in aestivation. Corolla rotate, spreading, with a 3-5, rarely with a 3-4-parted limb. Stamens alternating with the lobes of the corolla. Anthers large, exerted, cohering at the apex. Style perforating a fleshy disk; stigma globose. Capsule crowned by the calyx and an opercular disk, 2-celled, dehiscing in a radiant manner at the apex; receptacles convex, adnate to the depression. Seeds numerous, angular.—Herbs, for the most part hairy from short down. Leaves quite entire, opposite, one usually smaller than the other, rarely verticillate. Stipulas foliaceous, ovate, solitary on both sides. Peduncles terminal, and almost axillary, bearing fascicled umbels of flowers at the apex, very rarely only one flower. Flowers white. The species of this genus have the habit of those of Ophiorhiza.

1 A. sarmentosum (Wall. in Roxb. fl. ind. 2. p. 324.) plant rather villous, creeping at the base, and stoloniferous, the upper part of the stem erect; leaves ovate, obtuse, almost sessile, downy above, and villous on the nerves beneath, in two approximately pairs; flowers 3 or 4-parted, disposed in a terminal umbel or corimb-formed raceme. ½ S. Native of the East Indies, on rocks on the hills at Schukragiri, near Rujmahal; and of Nipaul, on the mountains to the northward of the valley on the route to Gosingothan. Stem and leaves rather pubescent. Flowers snow white. Corolla 5 times longer than the calyx. Leaves at end of stem.

Sarmentosum Argostemma. Pl. ½ foot.

2 A. verticillataum (Wall. l. c. p. 322.) plant erect, downy, and tufted; leaves 4 in a whorl, linear-lanceolate, rather falcate; peduncles 2-3, rarely solitary, bearing a few umbellate flowers each; flowers 4-5-parted. ½ S. Native of Nipaul, on rocks at Moreko in the valley. Root fleshy, and almost tuberous. Stems furnished with a pair or two of lanceolate connate scales. Leaves ciliate. Flowers snow white, rather smaller than those of the preceding species. The mouth of the corolla is marked with 10 minute tubercles, alternately receiving the basis of the filaments. Ovarium smooth. Wall. pl. rar. asiat. 2. p. 80. t. 185.

Whorled-leaved Argostemma. Pl. 4 inches.

3 A. rostra'tum (Wall. l. c. p. 326.) plant erect, smooth; leaves in 2-4 approximate pairs, narrow-lanceolate, acuminated, pubescent at the point, recurved, permanent; umbels pedunculate, terminal, many flowered; segments of corolla and tube of the anthers acuminated. ½ S. Native of the East Indies, on the Pundha mountains near Silhet. Stem furnished with several remote pairs of lanceolate-ciliated stipulas; the upper ones becoming enlarged and foliaceous. Pedicels an inch long, clavate, a little ventricose above the middle. Corollas white, nearly an inch in diameter. Habit of Trientalis Europae'a.

Beaked-anthered Argostemma. Pl. ½ to 2 foot.

4 A. rictum (Wall. l. c. p. 327.) plant glabrous; stem short; leaves smooth, ovate, subcordate, painted with reteculated white nerves, on very short petioles; umbels terminal, pedunculate, many flowered; flowers pentandrous. ½ S. Native of Pulo-Penang, growing on rocks near the water-fall. Leaves only 2, or in 2 remote pairs, slightly ciliate. Peduncle simple, or having 2 opposite branches, each bearing a round umbel of many small flowers. Unripe berry as large as a coriander seed, smooth.

Painted-leaved Argostemma. Pl. 1 to 2 inches.

5 A. borragi'neum (Blum. misc. ex D. C. prod. 4. p. 417.) stem creeping at the base, but erect above, and scabrous at the apex; leaves elliptic, acute at both ends, petiolate, with a few 3 x 2.
scattered hairs above, but more crowded on the nerves beneath, and on the petioles; umbels pedunculate, terminal, subtrifid; flowers pentamerous, at length second. O. S. Native of Java, in mountain woods in humid places. Stem 4-6 inches long. Leaves 4-6 along each stem.

**BORAGE-Like Argostemma.** Pl. 3/2 foot.

6 A. MONTANUM (Blum. s. ex D. C. prod. 4. p. 418.) stem tomentose hairy, ascending; leaves ovate, acuminate, ciliata, petiole, beset with scattered hairs above, and with bristle-like hairs on the nerves beneath; umbel terminal, pedunculate, bracteosed, 5-6-flowered.—Native of Java. Peduncle of Hydnora is long, 3-4 inches long. Leaves 10-12 on each stem, disposed in nearly equal distant pairs. Peduncle hardly longer than the leaves.

**Mountan Argostemma.** Pl. 3/2 foot.

7 A. FAUCIFOLIUM (Blum. s. ex D. C. prod. 4. p. 418.) stem creeping at the bottom, but branched, and rather scabrous above; leaves petiolate, ovate, acute, tapering a little at the base, hairy; umbels pedunculate, shorter than the leaves, terminal, subtrifid, few-flowered. P. S. Native of Java, on Mount Salak in shady places. Leaves 16-20 on each plant, membranous, pale beneath. Flowers white, smaller than those of the preceding species.

**Few-flowered Argostemma.** Pl. 3/4 foot.

8 A. caricifolium (Blum. s. ex D. C. prod. 4. p. 418.) stem creeping below, clothed with hairy pubescence; leaves opposite, very unequal, one of which in each pair hardly exceeds a stipula in size, the other is lanceolate, with an unequal base, rather ploso; peduncle terminal, 1-flowered. O. S. Native of Java, in woods on the higher mountains.

**One-flowered Argostemma.** Pl. creeping.

**Cult.** For culture and propagation, see Ophiopanax, p. 523. The species are all remarkable in their appearance.

**LXXII. SPIRADEI’CLIS** (from σπέρα, a spire, and κέλις, valves with folding doors; in allusion to the valves being divided into 2 parts, and also twisted at the apex). Blum. bijdr. p. 975. D. C. prod. 4. p. 418.

**Linn. syst. Periandria, Monogynia.** Calyx with an oblong turbinate tube, and a 5-toothed limb. Corolla with a short tube, and a 5-parted spreading limb. Stamens 5, included. Style girded by 4 glands; stigma 2-lobed in the throat. Capsule oblong, crowned by the calyx, 2-celled, 2-valved; valves biserite, at length twisted. Seeds numerous, angular.—This genus is nearly allied to Tula, with the tufted habit of Nertéra. Leaves opposite, ovate, rather undulated, glabrous. Spikes terminal and lateral, few-flowered. Flowers small, second, each furnished with one bractea.

1 S. castróss (Blum. l. c.)—Native of Java, at the foot of Mount Salak in humid places.

**Tutfed Spiradichsis.** Pl. tutfed.

**Cult.** For culture and propagation see Tula below.

—A small procumbent branched tufted herb. Leaves reniform, petiolate. Pedicels axillary, short, 1-flowered. This genus was alone known to Feuillée, and is therefore very doubtful. Habit of Nertérea, but differing in the flowers being pentamerous, and in the cells of the fruit being many seeded; it is perhaps, however, or that genus badly described.

1 T. ADANSION (Röm. et Schultes, syst. 4. p. 355.) Y. G. Native of Peru, on rocks by the sea-side. Soldanella facie, Feuill. obs. 3. pt. 2. p. 63. t. 44.

**Adanson’s Tula.** Pl. tutfed.

**Cult.** A mixture of loam, peat, and sand will be a good soil for this little plant; and it may either be increased by cuttings planted in sand under a hand-glass, or by seeds. The pot in which it is grown should be half filled with sherds.

**Linn. syst. Periandria, Monogynia.** Calyx with an ovate-globose tube, and a 5-clawed limb. Corolla funnel-shaped, 5-clawed; lobes furnished with a small tooth on each side; throat hairy. Anther 5, included, almost sessile. Style short; stigmas 2, thick. Capsule almost indehiscent, nearly globular, 2-celled, crowned by the limb of the calyx. Placentae fleshy, prominent on both sides within the cells. Seeds small, ovate.—A creeping tufted marsh annual herb. Stems filiform, glabrous. Leaves oblong, glabrous, ciliate at the base, with the petiole. Stipulas small, acute. Pedicels axillary, alternate, 1-flowered, short. Fruit bi-pap. Flowers small, white.

**Cult.** The seeds require to be sown on a gentle hot-bed in spring; and the plants when of sufficient size may be lifted out into a moist shady situation in the open ground.

**LXXV. DEPPEA** (named after M. Deppe, who has collected and sent home many plants from Mexico). Cham. et Schlecht. in Linnaea. 5. p. 167. D. C. prod. 4. p. 618.

**Linn. syst. Tetrandria, Monogynia.** Teeth of calyx 4, triangular. Corolla somewhat rotate, quite glabrous; lobes elliptic. Anthers 4, linear, exserted; filaments very short. Style longer than the stamens; stigma thicker than the style. Capsule membranous, elliptic, crowned by the calycine teeth beneath the vertex, 2-celled; cells 1-seeded, with a loculicidal dehiscence. Seeds fixed to the middle dispermous.—A small shrubby plant, with a woody root, and reddish inner bark. Leaves petiolate, elliptic, acuminate at both ends, rather pilose above and on the margins. Stipulas triangular, deciduous. Cymes terminal and axillary, pedunculate, of 3 or 4 branches. Flowers yellow. Habit, fruit, and capsule of Hedyotis, but the cells are 1-seeded as in the tribe Spermacoceae.

1 D. ERYTHROPA (Cham. et Schlecht. l. c. p. 168.)—Native of Mexico, in shady places near the Hacienda de la Laguna. D. hydrotélica, D. C. prod. 4. p. 618.

**Red-rooted Deppia.** Shrub 1 to 2 feet.

**Cult.** For culture and propagation see Dentella above.

**SUBTRIBE II. HEDYOjTIE.E.** (this tribe contains plants agreeing with Hedyotis in important characters). D. C. prod. 4. p. 419. Stipulas resembling a sheath on both sides, and ending in many bristles at the apex.

**LXXVI. HEDYOTIS** (from ἡδύς, hedge, sweet, and ὀξίς, oxis, an ear; the leaves are oval, soft, and firm, from
which circumstance they have been compared to ears). Roxb. fl. ind. 1. p. 368. Clunie et Schlecht. in Linnaea. 5. p. 153. D. C. prod. 4. p. 419.—Hedyotis species of Lin. and all authors.

Lin. syst. Tetrándria, Monogynia. Calyx with an ovate tube, and a 4-toothed limb: teeth erect, permanent, also separated on the fruit by acute narrow recesses. Corolla with a short tube, a bearded throat, and a 4-lobed limb. Stamens exerted a little; anthers ovate or roundish, small. Capsule ovate, somewhat attenuated at the apex, crowned by the calycine teeth, which are coniform, but separate, 2-celled, and delising in the middle of the cells. Seeds minute, angular, many in each cell.

—Herbs, sometimes suffruticose at the base, with a habit like that of Spermacoce. Stems tetragonal or nearly terete. Leaves opposite. Stipulas adhering to the petioles on both sides, ending in many bristles. Flowers axillary, usually glomerate.—This genus differs from Houslinia, to which St. Hil. pl. rem. bras. p. 281, has joined it, in the calyx being adnate to the fruit the whole length. It differs from Oldenlandia in the teeth of the calyx being separated on the fruit by narrow recesses, not by broad ones.

* Pedicels axillary, 1-flowered, solitary, and sometimes twin.

1 H. gracilis (D. C. prod. 4. p. 419.) plant decumbent and elongated, scabrous from hairs; leaves linear, acute; stipulasOVATE, opposite.

2. H. Adscetnionis (D. C. t. c.) stem suffruticose, branched, glabrous; leaves linear, acute, with revolute margins, and are, as well as the calyces, rather scabrous; pedicels axillary, solitary, 1-flowered, shorter than the flowers. 1. S. Native of the island of Ascension, where it was collected by Lesson, G. Don, &c. Herb becoming black on drying. Capsule compressed. Seeds very minute. Corolla white. Lobes of calyx long, linear.

Ascension Hedyotis. Pl. 1 1/2 foot.

3 H. pauciflora (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 419.) plant suffruticose, glabrous; branches tetragonal, smooth; leaves linear, very acute, with revolute margins; stipulas with many stiff erect bristles; flowers solitary, axillary, hardly pedicellate. 1. S. Native of the island of Luzon, one of the Philippines. Leaves 1 or 1 1/2 inch long, and a line broad. Fruit unknown, but the lobes of the calyx are separated by narrow recesses, indicating it to belong to this genus.

Few-flowered Hedyotis. Pl.

* * Flowers axillary, almost sessile, disposed in glomerate whorles.

4 H. tenelliflora (Blum. bijdr. p. 971.) stems suffruticose, kneed, procumbent; leaves on short petioles, lanceolate, veinless beneath, with scabrous margins; bristles of stipules long and setaceous; flowers usually twin, axillary, sessile. 1. S. Native of the island of Nusa Kambanga, near Java.

Slender-flowered Hedyotis. Shrub procumbent.

5 H. angustifolia (Cham. et Schlecht. in Linnaea. 4. p. 153.) stems branched a little, tetragonal, when young the angles are hairy; leaves linear, very narrow, acute, with revolute scabrous margins; stipulas hairy, membranaceous fringed; flowers 3-5-together, axillary, almost sessile, glomerate. 1. S. Native of the island of Luzon, one of the Philippines.

Narrow-leaved Hedyotis. Pl. 1/2 foot.

6 H. Bösch (D. C. prod. 4. p. 420.) plant glabrous; stems herbaceous, ascending, branched, slender, tetragonal; leaves linear; bristles of stipulas shorter than the fruit; flowers few, axillary, somewhat verticillate; fruit ovate, crowned by the teeth of the calyx, which are acute. 1. H. Native of Carolina, where it was collected by Bosc, and sent home under the name of Diodia. Leaves almost an inch long, and a line broad. Seeds very minute.

Boae's Hedyotis. Pl. ascending.

7 H. auriculata (Lin. spec. 147.) stem almost simple, tetragonal, rather hairy at the apex; leaves lanceolate-ovate, nerved; stipulas ciliated with bristles; flowers glomerate, axillary, somewhat verticillate. 1. S. Native of Ceylon, Malabar, also of Silhet and Nipan, ex Roxb. fl. ind. 1. p. 369. Rheem. mal. 10. t. 32.—Burn. fl. zey. t. 108. f. 1.? H. nervosa, Lam. dict. 3. p. 78.? Flowers white, sessile.

Asribed Hedyotis. Pl. 1/2 foot, procumbent.

8 H. genev*icula* (Roxb. fl. ind. 1. p. 368.) plant weak, decumbent; stems nodose, terete, smooth; leaves almost sessile, lanceolate, smooth; flowers on short pedunules, disposed in whorles.—Native of the Malay Islands. The rest unknown.

Kneed-stemmed Hedyotis. Pl. decumbent.

9 H. Lafeyroushi (D. C. prod. 4. p. 420.) stem erect, glabrous, terete, rather angular at the apex, and hardly branched; leaves oblong-lanceolate, acuminate at both ends, glabrous; stipulas of many bristles; flowers few, axillary, almost sessile, verticillate; capsules globose. 1. S. Native of the island of Vanikoro, where it was collected by Lesson. Stem 1 1/2 foot high. Leaves 4 inches long, and 8-10 lines broad, lined with 5-6 oblique nerves on each side.

La Peyrouse's Hedyotis. Pl. 1 1/2 foot.

10 H. crust*is*folia (Blum. bijdr. p. 971.) stems diffuse, rather hairy; leaves lanceolate, capitulate, almost veinless, except the middle nerve, scabrous beneath and on the margins, on very short petioles; stipulas setigerous; flowers disposed in dense whorles; filaments exserted.—Native of the west of Java, in humid shady places. Said to be allied to H. hispida. Bristles of the stipula long. Teeth of calyx very acute. Perhaps the same as H. crataegophyllum.

Thick-leaved Hedyotis. Pl. 2 to 3 feet.

11 H. crat*ase*g*om*um* (Spreng. pug. 2. p. 35.) stems terete, glabrous, articulated; leaves lanceolate, acuminate, veinless, scabrous; stipulas setaceous jugled; flowers sessile, disposed in glomerate whorles.—Native of Ambon, ex Rumph. amb. 6. p. 25. t. 10.; and of Java, ex Lin. not in Jamaica, as said by Roum. et Schultes, syst. 3. p. 199. Oldenlandia verticillata, Lin. mant. 46.

Strong-jointed Hedyotis. Pl. 1 foot.

12 H. hispida (Retz. obs. 1. p. 23. but not of Roth.) stems diffuse, branched, tetragonal, rooting at the nodi; leaves sessile, lanceolate, with hispid margins; stipulas with many bristles; flowers axillary, almost sessile, disposed in glomerate whorles; filaments inclosed.—Native of China, ex Retz.; of the Moluccs, ex Roxb. fl. ind. 1. p. 368.; of Java, Blum. bijdr. p. 971. Oldenlandia hi-pida, Poir. dict. 4. p. 536. Stamens shorter than the style, which is clavate, ex Retz. Capsule hispid, ex Spreng. pug. 2. p. 32.

Hispid Hedyotis. Pl. 1/2 foot, procumbent.

13 H. unc*il* ella (Hook. et Arn. in Beech. voy. pt. bot. pot. 19.2) plant suffruticose, glabrous; branches simple; leaves ovate-oblong-lanceolate, with almost simple longitudinal veins; flowers axillary, sessile terminal, numerous, almost sessile, disposed in glomerate whorles; capsules tubinate, glabrous, crowned, bipartite at the dissepiment; tube of calyx contracted, and the lobes subulate and recurvedly uncinate, long, and ciliated. 1. G. Native of China. This may be the type of a new genus, and is probably the H. cephalophora, R. Br. in Wall. cat. no. 842.

Hooked-calyx Hedyotis. Shrub.
14 H. rotundifolia (Sprague, lag. 3. p. 197.) plant decum- 
ben, branched a little; leaves petiolate, broad-ovate, somewhat
3-nerved; stipules scarious, ciliated; flowers axillary, almost
sessile, disposed in whorles; capsules hispid.—Native of
the East Indies, in humid places. Oldenlandia trinervia, Retz. obs.
4. p. 23.
Round-leaved Hedyotis. Pl. decumbent.
15 H. perfusilla (Hook. et Arn. in bot. misc. 3. p. 259.)
glabrous; stems tufted, diffuse, branched, weak; leaves olong;
stipules minute, not setigerous; pedicels terminal, and from
the forks of the branches, 1-flowered, about equal in length to
the leaves; tube of calyx glbose, hispid from bristles; teeth of
calyx erect, ovate, obtuse.—Occasionally found in inundated
places by the shores of La Plata, near Buenos Ayres. Stem 1
2 inches long, branched; the branches are furnished with
several short lateral ramuli, from the axils of which springs
a peduncle, which after flowering becomes reflexed. Very closely
allied to II. uniflora, but seems to differ from the genus by the
stipules not being furnished with bristles.
Least Hedyotis. Pl. tufted.
16 H. sodiflora (Wall. cat. no. 855.) glabrous; stems quad-
angular; petioles downy; leaves ovate-elliptic, acuminate,
veined; flowers much crowded, axillary, subverticillate, sessile.

L. S. Native of the East Indies, in Tavoy.
Knot-flowered Hedyotis. Pl. 1 to 2 feet.
17 H. argentea (Wall. cat. no. 858.) glabrous; stem quad-
angular; leaves broad-ovate, acuminated, whitish above, and
rusty beneath; flowers in axillary heads. \( \mathcal{L}. \) S. Native of
the Burmese Empire, on the banks of the Irrawaddy.
Silvery Hedyotis. Pl. 2 to 3 feet.
18 H. costata (R. Br. in Wall. cat. no. 849.) stem downy,
quadraangular; leaves lanceolate, tapering to both ends, glabrous,
with many parallel veins; flowers disposed in crowded axillary
heads, subverticillate; teeth of calyx separated by distant recesses.

L. S. Native of Pulo-Penang and Silhet.
ribbed Hedyotis. Pl. 2 to 3 feet.
19 H. pinifolia (Wall. cat. no. 850.) plant much branched;
branches quadrangular; leaves linear, with revolute edges;
flowers disposed in axillary and terminal verticillate heads. \( \mathcal{L} ).
S. Native of Pulo-Penang, and of the Burmese Empire, at
Prome and Amarast. Perhaps a species of Oldenlandia.
Pin-leaved Hedyotis. Pl. 3 to 4 feet.
20 H. conceps (R. Br. in Wall. cat. no. 844.) herbaceous, glo-
bose; stem and branches quadrangular; leaves ovate-lanceo-
late, acuminate, pale beneath; flowers crowded, axillary; stip-
ules somewhat pinnatifid; lobes of calyx rounded, separated
by narrow blunt recesses. \( \mathcal{L}. \) F. Native of Pulo-Penang.
Crowded-flowered Hedyotis. Pl. 3 to 4 feet.
21 H. macrophylla (Wall. cat. no. 841.) stem and branches
quadraangular; leaves large, roughish, veined, tapering to both
ends; stipulas pinnatifid; flowers much crowded, axillary, for-
ming glomerate whorles. \( \mathcal{L}. \) S. Native of Pulo-Penang. Calyx
downy, with the lobes separated by narrow recesses.
Large-leaved Hedyotis. Pl. 2 to 3 feet.
** ** Peduncles axillary, many-flowered; flowers crowded.
** ** **
22 H. capitatea (Lam. dict. 3. p. 80.) stem terete, almost
simple, downy; leaves almost petiolate, ovate-lanceolate, acute,
nerved, glabrous above, velvety on the nerves beneath; stipulas
setaceously jagged; peduncles axillary, solitary, much shorter
than the leaves, bearing each a dense head of flowers.—Native
of the East Indies, particularly in Java, in moist parts of moun-
Capitate-flowered Hedyotis. Pl. ½ foot.
23 H. lineata (Hook. fl. ind. 1. p. 369.) plant diffuse, pil-
ose; leaves sessile, ovate-lanceolate, with longitudinal simple
parallel veins; peduncles axillary, many flowered, rather long,
2-3-together; capsules round, pilose. \( \mathcal{L}. \) F. Native of the
East Indies, in Chittagong. The rest unknown.
Lined-leaved Hedyotis. Pl. diffusae.
24 H. ulmifolia (Wall. in Roxb. fl. ind. 1. p. 370.) plant
ascending, clothed with soft hairs; leaves oval-lanceolate, acute,
nerved, very villous on the nerves on both surfaces; stipulas
cup-shaped, acuminate at both ends, joined to both sides of
the petioles; peduncles axillary, much shorter than the leaves,
bearing many subcorymbose flowers; flowers usually by threes;
calyx villous, with acute lobes. \( \mathcal{L}. \) G. Native of Nipal. H.
lineata, D. Don, fl. nep. p. 194. but not of Roxb. Specimen
linen, Hamilton, mess. Stipulas coriaceous, acuminated in the
middle. Stems many from the same root, woody, simple. Cally-
cine segments lanceolate, spreading.

Elongated Hedyotis. Pl. 1 to 2 feet.
25 H. vestita (R. Br. in Wall. cat. no. 847.) stems, peduncles,
and petioles villous; stem quadrangular; leaves ovate-lanceo-
late, much acuminated, tapering at the base, downy, particu-
larly on the veins beneath; stipulas villous, bearing 3 long bris-
tles each; peduncles axillary, trichotonous, each division bear-
ing a head of flowers. \( \mathcal{L}. \) S. Native of Pulo-Penang and
Silhet. Leaves with parallel veins.
Clothed Hedyotis. Pl. 2 to 3 feet.
26 H. macrostemon (Hook. et Arn. in Beech. voy. pt. bot.
p. 192.) plant suffruticose, branched; branches pubescent; leaves
on short petioles, ovate-lanceolate, clothed with soft down be-
neath, rather spongy and shining above, with longitudinal
simple parallel veins; peduncles axillary, solitary, shorter than
the leaves, many flowered; flowers capitulate; stamens much ex-
serted; capsules hairy, free at the apex. \( \mathcal{L}. \) G. Native of
China. Closely allied to the two preceding species.

Long-stamened Hedyotis. Pl. ½ foot.
27 H. seryllifolia (Poir. suppl. 3. p. 14.) stem herbaceous,
branched, rather angular; leaves ovate, acuminate mucronate,
somewhat ciliated; stipulas bipartite, acuminated; flowers 2-4
in each head, axillary and terminal, on short peduncles; tube of
calyx downy.—Native of the island of Bourbon, where it was
collected by Bory de St. Vincent. Corolla white, shorter than
the calyx. Seeds innumerable, very minute. Stem hispid.

With Rhyme-leaved Hedyotis. Pl. 2 to 3 feet.
28 H. ensata: stem suberose, filiform, branched, rooting at
every joint; leaves small, oval or obovate, linear-lanceolate, ex
Lour, smooth; flowers axillary, solitary, on very short pedicels;
capsule nearly globular, covered with hollow pellucid hairs. \( \mathcal{L}.
S. Native of the East Indies and China. Oldenlandia rupens,
Burm. fl. ind. 38. t. 15. f. 2. Lour. coch. p. 78. Corolla bell-
shaped, white.
Creeping Hedyotis. Pl. creeping.
29 H. uniflora (D. C. prod. 4. p. 421.) plant herbaceous;
stems creeping, branched, weak; leaves ovate-roundish, obtuse;
stipulas small; pedicels terminal, 1-flowered, longer than the
leaves; tube of calyx rather hispid. \( \mathcal{L}. \) F. Native of Chili,
in sandy places along the banks of streams. Oldenlandia uni-
flora. Hook. et Pav. fl. iso. p. 57. Corolla with a broad tube,
which is bearded inside. Lobes of calyx ovate, acutish.
One-flowered Hedyotis. Pl. creeping.
30 H. geomerata (Ell. schiz. 1. p. 185.) stem nearly erect,
herbaceous, downy, branched; leaves lanceolate, attenuated at
the base, downy; stipulas acutely bidentate; flowers almost ses-
sile, capitulate, axillary and terminal, rarely almost solitary;
tube of calyx hispid. \( \mathcal{L}. \) ex Torrey. \( \mathcal{L}. \) ex Ell. Native of North
America, in humid places, from Carolina to New York. Torr.
amer. 1. p. 83. H. auriculata, Walt. car. p. 85. but not of
Lin. Oldenlandia uniflora, Lin. ex Willd. spec. 1. p. 674. H.
uniflora, Lam. iv. p. 271. H. Virginica and H. glomerata, Spreng. syst. 1. p 412, 413. Lobes of calyx 4, ovate, acuminate. Corolla subrotate, shorter than the calyx; with the lobes rather spinose. Stamens short, opposite the lobes of the corolla, ex Torrey. Style almost wanting; stigma thick, undivided. Seeds innumerable, very minute, as in the genus Oldenlandia.

Glomerate-flowered Hedyotis. Pl. 3. creping.

31 H. Gorensisis (D. C. prod. 4. p. 421.) plant diffuse, many stemmed; stems rather angular, glabrous, except at the nodi, where they are downy; leaves lanceolate, acute, glabrous; peduncles axillary and on the tops of the branches, disposed in umbellate heaps, a little shorter than the fruit; fruit downy, crowned by the calycine teeth, which are subulate, and somewhat involutely uncinate at the apex. O. F. Native of the coast of Africa, in the island of Goree. Habit of Chickweed. Leaves ovate-oblong or lanceolate. Capsule disheveling but slowly. Seeds very minute. Corolla not seen.

Var. β, erecta (D. C. l. c.) stems erect, much shorter than those of the species; heads of flowers solitary, terminal, umbellate. O. S. Native in humid parts of woods.

Goree Hedyotis. Pl. diffuse.

***** Panicles or coriynba terminal, loose, rarely axillary. The species are very different from each other, and from the rest of the genus.

32 H. latixa (D. Don, prod. fl. nep. p. 155.) stem herbaceous, weak, dichotomously branched, angular, glabrous; leaves ovate, acute, rather hairy on both surfaces, ciliated; stipules divided into bristles; peduncules axillaries, dichotomous; flowers usually by threes. O. G. Native of Nipal. Habit of a species of Ophiopoa. Anthers in some specimens examined exerted, and in others almost imlosed. Teeth of calyx acutely mucronate, 3 times shorter than the corolla. Capsule somewhat cylindrom, free at top, and dehiscing in the middle of the cells. Seeds ovate-roundish.

Loose-flowered Hedyotis. Pl. 1 1/2 feet.

33 H. Polyscenna (Wall. catt. 828.) branches tetragonal; leaves elliptic-lanceolate, acuminate, tapering to the base; stipules joined to the petioles, and forming a sheath with them, furnished with a tooth on each side; pedicle terminal, coriaceous, trichotomous; lobes of calyx separated by broad recesses. O. S. Native of Silhet. Perhaps a species of Oldenlandia.

Many-fruited Hedyotis. Pl. 2 to 3 feet.

34 H. mollis (Wall. catt. no. 859.) plant clothed with soft white down in every part, but particularly so on the under side of the leaves; peduncles axillary and terminal, panicled; pedicels coriaceous; stipules with 3 bristles. O. S. Native of Pulo-Penang.

Soft Hedyotis. Pl. 1 to 2 feet.

35 H. vaginata (Blum. herb. and mss. ex D. C. prod. 4. p. 421.) plant suffruticoso, glabrous; leaves lanceolate, much acuminated, nervled; stipules long, sheathing, drawn out on both sides into one puberulous bristle; coriaceous terminal, trichomes; throat of corolla bearded; samens exerted. O. S. Native of the island of Ternate, one of the Moluccas.

Sheathed-stipuled Hedyotis. Shrub.

36 H. elongata (R. Br. in Wall. catt. no. 865.) plant puberulous; leaves lanceolate or linear; stipules jagged; pedicules terminal, elongated, dichotomously branched; flowers distant on the branches of the peduncle, usually by two, and one in each fork, almost sessile. O. S. Native of the East Indies. Perhaps a species of Oldenlandia.

Elongated-stipuled Hedyotis. Pl. 1 to 2 feet.

37 H. scandens (Roxb. fl. ind. 1. p. 368.) stem terete, scandent, glabrous; leaves on short petioles, broad-lanceolate, acuminate, glabrous, shining; stipulas entire, joined to the pedioles, furnished with a short mucron on both sides; corymbs paniced, axillary, and terminal, with the bractlets rather villos; lobes of corolla and throat hairy inside; style villous at the apex; stigma bilamellate. O. S. Native of Nipaul and Silhet, where it is called Goeue. Petesia Hita, Hamilt. mss. ex D. Don, fl. nep. p. 134.

Climbing Hedyotis. Pl. cl.

38 H. capitella (Wall. catt. 837.) glabrous; leaves elliptic, acuminate, tapering at the base; stipulas joined to the pedicels, furnished with a tooth on both sides; pedicel terminal, composed of round heads of flowers. O. S. Native of Pulo-Penang, and Tavoy.

Headed-flowered Hedyotis. Shrub cl.

39 H. leschenaulti (D. C. prod. 4. p. 422.) suffruticoso; branches glabrous, tetragonal at the apex; leaves lanceolate, pliose beneath; stipulas combined with the petioles, forming a kind of cupula, and furnished with 3 bristles on both sides; pedicel terminal, with glabrous branches; limb of calyx with 4 short teeth; lobes of corolla hairy above; style shorter than the corolla. O. S. Native of the East Indies, on the Nelliglerry mountains, where it was collected by Leschenault. Allied to H. seddens, and with it will probably form a distinct genus.

Var. β, Wallichii (D. C. prod. 4. p. 422.) branches compressedly angular; leaves acuminate; limb of calyx 4-cleft to the middle; lobes oblong-linear; limb of corolla very hairy above. O. G. Native of Nipal, at Katmandu. Perhaps the same as H. seddens, Roxb. ex Wall. fl. ind. 1. p. 369, but it does not exactly agree with the description given of that plant by Roxburgh.

Leschenault's Hedyotis. Shrub cl.

40 H. articulata (R. Br. in Wall. catt. no. 854.) plant dense and dwarf; leaves much crowded, lanceolate, veiny; stipulas jagged; peduncle terminal and axillary, forming panicles. O. G. Native of the Nelliglerry mountains.

Jointed Hedyotis. Pl. 2 foot.

41 H. arborea (Roxb. in Beatta, voy. append. p. 310.) arborescent; leaves on short petioles, oblong, acuminate, shining, recurved at the apex; stipular sheath cylindrical, furnished with 1-3 unequal teeth; corymbs terminal, brachiately, almost globular; capsules globose. O. G. Native of the island of St. Helena, in woods towards the tops of the mountains, where it is called dogwood by the inhabitants. Lobes of calyx oval. Corolla short, glabrous. Perhaps a proper genus.

Tree Hedyotis. Shrub.

42 H. stylosa (R. Br. in Wall. catt. no. 853.) stems quadrangular; leaves glabrous, elliptic-lanceolate, tapering to both ends, cortaceous; stipulas pinnaed; peduncles axillary and terminal, trichotomous, forming paniced corymbs; corolla very hairy inside. O. G. Native of the Nelliglerry mountains.

Long-styled Hedyotis. Shrub 1 to 2 feet.

† Doubtful species.

43 H. crassifolia and H. rosea, Rafin. fl. lud. 77. are very doubtful plants, and are probably species of Anatis. Cult. None of the species of this genus are worth cultivating except in botanic gardens. Any light soil will suit them; and cuttings of the shrubby and herbaceous perennial species will root in the same kind of soil, with a hand-glass over them, in a little heat. The annual kinds require the same treatment as other tender annuals. All are easily increased by seeds.

LXXVII. OLDENLIA/NDIA (named by Plunier in memory of Henry Bernh. Oldenland, a Dane, who collected plants at the Cape of Good Hope in 1695. They came into the possession of Burmann, and there is an account of them in the 6th volume of Linnaeus's Annales Botanici). Lin. gen. no. 154.

2. **—Hedyotis species, Spreng. Smith, and Blume.**—Hedyotis and Oldenlandia, Gertr. fr. 1. t. 90.—Oldenlandia and Listeria, Neck. elem. no. 345 and 346.—Listeria, Rafin. ann. gen. sc. phys. 6. p. 81, but not of R. Br.

3. **L. s. Tetrandria, Meagoygium.** Calyx with a sub-globose tube, and 4 sub-approximate teeth, which remain on the fruit and are separated by very wide recesses. Corolla with a short tube, a 4-cleft limb, and a villous or glabrous throat. Stamens a little exserted; anthers ovate or orbicular. Stigma divided or bifid. Capsule almost globose, crowned by the small distant teeth of the calyx, 2-celled, dehiscing at top by a loculicolal chink. Seed small, innumerable, fixed to sub-globose placenta, and as if they were half immersed in them. —Small, herbaceous, or suffruticose plants, with the habit of chickweed. Leaves opposite, with the stipulas adhering to both sides of the petioles. Peduncles axillary and terminal, bearing 2-5 or many flowers, usually elongated and slender. Flowers usually white. This genus hardly differs from Hedyotis, except in the teeth of calyx being separated by wide recesses on the fruit instead of narrow ones, which character we think would scarcely constitute a sectional distinction. The species, however, have a different habit, and are more readily distinguished by it, than by any other character.

* Pedicels axillary, 1-flowered, usually solitary, rarely by twos or threes.

1. **O. Brachy'poda (D. C. prod. 4. p. 424.)** plant glabrous and decumbent; leaves linear; stipulas furnished with 2 bristles on both sides; pedicels axillary, 1-flowered, shorter than the flowers, solitary or twain; corolla tubular: anthers exserted to the length of the lobes of the corolla. 

2. **—Ramosissima (Fisch. mss. in Spreng. mant. 1. p. 35.** stems herbaceous, diffuse; leaves lanceolate, blunted; stipulas toothed; fruit almost solitary, axillary, sessile. 

3. **—Sabelo'sa (D. C. prod. 4. p. 424.)** on herbaceous, tufted, diffuse, much-branched plant, which is rough from short scattered hairs in every part; leaves linear, acute; stipulas membranous, furnished with many bristles; pedicels 2-3 together, axillary, 1-flowered, much shorter than the leaves, deflexed in the fruitiferous state; corolla length of the lobes of the calyx. 

4. **O. anglica (D. C. prod. 4. p. 424.)** stem branched, erectish, tetragonal, smoothish; leaves linear, acute, rather scabrous; pedicels axillary, 1-flowered, twain, 3 times shorter than the leaves; corolla tubular, about the length of the calyx. 

5. **O. Cape'nsis (Thumb. prod. p. 29. fl. cap. 1. p. 537.)** stem decumbent, branched, villous; leaves linear, acute, glabrous; pedicels numerous, 1-flowered, shorter than the leaves; lobes of calyx ciliated; throat of corolla villous. 

6. **—F. Native of the Cape of Good Hope, in sandy places by the margins of rivers. **Hedyotis Capensis, Lam. ill. no. 1425. Stigma clavate (ex Thunb.). Capsule ovate, didymous.

**Cape Oldenlandia.** Pl. decumbent.

7. **O. lanceo'folia (D. C. I. c.)** stem simple, weak, somewhat dichotomous, creeping; glabrous; leaves linear-lanceolate, glabrous, with rather scabrous margins; bristles of the stipulas distant; pedicules axillary, solitary, rarely twin. 

8. **Lanceo-leaved Oldenlandia.** Pl. ½ foot.

9. **O. herba'cea (D. C. I. c.)** plant glabrous, decumbent; leaves linear or linear-lanceolate; stipules of many bristles; pedicels axillary, 1-flowered, solitary or twin, shorter than the leaves, but 2-3 times longer than the flowers; tube of corolla cylindrical; anthers hardly exserted from the throat. 

10. **F. Native of the East Indies, Madagascar, Senegal, St. Domingo, Mexico, &c. O. Madagascariensis, Desf. cat. hor. p. 1815.**

11. **—Rhed. mal. 10. t. 23. and 35. Hedyotis herba'cea, Lin. fl. zeyl. p. 63. H. herba'cea, var. β, Blum. bijdr. p. 970.**

13. **O. tenuo'folia, Blum. bijdr. p. 970.** 

15. **O. scandi'brida (D. C. I. c.)** stem erect, branched, tetragonal, hairs along the angles; leaves linear, acute; pedicels axillary, 1-flowered, a little shorter than the leaves; corolla tubular, hardly longer than the calyx. 

16. **F. Native of N. Africa.** Oldenlandia tenuo'folia, Blum. fl. ind. 38. t. 14, f. 1. is referrible to this species, as the figure given agrees very well with it.

17. **Scabrous Oldenlandia.** Pl. ½ foot.

18. **O. Gram'miphora (D. C. I. c.)** plant decumbent, much branched, smoothish; leaves linear; stipulas of 2-3 setaceous divisions; pedicels axillary, 1-flowered, about equal in length to the leaves, twin or crowded; corolla hardly longer than the calyx. 

19. **F. Native of the East Indies and Arabia.** Hedyotis grammiphora, Lin. fl. suppl. p. 119. Vahl. symb. 2. p. 27. Spreng. prod. 2. p. 29, exclusive of the syn. of Pluk, which is referrible to Molíggo Cerváena. 

20. **F. Native of Senegal.** Oldenlandia grammiphora, Lin. fl. suppl. p. 119. Vahl. symb. 2. p. 27. Spreng. prod. 2. p. 29, exclusive of the syn. of Pluk, which is referrible to Molíggo Cerváena. 

21. **F. Native of Senegal.** Oldenlandia grammiphora, Lin. fl. suppl. p. 119. Vahl. symb. 2. p. 27. Spreng. prod. 2. p. 29, exclusive of the syn. of Pluk, which is referrible to Molíggo Cerváena. 

22. **F. Native of Senegal.** Oldenlandia grammiphora, Lin. fl. suppl. p. 119. Vahl. symb. 2. p. 27. Spreng. prod. 2. p. 29, exclusive of the syn. of Pluk, which is referrible to Molíggo Cerváena.
to the leaves. O. F. Native of Tranquebar and Java. He-
dyotis pinnata. Lin. fil. suppl. 119. Spreng. pg. 2. p. 34. 
bijdr. p. 971. Flowers white.

Dwarf Oldenlandia. Pl. decumbent.

13 O. LINIFOLIA (D. C. l. c.) leaves linear, attenuated at both 
ends; peduncles 1-flowered, longer than the leaves. O. F. 
Native of the East Indies. Hedyotis linifolia, Willd. mss. in 
Rom. et Schultes, syst. 3. p. 526. The rest unknown.

Flax-leaved Oldenlandia. Pl. decumbent.

14 O. VIRGATA (D. C. l. c.) plant very slender, glabrous; 
stems tetragonal; leaves linear; stipulas furnished with very 
short bristles, at length truncate; peduncles twin, 1-flowered, 
elongated: the ultimate ones disposed into a kind of terminal 
pinnacle; pedicels opposite, from the axis of the bracts, longer 
than them, and about equal in length to the internodes. O. F. 
Native of Guinea (ex Willd.), in the rice-fields of Casamance 
and Gambia (ex Perrottet and Leptier), and Sierra Leone (ex 
Schum. pl. guin. p. 69. Flowers and fruit very small. Leaves 
8-9 inches long. Stamens a little exerted.

Twiggly Oldenlandia. Pl. ¾ foot.

15 O. ASPERULE (D. C. l. c.) plant glabrous; stem erect, 
branched, tetragonal; leaves distant, linear, ciliated at the 
base; stipulas entire, cupular, truncate; pedicels straight, 1-flowered, 
rising from the axis of the upper leaves, which are almost 
aborted. O. F. Native of Ceylon, where it was collected by 
Leschenault. Habit almost of the species of Aspérula. 
Corolla greenish in the dried state, also glabrous in the throat, 
4-cleft. Anthers pedicellate, shorter than the lobes of the coro-
Lobes of calyx short, distant. Perhaps this plant ought to be 
removed from the genus.

Woodroof-like Oldenlandia. Pl. ¾ foot.

16 O. DIFFUSA (Roxb. fl. ind. 1. p. 444) stem terete, flaccid, 
spreading, scabrous; leaves linear-lanceolate, acute, smooth; 
spatulas at length of many bristles; peduncles axillary, 1-flow-
ered, 4-times shorter than the leaves. O. F. Native of the 
East Indies, at Banda. Corolla smooth, white. Stigma pro-
fusely bilab. Capsule roundish. Perhaps only a variety of 
O. biflora.

* * Peduncles 2-3 or many-flowered.

17 O. BIFLORA (Lin. spec. 174.) stems erect, weak, scabrous; 
leaves linear-lanceolate, rather scabrous while young; stipulas 
membranous, lanceolate, with ciliated fringed edges; peduncles 
axillary, shorter than the leaves, 2-3-flowered; corolla glabrous 
inside; anthers length of the lobes of the corolla. O. F. 
Native of the East Indies, Philippine Islands; and of Guinea, at 
Cape Coast, plentiful in the rainy season. Roxb. fl. ind. 1. p. 
445. Hedyotis biflora, Smith, in Rees’s cycly. 17. no. 15. Spreng. 
pug. 2. p. 31. Horn. Hort. hafn. 1. p. 130. Gerontogea 
biflora, Cham. et Schlecht. in Linnaea. 4. p. 155. Hedyotis 
diffusa, Willd. spec. 1. p. 566. Old. dichótoma, Willd. herb. ex 
Cham. et Schlecht. Burm. fl. zeyl. t. 11. Flowers small, white.

18 O. ALSINIFOLIA; glabrous; leaves membranous, lanceo-
late, tapering to both ends; peduncles axillary, few-flowered; 
spatula bristly at top; teeth of calyx distant. O. F. Native 
of Pulo-Penang. Hedyotis alsinifolia, R. Br. in Wall. cat. no. 
873. Plant diffuse.

Chickweed-leaved Oldenlandia. Pl. ½ to ¾ foot.

19 O. BRACHÝYODA; plant glabrous, diffusely branched; 
leaves linear, with revolute edges; peduncles short, axillary, 
bearing at the top an umbel of short pedicellate flowers, or the
white and tasteless; it is the bark only that is possessed of the colouring principle; when fresh it is orange-coloured, tingles the spicy yellow, and leaves a slight degree of acrimony on the point of the tongue, for some hours after chewing; to appearance it loses its yellow colour on drying, but still retains the above property on being chewed. It impregnates cold water or spirits with a straw-colour, and to boiling water it gives a brownish porter colour. The watery infusions and spirituous tinctures are changed into a bright and deep red by alkaline substances, and are rendered paler or nearly destroyed by acids. The colouring powers of this root are said to improve by keeping 2 or 4 years. When the wild sort can be had in any quantity, it is esteemed one-third or fourth stronger, and yields a better colour; and when these roots can be had of two years' growth they are reckoned still better. This plant is the Tseri-vello of the Telingas; and the Saya-ver or Imburel of the Tamuls. The Telunga physicians do not give any part of the plant a place in their Materia Medica; but the Malabar physicians say that the roots cure poisonous bites, colds, and cutaneous disorders, and warm the constitution.

26 O. **fune'cula**; downy in every part; leaves linear-lanceolate, mucronate; peduncles axillary or from the forks of the stems, bearing each a simple umbel of flowers, or 3 pedunculate umbels of flowers, rising from 2 leaves. O. H. Native of the East Indies. O. pubérula, R. Br. in Wall. cat. no. 884.

**Downy Oldenlandia.** Pl. ² foot.

27 O. **capilla'ris** (D. C. prod. 4. p. 426.) stem ascending, teretely tetragonal, and rather scabrous along the angles, much branched; leaves linear-lanceolate, rather scabrous; stipulas small, with setaceous bristles; peduncles axillary and terminal, loosely panicked, longer than the leaves, very slender, 2-4-6-flowered; flowers opposite, on long pedicels. O. F. Native of Madras. Corolla small, tubular. Capsule globose, glabrous.

**Capillary Oldenlandia.** Pl. ² foot.

28 O. **panicula'ta** (Lin. spec. p. 1667.) plant glabrous, erectish, branched; branches tetragonial; leaves ovate-lanceolate; stipulas small, undivided; racemes axillary and terminal, almost naked; pedicels longer than the leaves; corolla with a gibbous tube and a villous throat. O. F. Native of the East Indies, Moluccas, and Philippines.—Burm. fl. ind. 28. t. 15. f. 1. Hedyotis racemosa, Lam. dict. 3. p. 76. ill. 62. f. 2. Leaves smooth. Flowers small. Hedyotis dichotoma, Cav. icon. 6. p. 573. f. 2. and H. média, Cav. icon. 6. p. 574. f. 1. according to Bartling is probably distinct from this. Flowers small, red, on long pedicles.

**Panicled Oldenlandia.** Pl. creeping.

**Pentanodors Oldenlandia.** Pl. procumbent.

30 O. **multil'o'a** (Cav. icon. 6. p. 53. t. 574. f. 2.) glabrous; stem branched, furrowed, ascending; leaves sessile, ovate-oblong; stipulas small, undivided; peduncles axillary, opposite, and terminal, many-flowered; peduncles 3-flowered, elongated.—Native of the Philippine Islands, about Manilla, not of the Friendly Islands, as said by Poiré and Ramer. Very nearly allied to O. paniculata.

**Many-flowered Oldenlandia.** Pl. 15 foot.

31 O. **cras'sispi'lia** (Bartl. in herb. Henke, under Hedyotis) plant glabrous, suffruticosse, diffuse; branches tetragonal; leaves ovate or oblanceolate, oblong, fleshy; peduncles axillary and terminal, 3-flowered, usually shorter than the leaves; pedicels shorter than the flowers; segments of calyx lanceolate, short. —Native of the Island of Luzon, one of the Philippines.

**Thick-leaved Oldenlandia.** Pl. diffuse.

32 O. **strigulo'sa** (Bartl. in herb. Henke, under Hedyotis, ex D. C. l. c.) plant herbaceous, branched, erectish; leaves ovate-oblong, beset with very minute ciliates dots above, and with adpressed stipules beneath; stipulifrons, linear-subulate; peduncles axillary and terminal, longer than the leaves, 3-flowered; pedicels hardly any; calyx segments ovate-triangular. —Native of the Island of Mariane.

**Stri'gulose Oldenlandia.** Pl. ½ foot.

33 O. **ovati'folia** (D. C. prod. 4. p. 427.) plant almost stemless, villous; stem short, simple; leaves ovate, ciliated, on short petioles, white beneath; peduncles 3-4 together, rising from the top of the stem, trichotomous, slender, twice the length of the leaves. O. F. Native of the Philippine Islands at Manila. Hedyotis ovatifolia, Cav. icon. 6. p. 537. f. 1. Spreng. sys. 1. p. 414. Corolla pale red, hardly a line long. Stamens exerted.

**Ovate-leaved Oldenlandia.** Pl. ½ foot.

34 O. **al'ata** (Kom. in Röxh. fl. ind. 1. p. 442.) plant glabrous, erect; stem tetragonial, branched, leaves almost sessile, elliptic-oblong, smooth, rather fleshy; stipulas broad, crenately toothed, obtuse; panicule terminal, leafy; corolla ventricose, with the throat closed by villi; capsule somewhat compressed, furnished with a somewhat winged nerve on both sides. O. F. Native of the East Indies, Java, Timor, &c. on the edges of rice-fields. Old. alata, Wall. in herb. Puer. Hedyotis ramosissima, Blum. bijdr. p. 972. but not of Fisch. Perhaps Hedyotis paniculata, Lam. ill. 1412. but the figure in Burm. ind. t. 71. f. 2. cited for this plant has 5-clawed flowers, and is consequently not it. From the capsules being furnished with a somewhat winged nerve on each side, it comes very near to the genus Gonotheca. Flowers small, white.

**Wingel-nerved-capsulate Oldenlandia.** Pl. ½ foot.

35 O. **macrophyl'la** (Lepr. et Perr. miss. under Hedyotis, ex D. C. prod. 4. p. 427.) plant glabrous, erect, branched; leaves sessile, lanceolate, acuminate; stipulas undivided; peduncles axillary, racemose, longer than the leaves; pedicels in 4-5 opposite pairs.—Native of the Gambia, in rice-fields at Albreda, where it was collected by Leprieur and Perrottet. Allied to O. alata. Capsule somewhat turbinate, and probably furnished with a nervèd wing on each side.

**Long-leaved Oldenlandia.** Pl. ½ foot.

36 O. **læc'tea** (Cham. et Schlecht. in Linnaea. 4. p. 159. under Gerontogea) stem terete, pubescent; leaves linear-lanceolate, acute at both ends, flat; stipulas bidentate, scarious; peduncles terminal; corollas villous inside; anthers oblong, exerted. O. F. Native of the East Indies. Hedyotis lactea, Wight in ann. hort. t. 35. p. 3. H. cymosa, Spreng. sys. 1. p. 413? Flowers cream-coloured.

**Milk-coloured-flowered Oldenlandia.** Pl. ½ foot.

37 O. **fe'tida** (Forst. prod. p. 55.) plant suffruticosse; leaves spathulate; stipulas almost entire; corynbs trichotomous. O. F. Native of the Island of Tongatabu. Hedyotis fa'tida, Spreng. pug. 2. p. 28. Gerontogea fa'tida, Cham. et Schlecht. in Linnaea. 4. p. 154. The leaves in Forster's specimen are elliptic and acute.

**Fetid Oldenlandia.** Pl. ½ foot.

38 O. **micro'tica** (Cham. et Schlecht. in Linnaea. 4. p. 169. under Gerontogea) plant herbaceous, erect, much branched;
leaves petiolate, ovate-lanceolate, acuminate, scabrous above; stigmas small, downy, dentately ciliated; flowers disposed in loose cyme terminal panicles. O. F. Native of Mexico, at Baranca de Tioscolos, in shady places, where it was collected by Deppe and Schlecht.—Chichin-tzontapatico de Ocoptelayeche. Hern. mex. p. 366. Corolla funnel-shaped, a line or more long. Capsules small. A larger variety of this is found about Taxmico, ex Cham. et Schlecht. in Linnaea. 6. p. 414.

Small-sheathed Oldenlandia. Pl. 1 to 1½ foot.

39 O. DEPEPAN A (Cham. et Schlecht, in Linnaea. 5. p. 169. under Gerontogea) plant shrubby, much branched, erect, glabrous; leaves petiolate, ovate-lanceolate, tapering into the petiole, firm, much acuminate, rather revolute, and scabrous on the margins; stigmas white, beset with glandular down, sessily jagged: the bristles thickened and glandular at the apex; flowers disposed in loose panicles at the ends of the branches. P. S. Native of Mexico, at San Andres, where it was collected by Schiede and Deppe. Gerontogea Deppeana, Link and Otto, neu abhild. t. 36. Leaves large, but hardly an inch long. Corolla about 3 lines long. Anthers bluish. Flowers sometimes only 3-parted.

Deppe's Oldenlandia. Shrub 1 foot.

40 O. SPERGULCEAE (D. C. prod. 4. p. 428.) plant erect, almost simple, hairy; leaves oval-oblong; stipulas cupulate, mucronate; peduncles almost terminal, elongated, many-flowered, naked, calyx glabrous; corolla tubular; anthers sessile; style at length bipartite to the base. O. H. Native of Nipaul. Herb a finger in height, with the habit of Sparganium. Upper leaves usually 4 in a whorl. Peduncles glabrous. From the dehiscence of the capsule it agrees with O. conoida; but is very different in habit.

Spurrey-like Oldenlandia. Pl. ½ foot.

41 O. BOTUNDOPIA (Ham. ex Wall. cat. no. 6190. under Hedyotis) leaves elliptic-ovate, rounded at the apex, downy, but most particularly so on the veins beneath, close together; peduncles long, axillary, and terminal, panied. O. H. Native of the East Indies, at Golaepara. Hedyotis scapigera, R. Br. in Wall. cat. no. 881.

Round-leaved Oldenlandia. Pl. ½ to 1½ foot.

42 O. MARITIMA; plant glabrous; stems erect; leaves linear or lanceolate, acute, with revolute edges; panicles terminal, erect; peduncles swelling toward the top, angular, erect; teeth of calyx distant. O. S. Native of the East Indies, by the sea-side. Hedyotis maritima, Wall. cat. no. 6192. Old, gramminifolia, Wall. Old, stricta, herb. Russ. Sea-side Oldenlandia. Pl. 1 foot.

43 O. OXYPHYLLA; glabrous; leaves linear-lanceolate, tapering to both ends; peduncles terminal and axillary, dichotomous, panied; pedicels short, bracteate; teeth of calyx distant. O. S. Native of the mountains of Silhet. Hedyotis oxyphylla, Wall. cat. no. 6193. Leaves like those of the weeping willow. Stipulas broad at the base, ending in 2 subulate points at the apex, and a small tooth on each side. Sharp-leaved Oldenlandia. Pl. 2 to 3 feet.

44 O. HEYNEI; glabrous; leaves linear; stems diffusely branched, panied; pedicels slender, 2-6 together; stipulas bifid, short; teeth of calyx distant. O. P. Native of the East Indies. Hedyotis Heynei, R. Br. in Wall. cat. no. 867. Oldenlandia herbacea, Heyne and Roxb. but not of Lim. Flowers white.

Heyne's Oldenlandia. Pl. 1 foot, diffuse.

45 O. TUBULOSA; glabrous, erect; leaves ovate, acute; peduncles terminal and axillary, umbrellate or capitiate; flowers crowded, almost sessile; tube of corolla long, slender. O. F. Native of the East Indies. Hedyotis tubularis, R. Br. in Wall. cat. no. 876. Hedyotis minima, Heyne, in Wall. cat. no. 857.

Table 1-flowered Oldenlandia. Pl. ½ to 1½ foot.

46 O. MYSORENSIS; downy; stems quadrangular; leaves ovate, acute, clothed with rusty down on the nerves and veins beneath, and on the petioles, ciliated on the margins; peduncles terminal and axillary, racemose, branched; flowers almost sessile. O. F. Native of Mysore. Hedyotis Mysorenensis, Heyne ex Wall. cat. no. 882.

Mysore Oldenlandia. Pl. 1 foot.

Species not sufficiently known.

47 O. VSIPDA (Roth, nov. spec. p. 93. under Hedyotis) the whole plant is hispid from bristles; stem ascending, dichotomous, terete; leaves petiolate, ovate-lanceolate; stigmas sessily toothed; peduncles axillary, bearing few-flowered umbels; corolla twice the length of the calyx lobes.—Native of the East Indies. Anthers linear, length of corolla. Hedyotis indica. Rox. et Schultes, syst. 3. p. 195.

Hispid Oldenlandia. Pl. ½ foot, procumbent.

48 O. ASPERA (Roth, nov. spec. p. 94. under Hedyotis) the whole plant is roughish from papillae; stem straight, filiform, terete; leaves linear-subulate; stipulas linear-subulate, a little toothed; raceme terminal, pedunculate, sub-fassiculate, naked; teeth of calyx linear, 4-times shorter than the tube of the corolla.—Native of the East Indies. Hedyotis asperta, Spreng. syst. 1. p. 415. The stamens being inclosed, it is very doubtful whether it belongs to this genus.

Rough Oldenlandia. Pl. ½ foot.

49 O. AFFINIS (Roxb. et Schultes, syst. 3. p. 194. under Hedyotis) plant erect, much branched; branches rather tetragonal, scabrous at the angles; leaves linear, acuminate, finely ciliated; stipulas tridentate; peduncles disposed in a loose, divaricate, dichotomous panicle; corolla twice the length of the calyx.—Native of the East Indies. Hedyotis dichotoma, Roth. nov. spec. p. 93. but the Oldenlandia dichotoma of Spreng, now called Vahlia dichotoma, is a very distinct plant. Corolla blue. Anthers inclosed, and therefore it ought to be excluded from the present genus, but it is said to be nearly allied to O. biflora and O. herbacea.

Allied Oldenlandia. Pl. ½ foot.

50 O. HISIRUTA (Lin. fil. suppl. p. 127.) stem herbaceous, diffuse, and are as well as the calyces hispid; leaves ovate, acute, petiolate, veiny; peduncles axillary, bearing few-flowered umbels.—Native of Java. Hedyotis hisiruta, Spreng. pug. 2. p. 35.

Hairy Oldenlandia. Pl. diffuse.

51 O. PUSILLA (Roth, in Wildl. act. amœn. nat. cur. berol. 4. p. 216.) stem branched, tetragonal, rough; leaves linear, acuminate; racemes axillary, simple, few-flowered.—Native of the East Indies. Hedyotis attenuata, Wildl. l. c. Said to be allied to O. grammisifolia.

Small Oldenlandia. Pl. ½ foot.

52 O. NEILLII (Forst. prod. no. 56.) leaves ovate, sessile; umbels axillary, pedunculate, few-flowered.—Native of the Island of Tongatabu. The rest unknown.

Weak Oldenlandia. Pl?.

Zanquebar Oldenlandia. Pl. ½ foot.

54 O. DEPRESSA (Willd. spec. 1. p. 675.) stem diffuse; leaves elliptic, petiolate, glabrous; peduncles axillary, twin, 1-flowered.—Native of the East Indies. Hedyotis depressa, 3 y 2
RUBIACEÆ.  LXXVIII. GONOTHECA.  LXXIX. KOHAUTIA.

N. B. Oldenlândia nudicáulis, Roth, nov. spec. p. 96, and Old. maritima, exclusive perhaps of the synonyme of Lin., differs from this genus in the flowers being of 4 distinct petals, and in the word of stipulas; they therefore even do not belong to Rubiaceæ, but are probably Caryophyllaceous plants.

Cult. The species are not worth cultivating, unless in botanic gardens. A very sandy soil suits them best, and cuttings of the shrubby kinds will root in sand, under a hand-glass, or by seeds. The annual kinds should be treated like other tender annuals, by being raised on a hot-bed, and afterwards planted out. All the species require a considerable degree of moisture.

LXXVIII. GONOTHECA (from γωνία, gonia, an angle, and ἄφθρον, theke, a sheath; in reference to the capsule, which is furnished with a double wing on each side). Blum. non ex D. C. prod. 4. p. 429. but not of Rafin.—Hedyótis species, Blum. bijdr.

LIN. SYST. Tetrandria, Monogynia. Calyx with a somewhat compressed tube, and a short truncate somewhat 4-toothed limb. Corolla having the tube inflatet at the base, the throat villons, and the lobes keeled. Stamens inclosed. Style wanting; stigmas 2, obtuse. Capsule compressed, margined by a double wing on both sides, which runs down the pedicel, crowned by the tube and short limb of the calyx, and decorralling between the stigmas, membranous, 2-celled. Seeds numerous, ovate, small, scrobicular. —A glabrous, erect herb, with the habit of Oldenlândia. Stem divaricate, quadrangular. Leaves lanceolate, almost sessile. Stipulas toothed. Cymes pedunculate, axillary, and terminal, and flowered, few-flowered.

Blume’s Gonotheca. Pl. ½ foot.

Cult. See Kédua, p. 533. for culture and propagation.

LXXIX. KOHAUTIA (in memory of Francis Kohaut, who collected many plants and other objects of natural history in Senegal). Cham. et Schlecht. in Linnaea. 4. p. 156. D. C. prod. 4. p. 429.—Knóxia and Hedyótis species of authors.

LIN. SYST. Tetrandria, Monogynia. Calyx with an obovate tube; teeth acute, separated by acute recesses while in flower, but at last by very broad ones. Corolla with a long terete tube, and oval-lanceolate lobes, which are usually cuspitate by a mucron. Anters sessile, within the tube, inclosed under the throat. Style shorter than the anthers, bifid at the apex. Capsule globose, membranous, crowned by the teeth of the calyx, 2-celled, dehiscing at the cells. Seeds innumerable, small, half immersed in pits on the placentas, which are globose and stand on short pedicels. —Erect, twiggy, glabrous, branched herbs, with the habit of Aspérula. Leaves opposite, linear, or linear-lanceolate. Stipulas joined to the petioles, furnished with one or few bristles. Cymes terminal, corymbose, or loosely spicate.

1 K. GRANDIFLORA (D. C. prod. 4. p. 430.) leaves linear, lower ones the broadest, and nearly lanceolate; uppermost ones very slender and subulate; stipulas membranous, connecting the petioles; lower ones cuspidate in the middle, the rest furnished with 2 bristles on both sides; flowers trichotomously corymbose; lobes of corolla oval, mucronate. ♀ S. Native of Senegal, from which place it was sent by Bacle, under the name of Hedyótis herbaceæ; and in sandy places at Kounonn, where it was collected by Perrotet and Leprieur. Tube of corolla 6 lines long, and the lobes 3 lines long and 1½ broad.

Great-flowered Kohautia. Shrub ½ to 1 foot.

2 K. SÈNGGALÈNSIS (Cham. et Schlecht. in Linnaea. 4. p. 156.) leaves linear; floral ones subulate; stipulas with very narrow margins, joining the petioles, furnished with 2 bristles; flowers on short pedicels along the branches and at their tops, distant; lobes of corolla lanceolate. ♀ S. Native of Senegal. Knóxia Senegalensis, Reichh. in Sieb. fl. seneg. exsic. no. 9. Tube of corolla 4½ lines long; and the lobes 2½ lines long.

Senegal Kohautia. Shrub ½ to 1 foot.

3 K. STRÎCTA (D. C. prod. 4. p. 430.) leaves linear, with sub-revolute margins; stipulas joined to the petioles by a very narrow margin, furnished each with 2 short bristles; flowers trichotomously corymbose; lobes of corolla oblong-linear. ♂ S. Native of Senegal at Walo and Lampar, where it was collected by Leprieur and Perrotet; and at Sierra Leone by Afzelius. Hedyótis stricta, Smith, in Rees’s cyc. vol. 17, no. 21, but not of Wall. Root simple, perpendicular, white. Tube of corolla 5 lines long; and the lobes 2½ lines long and hardly a line broad.

Straight Kohautia. Pl. ½ foot.

4 K. Longiflóra (D. C. prod. 4. p. 430.) leaves linear, hardly acute; stipulas short, with many bristles; bristles spreading a little, length of membrane; flowers pedicellate along the branches on one side; corolla with a very long tube, and linear, hardly acute lobes. ♀ G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 1987. Tube of corolla 7 lines long; and the lobes 3 lines long, and scarcely a line in breadth. Teeth of calyx short. Pedicels 2½ lines long.

Long-flowered Kohautia. Pl. ½ foot.

5 K. CYNÁNCHICA (D. C. prod. 4. p. 430.) leaves linear, acute; stipulas membranous, joining the petioles; bristles reflexed, twin on both sides, at last deciduous; corybas few-flowered; lobes of corolla linear, hardly acute. ♀ G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 772. Capsule turbinate. Teeth of calyx short. Tube of corolla 3 lines long; with the lobes a little shorter than the tube.

Cyananchica-like Kohautia. Shrub ½ to 1 foot.

6 K. Setîfera (D. C. prod. 4. p. 430.) leaves linear, cuspidately mucronate, with somewhat revolute edges; stipulas membranous, joining the petioles, cleft into 4 spreading bristles on both sides, which are longer than the membrane; corybas few-flowered; lobes of corolla short, oval. ♀ G. Native of the south of Africa, where it was collected by Burchell, ex cat. geogr. no. 2392. Plant hardly a hand high. Bracteas stipulaceous, membranous, multifid. Tube of corolla hardly 2 lines long.

Bristle-bearing Kohautia. Pl. ½ foot.

7 K. GRÀCIALIS (D. C. l. c.) leaves linear; branches and peduncles compressed; stipulas truncate, fringed, at length naked; flowers on long peduncles, rising from the forks and from the tops of the branches; lobes of corolla linear-lanceolate, blunting, a little shorter than the tube. ♂ F. Native of Niaoul. Hedyótis stricta, Wall. act. soc. asiât. 13. p. 369, but not of Smith. Hedyórís gràciælis, Wall. in Roxb. fl. ind. p. 377. Hed. ìäs, Hamilt. ex D. Don, prod. fl. nep. p. 134. Tube of corolla 4 lines long; and the lobes 3 lines long, and hardly a line broad.

Slender Kohautia. Pl. ½ to 1 foot.

Cult. For culture and propagation see Oldenlândia above.
LXXII. KADUA. LXXIII. ANOTIS.

Linn. Syst. Tetradria, Monogynia. Calyx with a hemispherical tube, and a 4-creft or 4-toothed limb. Corolla coriaceous, glabrous inside, salver-shaped: with a long tube and a 4-creft limb. Genitalis inclosed. Anthers linear or oblong, almost sessile within the tube. Style filiform, thickest at the apex and bident: lobes bearing papillae inside. Capsule globose or elliptic, 2-celled, half adnate to the calyx, which is sometimes dry and sometimes fleshy, usually crowned by the segments of the calyx, dehiscing at the cells at the apex. Seeds immeasurable, small, angular, inserted in the placenta, which are spongy, and fixed to the middle dissepiment.—Smooth Australian sub-shrubs. Leaves opposite. Stipula soliaty on each side, acute, entire. Flowers in terminal cymes or solitary and axillary, pedunculate.

1. K. Cookiana (Cham. et Schlecht. in Linnaea. 4. p. 158.) branches opposite, terete; leaves linear, acute, with revolute margins; flowers few, terminal; capsule beaked at the apex. &. G. Native of the Island of O-Wahu. The beak of the capsule having both a loculichal and septicidal dehiscence at the same time, hence the capsule is at length apparently 4-beaked.

Cook's Kadua. Shrub ½ to 1 foot.

2. K. cordata (Cham. et Schlecht. l. c. p. 160.) branches almost terete; leaves sessile; upper ones coriaceous, acuminated, coriaceous; cymes dichotomous and trichotomous, leafy; capsule turbinate hemispherical, beakless. &. G. Native of the Island of O-Wahu. Lower leaves oblong-lanceolate.

Cordate-leaved Kadua. Shrub ½ to 1 foot.

3. K. glamera (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) lower parts of branches almost terete, upper part compressed; leaves oblong-lanceolate, suddenly contracted at the base into a very short pedicel; pedicels terminal, with elongated opposite branches, bearing each 2 falcate bracteas at the apex, and glomerate flowers; calyx and corolla downy. &. G. Native of the Sandwich Islands. The flowers may be said to be axillary, pedunculate, capitate, if the axis of the pedicle be viewed as a continuation of the branch. Teeth of calyx linear, stiff.

Glomerated-flowered Kadua. Shrub ½ to 1 foot.

4. K. Arnottii: plant erect, glabrous, branched; leaves oblong, on short pedicles; stipulae undivided, triangular; flowers disposed in fssicles in the axils of the superior leaves, the whole forming interrupted racemes; calyces downy; tube of corolla very long, terete: lobes obtuse, revolute; style bipartite to the base. &. G. Native of the Sandwich Islands, where it is called by the natives Kire. Hedychium conostyla, Gaud. in Freyc. voy. pt. bot. p. 471, t. 91. Oldenlandia conostyla, D. C..prod. 4. p. 428. Nearly allied to the preceding species, according to Arnott. Arnott's Kadua. Shrub ½ to 1 foot.

5. K. Menziesiana (Cham. et Schlecht. l. c. p. 160.) branches tetragonal; leaves elliptic, petiolar, bluntly acuminate, downy beneath at the base; stipulae glandular, truncate; cymes terminal, few-flowered; peduncles compressed, downy; drupe rather convex at the apex. &. G. Native of the Island of O-Wahu.

Menzie's Kadua. Shrub ½ to 1 foot.

6. K. Smithii (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) branches terete, but compressed towards the tops; leaves coriaceous, ovate-elliptic, glabrous, petiolar; stipulae triangular, bluntly apiculate; pedicel terminal, trichotomous, decuse; calyces and corollas downy. &. G. Native of the Sandwich Islands. Hedychium coriaceum. Smith, in Rees's cycl. vol. 17. no. 11. The tube of the corolla is long, and the segments of the limb are deflexed, with long-acuminated recurved points.

Smith's Kadua. Shrub ½ to 1 foot.

7. K. centranthoides (Hook. et Arn. in Beech. voy. pt. bot. p. 85.) branches tetragonal, densely leafy; leaves ovate-oblong, obtuse, or somewhat acuminate, on short pedicels, rather coriaceous; stipulae furnished with a sub-glandular mucron; flowers terminal, 1-3 together, pedicellate; drupe obovate. &. G. Native of the coral island, called Romanzoff's Island.

Romanzoff Island Kadua. Shrub ½ to 1 foot.

8. K. acuminata (Cham. et Schlecht. l. c. p. 163.) branches terete, compressed towards the tops; leaves lanceolate, long-acuminated, distinctly petiolate, rather coriaceous; stipulae triangular, acuminate; flowers axillary, usually twin, pedicellate; the teeth of calyx narrow-lanceolate, equal in length to the tube of the corolla; capsule globose. &. G. Native of the Sandwich islands, particularly of O-Wahu.

Acuminated-Leaved Kadua. Shrub ½ to 1 foot.

9. K. bordentia (Cham. et Schlecht. l. c. p. 164.) branches tetragonal, wrinkled transversely; leaves elliptic-lanceolate, acute, obtuse at the base, on short pedicels; stipulae membranous, deciduous, toothed a little on both sides; corolla thiroid, terminal; drupe nearly globose, crowned by the remaining part of the calyx, indehiscent. &. G. Native of the Island of O-Wahu. Flowers unknown.

Allied Kadua. Shrub ½ to 1 foot.

Cult. None of the species are worth cultivating, except in botanic gardens. They will grow in any light soil; and will be easily increased by cuttings planted under a glass-house, or by seed, which latter mode will be preferable.

LXXIII. ANOTIS (from a priv. awc wroc, qux olos, an ear; there are no accessory teeth to the calyx). D. C. prod. 4. p. 431.

Hedychium specios, Ruiz et Pav. et Cav.—Houstonia species, Lin. and others.

Linn. Syst. Tetradria, Monogynia. Calyx with an obovate tube, and a 4-toothed limb (f. 96. a.) teeth acute, separated by acute recesses, with no accessory ones. Corolla salver-shaped (f. 96. b.), having the tube a little longer than the lobes; limb 4-creft; throat almost glabrous. Anthers inclosed or a little exserted (f. 96. c.). Stigma somewhat 2-lobed (f. 96. c.). Capsule ovate, crowned by the calyx, 2-celled, with a loculichal dehiscence at the apex. Seeds 4-8 in each cell, ovate, and rather angular.—Subshrubs and herbs, natives of America. Leaves opposite, linear, mucronate or oval. Stipulas undivided or toothed. Flowers terminal, solitary or corymbose. This genus is nearly allied to Ruchiedillas, but differs from that genus in the want of accessory teeth to the calyx, whence the generic name. The genus probably contains the types of 3 different genera, which it may hereafter be necessary to separate.

Sect. 1. Erichtio. (this name has been given to this section on account of the plants contained in it having the habit of heaths). D. C. prod. 4. p. 431. Heath-like small shrubs, rarely herbs. Leaves linear, mucronate. Corolla salver-shaped, having the tube longer than the lobes (f. 96. d.). Tube of calyx almost adnate with the ovary to the apex.
1 A. filiformis D. C. prod. 4. p. 431.) stems herbaceous, creeping, much branched, tetragonal, glabrous; leaves sessile, linear, apiculate, rather ciliate; stipules small, ciliate; flowers solitary, terminal, almost sessile; anthers exerted. 2. F. Native of Peru, on the Andes, in frigid places. Hedyotis filiformis, Ruiz et Pav. fl. per. 1. p. 67. t. 87. f. b. Habit of a species of Galium. Corolla white; limb spreading at first, but reflexed at last. Lobes of calyx lanceolate, acute. Capsule ovate. (f. 96.)

Filiform Anotis. Pl. proc.

2 A. conferta (D. C. prod. 4. p. 431.) stem creeping, much branched; branches ascending, tetragonal; leaves linear, apiculated, flat, glabrous; stipulas subulate; flowers terminal, solitary; anthers at the throat. 2. F. Native of Peru, on the Andes of Tarma and Cantun. Hedyotis conferta, Ruiz et Pav. fl. per. 1. p. 57. t. 87. f. a. Leaves 2-3 lines long. Corolla white. Capsule glabrous, emarginate.

Crowded Anotis. Pl. climbing.

3 A. hypnoides (D. C. prod. 4. p. 432.) stems suffruticos, creeping, tufted; branches tetragonal; leaves sessile, linear-lanceolate, glabrous, piliiferous at the apex; stipulas subulate at the apex; flowers terminal, solitary, sessile; anthers exerted. 2. F. Native of the province of Quito, in very cold places of the Andes, about Assnaya. Houstonia bryoides, Willd. herb. ex Kunt. Hedyotis hypnoides, H. B. et Kunt, nov. gen. amer. 3. p. 389. Leaves hardly a line long. Corollas white.

Hypanum-like Anotis. Pl. creeping.

4 A. juniperifolia (D. C. prod. 4. p. 432.) plant suffruticos, procumbent, much branched; branches tetragonal; leaves linear, apiculated, sessile, with revolute edges; stipulas ovate, acute; flowers terminal, tern, pedicellate. 2. F. Native of Peru, in high frigid places of the Andes, of Tarma, and Cantun. Hedyotis juniperifolia, Ruiz et Pav. fl. per. 1. p. 57. t. 87. f. c. Corollas unknown.

Juniper-leaved Anotis. Pl. proc.

5 A. microphylla (D. C. l. c.) stems suffruticos, creeping; branches nearly terete; leaves oblong, glabrous on short pedicels, piliferous at the apex; stipulas tridentate at the apex; flowers solitary, sessile, terminal, but at length lateral; anthers exerted; cells of capsule 4-5-seeded. 2. F. Native of Peru, near the mines of Guanayaco, and the city of Minijampa. Hedyotis microphylla, H. B. et Kunt, nov. gen. amer. 3. p. 389. Willd. in Schultes, syst. 3. p. 526.

Small-leaved Anotis. Pl. creeping.

Cervantes’s Anotis. Shrub diffuse and tufted.

7 A. thyoides (D. C. l. c.) plant shrubby, erect, much branched; branches hairy; leaves sessile, linear, glabrous, with revolute margins; stipulas acutely bilab; corymbs terminal, trichotomous; cells of capsule 8-seeded. 2. F. Native of Peru, on high hills in the provinces of Tarma and Caxtambo. Hedyotis thyoides, Ruiz et Pav. 1. p. 56. t. 88. f. a. Leaves 5-6 lines long. Corollas white. Capsule obovate. Branchlets subtetragonal.

Var. γ. hyssopifolia (D. C. l. c.) plant suffruticosse; leaves an inch long; corymbs terminal, trichotomous. 2. F. Native of Chili, near Coquimbo; and of Peru, at Guamantanta and St. Bonaventura. Hedyotis hyssopifolia, Cav. icon. 6. p. 54. t. 575. f. 2. Corolla as in var. β. Branchlets bluntly tetragonal. Seeds larger than in any of its congeners, and is perhaps a proper species.

Thyme-leaved Anotis. Shrub 1 to 2 feet.

8 A. lariciofolia (D. C. l. c.) plant suffruticos, erect, branched, glabrous; leaves sessile, linear, acute, with hardly revolute margins; stipulas acute; peduncles 3-5-flowered, rising from the forks of the branches; anthers exerted. 2. F. Native of the Cordillera of Chili, on the highest mountains. Hed. lariciofolia, Cav. icon. 6. p. 54. t. 575. f. 1. Corolla of a redish brown colour, funnel-shaped. Capsule ovate, truncate.

Larch-leaved Anotis. Shrub ¾ to 1 foot.

9 A. setosa (D. C. l. c.) plant shrubby, erect, much branched; leaves on short petioles, ovate, acute, ciliately serrated, glabrous; stipulas connate, ovate, furnished with many bristles at the apex; flowers terminal, usually by threes. 2. F. Native of Peru, on the Andes at Churupallana and Huassa-Huassi. Hed. setosa, Ruiz et Pav. fl. per. 1. p. 56. t. 88. f. a. Corolla large, purple, with a broad terete tube, and having the lobes almost one-half shorter than the tube. Habit of Rachicädites nitida, but differs from it in the calyx being 4-lobed, without any accessory teeth. Anthers inclosed.

Bristly Anotis. Shrub 2 to 4 feet.

10 A. ericoides (D. C. prod. 4. p. 433.) leaves linear, in fascicles, furrowed; flowers terminal, subcorymbose. 2. F. Native of Peru, ex Rem. ex Schultes; and of New Granada, in icy places on the Andes, between Oma and Paramo de Sarragu, ex Kunt. The rest unknown. Hed. ericoides, Willd. herb. in Schultes, syst. 3. p. 527. and in Kunt, nov. gen. amer. 3. p. 393.

Heath-like Anotis. Shrub ½ to ¾ foot.

Sector II. Asphiodéités (asphi, amphhi, on both sides, and o vs oto, ovs oto, on ear). D. C. prod. 4. p. 433. Herbs erect. Leaves ovate, or lanceolate. Corymbs trichotomous. Corolla salver-shaped. Calyx drawn out to half the length of the ovarium only; the capsule is therefore naked at the apex.

11 A. lanceolátula (D. C. diss. ined. with a figure, ex prod. 4. p. 433.) plant glabrous; stem erect, tetragonal, with the angles a little winged; leaves sessile, lanceolate, acute, glabrous; stipulas lanceolate, membranous; corymbs trichotomous, terminal; corolla funnel-shaped; anthers exerted; capsule globose, half-adnate to the calyx. 2. F. Native of the south of Carolina, where it was detected by Bosc. Hed. lanceolátula, Poir. suppl. 3. p. 14. Genus novum, Fraser, mss. in herb. L’Her. Seeds nearly globose, 4-5 in each cell. Lobes of calyx linear, permanent, exceeding the capsule a little. Corolla purplish.
Lanceolate-leaved Anotis. Pl. 1/2 to 1/2 foot.

13 A. citrofolia; radical leaves ovate, obtuse, attenuated at the base, with ciliated edges: cauline ones ovate-spatulate, sessile; flowers corymbose, terminal, pedicellate; peduncles trichotomous; calyx segments linear-lanceolate; stem glabrous, branched at the top. 2. H. Native of North America, in Goat Island, and at the Falls of Niagara. Houstonia citroides, Torrey, fl. un. st. 1 p. 174. Hedyotis citroides, Hook. fl. amer. bor. 1 p. 286.

Ciliated-leaved Anotis. Pl. 1 foot.

14 A. purpurea; stems erect, branched at the top, and downy at the joints; leaves ovate-lanceolate or linear-lanceolate, sessile; corynbs terminal. 2. H. Native from Pennsylvania to Carolina, in dry woods. Knoxia purpurea, Lam. ill. p. 239. Houstonia purpurea, Lam. ill. 251. Hedyotis umbellata, Walt. fl. car. 85. Hed. varianis, Michx. fl. amer. bor. 1 p. 80. Flowers purple.

Sect. III. PANETOS (the plants flower all the year round). Rafin., in ann. gen. prod. phys. 5. p. 227. D. C. prod. 4. p. 433. Prostrate or creeping plants, with the habit of Anagallis. Leaves ovate-roundish. Flowers axillary and terminal, solitary. Calyx not adnate to the ovary at the apex, and therefore the capsule is naked at the top.

15 A. rotundifolia (D. C. prod. 4. p. 433.) stems herbarious, prostrate, branched; branches tetragonal; leaves nearly orbicular, on short petioles, glabrous, hardly ciliated; stipulas small; flowers axillary, solitary, on short pedicels; corolla salver-shaped, having the tube 3 times longer than the calyx; capsule half-adnate to the calyx. 2. H. Native of Carolina and Florinda, in dry exposed places by the sea side. Houstonia rotundifolia, Michx. fl. bor. amer. 1 p. 85. Ell. sketch. 1 p. 195. Anonymos procumbens, Walt. car. p. 86. Poirèia procumbens, Gmel. syst. 263. Habit of Verónica nummulariifolia. Flowers white.

Round-leaved Anotis. Pl. prostrate.

16 A. Salzmanni (D. C. l. c.) stems herbaceous, prostrate, branched; leaves nearly orbicular, on short petioles, glabrous, hardly ciliated; stipulas hardly any; flowers axillary, solitary, having the pedicels exceeding the leaves; corolla campanulate, twice the length of the lobes of the calyx, which are oval. 2. S. Native of Brazil, about Bahia frequent. Intermediate between the preceding and following species. Corollas pale red.

Salzmanni's Anotis. Pl. prostrate.

17 A. serpens (D. C. prod. 4. p. 433.) stems suffruticose, creeping, much branched; branches tetragonal; leaves roundish-ovate or elliptic, petiolate, entire, glabrous, with spinulose ciliated edges; stipulas dentately ciliated; flowers axillary, solitary, pedunculate; corolla subulate, ciliated a little; anthers a little exerted. 3. F. Native of Quino, on the burning Mount Antisana. Hedyotis sérpens, H. B. et Kunth, nov. gen. amer. 3. p. 390. t. 289. Hed. microphylla, Willd. herb. in Roem. et Schultes, syst. 3. p. 527. Houstonia microphylla, Willd. herb. 3. Corolla white, with a very short tube, and the lobes of the calyx distant as in Oldenlandia. Seeds usually 5 in each cell.

Creeping Anotis. Pl. creeping.

18 A. cærulea; plant tufted; stems erect, dichotomous; leaves ovalate-lanceolate, attenuated at the base: radical ones spatulate, and a little hairy; peduncles elongated, 1-flowered; corollas salver-shaped, with acute lobes. 2. H. Native of Virginia; and of Canada, about Quebec. Houstonia cærulea, Lin. spec. p. 152. Pursh. fl. amer. sept. 1. p. 106. Sims, bot. mag. t. 370. Houstonia Linnæi a, Michx. fl. bor. amer. 1 p. 84. Hedyotis coriacea, Hook. fl. bor. amer. 1 p. 286. A small tufted plant, with the habit of Anagallis tenuiflora, with light blue flowers. The first peduncles are 2-flowered. There is also a variety of this with white flowers.

20 A. tenella; stems creeping, filiform; leaves orbicular, acute, nerved; peduncles terminal, one-flowered, very long. 2. H. Native of North Carolina, on high mountains. Houstonia tenuella, Pursh. fl. amer. sept. 1. p. 106. Flowers purple. Very like A. serpyllifolia.

Slender Anotis. Pl. creeping.

Cult. This is a genus of pretty little plants. All the species require to be grown in small pots, well drained with sherds, in a mixture of peat and sand. They are increased by dividing at the root. Those natives of warm climates require protection in winter, by placing them in a frame or greenhouse.

LXXII. RACHICALLIS (from ράχις, rachia, a cag by the sea side, and καλλος, kallos, beauty; because the plants ornament the rocks by the sea side). D. C. prod. 4. p. 433.—Hedyotis species, Swartz, Knuth, &c.

Lin. syst. Tetrandria, Monogynia. Calyx with a hemispherical tube, and a 4-lobed limb, furnished with from 1-3 accessory teeth between each of the lobes. Corolla with a long terete tube, a short spreading bluntly 4-lobed limb, and a beardless throat. Anthers at the throat, inclosed. Stigma 2-lobed. Capsule rather dilynous, dehiscing by 2 valves at the cells, and crowned by the teeth of the calyx. Seeds 8-20 in each cell.

—Small shrubby South American plants, inhabitants of rocks by the sea side, with the habit of Passerina. Leaves oblong, fleshy, with revolute edges, sessile. Stipulas connate, unidentid or tridentate. Flowers solitary, sessile.

1 R. nitida (D. C. prod. 4. p. 433.) plant shrubby, much branched; branches crowded, densely leafy; leaves linear, acute, fleshy, with revolute margins, glabrous, and shining on both surfaces; stipulas connate, short, trifid at the apex; flowers solitary, terminal, sessile; corolla glabrous. 2. S. Native near Santa Fe de Bogotá. Hedyotis nitida, H. B. et Kunth, nov. gen. amer. 3. p. 592. Lobes of calyx 4, linear-lanceolate, fur-
nished with 2-3 linear accessory teeth between each. Anthers exerted. Capsule globose, turbinate at the base. Seeds ovate, angular, 8-9 in each cell.

**Shining Rockrascal** Shrubs 2 to 3 feet.

2 **R. repumatica** (D. C. pro. 4. p. 434.) plant shrubby, much branched; branches twisted, corky; leaves crowded in stellate fascicles, oblong, fleshy, with revolute edges, shining above; stipules connate, pubescent inside; flowers axillary, solitary, sessile; corollas villous, with a curved tube.  "Native of the Caribbean Islands, on rocks by the sea side; as of Cuba, Jamaica, &c. Hedýytis repústri, Swartz, prod. p. 29. H. B. et Kunth, nov. gen. amer. 3. p. 391. Hed. Americana, Jacq. am. p. 20. Oldenlándia repústri, Lam. dict. 4. p. 535. —Slone, Jam. t. 202. f. 1. Habit of Passerina. Corolla yellow. Calyx 4-cleft; lobes woolly inside, with 4 accessory teeth between each. Seeds ovate, angular, about 20 in each cell. This plant has been incertae sedis to the genus *Buchaea* by Smith in Reeve's cyc. vol. 17.

**Rockrascal** Shrubs 2 to 3 feet.

3 **R. Caracačana** (D. C. l. c.) plant suffrutescent, much branched; branches leafy at top; leaves oblong, acute, fleshy, with revolute margins, spreading, glabrous, and shining; flowers terminal and axillary, solitary, sessile.  "Native of South America, on the southern declivities of the mountains called Silla de Caracás. Hedýytis Caracasán, H. B. et Kunth, nov. gen. amer. 3. p. 393. Corolla violaceous.

**Caracaschi Rascaliss.** Shrubs 8 feet.

**Cult.** Elegant shrubby plants of difficult culture. A mixture of peat and sand will probably be the best soil for them, and they should be grown in pots half filled with pot-sherds. They may either be increased by seeds or by cuttings planted in sand, with a bell-glass over them. They should be placed on shelves in a green-house.

**LXXXIII. LUCYA (named by De Candolle after the late Lucy Dunal, who made many observations upon the Rubiaceae plants growing in the neighbourhood of Montpellier, as may be seen by comparing the fl. fr. ed. 3. vol. 5. p. 499., sister to Michel Felix Dunal, professor of botany at Montpellier.) D. C. prod. 4. p. 434.—Dunália, Spreng. but not of Kunth.—Hedýytis species, Swartz and A. Rich.—Peplis species, Lin.

**L. syst.** Tetrádria, Monogynía. Calyx with a hemispheric and the limb of 4 bifid ones, permanent. Corolla with a very short tube, and a 4-loved limb; lobes obtuse. Stamens shorter than the corolla. Style short, bifid. Capsule globose, dilynum, 2-celled, with a loculicidal and half septicidal dehiscence; hence the capsule appears 8-valved at the apex. Seed 2 in each cell, ex Spreng., 5-6, ex Rich.—A small herb, with the habitat of Péptis. Roots fibrous and tuberous. Stems short, glabrous. Leaves almost sessile, cordate-ovate, downy beneath; upper ones usually by fours. Flowers axillary, and nearly terminal, solitary on very short pedicels, small, white.

**Tuberous-rooted Lucy.** Herb small.

**Cult.** This plant should be treated like other tender annuals. It is not worth growing except in botanic gardens.

**L. syst.** Tetrádria, Monogynía. Calyx with a very short tube, adnate to the bottom of the ovarium, and a 4-parted limb; lobes subulate. Corolla with a very short tube, a bearded throat, and a 4-parted limb; lobes or segments oval. Stamens 4, with very short filaments, and inclosed anthers. Style 1, undivided. Capsule ovate, compressed, 2-celled, with a loculicidal dehiscence. Placentas oblong, ascending, adnate to the bottom of the dissepiment. Seeds numerous, very minute, angular, diaphanous. Embryo straight, slender, in fleshy albumen.—A glabrous herb, with the habit of *Gilium* or *Baffonia*. Leaves opposite, linear-subulate, having their bases connate from the almost entire stipular sheaths. Cymulus terminal, dichotomous, cymose, with small sessile flowers in the forks and tops of the branchlets, each flower propped by 2-4 bracteas. Corolla white.

**Procumbent Polypremium.** Pl. procumbent. **Cult.** This plant should be treated as other tender annuals.

**Tribe IV.**

**ISERTIEÆ (this tribe contains plants agreeing with the genus *létria*, in having a drupaceous fruit, containing many seeded pyrene or nuts). A. Rich. mem. soc. hist. nat. Par. 5. p. 108. and 235. D. C. prod. 4. p. 435. Fruit drupaceous (f. 97. g.), composed of numerous many-seeded pyrene (f. 97. c.). Albumen of seeds fleshy.—Shrubs or herbs. Leaves opposite. Stipulas interiofiliar.

**LXXV. META*B*OLOS (from μεταβόλος, metabolos, changeable; but the application is not evident). Blum. bijdr. p. 990. D. C. prod. 4. p. 435.—Sclerococcus, Burd. in herb. Haenke.

**L. syst.** Tetra-Pentándria, Monogynía. Calyx with an obovate roundish tube, and a 4, rarely 5-parted limb. Corolla funnelf-shaped, with a 4, rarely 5-cleft or parted limb. Stamens 4-5, inserted in the throat of the corolla. Style filiform; stigma thickened, 2-4-parted. Berry dry, crowned by the calyx, divisible into 2-4 many-seeded pyrene or nuts. Seeds angular, fixed to prominent placenitates.—Suffruticoso herbes. Stems tetragonal. Leaves opposite, with parallel veins. Stipulas twin on both sides, cut. Flowers disposed in whorles or axillary heads. This genus is evidently very distinct from *Hedýytis* in the fruit being indehiscent (ex Blum), and in the cells being usually 4 or 5.

1 **M. beenus** (Blum. bijdr. p. 991.) stem suffrutescente, prostrate; leaves on short petioles, ovato-lanceolate, acuminate, lined with veins, rather scabrous; whorls of flowers glomerate, axillary.  "Native of Java, in the province of Buitenzorg, in shady places.

**Veiny-leaved Metabolos.** Shrub prostrate.

2 **M. latifolius** (Blum. l. c.) stem suffrutescente, divericato; leaves on longish petioles, elliptic-lanceolate, acuminate at both ends, rather scabrous; flowers disposed in dense axillary glomerate whorles.  "Native of Java, on the mountains.

**Broad-leaved Metabolos.** Shrub diffuse.

3 **M. rugosus** (Blum. l. c.) stem shrubby, decumbent; leaves
oblong-lanceolate, acuminate, wrinkled, a little ciliated, downy beneath; flowers in dense axillary heaps; fruit containing 4 pyrenae. F. S. Native of Java, on the top of Mount Gede. Stigma exerted, 4-cleft.

Wrinkled Metabolos. Shrub procumbent.

4 M. prostratus (Blum. l. c.) stem suffruticoso, prostrate; leaves oblong-lanceolate, glabrous; heads of flowers axillary, sessile or pedunculate. F. S. Native of Java, in woods on the mountains.

Prostrate Metabolos. Shrub prostrate.

5 M. rigidus (Blum. l. c.) stem suffruticoso, erect; leaves elliptic-oblong, acuminate at both ends, stiff, glabrous; heaps of flowers axillary, bibracteate; calyx campanulate, quadrinerved. F. S. Native of Java, on Mount Seribu, and on Mount Bonok, in the province of Bantam. Leaves 6 inches long.

Stiff Metabolos. Shrub.

6 M. lineatus (Bartl. in herb. Haenke, ex D. C. prod. 4. p. 435. under the name of Sclerococcus) stem herbaceous, erect, and are, as well as the branches, beset with hairs; leaves on short petioles, ovate-lanceolate, acuminate, downy, lined with veins; heads of flowers somewhat corymbose, axillary, on short peduncles. F. S. Native of Mexico, according to Haenke, herb.; but probably of the Philippine Islands. Very like the following species, and probably only a variety of it. Stipulas membranaceous, and connate at the base, ending in long subulate bristles, as in M. centurica. Flowers small. Stamens a little exerted.

Lined-leaved Metabolos. Pl. erect.

7 M. cerulea (Blum. bijdr. p. 991.) stem suffruticoso, procumbent, and is, as well as the branches, beset with soft hairs; leaves lanceolate, on short petioles, acuminate, downy, lined with veins; heads of flowers subcorymbose, axillary. F. S. Native of Java, about Buitenzorg, in humid shady places.

Blue-flowered Metabolos. Shrub procumbent.

8 M. radiicans (Bartl. in herb. Haenke, under the name of Sclerococcus) stem herbaceous, radicant at the base, glabrous, having 2 downy lines at the apex; leaves lanceolate, petiolate, glabrous, pale beneath; teeth of stipulas setaceous; pedicels axillary, very short, disposed in a kind of half whorls, very short.—Native of the island of Luzon, one of the Philippines.

Rooting Metabolos. Pl. creeping.

9 M. angustifolius (Bartl. in herb. Haenke, under the generic name of Sclerococcus) stems shrubby; leaves linear-lanceolate, almost sessile, lined with veins, downy on the nerves beneath, as well as the branchlets; stipulas ovate-lanceolate, cuspidate, downy, a little toothed at the apex; flowers on short pedicels, disposed in axillary and terminal heaps. F. S. Native of the island of Manilla, near Sorzogon.

Narrow-leaved Metabolos. Shrub.

10 M. pterocercus (Bartl. in herb. Haenke, under the generic name of Sclerococcus, ex D. C. prod. 4. p. 436.) plant shrubby; leaves linear-oblong, attenuated at the base, glabrous above in the adult state, and clothed with rusty wool beneath, particularly on the nerves, as well as the branchlets; stipulas ovate, acute, quite entire; flowers axillary, glomerate, almost sessile. F. S. Native of Luzon, one of the Philippines, at Sorzogon. Some of the fruit examined have 3 cells only.

Rustic Metabolos. Shrub.

11 M. lewicatus (Bartl. in herb. Haenke, under the generic name of Sclerococcus, ex D. C. 1. c.) plant shrubby, smoothish; leaves ovate-lanceolate, petiolate, glabrous above, rather scabrous on the nerves beneath, as well as on the petioles and branchlets; stipulas lanceolate, pectinately ciliolate; flowers axillary, glomerate, almost sessile. F. S. Native of the island of Luzon, one of the Philippines.

Smooth Metabolos. Shrub.

Cult. For culture and propagation see Hamelia, p. 542.
Pondery Gonzalea. Shrub 8 to 9 feet.

G. Panameana (Pers. ench. 1. p. 132.) leaves oblong, acuminate, acute at the base, petiolate, hairy from very short down above, and whitish from shortomentum beneath; stipulas broad at the base, and subulate at the apex, length of the petioles, ½. S. Native of Panama and Mexico. Buena Panaménésia, Cav. icon. 6. p. 571. Branches sub-tetragonal. Corollas reddish yellow.

Panama Gonzalea. Shrub 5 to 7 feet.

G. cornifolia (H. B. et Kunth, nov. gen. amer. 3. p. 416.) leaves oblong or ovate-oblong, acuminate, downy on both surfaces; stipulas subulate at the apex; spikes terminal, elongated; calyceous lobes linear; fruit almost always 2-celled. ½. S. Native of Cuba, near Havannah, Porto-Rico, and Guadaloupe. Lygismum spicatum, Lam. ill. no. 1477. Gonzáles Panaménies, ex Guadalupe, Spreng. syst. 1. p. 417. ex herb. Balb. Barlieria hisnuta, Jacq. obs. with a good figure.

Spike-flowered Gonzalea. Shrub. 8 to 10 feet.

9 G. incanescens (D. C. prod. 4. p. 437.) leaves pubescent above, and canescent from adpressed silky villi beneath; lobes of calyx oblong. ½. S. Native of Tobago?

I. S. Gonzalea. Shrub.

Cult. For culture and propagation see Hamélia, p. 542.

Lin. syst. Hevéa. Monoïgía. Calyx with a subglobose tube, and a short permanent 4-6-toothed limb (f. 97. a.). Rich. Corolla with a long tube (f. 97. b.), which is more slender in the middle than anywhere else (f. 97. b.); and with 6 short obtuse erect lobes at the apex (f. 97. c.), which appear a little twisted before expansion, densely clothed with yellow down inside, having the recesses or sinuses between the lobes drawn out into little crests. Stamens 6, inclosed (f. 97. d.). Stigmas linear, erectly stellate (f. 97. e.). Berries globose (f. 97. f.), crowned by the calyx (f. 97. h.), containing 6 brittle many-seeded triquetrous pyriform (f. 97. c.), which are furrowed inside. Seeds subglobose, truncate at the base. Albumen fleshy.—South American trees, shrubs, or striated or quadrangular branches. Leaves oval, acuminate at both ends, on short petioles, clothed with short down beneath. Stipulas twin on each side, lanceolate-subulate. Thyrs terminal, many-flowered, spike-formed or panicle-formed; peduncles opposite. Flowers scarlet.

1 I. spiciflórum (D. C. prod. 4. p. 487.) leaves ovate-oblong, acuminate, acute at the base; thyrses spike-formed; flowers on very long pedicels along the axis. ½. S. Native of Guiana or Cayenne, where it was collected by Patris. Leaves and flowers like those of I. coecínea, but differing in the in florescence.

FIG. 97. Spike cylindrical, having the flowers on the lower part remote and opposite, and those at the top crowded. Corollas scarlet.

Spike-formed Isertia. Shrub 10 to 12 feet.

2 I. coccifera (Vahl. ecol. 2. p. 27.) leaves oval, acuminate, acute at the base; thyrs oblong, panicled. ½. S. Native of Guiana, Cayenne, and Maranham, as also on the banks of the Magdalena, among bushes. Guettardia cocchina, Aubl. guian. 1. p. 317. t. 125. Lam. ill. t. 259. Corolla an inch long, velvety on the outside, scarlet. Berries red. There is a variety of this plant, according to Kunth, having the leaves disposed 3 in a whorl. The wood is bitter. A decoction of the leaves is used by the Creoles in fomentations.

3 I. Henkeana (D. C. prod. 4. p. 437.) leaves oval, acuminate at both ends; thyrs ovate, panicle-formed, with verticillate branches. ½. S. Native of Mexico. Isertia cocicina, Bartl. in herb. Henke, ex D. C. 1. c. Calyxes as in I. parviflóra. Corolla unisetulate; a little smaller than those of the preceding, but one-half larger than those of the following, clothed with fine velvety down on the outside.

Henke’s Isertia. Shrub 8 to 10 feet.

4 I. parviflóra (Vahl. ecol. 2. p. 28. t. 15.) upper leaves oblong; lower ones cordsate at the base; thyrs ovate, panicle-formed, with opposite branches. ½. S. Native of Trinidad. Leaves almost glabrous, except on the nerves. Teeth of calyx 4, and of these are larger than the rest, and are probably formed of 2 combined ones each. Corolla scarlet, uniglular, glabrous on the outside. Fruit unknown.

Small-flowered Isertia. Shrub 8 to 10 feet.

Cult. The species are worth cultivating in every collection of stone plants, for the beauty of their leaves and panicles of showy scarlet blossoms; their culture and propagation are the same as that recommended for Hamélia, p. 542.

Tribe V.

Lin. syst. Pentadántria, Monoïgía. Calyx with an oblong tube, and a 5-toothed limb, 2 of the teeth opposite each other, larger than the rest, outer ones erect, incurved, the 2 smaller teeth convinient. Corolla and stamens unknown. Berry oblong, crowned by the limb of the calyx, 4-celled. Seeds many, nestling in the pulp. Albumen fleshy.—Perhaps this genus is distinct from Gonzáles or Evosómia, but it is hardly known.

1 T. du’bria (Gärtn. 1. c.) ½. G. Native of Chili. Nothing is known of this plant except the fruit.

Doubtful Tepesia. Shrub.

Cult. For culture and propagation see Hamélia, p. 542.

LXXXIX. EVO’SÓMIA (from ev, ev, well, and oσμη, smell).

**Lin. syst. Tetra-Pentádria, Monogynía.** Calyx with an ovate tube, and a very short 4-toothed limb (f. 98 a). Corolla subrotate, 4-cleft beyond the middle (f. 98 b). Stamens 4, inserted in the throat (f. 98 b), a little exerted or inclosed; anthers ovate. Style filiform; stigma thick or 4 lobed. Fruit ovate (f. 98 f), crowned by the calyx (f. 98 g), 4-celled (f. 98 h); cells many seeded.—Glabrous shrubs or small trees, with terete branches, natives of South America. Leaves petiolate, oval, acute at both ends, membranous. Stipulas ovate, acute, short, deciduous. Racemes short, by two or threes from the axils of the lower leaves; pedicels elongated, capillary. Flowers red. The young fruit in *E. Caripénis* is sweet-scented; hence the generic name.

1 E. *Caripénis* (Humb. et Bonpl. 1. c.) leaves oval, acuminate at both ends; racemes loose, a little longer than the pedi
telos; pedicels slender, elongated. F. S. Native of South America, in the province of Cumana, near Caripé. Flowers red (f. 98).

**Caripe Evosmia.** Tree 20 ft.

2 E. *aggregata* (Spreng. syst. 1. p. 417) leaves lanceolate, acuminate; flowers in fascicles; pedicels shorter than the calyx. F. S. Native of Peru, in groves on the Andes at Chucnero, Chinchao, and Muna.

O-Higginásía aggregátæ, Ruiz et Pav. fl. per. 1. p. 55. t. 83. f. b. Higginássia aggregata, Pers. ench. 1. p. 133. According to Jussieu, this plant is referable to *Sabicea*, but according to Kunth to *Gonzalezia*. But it certainly differs from all the other species of O-Higginásia of the fl. per. in the fruit being 4-celled and many-seeded. Flowers red.

**Aggregate-flowered Evosmia.** Shrub.

Cult. For culture and propagation see *Hamelía*, p. 542.

**Lin. syst. Tetra-Pentádria, Monogynía.** Calyx with an oblong or turbinate tube, and a 4-5-parted permanent limb. Corolla salver-shaped, with a long slender tube, a hairy throat, and a 4-5-parted limb; with the lobes acute. Stamens 4-5, inclosed or hardly exerted. Style filiform, clavate at the apex, 4-5-lobed. Berry almost globose, crowned by the calyx, 4-5-celled; cells many seeded. Seeds minute, angular.—Climbing shrubs or subshrubs. Leaves oval, acute, on short pedi
tels. Stipulas solitary on both sides. Flowers white, axillary, in sessile fascicles, or corymbose and pedunculate. Corollas pilose.

§ 1. **Parts of flowers quinary.**

1 S. *cinerea* (Aubl. guian. 1. p. 192, t. 75.) leaves ovate, acutish, villous above in the young state, but at length becoming glabrous, and clothed with dense white tomentum beneath; stipulas broad-ovate, acutish; flowers bracteate, disposed in axillary fascicles. F. S. Native of Guiana and Cayenne, in hedges and among bushes. Schwenkfeldia cinerea, Swartz, fl.

**Grey Sabicea.** Shrub cl.

2 S. *hirata* (Swartz, prod. 1. p. 46.) leaves ovate-lanceolate, acuminate, hairy on both surfaces; stipulas coriádate-ovate, large, membranous at the base, flowers peduncled, in short peduncles; inflorescence of 4 leaves. F. S. Native of Jamaica, and probably of Trinidad, if the specimen in Sibb. fl. trin. no. 327. be the same; of Porto-Rico, according to specimens from Bertero; and of Mexico, ex icon. fl. mex. ined. Flowers white. Berries snow white when ripe, ex Swartz; but in the figure in fl. mex. they are painted reddish, and is therefore probably a distinct species. Branches striated, hairy.

**Hairy Sabicea.** Shrub cl.

**Hirsute Sabicea.** Shrub cl.

4 S. *eríántha* (D. C. prod. 4. p. 439.) leaves elliptic-oblong, acuminate, pilose above, and clothed with hoary tomen
tum beneath; branches very hairy; stipulas ovate, acute, glabrous inside; flowers numerous, axillary, sessile; lobes of calyx linear; tube of corolla very pilose on the outside. F. S. Native of Brazil, in Bahia, in hedges, where it was collected by Salzmann, G. Don, &c.

**Woolly-flowered Sabicea.** Shrub cl.

5 S. *tirúlora* (D. C. prod. 4. p. 439.) stems twirly, velvety; leaves on short pedi
tels, oblong-lanceolate, acuminate, pale and villous beneath; stipulas lanceolate-subulate, undivided; flowers axillary, 1-3-together, rising from a short peduncle; bracteoles ciliated; ovarium long, glabrous, crowned by the elongated linear-subulate calycine teeth. F. S. Native of Madagascar. Triosteum tirúlora, Vahl, symb. 3. p. 37.

**Three-flowered Sabicea.** Shrub cl.

6 S.? *diversifóllia* (Pers. ench. 1. p. 203.) under side of leaves and branchlets hoary; the opposite leaves very unequal among themselves, the larger one broad, elliptic or ovate, obtuse, glabrous above, and hoary beneath; the smaller one brac

**Diverse-leaved Sabicea.** Shrub cl.

§ 2. **Parts of flowers usually or always quinary.**

7 S. *áspéra* (Aubl. guian. 1. p. 194. t. 76.) leaves elliptic, acuminate, rough above, and villous beneath; stipulas oblong-oblong, acute; flowers sessile, disposed in subverticillate fascicles. F. S. Native of Guiana, on the banks of the river Sine-

**Rough Sabicea.** Shrub cl.

8 S. *umbellátã* (Pers. ench. 1. p. 203.) leaves oval, acuminate, acute at the base, scabrous on both surfaces from adpressed down, pale beneath; stipulas ovate, spreading; corymba many-flowered, pedunculate. F. S. Native of Peru, in groves on the Andes at Cuchero, Macora, and Chinchao.
Flowers white. Berries white, roundish.

**Umbellifer-flowered Sabicea.** Shrub cl. 9 S. *Argillaria* (Bartl. in herb. Hanke, ex D. C. prod. 4. p. 440.), stem herbaceous, glabrous; leaves oblong-lanceolate, glabrous, ciliated with silky down; stipulas subulate; heads pedunculate, axillary, few-flowered, glabrous.—Native of Peru, on the mountains about the Guanoco.

**Dwarf Sabicea.** Pl. cl. ?

Cult. For culture and propagation see *Olosyta* below.

**XCI. OLOSTYLA** (from olos, holos, entire, and *στυλος, stylos*, a style; the style is undivided). D. C. prod. 4. p. 440.—Stylocoria, Labill. sert. calep. p. 47, but not of Cav.

**Lin. syst. Pentandria, Monogyyna.** Calyx with an ovate tube, and a very short 5-toothed limb. Corolla sub-rotate, with a short tube, which is pilose inside, and a 5-lobed limb; lobes valvate in ostivation, linear-lanceolate, with inflexed edges. Stamens 5, inserted in the throat of the corolla; anthers linear, exserted. Style clavate, undivided. Berry glabrous, crowned by the teeth of the calyx and urceolus, 4-celled; cells many-seeded. Seeds minute, elliptic, nesting in the pulp.—A glabrous unarmed shrub. Leaves opposite, ovate-oblong, coriaceous, on short petioles. Stipulas broad, short, apiculate. Flowers disposed in a terminal somewhat thyrsoid corymb.—

This genus differs from *Stylocarpina* in the fruit being 4-celled, not 2-celled as in that genus.

**Corolla-flowered Olostyla.** Shrub 5 to 6 feet. Cult. A mixture of loam, peat, and sand will suit this shrub; and cuttings will root in sand under a hand-glass. It is a very pretty shrub, and therefore worth cultivating.

**XCVII. AXANTHES** (from axon, axon, an axile-tree, and *άνθος, anthos*, a flower; the flowers are disposed in axillary heads or corymb). Blum. bijdr. p. 1002. D. C. prod. 4. p. 440.—Wallichia, Reinw. cat. hort. jum. fl. ex flora. 1822. p. 107. but not of Roxb. nor D. C.—Meeskühauthe, Blume. herb. ex D. C. l. c.

**Lin. syst. Pentandria, Monogyyna.** Flowers hermaphrodite, or dioecious but abortion. Calyx with an urceolate tube and an entire limb. Corolla rotate, with a short cylindrical tube, which is furnished with 5 fascicles of hairs in the throat, and spreading lobes. Stamens 5 in the hermaphrodite flowers, inserted in the throat of the corolla, hardly exserted. Ovarium and style wanting in the male flowers, but the ovarium in the female flowers is covered by a sulate disk. Style short; stigma 5-lobed: lobes at first connivent. Berry globose, crowned by the permanent calyx, 5-celled, many-seeded; placenta flabby. Seeds minute, beset with depressed dots.—Shrubs or trees. Leaves opposite. Flowers disposed in axillary heads or cymes, rarely in corymb.

* *Flowers dioecious by abortion.*

1 A. macrophylla (Blum. bijdr. p. 1002.) stem shrubby; ultimate branches rather tetragonal; leaves oblong, much acuminate, acutish at the base, shining above, but clothed with adpressed silky down beneath; heads of flowers axillary, sessile, involucrated. *S*. Native of Java, in mountain woods.

**Long-leaved Axanthes.** Shrub.

2 A. tomentosa (Blum. herb. and mss. ex D. C. prod. 4. p. 440.) stem unknown; branches geniculate, clothed with velvety tomentum; leaves oblong, much acuminate, glabrous above, but clothed with velvety tomentum on the nerves beneath as well as on the petioles; cymes pedunculate, axillary. *S*. Native of Polo Penang.

**Tomentose Axanthes.** Shrub.

3 A. strigosa (Blum. bijdr. p. 1002.) stem arborescent; ultimate branches geniculate, strigose; leaves oblong, attenuated at both ends, glabrous above, but rather strigose on the veins beneath; flowers on short peduncles, crowded, axillary. *S*. Native of Java, on the mountains of Seribu.

**Strigose Axanthes.** Tree small.

4 A. arborea (Blum. l. c.) stem arborescent; branches terete, glabrous; leaves oblong-lanceolate, acuminate at both ends, glabrous; cymes pedunculate, axillary. *S*. Native of Java, on the higher mountains, in woods. Wallichia arborea, Reinw. cat. hort. jum. fl. p. 11. ex Blume.

**Arborescent Axanthes.** Tree.

5 A. Timorensis (D. C. prod. 4. p. 441.) stem unknown; branchlets terete, and are as well as the petioles villous; leaves oblong, acuminate at both ends, glabrous above, but clothed with adpressed villi beneath on the veins; cymes axillary, pedunculate, bifid. *S*. Native of the Island of Timor. Calyx downy. Corolla clothed with strigose villi on the outside.

**Timor Axanthes.** Tree.

* *Flowers hermaphrodite.*

6 A. corystosa (Blum. l. c.) stem arborescent; ultimate branches somewhat tetragonal, puberulous; leaves glabrous, oblong-lanceolate, much acuminate at both ends, shining above, but downy beneath as well as the corymb, which are axillary. *S*. Native of Java, on the top of Mount Burangrang.

**Corymbose-flowered Axanthes.** Tree.

Cult. See *Hamelia*, p. 542. for culture and propagation.

**XCVIII. UROPHYLLUM** (from υρος, oura, a tail, and φυλλον, phyllon, a leaf; the leaves terminate in very long taper points). Jack and Wall. in Roxb. fl. ind. 2. p. 184. D. C. prod. 4. p. 441.—Wallichia, Roxb. nec. but not of others.

**Lin. syst. Pentandria, Monogyyna.** Calyx with an ovate tube, and a short, campanulate rather 5-cleft limb. Corolla funnel-shaped, with a bearded throat and a 5-parted limb; the lobes oblate, and valvate in abstation. Stamens 5, shorter than the limb; anthers linear. Stigma thick, 5-lobed. Ovarium crowned by a glandular disk. Berry globose, 5-celled; cells many-seeded. Seeds minute, shining, marked by pentagonal pores, as in *Pomatinum*. Erect shrubs. Leaves on short petioles, oblong-lanceolate, ending each in a very long taper point. Stipulas oblong, acute, deciduous. Peduncles axillary, short, bearing verticillate heads of flowers. Bracteas numerous, acute, surrounding the heads of flowers. Corollas greenish.

1 U. villifera (Jack and Wall. l. c.) shrub villous; branches terete; calyx 5-lobed. *S*. Native of Polo Penang. Branches as well as the veins of the leaves densely clothed with soft hairs. Leaves shining above and villous beneath, 10 inches long.

**Villos Urophyllum.** Shrub.

2 U. glabrum (Jack and Wall. l. c.) shrub glabrous; branches tetragonal; calyx almost entire. *S*. Native of Polo Penang, where it is called *Loda Utan* by the Malays. Leaves about 6 inches long.

**Glabrous Urophyllum.** Shrub. Cult. See *Hamelia*, p. 542. for culture and propagation.

**XCIV. HAMELIA** (so named in honour of Henry Louis du Hamel du Monceau, the celebrated author of several valuable

Linn. syst. Pentadactyla, Monogynia. Calyx with an oval tube, and a 5-toothed limb (f. 99. a.); teeth erect, short, acute, permanent. Corolla with a somewhat pentagonal tube (f. 99. b.), and a small, 5-lobed equal limb (f. 99. c.), which hardly spreads at all. Stamens 5, inserted in the middle of the tube (f. 99. b.) of the corolla, inclosed; anthers oblong-linear (f. 99. f.). Stigma obtuse, somewhat pentagonal (f. 99. c.). Berry oval, 5-furrowed, 5-celled (f. 99. d.), crowned by the calyx; cells membranous, many-seeded. Seeds small, compressed. Albumin fleshy.—American shrubs. Leaves opposite, or 3 or 4 in a whorl, petiolate, ovate-oblong, acute at both ends. Stipulas lanceolate-subulate, solitary on both sides. Cymes dichotomous or trichotomous, disposed usually in terminal panicles or corymbus. Bracteas small. Flowers of a crozaceous red colour.

* Leaves verticillate.

1 H. patens (Jacq. amer. p. 72. t. 50. pict. t. 72.) leaves 3 in a whorl, ovate-oblong, acuminate at both ends, clothed with villous pubescence; cymes di-trichotomous, coloured, disposed in a terminal pedunculate umbel; corolla cylindrical. § S. Native of Jamaica, Cuba, Mexico, Brazil, Peru, &c. in hedges on the mountains. Lin. spec. 246. Smith, exot. bot. t. 24. Garrn. fl. carp. 3. p. 196. f. 3. H. coecinea, Swartz, prod. p. 46. Duhamélia páterns, Pers. ench. 1. p. 203. H. páterns, Ruiz et Pav. fl. per. 2. p. 221. f. a.? Flowers almost scarlet. Berries black. Branches villous at top. There are varieties of this species with velvety, villous, or downy leaves, always most so on the under surface.

Var. b. crêta (Lam. dict. 3. p. 68.) racemes erect. § S. Native of Cuba, in woods; and of Mango Island. H. crêta, Jacq. amer. p. 71.

Var. γ. quinquiflora; leaves and branches of cymes 5 in a whorl. § S. Native of Mexico, on the mountains of Matatlano. H. páterns, Moc. et Sesse, fl. mex. icon. incl. H. verticillata, fl. mex. mass. incl. Perhaps a proper species.

2 II. Xorulleensis (H. B. et Kunth, nov. gen. amer. 3. p. 414) leaves 3 in a whorl, elliptic-oblong, acuminate, acute at the base, glabrous above and downy beneath; cymes composed of 5-6 spikes, terminal; corollas campanulately ventricose. § S. Native of Mexico, on the burning Mount Xorullo. Flowers of a yellowish red colour.

Xorullo Hamelia. Shrub 4 to 5 feet.

3 H. Christi (Ruiz et Pav. fl. per. 2. p. 69. t. 221. f. b.) leaves 3 in a whorl, oblong, hairy on both surfaces; cymes coloured, disposed in a terminal panicle; corollas cylindrically pentagonal. § S. Native of Peru, in groves. Duhamélia phacocarpa, Pers. Petioles and peduncles red. Flowers unisulateral, pedicellate. Corollas of a reddish coppery colour. Berry dark purple, globose, hispid.

4 H. latifolia (Rich. in Sieb. fl. trim. no. 32.) leaves 3 in a whorl, ovate-lanceolate, acuminate, acute at the base, glabrous on both surfaces; cymes dichotomous, few-flowered, disposed in a terminal pedunculate umbel; corollas cylindrical. § S. Native of Trinidad. Flowers smaller than those of H. patens, but similar in colour.

5 H. ventricosa (Swartz, prod. p. 46. fl. ind. occ. 1. p. 445.) leaves 3 in a whorl, quite glabrous, ovate-oblong, acuminate; racemes terminal (rarely axillary); flowers on long pedicles; corollas tubularly campanulate, ventricose. § S. Native of Jamaica, on hills, and among bushes in arid places, where we have seen it in great abundance from Kingston to the bottom of the Port Royal mountains, by the road side, and about Spanish Town; and of Mexico, about Real del Monte. Lindl. bot. reg. t. 1195. Sims, bot. mag. t. 1894. H. grandiflora, L'HEr. sert. ang. 4. t. 7. Salis. par. t. 55. Duhamélia ventricosa, Pers. ench. 1. p. 203.—Sloane, hist. jam. 2. no. 63. t. 183. f. 2. Margins of leaves at length becoming reddish. Flowers yellow, almost an inch long. Berries oblong, scarlet. This species grows to a considerable sized tree, affording boards for tables and cabinets, of the softness and grain of elm, whence its name Spanish elm. The cabinet makers, who use it much, call it Prince-wood. Perhaps H. pauciflora, Willd. rel. in Reem. et Schultes, syst. 5. p. 267. Stipulas linear-subulate, not pinnatifid, as said by Wildenow. Corollas glabrous, purple. There is a variety of this species having a 6-cleft corolla and 6 stamens.

** Leaves opposite.

7 H. chrysanthha (Swartz, prod. p. 46. fl. ind. occ. 1. p. 444.) leaves opposite, ovate-oblong, cuneate, acuminate, quite glabrous; racemes terminal; flowers pedicellate; corollas cylin.

drical; cymes of 1-3 flowers, generally in clusters; stems of small bushes, and according to Hawke, herb, of Mexico; and at Caracas, according to Vargas.—Browne, jam. 166. t. 14. f. 1. —Plum. amer. ed Burm. t. 218. f. 1.—Duhamélia chrysanthha, Pers. ench. 1. p. 203. exclusive of the syn. of Jacq. H. páterns, West. St. Croix. p. 200. Flowers yellow, almost an inch long, inflated in the middle.

8 H. lutea (Rohr ex Smith, in Rees's cyc. vol. 17. no. 4.) leaves opposite, ovate, acuminate, acute at the base, glabrous; cymes terminal; flowers almost sessile; corolla short, with a ventricose throat. § S. Native of Santa Cruz, and at Caracas. H. chrysanthha, Jacq. coll. 3. p. 204. icon. rar. 28. 533. but not of Swartz. Hamelia's species, no. 2 without a name.

Yellow-flowered Hamelia. Shrub 4 to 5 feet.

9 H. axillaris (Swartz, prod. p. 46. fl. ind. occ. 1. p. 443.) leaves opposite, ovate-lanceolate, glabrous; stem suffrutescent; cymes bifid or trifid, pedunculate, rising from the forks of the branches; flowers secund, sessile; corollas tubular, pentagonal; berry ovate-oblong, crowned by the 5 distant subulate teeth of the calyx. § S. Native of Jamaica, in rocky places among
bushes; and of St. Domingo near rivers. Branches sub-herbaceous. Flowers pale yellow. Berries small.

Var. \( b \), *appendiculata* (D. C. prod. 4. p. 442.) leaves on longer petioles, and more distinctly acuminate. H. S. Native of Porto Rico. H. *appendiculata*, Gaertn. fil. carp. 3. p. 64. t. 91. f. 1. H. lúcida, Desf.

10 H. *rostrata* (Barlt. in herb. Hanke, ex D. C. prod. 4. p. 412.) leaves usually opposite, rarely 3 in a whorl, ovate, acuminate, downy beneath, as well as the petioles and branch-lets; cymes terminal, 3-4-parted, downy; corollas glabrous; berries ovate-globose, glabrous, beaked. H. S. Native of Mexico, at Acapulco. Branches terete or trigonal.

*Beaked*-berried Hamelia. Shrub 4 to 5 feet.

**Cult.** All the species of this genus are very ornamental while in blossom. They are free flowerers and of easy culture. A mixture of loam and peat is the best soil for them; cuttings strike root freely in the same kind of soil, under a hand-glass, in a moist heat.

**Lin. syst.** *Pentéântria, Monogynia*. Flowers incompletely unisexual by abortion. Limb of calyx tubular, 5-toothed. Corolla tubular, longer than the calyx; limb spreading, 5-parted: segments oval, acute. Stamina 5, almost sessile, inserted in the tube; anthers linear, inclosed. Style simple, in the male flower it is exserted, staminate, and terminating by a long, acute, simple stigma: in the female and hermaphrodite flowers the anthers are shorter than in the males, and the stigmas are 5 and linear. Berry somewhat coriaceous, globose, depressed, crowned by the tubular limb of the calyx, 5-celled; cells many-seeded. Seeds wrapped in thin pulp.—A small tree. Leaves opposite, coriaceous, oblong, acuminate. Stipulas rather connate, entire, acute. Flowers solitary or in fascicles, terminating the branches, cream-coloured, almost sessile.—Habit of *Géupa*.

**Cult.** See *Hamelia* above for culture and propagation.

**Lin. syst.** *Penta-Octântria, Monogynia*. Calyx with an obovate tube, and a short truncate or sub-dentilicate limb. Corolla funnel-shaped, with a terete tube, and a rather dilated pilose throat; lobes or segments 5-8, spreading, thickened inside, and sometimes furnished with a retrograde callosis toothlet. Anthers 5-8, sessile, linear, inserted in the throat of the corolla, hardly exserted. Style short; stigma bifid (ex Vahl and Rich.), quadrifid (ex Swartz). Berries pea-formed, 5-4-sided, crowned by the limb of the calyx, 2-4-celled; cells many-seeded. Seeds very minute, nesting in the pulp.—Glabrous radicant shrubs, growing on tree. Leaves petiolate, oval or lanceolate, coriaceous. Stipulas oval-oblong, falling off at length, but those at the base of the peduncles are more permanent, and may be called bracteas. Peduncle solitary or numerous, longer than the petioles. Flowers 4-12 together, sessile, capitate, girdled by an orbicular, entire, or rather lobed involucrem, which is formed from two combined bracteas.

1 S. *capitâta* (Vahl, ccl. 1. p. 35. t. 5. exclusive of the syn. of *Swartz*) leaves elliptic, bluish, but more acute at the base; peduncles solitary, terminal, head of flowers girdled by a sub-lobate involucrem; limb of calyx truncate, quite entire; corolla 5-6-lobed. H. S. Native of Mont-Serrat, on the higher mountains. *Ureçória* exótica, Gmel. syst. 2. p. 390. Branches square. A climbing sub-parasitical shrub.

*Capitate*-flowered Schradera. Shrub cl.

2 S. *Basilil'khis* (Mart. in Schultes, syst. 7. p. 164.) leaves elliptic, obtuse; peduncle terminal, solitary; head of flowers surrounded by an entire involucrem; limb of calyx quite entire; corolla 5-6-lobed: the segments reflexed. H. S. Native of Brazil, in woods at Lake d’Almada, in the province of Bahia.

*Brazilian* Schradera. Shrub cl.

3 S. *cæphalotes* (Wild. spec. 2. p. 238.) leaves oblong, acuminate; peduncle terminal, solitary, short; head of flowers surrounded by an entire involucrem; limb of calyx somewhat dentilicate; corolla 7-8-lobed. H. S. Native of Brazil in woods on the mountains. *Fichisia involucreata*, Swartz, prod. p. 62. fl. ind. occ. 2. p. 674. Flowers 4-8, within the involucrem, white. Stigma quadrifid. Berry 4-celled, ex *Swartz*.

4 S. *polyc'pha'la* (D. C. prod. 4. p. 444.) leaves oval, acuminate; peduncles numerous, terminal; heads surrounded by entire involucrem; limb of calyx quite entire; corolla 5-6-lobed. H. S. Native of French Guiana, where it was collected by Patris. Berries ovate, crowned by the entire limb of the calyx, 3-5-celled; cells many-seeded.

Many-headed Schradera. Shrub cl.

**Cult.** The species of this genus are elegant when in flower. Vegetable mould is the best soil for them; and they will be easily increased by separating the rooted branches.

**XCVII. BRIGNOLIA** (in honour of J. L. Brignoli, a professor of Verona, author of Fasciculus rarium plantarum Forajasisenium, 4to. Urbia, 1810.) D. C. diss. ined. with a figure, prod. 4. p. 444. but not of Bertol.

**Lin. syst.** *Hexándria, Monogynia*. Calyx with a short roundish tube, and a 4-toothed limb; 2 of the teeth larger than the other 2, and probably made up of 2 combined ones each. Corolla with a short tube, and a 6-lobed limb; lobes linear-oblong, bluish, longer than the tube, very hairy inside as well as the throat. Stamina 6, inserted in the tube, alternating with the lobes; filaments very short; anthers linear. Style filiform; stigma capitulate, undivided. Fruit globose, fleshy, many-seeded, crowned by the calyx. The rest not sufficiently known. A shrub or tree. Branches terete, villous. Leaves opposite, petiolate, oval-oblong, obtuse at the base, acuminate at the apex, downy on the petioles and nerves, the rest glabrous. Stipulas twin on both sides, lanceolate, acuminate, but when young combined into an inter-petiolar stipula, but at length separating from the base to the apex into 2 parts each. Corysts terminal, pedunculate, with a short hairy rachis, and downy crowned, trichotomous branches. Bracteas ciliate. Flowers sessile in the forks of the corysts, and at the tops of the pedicels.—This genus is nearly allied to *Isérita*, but from the fruit not being sufficiently known, its place in the order is very doubtful.

1 B. *acuminâta* (D. C. prod. 4. p. 444.). H. S. Native of Trinidad, where it was collected by Lockhart. Leaves almost
a foot long and 3 inches broad, pale beneath. Petioles 8-12 long, a little longer than the stipulas. Corymb much shorter than the leaves.

**Acuminated**-leaved Brignolia. Shrub.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Lin. syst. Dentadria, Monogynia.** Calyx with an ovate tube, and a short, permanent, entire, or 5-toothed limb. Corolla salver-shaped, brisly, with a terete tube, and a 10-parted limb: lobes elliptic-oblong. Stamens 10, inserted in the middle of the tube of the corolla; anthers linear, followed. Style 1, thickened, furrowed lengthwise; stigma 6-7 or more. Berry globose, 10-20-celled. Seeds oblong, disposed in 1 row in each cell, and as if they were imbricated, separated by small transverse disseminations.—Shrubs. Leaves opposite, ovate, lanceolate, acuminated at both ends, clothed with adpressed silken down beneath. Stipulas deciduous. Peduncles short, 1-flowered, 1-flowered.

1 P. *sericeum* (Desf. mem. mus. 6. p. 6. t. 2) calyx quite entire. ♂ S. Native of the Island of Timor.

**Silky Polyphragmon.** Shrub.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Lin. syst. Pentandria, Monogynia.** Limb of calyx marginal, erect, nearly entire. Corolla short, tubular, with a 5-parted limb; segments lanceolate, spreading, imbricate in evagination. Stamens 5, inserted in the throat, exserted; anthers linear. Style simple, thickened and fusiform towards the apex; stigma bifi: lobes approximate. Ovarium 4-5-celled; cells 3-5-ovulate; ovula fixed to the inner angle of the cell. Fruit rather fleshy, 4-5-celled; cells 2-3-seeded, crowned by the short neck of calyx.—A small glabrous tree, native of Senegal, with the habit of *Bacouia*. Branches terete, cuneous, glabrous. Leaves opposite, elliptic, coriaceous, glabrous. Stipulas interpetiolar, deciduous. Flowers axillary, racemose; racemes sometimes trichotomous.

1 M. *Senegalensis* (A. Rich. l. c.). ♂ S. Native of Senegal, where it was collected by Leprieur and Perrottet. *Senegal* Morelia. Shrub.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Tribe VI.**

**CORDIEREE** (this tribe contains plants agreeing with the genus *Coridieria* in having baccate many-celled fruit, and in the cells being 1-seeded). A. Rich. mem. soc. hist. nat. par. 5. p. 107. and 222. D. C. prod. 4. p. 445. Fruit baccate, of many 1-seeded cells. This differs from Tribe *Guettardioae* in the fruit not containing pyræae, but true cells; and from Tribe *Haméliae* in the cells being 1-seeded, not many-seeded.

**Lin. syst. Penta-Hezandria, Monogynia.** Limb of calyx 5-6-toothed, wide. Corolla with a shortish tube, a naked throat, and a 5-6-parted limb; segments narrow, spreading. Stamens 5-6, inserted in the throat of the corolla, exserted; filaments short; anthers linear. Stigmas 2, linear, shorter, somewhat recurved, exserted. Ovarium 2-celled; cells biovulate; ovula collateral.—Shrub. Leaves opposite, linear-lanceolate, gradually tapering at the base, and joined by the broad, acuminated, entire stipulas. Flowers downy, almost sessile, crowded in the axis of the leaves.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Lin. syst. Monocodia, Pentandria.** Flowers unisexual. With the sexes on different branches. Male flower. Calyx cup-shaped, solid, with an entire limb. Corolla salver-shaped, with a long tube, which gradually tapers to the apex, and is a little incurved, coriaceous, shining, and as if it werehorny; with a 5-parted limb; having oblong acute lobes, and a very narrow naked throat. Stamens 4-5, inclosed, inserted in the middle of the tube; anthers rising from the bottom of the calyx. Styles only vestigies.—Female flower. Calyx sub-globose, adnate to the ovary, with an entire marginal limb. Corolla straight, less attenuated at the apex than in the male flowers, with a 4-5-parted limb. Stamens small, abortive. Disk depressed in the middle. Stigmas 4-5, subulate. Berry globose, depressed, umbilicate, fleshy, 4-8-celled; cells 1-seeded. Seeds black, smooth. Amblumen fleshy. Embryo parallel with the hyalum, having a terete radicle, and subordinate cotyledons, which are the length of the radicle.—Bushy shrubs, 4-5 ft high. Leaves opposite, elliptic, acuminated, glabrous; stipulas very acute, combined at the base. Flowers white, occupying the tops of the branches: male ones by threes, sessile, girdled by 4 scale-formed bracteas.
tess: the female ones solitary, and furnished with 4 bracteas each.

1 C. trilfolia (D. C. prod. 4. p. 445.). ½. S. Native of Guiana, on the banks of the river Kourou.

Three-flowered Cordiera. Shrub 4 to 5 feet.

Cult. For culture and propagation see Hamelia, p. 542.

Tribe VII.

Sub-tr. I. Morindaæ (this sub-tr. contains the genus Morinda). D. C. prod. 4. p. 446. Flowers and fruit collected into heads and combined.

LIN. Syst. Pentandria, Monogyna. Tube of calyx obovate, usually combined with those nearest it; limb short, hardly toothed. Corolla funnel-shaped, with a nearly terete tube, and a spreading, 5-lobed, rarely 4-lobed limb. Stamens 5, rarely 4; filaments short; anthers incised, except in one species. Style filiform, usually exserted; stigma bifid, except in one or two species, in which it is entire. Berries containing 2-4 1-seeded pyrenae each, usually combined, compressed or angular from being so close together, areolate from the vestiges of the calyx. Embryo terete, in fleshy albumen.—Shrubs or small trees, natives within the tropics. Leaves opposite, rarely 3-4 in a whorl. Stipulas intrapetiolar, usually obtuse and membranous. Peduncles solitary or numerous, axillary or terminal, sometimes combined at the base, when this is the case they are said to be branched. Flowers aggregate, sessile, upon a sub-glabrous naked receptacle, forming dense, globose, or ovate heads; having the berries at length combined into a spurious fruit or compound berry. The bark of the roots is styptic, and is used by dyers.

SECT. I. Roöic (Roöic is the American name of M. Roöic). Plum. gen. 11. t. 26. D. C. prod. 4. p. 446.—Morinda of most authors. Flowers pentamemous, pentandrous. Stigma bifid. Berries containing 2-4 1-seeded pyrenae each.

* Peduncles terminal, twin, or lateral and opposite the leaves, in the latter case one of the opposite leaves is deficient or half abortive.

1 M. citrifolia (Lin. spec. 250.) plant glabrous, almost arboraceous; branchlets tetragonal; leaves oblong, attenuated at both ends, shining; stipules semi-lunar, membranous, obtuse; heads on short peduncles, opposite the leaves, bracteas; berries combined into an ovate mass. ½. S. Native of the East Indies, as in Malabar and Pegu, &c. as well as of the Society Islands. Geert. fruct. 1. p. 144. t. 29. Roxb. fl. ind. 2. p. 196. Ham. in Lin. trans. 13. p. 533. Lour. coch. p. 140.—Rheed. mal. 1. p. 97. t. 52.—Rumph. amb. 3. p. 158. t. 99. Peduncles opposite to a solitary leaf, on the upper side of the

RUBIACEÆ. CHI. MORNINDA.

branchlets, each supporting a small head of small white flowers. Anthers half hid in the tube of the corolla. Berries combined in the head, white and polished. The root of this species is employed by the natives of India to dye red.

2 Par. β. papparæcea (D. C. prod. 4. p. 446.) leaves oblong, acuminated at both ends, on long petioles, papery; stipules triangular. ½. S. Native of the East Indies, where it was collected by Labillardiere.

3 Par. γ. latifolia (D. C. l.c.) leaves oblong, blunt at the base, hardly acute; stipulas broad, membranous, very blunt. ½. G. Native of the Islands of O-Wahu and Radak, where it was collected by Chamisso. M. citrifolia, Cham. et Schlecht. in Linnaea, 4. p. 149.

2 M. tinctoria (Roxb. fl. ind. 2. p. 197.) glabrous and somewhat arborescent; leaves oblong, almost sessile, smooth, but not shining; peduncles opposite the leaves, solitary, much longer than the petioles; heads ovate; stamens incised. ½. S. Native of the East Indies, almost everywhere. M. citrifolia, Hunt. in asiat. res. 4. p. 35. Trunk seldom above a few feet in height, but supporting a pretty large shaly head of branches. Leaves pale beneath, from 6-10 inches long. Peduncles supporting each an oval head of pure white jasmine-like sweet-scented flowers. Fruit like that of M. citrifolia. The bark of the root is used to dye red; the colour is fixed with alum, but it is neither bright nor durable. In some parts of India it is cultivated for the sake of its roots. In the Circars the dyers use the bark of the fresh roots bruised and gently boiled in water for a short time. The cloth or yarn is prepared in a cold infusion of the powdered galls of Terminalia Chebula, in milk and water; it is then dried and moistened with alum water, and again dried, and receives from the above decoction a pretty bright but fugitive red. The green fruit are picked by the Hindoos, and eaten with their curries. The wood is hard and very durable, variegated with red and white, and is employed for gun-stocks in preference to all other kinds.

Dyers! Indian-mulberry. Tree small.

3 M. breacæata (Roxb. fl. ind. 2. p. 198.) glabrous and sub-arborescent, stiff; leaves oblong, shining, on short petioles; stipulas large, semi-circular at the apex; peduncles solitary, opposite the leaves, bracteate. ½. S. Native of the East Indies, in the Ganjam district; also of the Moluccas and Philosophes. Cham. et Schlecht. in Linnaea, 4. p. 149. Ham. in Lin. trans. 13. p. 533. Blum. bijdr. p. 1006.—Rumph. amb. 5. p. 157. t. 98. Leaves deep green and polished on both sides. The crown of the germ has frequently a small portion of it growing to be a long linear-lanceolate leaf. The anthers are incised, and the stigmas exserted, as in most of the other species of the genus. Peduncles supporting each a small head of small pure white jasmine-like flowers. Berries 4-seeded, combined. Corolla with a very villous throat.

Bracteata! Indian-mulberry. Tree small.

4 M. exsæta (Roxb. fl. ind. 2. p. 199.) arborescent; branches somewhat tetragonal, sometimes villous; leaves on short petioles, oval, acute, smooth, or downy beneath; stipulas emarginate; peduncles opposite the leaves, generally solitary, but sometimes rising by two or threes; heads roundish; stigma incised; stamens exserted. ½. S. Native of Bengal. Branches spreading in every direction. Peduncles supporting each a head of many pure white jasmine-like flowers. Berries 4-seeded, combined.

Exserted-stamened Indian-mulberry. Shrub 6 to 12 feet.

5 M. geminisata (D. C. prod. 4. p. 447.) branches tetragonal, puberulous; leaves ovate or oval, cuneated at the base, hardly petiolate, rather downy beneath; peduncles twin, opposite the leaves; stigma and anthers at the throat. ½. S. Native of
Gambia and Casamance, among bushes, where it was collected by Leprieur and Perrottet. Flowers white.

_Twin-_peduncled Indian-mulberry. Shrub.

6 M. _multiflora_ (Roxb. fl. ind. 2. p. 200.) sub-arborescent; leaves oval-oblong, acute, with undulated margins, downy on both sides, but particularly so beneath; peduncles terminal and opposite the leaves, solitary or twin or tern, villous, usually compound; heads nearly globose, many-flowered. Œ. S. Native of the South Indies, in Berar. Stamens inclosed. Style exerted. Berries combined in a head, about the size of a mulberry, each containing 4 seeds. This plant is cultivated about Nagpore for the sake of its roots, as the other species are in various other parts of India, and for the same purpose.

Many-flowereel Indian Mulberry. Tree small.

7 M. _furensens_ (Smith, in Rees's cycle. vol. 24. no. 3.) young branches tomentose; leaves elliptic-lanceolate, acuminate at both ends, scabrous, but with villous veins; peduncles hairy, opposite the leaves, and terminal; heads globose, few-flowered; corollas elongated, almost glabrous. Œ. S. Native of the Mauritius.

Downy Indian-mulberry. Tree or shrub.

8 M. _squarrosa_ (Ham. in Linn. trans. 13. p. 535.) shrubby, erect, glabrous; leaves elliptic or lanceolate, undulated; peduncles naked, opposite the leaves, solitary, twice the length of the pedicels; heads ovate, nodose in the fructiferous state from the berries being prominent. Œ. S. Native of the East Indies, among bushes at Campoura. Berries of a livid whitish colour: having the pulp white and diaphanous; each containing 4 seeds never combined or confounded, many of them abortive.

_Squarrosa_ Indian-mulberry. Shrub.

9 M. _angustifolia_ (Roxb. fl. ind. 2. p. 201. but not of Roth.) shrubby, erect, glabrous; leaves elliptic or lanceolate, blistered, almost sessile; stipulas somewhat cordate, united into a ring; peduncles short, solitary, almost terminal, but usually opposite the leaves; heads globose, many-flowered; berries distinct in the head. Œ. S. Native of the East Indies, at Chittagong. Roxb. cor. 3. t. 257. Peduncles seemingly-terminal when they begin to blossom, but soon afterwards a branch shoots out from between each peduncle and its respective opposite leaf, which marks their proper situation to be opposite the leaves, supporting each a head of pure white jasmine-like flowers. Anthers hid in the middle of the tube; stamens 4; filaments succulent, of a deep shining black, with very dark-coloured pumice, containing 4 seeds each. The root of this species is used by the natives of India for dyeing, where the plant is in plenty.

_Narrow-leaved_ Indian-mulberry. Fl. April, July. Clt. 1816. Shrubs 4 to 5 feet.

10 M. _persicifolia_ (Ham. in Linn. trans. 13. p. 535.) sulphur-ticose, diffuse, glabrous; branches tetragonal; leaves elliptic, acute, on short pedicels; stipulas subulate, longer than the pedicels; heads sessile, solitary, opposite the leaves, usually containing about 10 flowers, and sometimes bracteate by a leaf. Œ. S. Native of Pegn and Ava, in woods. Corolla incurved, much longer than the head.

_Peach-leaved_ Indian-mulberry. Shrub 1 to 2 feet.

11 M. _Turbacensis_ (H. B. et Kunth, nov. gen. amer. 3. p. 380.) shrub downy, twining; leaves obovate-oblong, acute; stipulas conate at the base, acute, downy; heads terminal and opposite the leaves, on very short peduncles; corollas villous on the outside. Œ. S. Native of New Granada, between Turbaco and Carthagena. Flowers white.

_Turbaco_ Indian-mulberry. Shrub er.

** Terminal peduncles twin, but the lateral and axillary ones are solitary.

12 M. _Roto_ (Lin. spec. 250.) glabrous, procumbent at the vol. iii.

lead; leaves lanceolate, acuminate at both ends, on short pedicels; stipulas broad, very short, mucronate; heads small, axillary, and nearly terminal, on short peduncles. Œ. S. Native of St. Domingo, Cuba, and Mexico. Jacq. hort. vind. t. 16. Lin. hort. clff. p. 73. _Roioe rosaceum_ fructu Cupres-sino. Plum. gen. p. 11. t. 26. Plak. alm. t. 212. f. 4. Flowers white. Berries 1-seeded, ex Plum., but 2-seeded, ex Linin, combined into a globose head. The roots dye linen of a dark colour.

13 M. _longiflora_; a branched rather climbing shrub; leaves elliptic-lanceolate, acuminate; peduncles short, axillary, bearing each a head of 6-7 flowers. Œ. S. Native of Sierra Leone, among bushes, Corolla white, with a very long tube.

_Long-flowereel_ Morinda. Shrub er.

14 M. _quadrangularis_; shrubby; branches rather quadrangular; leaves broad, oblong, acute, membranous, veins; peduncles axillary, bearing each a head of 9-10 flowers. Œ. S. Native of Sierra Leone, among bushes on the mountains, and in the lowlands. (V. S. in herb. Lamb.)

_Quadranigular_ -branched Indian-mulberry. Shrub 3 to 4 ft.

15 M. _peduncularis_ (H. B. et Kunth, nov. gen. amer. 3. p. 380.) glabrous, erect; leaves elliptic-oblong, acuminate, shining; stipulas short, connate, acuminate; heads axillary, on long peduncles; bracteas ovate, acuminate. Œ. S. Native of South America, in woods on the banks of the Orinoco, near San Domingo. Bracteas tetragonal. Corollas white, glabrous. Tube of calyx downy.

_Peduncular-flowereel_ Indian-mulberry. Shrub 4 to 5 feet.

16 M. _retusa_ (Lam. and Poir. dict. 4. p. 316.) arborescent, glabrous; leaves obovate-obtuse, attenuated at the base, on short pedicels, shining above; stipulas connate, membranous, obtuse; heads globose, on short peduncles, terminal. Œ. S. Native of Madagascar, where it is called Lingo. Poirot says, in his diagnosis of this species, that the heads are lateral, but in his description he says they are exactly terminal.

_Retuse_ -leaved Indian-mulberry. Tree.

17 M. _Palmetorum_ (D. C. prod. 4. p. 448.) shrubby, glabrous; leaves oval-lanceolate, acuminate, on short pedicels; stipulas broad-ovate, cuspitate, membranous, foliaceous; heads almost terminal, altemate, glabrous, on peduncles, which are shorter than the leaves. Œ. S. Native of Africa, in Cayor and Gambia at the roots of palm-trees, where it was collected by Leprieur and Perrottet. Peduncles variable in length, from 3 to 5 inches long. Limb of calyx campanulate, hardly 5-toothed. Corolla villous on the outside. Style short. Anthers almost exerted.

_Palm_ Indian-mulberry. Shrub.

18 M. _stenophylla_ (Spreng. syst. 1. p. 749.) branches nearly terete, glabrous, but when young rather tetragonal, and clothed with greyomentum; leaves elliptic-lanceolate, acuminate at both ends, on short pedicels, grey from very short tomentum; stipulas lanceolate, at length reflexed; peduncles axillary, solitary, tomentose. Œ. S. Native of the East Indies, near Callidir, where it is cultivated for its roots, which are used for dyeing. M. angustifolia, Roth, nov. spec. p. 147. but not of Roxb. The figure in Rumph. amb. 3. t. 98. is sometimes referred to for this species, but is probably distinct.

_Narrow leaved_ Indian-mulberry. Shrub or tree.

19 M. _tomentosa_ (Hcyn. in Roth, nov. spec. 147.) branches angular, glabrous; leaves sub-cordate, ovate, acuminate, clothed with grey tomentum beneath, and on the veins above; pedicels long, channelled; peduncles axillary, solitary. Œ. S. Native of the East Indies. Perhaps the same as the following, but it differs in the glabrous branches and long pedicels.
**CIII. MORINDA.**

**Tomentosum** Indian-mulberry. Shrub.

20 M. *mu'ria* (Ham. in Lin. trans. 13. p. 556.) sub-arbores; branches tetragonal, tomentose; leaves cordate-elliptic, acuminate, tomentose on both surfaces, on very short pedi·oles; stipulas usually bifid; peduncles axillary, solitary, brace-tless, shorter than the pedi·oles. _HT. S. Native of the coast of Coromandel, in the woods of Carnata, where it is called *Mudi*. Each head contains 5-6 flowers.

**Mudi** Indian-mulberry. Tree small.

21 M. *cha chuca* (Ham. l. c.) sub-arbores; branches hexagonal; leaves elliptic, acute, often 3 in a whorl, scabrous above, pubescent beneath, and bearded at the axes of the ribs; stipulas semi-circular, often 2-lobed; peduncles axillary, solitary, naked, a little longer than the peti·oles. _HT. S. Native of Bengal, in woods at Matisia and Magadha, where it is called *Chakhuca*, i. e. six eyes, from the heads containing only 6 flowers. The bark of the root is used in dyeing red, like others of the species.

**Chakhuca** Indian-mulberry. Shrub.

22 M. *novosa* (Ham. l. c.) sub-arbores; branches obtuse-angled; leaves opposite, or 3-4 in a whorl, glabrous, elliptic, acute, on very short peti·oles; stipulas marcescent; heads axillary and terminal, pedunculate, egg-shaped, nodose from many of the berries being abortive. _HT. S. Native of the East Indies, in the woods of Magadha. Very like M. *Coriæa*.

**Novosa** Indian-mulberry. Tree.

23 M. *coriæa* (Ham. l. c.) arbores; branches with obtuse angles, glabrous; leaves elliptic, acute, undulate, glabrous, on very short peti·oles; stipulas marcescent; pedi·uncles axillary, and terminal, much longer than the peti·oles, glabrous, bracteate at the apex; heads roundish. _HT. S. Native of the East Indies, in the woods of Mithila, where it is called by the natives *koreæa*. Flowers white, large, sweet-scented, 10-12 in each head.

**Coriæa** Indian-mulberry. Tree.

*** Peduncules crowded, umbellate.

24 M. *umbellата* (Lin. spec. 250.) arbores; erect; leaves petiolate, lanceolate-ovate; peduncles crowded, terminating the branches. _HT. S. Native of Ceylon. This plant is unknown at the present day, and probably the same as *M. microcephala*. Umbellate-flowered Indian-mulberry. Ct. 1809. Tr. or shr.

25 M. *microce phala* (Bartl. in herb. Henke, ex D. C. prod. 4. p. 449.) shrub glabrous, climbing a little; branches terete; leaves ovate-oblanceolate; stipulas ovate-triangular, acuminate, 3 times shorter than the peti·oles: heads pedunculate, 4 together, forming umbels at the tops of the branches. _HT. S. Native of the Island of Luzon. Flowers white.

**Small-headed Indian-mulberry. Shrub ct.**

**Cochin-chine** Indian-mulberry. Tree.

27 M. *se'ndens* (Roxb. ft. ind. 2. p. 202.) shrubby, climbing; leaves oblong-lanceolate, acuminate at both ends, on short peti·oles; stipulas membranous, obtuse; peduncles numerous, umbellate, terminal. _HT. S. Native of the East Indies, on the east side of Point de Galée Bay. Leaves 6 inches long, and an inch broad. Peti·oles hardly longer than the stipulas. Peduncles 7-8, short. Fruit-bearing heads glabrous, about the size of a pea. Flowers white, few in each head.

**Scandent Indian-mulberry. Shrub ct.**

28 M. *sarmen tosa* (Blum. bijdr. p. 1006.) climbing; leaves oblong-lanceolate, acuminate, glabrous; peduncles terminal by two or three, and twin and axillary, concrete at the base, or they may be said to be solitary and bifid; heads usually containing only 4 flowers. _HT. S. Native of Java, on Mount Burangrang in the province of Krawang. Allied to *M. sciodens*.

**Twiggly Indian-mulberry. Shrub ct.**

29 M. *la'xa* (Bartl. in herb. Henke, ex D. C. prod. 4. p. 449.) leaves oblong, acuminate at both ends, membranous, downy beneath as well as on the branches; stipulas semi-circular, cuspitate; floriferous branches rising from the axes of the superior leaves, opposite, bearing each 2 leaves, and numerous small peduncled heads, which are disposed in an umbel·late manner. _HT. S. Native of Mexico.

**Loose Indian-mulberry. Shrub.**

---

**SECT. II. PADAV'AA (Pada-cara is the Malabar name of *M. tetrandra*). D. C. prod. 4. p. 449. Flowers tetramerous, tetrads. Style bifid at the apex. Berries containing each 4 1-seeded pyrene. Perhaps a proper genus.

**Tetrandrous Indian-mulberry. Shrub diffuse.**

31 M. *parvîfolia* (Bartl. in herb. Henke, ex D. C. prod. 4. p. 449.) shrubby, glabrous; sterile branches twining; leaves linear-oblong, cuspitate, glabrous, as well as in the axes of the veins; stipulas combined into a truncate sheath; heads terminal, 4-5 together in an umbel, pedunculate. _HT. S. Native of the Island of Luzon. Very like the last species, but the number of the parts of the flower is unknown.

**Small-leaved Indian-mulberry. Shrub.**

---

**SECT. III. PHYLIRÉ'A*STH*UM (from Phyllirēa and astrum, an affixed signification, like; the shrub contained in this section has much the habit of *Phyllirēa*). D. C. prod. 4. p. 449. Flowers tetramerous, tetrads. Style clavate, unbidv. Berries containing each 4 1-seeded pyrene. Perhaps a proper genus.

32 M. ? PHYLIRÉE'OIDS (Labill. nov. caled. p. 49. t. 49.) shrubby, glabrous, erect; leaves elliptic-oblong, acute, on short peti·oles; stipulas short, membranous, marcescent; heads axillary, opposite, almost sessile, few-flowered. _HT. S. Native of New Caledonia. Leaves rather sulphur-coloured beneath when dry. Heads smaller than a pea. Calyx nearly entire. Corolla 4-cleft short. Style clavate. Berry 4-celled; cells 1-seeded.

**Phyllirēa-like Indian-mulberry. Shrub 5 feet.**

---

**SECT. IV. CHRYSORHIZA (from χρυσός, chryos, gold, and ρίζα, rizâ, a root; the roots are yellow). D. C. prod. 4. p. 450. Flowers pentamerous, pentadands. Berries 2-celled, 2-seeded, Heads of flowers opposite the leaves. Habit of the other species of *Morinda*, but probably a proper genus.

33 M. *chrysorhizā* (D. C. prod. 4. p. 450.) shrub much branched; branches glabrous, bluntly tetragonal; leaves oblong-elliptic, on short peti·oles, pubescent in the axes of the veins beneath; stipulas roundish, foliaceous, entire; heads pedunculate, opposite the leaves. _HT. S. Native of Guiana, where it is called by the natives *Boj-tégi-tjo*. Psychotria? chrysorhiza, Schum. pl. guin. p. 111. Corolla salver-shaped, white. Stigma bipartite.

**Golden-rooted Indian-mulberry. Shrub.**
CULT. For culture and propagation see Hamelia, p. 542.

Subtribe II. Guettardieae (this sub-tribe contains shrubs agreeing with Guettardia in the flowers being distinct). D. C. prod. 4. p. 450. Flowers distinct, never combined.

Lin. syst. Tetrandria, Monogyina. Limb of calyx tubular, with an entire border. Corolla funnel-shaped, 4-cren, having the throat closed by arched scales or hairs. Stamens 4, inclosed. Ovaryurum with a fleshy disk. Style 1. Stigma simple (ex Jack.), quadrifid (ex Blum.). Drupe baccate, crowned by the annular base of the calyx, containing each 4 triquetrous, 1-seeded, chartaceously arillate pyrene. Embryo erect.—Half parasitical suffruticose plants, tuberos at the base. Leaves opposite, crowded, petiolar, glabrous. Stipulas petiolat, ciliolate. Flowers sessile. The germinating plant has a tubum (ex Blum.).

2 M. araita (D. C. prod. 4. p. 450.) tubers covered with rows of prickles; leaves oblong-crenate; limb of calyx quite entire; throat of corolla closed with arched scales; stigma quadrid. S. Native of the western provinces of Java, in the mountains, upon trees, where it is called by the natives Tankuroh. M. tuberosa, Blum. bijdr. p. 1001.—M. echinata, Gaud. in Freyc. voy. pt. bot. t. 96. has the stem beset with rows of prickles; stipulas twin on both sides, connected by their bases within the petioles into a bilif limb; leaves petiolar, elliptic, acute at both ends; but perhaps both plants are the same. Armed Myrmecodia. Shrub.

Cult. For culture and propagation see Schraderia, p. 542.

Lin. syst. Tetrandria, Monogyina. Limb of calyx short, entire. Corolla with a short tube, which is hairy inside, and a flat, 4-lobed limb. Stamens 4, inserted in the throat; filaments short. Style filiform; stigma 2-lobed. Drupe juicy, containing 2 1-seeded pyrene, which are flat inside, and convex on the back, coriaceous. Embryo erect, in the center of the albumen.—Falsely parasitical shrubs, growing upon trees, tuberos at the base. Leaves oval, on short petioles. Stipulas small, linear. Flowers axillary, sessile, white.—Habit of the Myrmecodia.

1 H. fornicatum (Jack. l. c. Blum. l. c.) leaves almost sessile, oval, rounded at the apex. S. Native of the Moluccas, Sumatra, and Nusa-Kambangs, upon trees in the woods. Lasistoma fornicatum, Spreng. syst. 1. p. 428. Nidus germaniis, formicatum nigraurrum. Rumpl. amb. 6. p. 119. t. 55. The trunk of this plant is an irregular tuber, fixed to trees by fibres like the stems of ivy; it is hollow inside, and becomes the nest of black ants.

Ants' Hydnophytum. Shrub parasitical.

2 H. montanum (Blum. bijdr. p. 956.) leaves on short petioles, oblong, obtuse. S. Native of Java, on the mountains, in the province of Buiten zombie, upon trees. The base of the stem is swollen, as in the first species. Mountain Hydnophytum. Shrub parasitical.

Cult. For culture and propagation see Schraderia, p. 542.

Lin. syst. Tetrandria, Monogyina. Limb of calyx small, 4-toothed. Corolla small, sub-campanulate, with a villous throat, and a 4-cren spreading limb. Stamens 4, inserted in the mouth of the tube; filaments very short. Style short, perforating the disk; stigma bifi in the throat. Drupe crowned by the calyx, 2-celled; cells containing each 2 1-seeded pyrene. Embryo inverted in the albumen.—A shrub, having the habit of Coffea, with divaricate branches. Leaves distich. Flowers densely crowded on sessile hemispherical, axillary receptacles, sessile, bracteate, umbellate; but the fruit is pedicellate.

1 H. frutescens (Blum. l. c.) S. Native of Java, in woods on Mount Burungang. Shrubby Hypophyrum. Shrub 4 to 5 feet.

Cult. For culture and propagation see Hamelia, p. 542.

Lin. syst. Tetrandria, Monogyina. Calyx with an ovate tube and a small 4-toothed limb. Corolla funnel-shaped, subcampanulate, 4-cren (f. 100. b.), glabrous inside. Filaments rising from the bottom of the corolla (f. 100. c.), but not adnate to its tube; anthers roundish, hardly exerted. Style filiform; stigma 2, hairy (f. 100. d.). Berry roundish (f. 100. f.), umbilicate, containing 2-4 1-seeded, coriaceous pyreene. Seeds semi-ovate, convex on the outside, flat and furrowed inside. Albumen horny. Embryo dorsal, straight, inverted (ex Gauertia), erect (ex Pet. Th. and Blum.).—Creeping herbs, with the habit of Michelia. Leaves opposite, rather fleshy, oval. Stipulas small. Flowers terminal, sessile, solitary, white. Berries red.—Perhaps this genus is sufficiently distinct from Michelia.

1 H. depressa (Banks, in Gærtn. l. c.) stems low, creeping; leaves petiolar, flat, sub- appressed. S. Native of New Granada on Silla de Caracas, Peru, Chile, Falkland Islands, Tristan d'Acuna, Java, &c. in humid or marshy places. N. deprimus, Smith, icon. ined. 2. p. 28. Tratt. arch. 3. p. 129. D'Urv. fl. mal. p. 45. Gaud. fl. mal. p. 16. Erythrodonanum alsineformé, Pet. Th. fl. trist. p. 42. t. 10.—Gomozia Granetiana, Mat. in Lin. fil. suppl. 4. 2.

Rising Nertera. Fl. creeping.

Cult. The species of *Nertéa* are small creeping suffrutescent evergreen plants, of little beauty even when in flower; they grow best in a mixture of turfy peat and sand; and are increased easily by separating the rooted creeping stems. They may be placed among the alpine plants in summer, but in winter they will require the protection of a green-house. They should be grown in pots well drained with sherds, placed in pans of water.

Linn. syst. Tetradria, Monogynia. Calyx with an ovato-globose tube, and a large 4-toothed limb. Corolla funnel-shaped, with a terete tube, and a 4-lobed spreading limb, having the throat and lobes of the limb hairy inside. Filaments adnate to the tube, almost to the throat; anthers ovate, hardly exerted. Style filiform; stigmas 4, inclosed. Berries almost globose, crowned by the teeth of the calyx, containing 4 horny 1-seeded pyrenes each; and sometimes containing 8, when 2 berries are combined. Albumen somewhat cartilaginous. Embryo minute, erect, with very short cotyledons.—American globrous creeping evergreen herbs, with the habit of *Lianca* or *Nertéa*. Leaves roundish or ovate. Stipulas small, solitary on each side. Flowers axillary and terminal, sometimes combined by twos at the tops of the peduncle, and sometimes solitary and sessile.

1. *M. repens* (Lin. spec. p. 161.) leaves roundish; flowers 2 on the top of each peduncle, combined; berries combined. 2. H. Native of North America, from Boston to Carolina; Upper Canada; and of Mexico between Puebbo-Viejo and Real del Monte, in slidy woods at the roots of trees, and among mosses. —Huds. alim. t. 444. f. 2.—Cat. ear. t. 20.—Pult. gaz. t. 1. f. 13. Corollas white, tinged with purple, usually 2 together on the top of each peduncle, and seated on two combined ovaries; the flowers are sometimes also combined, and therefore 8-cleft, according to the obs. of Torrey. Berries red, insipid.

Ovate-leafed Mitchellia. Fl. cr.

Cult. These are small creeping evergreen plants of very little beauty; they will grow very well in a peat border, or in pots filled with a mixture of peat and sand, placed among other alpine plants; they are easily increased by separating the creeping stems.

Linn. syst. Tetra-Hezadria, Monogynia. Limb of calyx 3-6-parted or toothed. Corolla funnel-shaped, regular, 4-6-cleft, for the most part hairy. Stamens 4-6, inserted towards the throat; filaments very short; anthers linear, exerted or inclosed. Stigmas 4-9, linear, thick. Drupe baccate, crowned by the permanent calyx, containing 4-9 triquetrous coriaceous 1-seeded pyrenes.—Shrubs or subshrubs, natives of India, usually with an ungrateful smell. Flowers crowded or in dense heads, axillary and terminal, baccate. Drupes usually blue.—This genus, according to Blume, is nearly allied to *Ancylosanthus* and *Pauliaura*.

* Limb of calyx 3-6-parted.

Blue-fruited Mephitidia. Fl. shrub.

2. *M. attenauata* (Jack, l. c. p. 126. under *Lasianthus*,) plant suffrutescent, villous; leaves oblong, attenuated at the apex, but roundly cordate at the base, glabrous above; flowers axillary, 8-4-together, almost sessile, involucreted by lanceolate bracteas. 2. F. Native of the interior of Bencoolen. Calyx 4-parted. Corolla yellow, pilose. Berries deep blue, smaller than those of the preceding species.

Attenuated-leafed Mephitidia. Fl. shrub.

3. *M. inaequata* (Blum. bijdr. p. 996. under *Lasianthus*, as well as all the following species,) shrub, hairy; leaves oblong, acuminate, unequally rounded at the base; flowers axillary, crowded, involucreted by bracteas. 2. F. Native of Java, on mountains Saka and Seribu. Corolla white.

Unequal-leafed Mephitidia. Fl. shrub.

4. *M. rhinocerotis* (Blum. bijdr. p. 996.) shrub; leaves oblong, acuminate, rounded at the base, glabrous above, but hairy beneath, as well as the branches and calyces; flowers crowded, axillary. 2. F. Native of Java, in the higher woods on mounts Saka; Gede, &c. Corollas white.

Horn-scented Mephitidia. Fl. shrub.

5. *M. capitata* (Blum. bijdr. p. 996.) shrub; leaves oblong-lanceolate, acuminate, attenuated at the base, glabrous above, and hairy beneath, as well as the branches, peduncles, and calyces; heads of flowers pedunculate, axillary. 2. F. Native of Java, in woods on the mountains. Flowers white.

Capitiate-flowered Mephitidia. Fl. shrub.

6. *M. tomentosa* (Blum. bijdr. p. 997.) shrub; leaves oblong, long-acuminate, acute at the base, glabrous above, but...
tomentose on the veins beneath, as well as on the branches; flowers axillary, solitary or twin, sessile. \( h \). S. Native of Java, in woods on Mounts Salak, Gede, &c. Corollas white.

Tomentosa Mephitidia. Shrub.

7 M. \( \text{obscera}^{3} \) (Blum. mss. ex D. C. prod. 4. p. 453.) shrubby; leaves oblong, acuminate, rather obliquely attenuated at the base, clothed with tomentum beneath, as well as on the rib above and the branches; heads of flowers axillary, almost sessile. \( h \). S. Native of Java, in the western parts on the mountains. Corollas white. This species differs from \( M. \text{toncosa} \) in the stipules being larger, and in the flowers being more numerous, &c.

Obscura Mephitidia. Shrub.

8 M. \( \text{luctida}^{2} \) (Blum. bijdr. p. 997.) shrubby; branches glabrous; leaves ovate-oblong or lanceolate, cuspitate, shining above, rather pubescent beneath at the margins, and on the veins; flowers crowded, axillary, rarely solitary. \( h \). S. Native of Java, in the more elevated woods. Flowers white.

Shining-leaved Mephitidia. Shrub.

9 M. \( \text{tomentosa}^{1} \) (Blum. bijdr. p. 997.) shrubby; branches glabrous; leaves oblong, acuminate, attenuated at the base, and are as well as the branches glabrous, but ciliated at the apex; stipules large, roundish, rather membranous; flowers crowded, axillary; calyx hairy. \( h \). S. Native of Java, on Mount Salak. Corollas white.

Stipular Mephitidia. Shrub.

10 M. \( \text{levigata}^{1} \) (Blum. bijdr. p. 998.) shrubby; leaves oblong, acuminate, acutish at the base, and are as well as the branches glabrous; fascicles of flowers axillary; calyx 5-parted. \( h \). S. Native of Java, in mountain woods. Flowers white. There is a variety of this with lanceolate leaves.

Smooth Mephitidia. Shrub.

11 M. \( \text{latusuullu} \) (Blum. mss. ex D. C. prod. 4. p. 453.) shrubby; leaves oval, acute at both ends, reticulately veined, and are as well as the branches glabrous; flowers crowded, axillary, on short peduncles. \( h \). S. Native of Java, on Mount Salak in shady parts of woods. Corollas white. Fruit globose, orange coloured. Lobes of calyx lanceolate, parted to the base, at length becoming conic.

Broad-leaved Mephitidia. Shrub.

** Limb of calyx with short lobes.

12 M. \( \text{inoobara} \) (Blum. bijdr. p. 998.) shrubby; branches glabrous; leaves oblong or oblong-lanceolate, acuminate at both ends, glabrous, downy on the veins beneath; flowers crowded, axillary, girded by blunt bracteas. \( h \). S. Native of Java, in woods on Mount Gede. The leaves of this species are without any ungrateful smell.

Scentless Mephitidia. Shrub.

13 M. \( \text{hexandra} \) (Blum. bijdr. p. 998.) shrubby; leaves lanceolate, long-acuminate, clothed with strigose down on the rib above, and on the veins beneath, as well as the branches; flowers axillary, usually solitary, hexandrous. \( h \). S. Native of Java, in the more elevated woods on Mount Salak. Corollas white.

Hexandrous Mephitidia. Shrub.

** Limb of calyx with short teeth.

14 M. \( \text{verosa} \) (Blum. bijdr. p. 999.) shrubby; leaves on short pedicles, oblong, acuminate, obliquely attenuated at the base, very veiny, glabrous above, downy on the veins beneath, as well as on the branches; flowers crowded, axillary, sessile. \( h \). S. Native of Java, in woods on the Seribu mountains. Corollas white.

Veiny Mephitidia. Shrub.

15 M. \( \text{stilvestrus} \) (Blum. bijdr. p. 999.) shrubby; leaves on short pedicels, oblong-lanceolate, acuminated at both ends, glabrous, veiny, clothed with adpressed down on the veins beneath, as well as on the branches; flowers crowded, axillary, sessile; fruit containing 4-5 pyrenes. \( h \). S. Native of Java, along with the preceding, from which it differs in the smaller leaves, which are unequally narrowed at the base, in the fewer and remoter veins, and in the more obsoletely toothed calyx.

Wild Mephitidia. Shrub.

16 M. \( \text{reticulata} \) (Blum. bijdr. p. 1000.) shrubby; leaves large, on short pedicles, oblong, acuminated, acute at the base, glabrous above, and reticulately veined, rather tomentose on the veins and branches; flowers crowded, axillary, almost sessile. \( h \). S. Native of Java, on the Seribu mountains. Flowers white.

Reticulated-leaved Mephitidia. Shrub.

17 M. \( \text{purpurea} \) (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, and are as well as the branches glabrous; peduncles crowded, 1-flowered, axillary, or lateral from the leaves having fallen. \( h \). S. Native of Java, on mounts Salak, Gede, &c. in shady places. Flowers purple.

Purple-flowered Mephitidia. Shrub.

18 M. \( \text{stercoraaria} \) (Blum. bijdr. p. 1000.) shrubby; leaves lanceolate, long-acuminated, acute at the base, glabrous except the veines beneath, which are clothed with adpressed down, as well as the branches; flowers crowded, axillary, sessile; fruit globose, containing 7-9 pyrenes. \( h \). S. Native of Java, on the mountains. Allied to \( M. \text{stillestris} \); but the fruit is evidently distinct. Flowers white.

Stinking Mephitidia. Shrub.

Cult. See \( M. \text{amelia} \), p. 542, for culture and propagation.

LIN. SYST. Pentandria, Monogynia. Calyx with a short oblong tube, and a small spreading 5-toothed deciduous limb. Corolla campanulately globose, 5-cleft, hairy inside at the throat; lobes lanceolate, acute, reflexed. Stamens 5, with very short filaments, and exerted anthers. Stigma capitate, (bilamellate, ex Vaill.) 4-5 lobed (ex Roxb.). Berry apple-shaped, not crowned at the apex by the calyx, but marked by a sinuated areola, indicating the place from which the limb of the calyx had fallen off, containing 5 bony 1-seeded pyrenee, which are obtuse at the base, and acute at the apex. Seed oblong, fixed to the inner angle of the cell, near the middle. Albumen fleshy. Embryo large, inverted, with long plano-convex cotyledons, and a bluntly cordate compressed superior radicle,—Small trees. Leaves petiolate, ovate. Stipulas solitary on both sides, lanceolate. Cymes branched, subpaniculate, axillary, or rising beneath the leaves from the cicatrices, occasioned by the folding of the old leaves. Flowers white.—This genus is anomalous in the order, from the structure and situation of the seeds; it is allied to \( Cántium \), but differs from that genus in the ovary being 5-celled, not 2-celled.

1 V. \( \text{edulis} \) (Vaill. symb. 3. p. 36.) unarm'd; leaves ovate, membranous, glabrous; cymes rising beneath the leaves. \( h \). S. Native of Madagascar, from whence it has been introduced to China and the Mauritius. Lam. ill. t. 159. Sieb. fl. murr. exs. 2. no. 77. and no. 138. V. \( \text{cymo-4} \), Guett. fil. earp. 5. p. 73. t. 193. V. Madagascariensis, Gmel. syst. 1. p. 307. V. Connor'soni, Desf. ex Steud. Jaqc. hort. vind. 1. t. 44. Vavanga, Chienemis, Rohr, and Vavanga edulis, Vaill. act. soc. hist. nat. hafn. 2. pt. 1. p. 297, and p. 298. t. 7. The habit of the tree
is much like that of Callicarpa. The fruit is eaten by the natives of Madagascar and the Mauritius under the names of Vao-tanga and Vao-vanguer. Flowers white.

**Edible-fruit** Vangueria. Cilt. 1809. Tree 10 to 15 feet.

2 V. spinosa (Roxb. fl. ind. 2. p. 172.) spines decussate; leaves ovate-oblong, smooth; cymes axillary, in fascicles. S. Native of Bengal and China; in Bengal it is called *Magya*. Meynea spinosa, Link, Jahrb. 1-3. H. p. 32. Rôm. et Schultes, mant. 1. p. 67. and 84. Leaves opposite or three in a whorl, 3-4 inches long. Flowers axillary, fascicled on a short peduncle, with proper longer pedicels, small, of a pale greenish colour. Antlers small, cordate. Stigma 4-lobed. Berry size of a cherry, turbinate, smooth, yellow when ripe, succulent, and edible. The flowers and habit of the whole plant are exceedingly like *Céanthium purpureum*.

**Spinosa Vangueria.** Fl. June, July. Cilt. 1816. Shrub large. 3 V. infassa (Burch. cat. geogr. pl. afr. austr. No. 2029. trav. 2. p. 258, and 259. with a figure,) unarmed; leaves tomentose, roundish-ovate, usually acuminate; cymes axillary. S. Native of the south of Africa, without the tropic, in the territory of Bachapin, where it is considered unlucky by the inhabitants. Fruit round, an inch in diameter, but not edible.

**Unlucky Vangueria.** Shrub 5 to 10 feet.

N. B. Vangnéria verrucosa, Sieb. f. mar, does not belong to the present order, but is probably a species of *Logania* or *Solidum*.

**Cult.** For culture and propagation see *Hamelia*, p. 542.

**Lin. syn. Tetra-Eméandria, Monogynia.** Calyx with ovate or globose tube; and a tubular permanent or deciduous limb, which is either truncate or irregularly toothed (f. 101. a). Corolla salver-shaped, with a cylindrical tube (f. 101. c), and from 4-9 oval-lobed lobes (f. 101. b). Anthers 4-9, sessile in the throat of the corolla, inclosed. Stigma capitate, rarely 2-lobed. Drupes roundish or ovate, crowned by the tube of the calyx (f. 101. d), commonly blunted and 4-celled pustules (f. 101. c), having the cells straight or curved, 1-seeded. Seeds erect, nearly terete.—Small trees or shrubs, natives of South America, and a few of India. Leaves ovate or lanceolate, rarely cordate. Stipulas lanceolate, deciduous, except in one species in which they are sheathing and truncate. Peduncles axillary, bifid, rarely twice bifid. Flowers sessile and mulilateral along the branches of the peduncles, and solitary in the forks.

1 G. speciosa (Lin. spec. 1498.) leaves broad, ovate or oval-obovate, usually subacrate at the base, obtuse and apiculated at the apex, downy beneath; stipulas ovate or lanceolate, acuminate, deciduous; cymes pedunculate, velvety, much shorter than the leaves; flowers of from 4 to 9 parts; fruit depressed, marked by an areola at the apex. S. Native of the East India islands; coast of Coromandel and Malabar, &c. Lam. ill. t. 154. f. 2. Roxb. fl. ind. 2. p. 521. Lindl. bot. reg. t. 1393. Cadamba jasminiflora, Sonn. trav. 2. p. 128. Rava-Pou, Rheed.

mal. 4. p. 47. and 48. Leaves canescent from villi in the young state, but the adult ones only along the nerves. Branches horizontal, forming a large shady head. Peduncles twice bifid. Flowers unisexual, large, white, exquisitely fragrant, partaking much of the scent of cloves. Seeds much curved, with the concave part of the curve outwards. Leaves sometimes downy on both surfaces. (f. 101.)

V. var., *glabra* (D. C. prod. 4. p. 455.) young leaves downy along the nerves and veins, but the adult ones are glabrous. S. Native of Mexico, but probably only cultivated in gardens. There are varieties of this with the leaves either subcorolate or subattenuated at the base.

**Shorey Guettarda.** Fl. June, July. Cilt. 1771. Tree 30 ft.

**Sect. II. Guettardaria** (altered from the generic name). D. C. prod. 4. p. 455. Limb of calyx usually permanent, truncate or irregularly subdentate. Corolla silky on the outside, with the lobes flat. Drupes having the cells of the pustule straight.

§ 1. Tube of corolla silky, villous or downy. Drupes containing a 4- or 5-celled pustule.

2 G. arge'stea (Lam. dict. 3. p. 54. ill. t. 154.) leaves ovate, acuminate, on short peduncles, glabrous and smooth above, but clothed with silky velvety down below, with the transverse nerves parallel; stipulas villous on the outside, ovate, terminating in a subulate point; cymes pedunculate, bifid, velvety; flowers hexameric, with a villous tube, which is 10 times longer than the ovary. S. Native of Cayenne. G. speciosa, Aubl. guian. i. p. 320. but not of Lin. Peduncles about the length of the leaves. Leaves 5 inches long and 3 broad. Pericarp 5-6 lines long. Corolla 15 lines long, white. Ovarium 6-celled, 6-ovulate.

**Silcry Guettarda.** Tree 20 feet.

3 G. Hayase'snis (D. C. prod. 4. p. 455.) leaves obovate, acuminate on the base, and mucronate at the apex, scabrous above, and tomentose beneath; stipulas acuminate, 3 times shorter than the pedilae; peduncles hairy, about the length of the leaves; cymes tripartite; tube of corolla 4 times longer than the ovary, and the limb 5-6-cleft. S. Native of Cuba, about the Havana. Allied to *G. ambigua*. Flowers white.

**Havanahavanna** Guettarda. Tree.

4 G. Messinia (Wall. cat. no. 6221.) leaves oblong, acuminate, paler beneath, glabrous in every part, except on the mid-rib beneath; cymes pedunculate, axillary, dichotomous; calyx 5-parted, permanent; corolla villous on the outside; fruit roundish, crowned by the calyx. S. Native of the East Indies. Stipulas ovate. Flowers white, not so large as those of *G. speciosa*.

**Mission Guettarda.** Shrub or tree.

5 G. americana (D. C. prod. 4. p. 455.) leaves ovate or obovate, cordate at the base, and rather mucronate at the apex, scabrous above, but clothed with downlike tomentum beneath; stipulas acuminate, one-half shorter than the pedilae; peduncles hairy, about the length of the leaves; cymes bifid; fruit globose, reticulated, crowned by the tubular calyx. S. Native of Guadaloupe, and also of Jamaica, if, as is suspected, this be the *Halepsia, P. Browne*, jam. p. 205. t. 20. f. 1. Flowers white.

**Ambigous Guettarda.** Shrub 8 to 10 feet.

6 G. cordata (H. B. et Kunth, nov. gen. amer. 3. p. 430.) leaves ovate-elliptic, deeply cordate, rounded at the apex, rather pilose above, and clothed with white tomentum beneath; stipulas ovate, acute, length of pedilae; peduncles 3 or 4 times longer than the pedilae; cymes 3-flowered; flowers hexameric, with a downy tube, which is 4 times longer than the ovary. S.
Native of New Granada, near Ibagué and Cuesta de Tolima, in hot places. Said to be nearly allied to *G. scabra*.

**Cordate-leaved Guettarda.** Tree or shrub.

7 G. *rugo*sa (Swartz. prod. p. 59. fl. ind. occ. 1. p. 632.) leaves ovate-subulate, mucronate, scabrous above, and tomentose beneath; peduncles 3 or 4 times longer than the leaves, compressed, villous; cyanes bifid: flowers hexameric, with a villous tube, which is 3 times longer than the ovary.  S. Native of the Caribbee islands, as of Santa Cruz, Antigua, and Dominica. Vahl, symb. 3. p. 59. Tube of corolla an inch and a half long, silky. Very nearly allied to *G. scabra*, but differs in the nervules of the leaves being less prominent and straight, not reticulate. Drupe purplish, containing a 6-seeded putamen.

**Wrinkled Guettarda.** Clt. 1793. Tree.

8 G. *scabra* (Lam. ill. t. 154. f. 3.) leaves obovate, mucronate, coriaceous, scabrous above, reticulated and pubescent beneath; stipulas lanceolate, acuminate, caducous; peduncles compressed, villous, almost 4 times longer than the pediote; cyanes bifid: limb of corolla 6-7-parted; stannens 6-7; tube of corolla villous, 3 times longer than the ovary.  S. Native of the West Indies, as of Porto-Rico. Vent. choix. t. 1. Mathiola scabra, Lin. spec. 1661. Mathiola, Plun. ed. Burm. t. 173. f. 2. Flowers white. Drupe containing an angular 4-7 celled putamen, and crowned by the somewhat crenate limb of the calyx.

**Scabrous Guettarda.** Clt. 1818. Tree.

9 G. *piluliformes* (Cham. et Schlecht. in Linnea. 4. p. 182.) leaves ovate, acute, on long petioles, smoothish above, but not scabrous, and clothed with silkyomentum beneath, as well as the branches and inflorescence; stipulas elongated, triangular, very soon falling off; peduncles shorter than the leaves, twice bifid, with the branches expanded; limb of calyx very short, somewhat truncate; drupe globose, depressed.  S. Native of Brazil within the tropic. Leaves 4 inches long and 2½ broad, on petioles about 15 lines long. Corolla densely clothed with down, having the leaf almost an inch long, and the limb 4-6-parted.

**Filiforme-like Guettarda.** Shrub 10 feet.

10 G. *Pedunculare* (Wall. cat. no. 6222.) leaves ovate-oblong, acuminate, glabrous; peduncles axillary, solitary, 1-flowered, girded by a ring just under the fruit, which is extended into 2 opposite subulate points; fruit oblong, crowned by the 4 permanent teeth of the calyx.  S. Native of Sirinagur.

**Peduncular-flowered Guettarda.** Shrub or tree.

11 G. *Platy*roda (D. C. prod. 4. p. 456.) leaves oval, mucronulate, acute at the base, on short petioles, glabrous and smooth above, but hoary beneath; stipulas triangular, acute; peduncles compressed, smoothish, length of the leaves, cyane at the apex, and bearing 5-7 flowers; limb of calyx short, tubular, a little toothed; fruit globose, depressed.  S. Native of Brazil, in the sand by the sea side at Bahia, where it was collected by Salzmann.

**Broad-peduncled Guettarda.** Shrub.

12 G. *Mollis* (D. C. prod. 4. p. 456.) leaves elliptic, somewhat mucronate, downy above and villous beneath; peduncles 5 times longer than the pediote; cyanes capitulate, villous; flowers hexameric, with a villous tube, which is 2 or 3 times longer than the ovary.  S. Native of St. Domingo. G. elliptica, ex Hispaniola, Spreng. syst. 1. p. 789.

**Soft Guettarda.** Tree or shrub.

13 G. *Xylolotoide* (H. B. et Kunth, nov. gen. amer. 3. p. 420.) leaves oblong, acute, rounded at the base, glabrous above, and downy beneath, but hairy on the veins, as well as on the branches; stipulas lanceolate, length of the pediote; peduncles 6 times longer than the pediote; cyanes 3-7-flowered; flowers hexameric, having the tube 8 times longer than the ovary.  S. Native on the banks of the Orinoco, between Angustura and Ferreras. Dierobotryum divaricatum, Willdl. in Schultes, syst. 5. p. 221. Flowers white. Fruit globose, downy, containing a 5-6-seeded putamen.

**Fly-Honeysuckle-like Guettarda.** Tree 20 feet.

14 G. *fumivflora* (Vahl. ecol. amer. 2. p. 26.) leaves oblong, polished, and glabrous on both surfaces, but having the middle nerve rather downy; stipulas small, subulate; peduncles crowded at the tops of the branches, rather shorter than the leaves, 3-flowered, rarely bifid, each branch bearing 3 flowers; flowers smaller, either pentamerous or hexameric; ovary striated; tube of calyx often obscurely bifid; tube of corolla villous.  S. Native of Santa Cruz, Montserrat; and of Mexico, at Acapulco. Edechi, Loefl. trav. 259. and p. 371. ex Rohr. *Ibora* pentandra, West. ms. Fruit globose, about the size of a pea, not crowned.

**Small-flowered Guettarda.** Shrub 6 to 8 feet.

15 G. *odorata* (Lam. ill. t. 154. f. 4.) leaves oval, acute at both ends, glabrous above, but rather villous on the nerve beneath, as well as on the pediote and branches; stipulas subulate, deciduous; peduncles almost one-half shorter than the leaves, villous, as well as the cyanes, which are bifid; flowers pentamerous; tube of calyx unequal, 7 times longer than the ovary.  S. Native about Carthagena and Havannah, among bushes by the sea side. Laugertia odorata. Jacq. amer. p. 64. t. 177. f. 21. pict. t. 259.

f. 16. Drupes containing a roundish 5-furrowed 5-celled putamen. Flowers of a dirty reddish colour, 9-10 lines long, villous on the outside, very sweet-scented at night. Fruit black, size of a pea. There is a spinosecent variety of this species according to Jacquin.

**Sweet-scented-flowered Guettarda.** Clt. 1818. Sh. 6 to 10 ft.

16 G. *Membranacea* (Swartz. prod. p. 59. fl. ind. occ. 1. p. 635.) leaves ovate, acuminate, membranaceous, rather hispid on both surfaces; down very minute, curved; peduncles length of the pediote, dichotomous; flowers secund, tetramerous; limb of calyx rather bifid, truncate; tube of corolla downy.  S. Native of Hispaniola, among bushes on the mountains. Corolla white, half an inch long. Drupe oblong, 4-seeded.

**Membranous Guettarda.** Shrub.

17 G. *Elliptica* (Swartz. prod. p. 59. fl. ind. occ. 1. p. 634.) leaves elliptic, obtuse, smoothish above, and downy beneath, as well as on the branches; peduncles shorter than the leaves; cyanes bifid; flowers tetramerous, with a silky tube, which is 5 times longer than the calyx.  S. Native of Jamaica, in dry fields. Drupe roundish, 4-seeded. Stigmata 2, blunt. Flowers small. This species is easily distinguished from *G. mollis*, with which it has been confused by Sprengel in his *Syst*.

**Elliptic-leaved Guettarda.** Tree 20 feet.

18 G. *Microphylla* (Barbl. in herb. Heineke, ex D. C. prod. 4. p. 457.) leaves ovate-oblong and oblong, smoothish above, and rather downy beneath; peduncles 3 or 4 times shorter than the leaves, 3-flowered; calyx quadrifid, with acute segments; corolla silky on the outside, with rounded lobes.  S. Native of Luzon, one of the Philippines. Very like *G. parviflora*.

**Small-leaved Guettarda.** Shrub.

19 G. *Uruguensis* (Cham. et Schlecht. in Linnea. 4. p. 183.) leaves elliptic-oblong, acuminate, rather pilose above,
canescent from thementum beneath, as well as the petioles, branchlets, and inflorescence; stipulas lanceolate, triangular, caducous; peduncles twice bifid, shorter than the leaves; limb of calyx very short, somewhat truncate; corolla silky; drupe oblong, 3-4-seeded. ° S. Native of the south of Brazil, on the banks of the Uruguay. Leaves 2 inches long, and an inch broad, on petioles 1-2 lines long. Tube of corolla 2-3 lines long; lobes 5, roundish.

**Uruguay Guettarda.** Shrub 10 feet.

20. G. FINLAYSONIÁ (Wall, cat. no. 6223.) leaves obovate-oblong, obtuse at the apex; calyx truncate; pedicels solitary, axillary, 1-flowered, much shorter than the leaves; corolla villous outside. ° S. Native of the East Indies. **Finlayson’s Guettarda.** Shrub.

21. G. WALLICHIA (Wall.); leaves oblong, acuminate, glabrous; pedicels 1-flowered, rising in numbers from short axillary peduncles; calyx truncate; corolla glabrous, apparently purple, ½ inch long. ° S. Native of the East Indies; fruit roundish, not crowned. Perhaps belonging to the first section. **Wallich’s Guettarda.** Shrub.

§ 2. Doubtful species, having 4-cleft silky corollas, and the drupes containing a 2-3-celled putamen. Perhaps species of the genus Steinitzianum.

22. G. PROTRACTÁ (Bartl. in herb. Hennke, ex D. C. prod. 4. p. 457.) leaves ovate or ovate-lanceolate, acuminate, rather villous on both surfaces, silky on the nerves and veins beneath; peduncles cymose, bifid, having the branches recurved. ° S. Native of Mexico. Perhaps a species of Steinitzianum.

Var. a, brevipes (D. C. prod. 4. p. 457.) leaves ovate, with 9 very prominent nerves on each side of the mid-rib; peduncles twice the length of the petioles; limb of calyx truncate, irregularly subulate; corolla 4-cleft, clothed with silky tomentum outside. ° S. Native of Mexico.

Var. b, longipes (D. C. l. c.) leaves ovate-lanceolate, with 7-8 rather prominent nerves on each side of the mid-rib; peduncles 4 times longer than the petioles; drupes ovate-oblong, acute, 2, sometimes 3-celled. ° S. Native of Mexico, at Acapulco.

**Protracted Guettarda.** Shrub.

23. G. ARMÁCA (Bartl. in herb. Hennke, ex D. C. prod. 4. p. 457.) armed with opposite spines; leaves ovate, acuminate, smoothish above, but clefted with hairy tomentum on the nerve and veins beneath, as well as on the branchlets; peduncles cymose, bifid, 3 or 4 times longer than the petals; segments of calyx 4, narrow-lanceolate, acute; corolla silky, with acute lobes; drupe ovate-oblong, (ex Bartl.) 2-3-celled. ° S. Native of Mexico. Very nearly allied to G. protracta. **Armed Guettarda.** Shrub 6 to 8 feet.

24. G. PANÇULA (Bartl. in herb. Hennke, ex D. C. l. c.) leaves ovate, acuminate, glabrous above, clothed with silky tomentum on the nerve and veins beneath, as well as on the branchlets; cymes dichotomous, many-flowered, on long peduncles, axillary, but the ultimate ones are disposed in a panicle; corolla clothed with silky tomentum outside, with ovate-oblong lobes. ° S. Native of Peru, on the mountains. Corolla 6 lines long. Teeth of calyx acute, smoothish. Fruit unknown. **Panicled-flowered Guettarda.** Shrub 6 to 8 feet.

**Sect. III. ULOLOBUS** (from oulder, oulder, curled, and kofs, leaf, a leaf in reference to the curled lobes of corolla), D. C. prod. 4. p. 457.—Laugéria, Ruiz et Pav. fl. per. 2. p. 22, but not of Jacq. Limb of calyx short, 5-parted almost to the base, permanent. Corolla silky on the outside, with 5 lobes, which are curled on the margins.

25. G. CRISPISOÓRA (Vahl, eclog. 1. p. 36. t. 6.) leaves broad-ovate, acuminate, obtuse at the base, having the lower lateral nerves approximate. ° S. Native of the Island of Montserrat, towards the tops of the mountains, ex Vahl; and of St. Vincent, on the edges of mountains, in inundated places, ex Forsyth; and about Santa Fe de Bogota, ex Mutis, in H. B. et Kunth, nov. gen. amer. 3. p. 420. G. crispoóora var. a, Pers. Roem. et Schultes. Stipulas large, undulate, foliaceous, ovate, acuminate. Guettardia membranacea, Sieb. et ex Dec. mart. no. 57, from Martinico, is the same, or a very nearly allied species. **Crispiled-flowered Guettarda.** Tree or shrub.

27. G. DEPENDENS (D. C. prod. 4. p. 458.) leaves oval-oblong, acuminate, acute at the base; stipulas shorter than the petioles; drupes oblong, 3-4-celled. ° S. Native of Peru, in groves about Mana. Laugéria dependens, Ruiz et Pav. fl. per. 2. p. 23. t. 145. f. b. Branches of cyme spreading, usually dependent. G. crispoóora var. b, Pers. and Roem. et Schultes, but is more nearly allied to hirsuta than to G. crispoóora. **Dependent-cymed Guettarda.** Tree 20 feet.

28. G. CORACÉA (Pers. ench. 1. p. 200.) quite glabrous; leaves elliptic-ovate, rather coriaceous, bluish, almost nervesless, rather paler beneath; stipulas acuminated, deciduous; peduncles about equal in length to the leaves, compressed, bifid or twice bifid; flowers tetramerous, glabrous, unilateral, and distant along the branches of the peduncle; tube of calyx bluntly 4-toothed. ° S. Native of the Island of Montserrat, ex Vahl; and Guadaloupe, at Pointe-a-Pitre. Laugéria coracéa, Vahl, eclog. 1. p. 26. Laugéria tubulosa, Fors. in herb. L’Her. Drupe oblong, ex Vahl, containing a 4-celled putamen. Corolla 6-7 lines long. Perhaps Viviania Dominigena, Rafin. speech. 1. p. 117. **Coriaceous-leaved Guettarda.** Tree or shrub.

29. G. RESISTÓSA (Pers. ench. 2. p. 200.) leaves lanceolate, attenuated at both ends, glabrous, glaucous beneath; stipulas combined into a somewhat truncate ciliated sheath; branchlets and cymes clothed with glaucous resin; peduncles a little shorter than the leaves; cymes bifid, crowded with flowers; flowers pentameric, glabrous; limb of calyx short, truncate, or hardly 5-toothed. ° S. Native of Montserrat, on the mountains, ex Vahl; of Guadaloupe, where it was collected by Perrottet; of Porto Rico, Riedley; of Trinidad, ex Sieber, f. lin. no. 112; and of Mexico, ex herb. Puerari. Laugéria resistósa, Vahl, eclog. 1. p. 27. t. 10. f. 6. with a figure. Terebrária, Sesse, fl. mex. icon. incd. Drupe oblong, containing a 4-celled, 4-seeded putamen, ex Vahl, but in the specimen examined the drupe contains a 4-5-celled 4-5-seeded putamen; there are therefore 2 species confused under this name. **Resistant Guettarda.** Shrub 8 to 10 feet.

30. G. BANONIX (Wall, cat. no. 6220.) leaves elliptic, acuminate, coriaceous, quite glabrous; peduncles axillary, solitary, or twin; cymes dichotomous; stipulas ovate, acuminated. ° S. Native of the East Indies, in Sirinagar. Flowers small. Calyx a little twisted. **Brown’s Guettarda.** Shrub.
† Species not sufficiently known.

31 G. Fontanei (D. C. prod. 4, p. 458.) stem arboreous; leaves broad-ovate, acuminate, and are, as well as the divaricate branches, villous; stipulas ovate, acute, deciduous. f. S. Native country unknown. G. hirsuta, Desf. cat. hort. par. ed. 3. p. 404, but not of Pers. Habit of G. argentea.

Desfontaines' Guettarda. Shrub.

32 G.? umbellata (Spreng. neu endt. 3. p. 48.) leaves oblong, quite glabrous on both surfaces; branches tubercular, compressed, dilated at the top; peduncles axillary, aggregate; flowers pentamerosus, glabrous. f. S. Native of Brazil. The calyx is said to be 5-toothed, and the drupe 6-celled. This plant ought probably to be excluded from the order.

Umbellata-flowered Guettarda. Shrub or tree.

Cult. For culture and propagation see Hamiltonia, p. 555. The species bear very fine leaves and flowers, and are therefore worth cultivating.

Lin. syst. Tetrandra, Monogyina. Calyx with a very short tube, and a 4-toothed limb. Corolla small, almost rotate, with a very short tube, and a 4-lobed spreading stem. Stamens 4, with exerted filaments, which are about equal in length to the limb of the corolla, and roundish anthers. Drupe dry, thin, ovate, crowned by the calyx, containing a 2-celled nut; cells 1-seeded.—A sarmentose shrub, native of Guiana, climbing among bushes. Leaves opposite, petiolate, ovate, acute. Stipulas oval, obtuse, deciduous, interpetiolar. Peduncles axillary, 3 times shorter than the leaves, racemously panicled: having the branches opposite, the lower ones the longest. Flowers small, sessile along the branches, bluish.

1 M. sarmentosa (Aubl. guian. 1. p. 106. t. 41.) f. S. Native of French Guiana, upon trees on the banks of rivers. Lam. ill. t. 66. f. 2. Cunninghamia sarmentosa, Willd. spec. 1. p. 615. Stipulas acute, ex Aubl., and the leaves tormentose beneath; but in the specimens examined the stipulas are obtuse, and the leaves are rather villous beneath, and at length glabrous. Perhaps there are two distinct species, Aublet's and Patris's.

Cult. See Pederia, p. 561. for culture and propagation.

Lin. syst. Tetrandra, Monogyina. Calyx with an ovate or oblong tube, and a short campanulate 4-toothed limb. Corolla tubular, 4-cleft, with acutish lobes, which are shorter than the tube. Anthers oblong, almost sessile in the throat, not exserted. Stigma bifid. Drupe somewhat baccate, ovate or oblong, crowned, containing a 2-celled nut: cells 1-seeded. Seeds erecte. Small trees, natives of the Mauritius. Leaves petiolate, opposite, or 3 in a whorl, oblong or obovate, glabrous, usually beset with glandular hairs in the axils of the veins. Stipulas interpetiolar, acute, deciduous. Peduncles axillary, shorter than the leaves, bifid. Flowers small, white, sometimes dioecious from abortion, unialateral, and sessile along the branches of the peduncles. This genus has the inflorescence of Stenostomum, but differs in the parts of the flowers being quaternary, not quinary. The flowers are nearly like those of Malanea, but the inflorescence is different; the tube of the corolla is longer, and the anthers almost sessile.

1 A. anthirhoca (D. C. prod. 4. p. 459.) leaves 3 in a whorl, obovate-oblong, cuneated at the base, acuminate at the apex, glabrous on both surfaces; flowers hermaphrodite; drupes oblong. f. S. Native of the island of Bourbon, and probably of the Mauritius, where it is called bois de Loutte. A. Losanna, Comm. in herb. Juss. Malanea verticillata, Lam. ill. t. 66. f. 1. Desr. in Lam. dict. 3. p. 688. Antirhoea Borbonica, Gmel syst. 1. t. 244. Cunninghamia verticillata, Willd. spec. 1. p. 615. Drupe the size of a grain of wheat. Flowers small, white.

Whorled-leaved Antirhoea. Tree 20 feet?

2 A. dioica (Bory, in litt. ex D. C. prod. 4. p. 459.) leaves opposite, and 3 in a whorl, obovate, cuneated at the base, short-acuminate, smoothish, beset with glandular pili in the axils of the veins; flowers dioecious from abortion; drupes oblong; f. S. Native of the Mauritius. Pet. Th. mel. obs. p. 56. Malanea neuroropa, Comm. in herb. Thouin. Flowers small, whitish.

Var. γ, acuminata (D. C. l. c.) leaves almost smooth, long-acuminate. f. S. Native of the Mauritius. Guettarda acuminata. Sieb. fl. maup. 1. no. 60.

Dioecious Antirhoea. Tree 20 feet?

A. frangulacea (D. C. prod. 4. p. 460.) leaves opposite, ovate, acute, at the base, and rather acuminate at the apex, smoothish, with the axils of the veins glandless; flowers hermaphrodite; drupes ovate. f. S. Native of the Mauritius. Guettarda frangulacea, Sieb. fl. maup. exsicc. 2. no. 59. Drupe one half shorter than in the first species, sometimes 3-celled and 3-seeded, which shows its affinity with Guettarda. Flowers small, whitish.

Frangula-like Antirhoea. Tree.

Cult. For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Tetrandra, Monogyina. Calyx with an ovate tube, and a small 5-toothed limb; teeth permanent, connivent, rather unequal. Corolla funnel-shaped, having the tube a little wider at the throat, and a 5-lobed limb: lobes lanceolate, bluntish. Anthers 5, oblong, hardly exserted. Stigma 2-lobed. Drupe ovate-oblong, crowned, containing a 2-celled nut. Seeds terete, solitary in the cells, inverted. Embryo central, in the fleshy albumen. West Indian trees. Leaves opposite, oval or oblong, on short petioles. Stipulas at length deciduous. Peduncles axillary, divided into a bident cyme. Flowers small, white, sessile and unialateral along the branches of the cyme, and one in each fork.—Inflorescence of Antirhoea, but differs from that genus in the parts of the flowers being quinary; and from Guettarda in the putamen of the fruit being 2-celled, not many celled.

§ 1. Corollas glabrous.

1 S. lucidus (Gérard. fil. carp. 3. p. 69.) leaves oblong, obtuse, shining above, glabrous on both surfaces; teeth of calyx short, obtuse. f. S. Native of the West Indies, as in Jamaica, Santa Cruz, St. Lucia, Porto-Rico, Trinidad, &c. Stürmiana luci...
RUBIACEÆ. CXIV. STENOSTOMUM. CXV. CHIONE. CXVI. TIMONIUS. CXVII. HAMILTONIA.

1 C. glabra (Rich. l. c. under Crúcea.) ñ. S. Native of Tortoise island. Psychérita megapòspérra, Vahl, eclog. amer. 3. p. 3. t. 21. ex herb. Jass, but neither the description nor the figure agree well with it, and it is therefore Jacquinia venosa, Swartz, prod. p. 47. Reem. et Schultes, syst. 4. p. 401.

Glabrous Chione. Cít. 1824. Tree 40 feet?

Cult. For culture and propagation see Hamiltoniana, p. 555.

CXVI. TIMONIUS (Timon or Aytimon is the name of the first species in Amboyna.) Rumph. amb. 3. p. 216. t. 140. D. C. prod. 4. p. 461.—Boëba, Gand. voy. uran. t. 93.—Boëba's, A. Rich. mem. soc. hist. nat. Par. 5. p. 215.—Buréné, Cham. et Schlecte. in Linnaea. 4. p. 188.—Erithalis, Forst. but not of Lin.

LIN. SYST. Tetrándria, Monogynária. Calyx with an ovate tube, and a tubular truncate 2-6-toothed limb. Corolla tubular, salver-shaped, with a 4-5-parted spreading limb, a naked throat, and oval obtuse lobes. Stamens 4, almost sessile, inserted in the upper part of the tube of the corolla. Anthers oblong-heart-shaped, sessile in the throat. Stigma 2, exerted, digitately 5-crenate, with the lobes linear. Drupes globose, smooth, crowned by the limb of the calyx, containing from 7-25 bony distinct 1-seeded indesinable pyrenees. Seeds inverted, linear. Albumen fleshy. Embryo terete.—Glaborous trees. Leaves opposite. Stipulæ interpetiolar, acute, entire. Peduncles axillary, shorter than the leaves, bearing each 3 flowers at the apex, the middle flower sessile, and the lateral ones pedicellate, each girdled by a cup-shaped 2-lobed permanent bracteae at the base. Allied to Guettardia, but differs in the pyrene being distinct, not combined.

Rumphii's Timoniús. Tree.

2 T. Forsteri (Cham. et Schlecte. in Linnaea. 4. p. 189, under Buréné) leaves opposite; flowers axillary; male ones disposed in cymes, bearing 4-5 anthophoric ones or 5 corollaries roundish. ñ. S. Native of the Society Islands; and in Romanzoff's Island. Erithalis polygama, var. a. Forst. prod. 1. p. 101. Erith. cymósa, Spreng. pag. 1. p. 17. Erith. polygama a. Willd. spec. 1. p. 997. Fruit containing usually 25 pyrenees. The flowers are described by Chamiso and Schlecte, as quaternary and quinary, but they are also sometimes senary.

Forster's Timoniús. Tree.

3 T. Gaedichardii (Cham. et Schlecte. in Linnaea. 4. p. 190, under Buréné) leaves elliptic, bluntest, acute at the base; cymes on long peduncles; fertile ones 3-flowered; but the sterile ones are twice bífida and 7-flowered. ñ. S. Native of the Island of O-Wahu, and of a number of the Sandwich Islands. Böeoa elátior, Gand. in Freyc. voy. p. 473. t. 93. Fruit containing usually 12 bony pyrenees.

Gaedichard's Timoniús. Tree.

Cult. For culture and propagation see Hamiltoniana, p. 555.

CXVII. HAMILTONIA (so named after William Hamilton of Woodlands, near Philadelphia, in North America, an eminent botanist, and the first who was at the expense of erecting a conservatory in that country for the preservation of plants of hot climates). Roxb. hort. beng. (1814.) p. 15. fl. ind. 2. p. 223, but not of Mulh. nor Willd.—Spermacetiobyn, Roxb. cor. 3. (1819.) p. 32.

LIN. SYST. Pentándria, Monogynária. Calyx with an ovate tube, a 5-parted limb, and subulate permanent segments.
Corolla funnel-shaped, with a long straight tube (f. 102. b.), and 5 oblong lobes (f. 102. c.). Stamens 5, inserted in the throat of the corolla, inclosed. Stigma 5-cleft. Capsule crowned by the calyx, deliquescent at the apex, 1-celled, containing 5 triquetrous 1-seeded pyrenes. Seeds inserted by the base, erect, covered by a dry reticulated membrane or epidermis. Albumen very sparing. Embryo erect, with an oblong radicle, and cotyledones foliaceous—East Indian shrubs. Leaves lanceolate, on short pedicels. Stamens short, acute, broad, and adpressed at the base. Flowers disposed in fascicles or umbels, sweet-scented.—This genus has been joined with Ankylostachys by Jussieu, but is sufficiently distinct from that genus.

Sweet-scented Hamiltonia. Fl. Oct. Clt. 1818. Sh. 4 to 6 ft. 2 H. scabra (D. Don, prod. fl. nep. p. 137.) leaves ovate-lanceolate, short-acuminate, scabrous on both surfaces, rounded at the base; calycine segments linear, villous. S. Native of Nipaul, at Narainhetti, and between Betourrna and Bempedli, chiefly between Bhindsabon, and the last-mentioned village, forming the most extensive thickets. Dr. Wallich has also met with it about the village near Cheeasnageree, and on several mountains in the valley. Hamiltonia Dilina and Nonatelia filamentosa, Hamilt. mas. Hamilton azureum, Wall. in Rosb. fl. ind. 2. p. 225. Spermatocitum azureum, Lindbl. bot. reg. 1235. Flowers azure blue, perfuming the air by their delicious fragrance, from November until March, during which time they are very beautiful. Indeforrescence ample, densely villous, especially the corollas. The tender parts of the plant emit a fetid smell, like those of Pezonia and Serissa.

Scabrous Hamiltonia. Fl. Jan. Clt. 1823. Sh. 4 to 6 ft. 3 H. vilosa (Rosb. fl. ind. 2. p. 226.) shrub stiff, very pilose; leaves lanceolate; fascicles of flowers axillary, intermixed with hairy bracteas. S. Native of the Moluccas.

Pilose Hamiltonia. Shrub 4 to 6 feet.

Cult. The species are desirable for every collection of vote plants, being free flowerers, very fragrant, and of easy culture. They succeed best in a mixture of loam and peat; and cuttions strike root readily in sand, with a hand-glass over them, in a moist heat.

CXVIII. LEPTODERMIS (from λεπτος, leptos, slender, and δέρμα, derma, the skin; the branches are covered with separating fibrous bark). Wall. in Rosb. fl. ind. 2. p. 191. A. Rich, mem. soc. hist. nat. par. 5. p. 221. D. C. prod. 4. p. 462.—Hamiltonia species, D. Don, prod. fl. nep. p. 137.

Lin. Syst. Pentandria, Monogyna. Involucre calyxiform, of 2 leaves, closely girding the ovary. Tube of calyx inclosed within the involucrum; limb of calyx short, permanent, 5-lobed; lobes roundish, adpressed. Corolla funnel-shaped, scabrous from minute papilla, with a terete tube, which is hairy inside, and 5 ovate cuspulate lobes which are involute and valvate in ovation. Stamens 5, with very short filaments and inclosed anthers. Ovarium 5-celled; cells 1-seeded. Style filiform; stigma quadrate. Fruit oblong, 5-celled? 5-valved? 5-seeded.—Shrubs, with decussate, tetragonal branches. Leaves lanceolate or oblong, on short pedicels, membranous. Stipulas length of petioles, adpressed, permanent, acute. Flowers sessile, scentless, white.—Perhaps sufficiently distinct from Hamiltonia.

1 L. lanceolata (Wall. in Rosb. fl. ind. 2. p. 191.) leaves lanceolate, attenuated, acute, membranous, villous; flowers sessile by threes at the ends of the branches; stipulas triangular, villous; branches quadrangular, downy while young. G. Native of Nipaul, 3 the mountains, though it is among the less common plants. Hamiltonia fruticosa, D. Don, prod. fl. nep. p. 137. Flowers white, scentless. According to the description in fl. nep. the flowers are said to be hexameric and hexandrous.

Lanceolate-leaved Leptodermis. Shrub 3 to 4 feet. 2 L. ort捐款 (Bunge, in mem. acad. sc. Petersb. 2. p. 108.) leaves oblong, glabrous; flowers terminal, aggregate. G. Native of China, on the mountains.

Lin. Syst. Penta-Hexandria, Monogyna. Calyx with an ovate tube, and a campanulate 5-6-toothed permanent limb. Corolla bearded inside, with a short tube, and a 5-6-lobed spreading limb; lobes acute, rather longer than the tube, valvate in estimation. Anthers 5-6, almost sessile at the throat. Stigmas 5-6-hamellate. Berry globose, furrowed, crowned by the limb of the calyx, containing 4-6 1-seeded pyrene. Seeds erect. Albumen fleshy. Embryo erect.—Small glabrous trees, with knotted fragile branches. Leaves petiolate, smooth. Stipulas ovate, caducous, with an elevated zone, which is joined to the petioles. Peduncles rising from the axils of the upper leaves, loosely panicked, shorter than the leaves.

1 P. Borbonica (Gmel. syst. 1. p. 577.) leaves oblong-lanceolate; peduncles 7-8-flowered. S. Native of the Island of Bourbon, on the mountains, where it is called Bois cassaut. P. corymbosa, Gaertn. fl. capp. 3. p. 82. P. Borbonica, Rosb. fl. ind. 2. p. 158. Flowers minute, pendent, disordered in axillary and terminal trichotomous corymb. Stigma 3-lobed. Drupe containing 3 pyreens.

Bourbon Psathura. Tree small.

2 P. Myrtilloides (A. Rich, diss. 1. c.) leaves oblong, bluntish; peduncles usually 5-6-flowered, lateral flowers sterile and deciduous; limb of calyx 5-parted; lobes lanceolate. S. Native of the Mauritius. Perhaps sufficiently distinct from the preceding.

Myrtle-leaved Psathura. Tree small.

3 P. terniflora (A. Rich, diss. 1. c.) leaves elliptic-lanceolate, acute; peduncles at the tops of the branchlets, usually by threes, 1-flowered; limb of calyx wide, obliquely 5-7-toothed. S. Native of the Mauritius.

Three-flowered Psathura. Tree small.

Cult. For culture and propagation see Hamiltonia above.
§ 1. Fruit containing 4 pyrene. Myouinia virae.

1 M. obovata (Lam. ill. no. 1482. t. 68. f. 1. dict. 4. p. 397.) leaves obovate, obtuse, on short pedioles; pedicels 1-3-flowered; berries bluntly tetragonal. 8 s. Native of the Island of Bourbon, where it is called Bois de rat, from the fruit being grateful to rats. M. Bordéenca, Ramb. nom. Berries red, size of grapes.

Obovate-leaved Myouinia. Shrub 4 to 6 feet.

2 M. MYRTIFOLIA (Lam. ill. no. 1483. t. 58. f. 2. dict. 4. p. 385.) leaves ovate-lanceolate, acute, on short pedioles; pedicels 1-3-flowered; berries spherical. 8 s. Native of the Island of Bourbon. M. lanceolata, Willd. spec. 1. p. 614. Rubiaceae, no. 103. Sieb. fl. major. fasc. 2.

Myrtle-leaved Myouinia. Shrub 4 to 5 feet.

3 M. MULTIFLORA (A. Rich, diss. p. 132.) leaves nearly sessile, rather cordate at the base, ovate-oblong, acute, shining above, reticulately veined, very minute; corollas terminal. 8 s. Native of the Mauritian. Ixora parviflora, Lam. ill. no. 1470. t. 66. f. 2. exclusive of the syn. of Rhed. Ixora micrantha, Roum. et Schults, syst. 3. p. 179. Faramea corimbosa, Sieb. fl. major. no. 2. no. 2. but not of Aubl.

Var. B, oblongifolia (D. C. prod. 4. p. 465.) leaves oblong, obtuse; corollas more crowded.

Tar. a, ovata (D. C. I. c. 1.) leaves ovate. 8 s. Ixora parviflora, Poir. suppl. 3. p. 207. Engénia violacea, Lam. dict. 3. p. 200. Myrtus androsaemoides, Poir. dict. 4. p. 409. Faramea, Sieb. fl. major. no. 6. no. 3. Perhaps a proper species.

Many-flowered Myouinia. Shrub 4 to 5 feet.

4 M. UMBELLATA (Barrl. in herb. Hanke, ex D. C. prod. 4. p. 463.) leaves obovate or obovate-oblong, coriaceous; pedicels axillary, many-flowered at the apex; pedicels 7-8, umbellate; berries roundish; calyces teeth very short, acutish. 8 s. Native of the Island of Luzon, one of the Philippines. Segments of corolla valvate in restitution. Genital not exerted. Seeds narrow, cylindrical, as in Guttātā, ex Barb. Perhaps a section of Myouinia, as Langbergia of Guttātā. Umbellate-leaved Myouinia. Tree small or shrub.

Cult. For culture and propagation see Hamiltonia, p. 555.

LIN. SYST. Tetra-Pentandria, Monogynia. Calyx with an obovate tube, and a small 4-5-toothed limb. Corolla subcampanulate, spreading, 4-5-cleft, with lanceolate acute lobes, and a tomentose throat. Stamens 4-5, hardly exerted. Stigma capitate, bifid: having the lobes approximate (ex Rich.). Fruit pear-shaped, 6-8-striped, but not crowned, containing 4-5 1-seeded, bony, combined pyrene. Embryo inverted. Alburnum fleshy.—Small glabrous trees, natives of the Mauritian. Leaves on short pedioles. Stipulas lanceolate, acuminate, rather longer than the pedioles. Pedicels axillary, 1-3-flowered. The number of the cells of the fruit is variable.

1 P. oleoides (Lam. ill. no. 1484. t. 65. f. 3.) leaves oblong, obtuse; stipulas glabrous; pedicels 1-3-flowered; drupes 8-seeded. 8 s. Native of the Island of Bourbon, where it is called Bois Mussard. P. Commersoni, Gmel. syst. 1. p. 247. P. salicifolia, Willd. spec. 1. p. 614. Olive-like Pyrostria. Tree 20 feet.

2 P. hexaspermum (Rosxb. fl. ind. 1. p. 403.) leaves oblong, acute; stipulas plicate; corollas axillary, dichotomous, with recurved branches; drupes 6-seeded. 8 s. Native of the East Indies in the Island of Huminah.

Six-seeded Pyrostria. Tree.

3 P. ORBICULARIS (A. Rich, l. c.) leaves oval-ornicular, sessile at the base and rather coruate, obtuse at the apex; stipulas glabrous; pedicels 1-flowered, furnished each with an involucre composed of 2 keeled leaves, which give the flower. 8 s. Native of the Island of Bourbon.

Orbicular-leaved Pyrostria. Shrub.

4 P. CORPUSCULA (A. Rich, l. c.) leaves oval, acute, rather coruate at the base, on very short pedioles; stipulas combined, sheath-formed, obtuse, and permanent; flowers pedicellate, solitary, girded by scales, which are combined into the form of an involucre; lobes of corolla oval, acute. 8 s. Native of the Mauritian.

Heart-leaved Pyrostria. Tree small.

5 P. POLYMORPHA (A. Rich, l. c.) leaves sometimes linear-lanceolate, sessile, variegated: sometimes orbicular and obtuse, petiolate: sometimes oblong-cordate, acute: stipulas acute, hardly combined at the base, caducous; flowers solitary, girded each by a 3-4-toothed tomentose involucre; lobes of corolla lanceolate. 8 s. Native of the Mauritian.

Variable Pyrostria. Tree small.

6 P. MACKERELLA (A. Rich, l. c.) leaves oval-oblong, somewhat coruate, on short pedioles, serobiculate in the axils of the veins beneath; stipulas glabrous; flowers sessile, solitary, axillary, girded each by a 2-leaved involucre. 8 s. Native of the Mauritius.

Frut egg-shaped, ribbed, crowned by the calyx.

Long-leaved Pyrostria. Tree small.

Cult. For culture and propagation see Hamiltonia, p. 555.

CXII. OCTAVIA (from Octavus, the eighth; in reference to the drupe containing 8 pyrene). D. C. prod. 4. p. 464.

LIN. SYST. Tetra-Pentandria, Monogynia? Calyx with a glabrose tube, and a truncate hardly conspicuous limb. Corolla, stamina, and style unknown. Ovarium crowned by a fleshy shining permanent disk, which is perforated in the middle. Drupe fleshy, glabrous, smooth, not crowned by the calyx, containing 8 1-seeded pyrene, which are disposed in a whorl. Alburnum fleshy. Embryo unknown.—A glabrous shrub, native of Guiana. Leaves petiolate, oval, long-acuminated, membranous, shining above. Bracteas ovate-oblong, acuminate, erect, much shorter than the pedioles, falling off very slowly. Flowers sessile, solitary, bractless, in the axils of the superior leaves, or on the tops of the branchlets.—This genus is not sufficiently known from the want
of the flowers; but it appears to come nearest to Pyrostria, but differs from that genus in the truncate calyx and florecence.

1 O. sessiliflora (D.C. l.c.) ]._S. Native of French Guiana, where it was collected by Patris.

Sessile-flowered Octavia. Shrub.

Cult. — See Hamiltonia, p. 555. for culture and propagation.

Lin. syst. Tetradria, Monogynia. Lint of calyx small, 4-toothed. Corolla globose, with a villous throat, and a short spreading 4-leaflet limb. Stamens 4, included; filaments very short, inserted beneath the throat; anthers linear. Style included, perforating the fleshy disk; stigma subulate, 4-toothed at the apex. Drupes succulent, obovate, umbonate, inflated, when young 4-celled, but in the adult state usually 1-celled, containing generally 4 1-seeded pyrene, which are furnished with papery aril at the base, and fixed to the central axis, which is incomplete. Embryo incurved. — A shrub, with the habit of Fennelia. Leaves small, trapexiform, almost sessile. Peduncles axillary, filiform, usually bearing 2 flowers at the apex. — This genus is nearly allied to Pyrostria.

1 L. riffoi (Blum. l.c.) ]._S. Native of the western parts of Java, on the mountains in woods.

Two-flowered Litosantes. Shrub 4 to 6 feet.

Cult. — For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Peta-Decemberia, Monogynia. Calyx with an ovate tube, a short permanent subtruncate limb, having its border hardly 5-10-toothed. Corolla rotate, almost without a tube, 5-10-parted; lobes linear-oblong, spreading. Stamens 5-10, scarcely adnate at the bottom of the corolla; filaments subulate; anthers linear. Stigma appearing simple at first sight, but on more close examination it will be found to be bilamellate. Drupes globose, furrowed, crowned by the calyx, containing 5-10 1-seeded pyrene. Seeds pendulous. Alloemen fleshy. — Glabrous shrubs.

Leaves petioled, having the lateral nerves hardly evident. Stipules broad, short, mucronate, sheathing, permanent. Peduncles axillary, panicked, rather longer than the leaves. Flowers small, white.

1 E. fruiticosa (Lin. spec. 251.) leaves obovate; panicles pedunculate; berries 8-10-furrowed, crowned by the truncate limb of the calyx. ]._S. Native of Martinico, Guadaloupe, Jamaica, St. Thomas, Porto-Rico, Cuba, &c. in woods on the mountains. Swartz, obs. p. 80.-Browne, jan. t. 17. f. 3. — Plum. ed. Burm. t. 249. f. 2. — Erithalidae odorifera, Jacq. amer. 72. t. 173. f. 23. Flowers white, sweet-scented, usually hexadromous. Berries purplish.

Var. 3. inodora (Jacq. amer. p. 72.) shrubby; branches procumbent; flowers inodorous; berries white. ]._S. Native of Curacoa, on rocks by the sea side. E. inodora, Rem. et Schultes, syst. 5. p. 268. This is a shrub about 2 feet high.

2 E. angustifolia (D. C. prod. 4. p. 465.) leaves oblanceolate, acuminate at both ends; panicles pedunculate, few-flowered; berry 5-9-furrowed, crowned by the 5-toothed limb of the calyx. ]._S. Native of Cuba, about the Havana.

Teeh of calyx 5-6, more conspicuous than those of the first species. The tube of the corolla is a little longer. Berry nearly dry, containing 5-7 pyrene.

Narrow-leaved Erithalis. Shrub.

3 E. ? pentagonia (D. C. prod. 4. p. 465.) leaves oval-lanceolate, acute; panicles terminal; fruit deeply 5-furrowed, not crowned by the calyx; style very short, crowned by 5 reflexed stigmas. ]._S. Native of Cuba. Fruit the size of a pea, containing 5 chartaceous compressed narrow pyrene. Style permanent. Corolla and stamens unknown. Habit of the other species of Erithalis, but is probably a distinct genus.

Five-angled-fruited Erithalis. Shrub 4 to 6 feet.

Cult. — For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentandria, Monogynia. Calyx with a subglobose tube, a 5-leaflet limb, and acute lobes. Corolla salver-shaped, with a terete tube, and 5 spreading linear obtuse lobes. Stamens 5; filaments exserted from the throat of the corolla; anthers oblong. Stigma thick, undivided. Drupes globose, crowned by the calyx, furrowed, containing 5 bony 1-seeded pyrene. — Small glabrous trees. Leaves obovate, obtuse or emarginate at the apex, emeuted at the base, coriaceous, downy beneath. Stipulas sheathing. Spikes of flowers axillary, at the tops of the branches, pedunculate. Flowers seceded, 2-4 in a cluster, flesh-coloured, propped by 3-5 coloured bracteas.

1 R. secundiflorum (Humb. et Bonpl. l.c.) ]._S. Native of South America, on the shady banks of the Orinoco and Atapapo, near St. Balthasar. Nonatelia secundiflora, Spreng. syst. 1. p. 751. The leaves and branches are covered by a kind of yellow resinous matter. Berries size of a pea, brownish.

Secondary-flowered Retiniphillum. Shrub 10 to 12 feet.

Cult. — For culture and propagation see Hamiltonia, p. 555.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a 5-toothed permanent limb. Corolla tubular, funnel-shaped, having the tube as if it was gibbous, and a 5-lobed limb. Stamens 5, almost inclosed. Stigmas 2 obtuse. Drupes globose, furrowed, containing 5 coriaceous 1-seeded pyrene. Alloemen horny. — Shrubs or small trees. Leaves glabrous or downy, oval-oblong. Stipulas combined together more or less, or free. Thyrs terminal, panicle-formed or corymbose-formed. Flowers often bracteolate, white.

1 N. racemosa (Aubl. guian. 1. p. 187. t. 72.) leaves elliptic-oblong, acuminate at both ends, petiolate; stipulas twin on both sides, 3 times shorter than the petioles; thyrses panicked, a little longer than the petioles; flowers bracteolate at the base.

2 N. Panameæsia (D. C. prod. 4. p. 466.) leaves oblong, acuminate at both ends, petiolate; stipulas twin on both sides,
connected at the base by a ligula, linear-subulate, longer than the pedioles; thyrse terminal, panicked, divaricate, sessile, short.  
5. Native of Panama. N. divaricata, Bartl. in herb.  

Panama Nonatelia. Shrub 3 to 4 feet.  
5 N. violacea (Aubl. guian. 1. p. 185. t. 73.) leaves elliptic, acuminate, tapering into the short pedioles at the base; stipulas solitary on both sides, ovate, obtuse, deciduous; thyrse many-flowered, about half the length of the leaves; flowers bracteate.  
53. Native of French Guiana, in woods.  

The flowers are 5-fused, of a violaceous color, about the size of currants.  

Shrub 4 to 5 feet.  
4 N. officinalis (Aubl. guian. 1. p. 182. t. 73.) leaves ovate, acute, glabrous; stipulas combined into a 4-toothed sheath; panicles corymbose; involucrum small, 3-leaved under each flower.  
7. Native of Cayenne, in sterile places. Lam. dict. 1. p. 342. Stems nodose. Flowers white. Berry 5-celled and 5-seeded, according to Aublet. Psychotria involucrata, Swartz. f. ind. occ. p. 413. a native of Jamaica, is certainly distinct from the plant of Aubl. in the fruit being 5-celled and 2-seeded.  

Officinal Nonatelia. Fl. June, July. Cl. 1827. Shrub 2 to 3 feet.  
5 N. lutea (Aubl. guian. 1. p. 190. t. 74.) leaves broad-ovate, acuminate; stipulas bluntly 2-lobed; panicles erect; tube of corolla narrow at the base, long, and with the segments of the limb acute.  

Yellow-flowered Nonatelia. Fl. June, July. Cl. 1823. Shrub 1 foot.  
6 N. longifolia (Aubl. guian. 1. p. 185. t. 71.) leaves lanceolate, acuminate, acute at the base, glabrous; stipulas combined into a sheath, furnished with 2 acute lokes on each side; thyrse panicle, few-flowered, pedunculate, one-half shorter than the leaves; tube of corolla incurved, and with the segments of the limb blunted.  

Long-flowered Nonatelia. Shrub 2 to 3 feet.  
7 N. grandiflora (H. B. et Kunth, nov. gen. amer. 3. p. 423.) leaves elliptic-oblong, acuminate, acute at the base, glabrous; stipulas connate, bifid; corollas pedunculate, terminal.  
73. Native of South America, on the banks of the Orinoco and the Tumacai, near Yavita. Flowers rose-coloured. Fruit oval, furrowed, 5-celled, ex Bonpl.  

Great-flowered Nonatelia. Shrub.  
8 N. Macrophylla (H. B. et Kunth, l. c. p. 423.) leaves ovate, acuminate, membranous, glabrous above, and clothed with fine down beneath; panicles terminal, pedunculate.  

Great-leaved Nonatelia. Shrub.  
9 N. Formosa (A. Rich. in mem. soc. hist. nat. Par. 5. p. 307.) leaves elliptic, long-acuminated, abruptly petiolate, glabrous above, and rugged from tomentum beneath; spikes terminal, simple, erect, length of leaves; flowers tetramerous; fruit 4-celled; corolla with a long tube, which is very villous inside.  
73. Native of French Guiana. Allied to N. longiflora.  

Beautiful Nonatelia. Shrub.  
10 N. divaricata (A. Rich. l. c.) leaves elliptic, acuminate, tapering into the petioles at the base; flowers 5-fused together, on the top of a common peduncle; fruit globose, 4-furrowed, containing 4 pyrene.  
73. Native of French Guiana, in woods. Flowers unknown.  

Divaricate Nonatelia. Shrub.  
11 N. hisenda (Wall. in Roxb. fl. ind. 2. p. 157.) leaves oblanceolate, acuminate at the base, villose beneath; stipulas linear-lanceolate, broad at the base; flowers sessile, axillary, verticillate, with hispid bracteas; stigma 5-lobed.  

Hispid Nonatelia. Shrub 3 to 4 feet.  

Cult. For culture and propagation see Hamiltonia, p. 555.

L. syst. Tetra- Pentandria, Monogynia. Limb of calyx short, quite entire. Corolla 4-5-parted, villous inside, with the segments of the limb coning at the base, and spreading at the apex, each tipped by a short inflated claw. Stamens 4-5, inserted in the base of the corolla. Stigma bifid, warded. Drupe globose, baccate, umbilicate, containing 4 1-seeded triquetrous pyrene, which are furnished with papery aril. Embryo albuminous, erect.—A climbing glabrous shrub. Leaves opposite, oblanceolate, acute, coriaceous, glabrous. Stipulas permanent, twin on both sides, approximate, erect, at length marcescent. Flowers crowded, axillary. This genus is nearly allied to Nonatelia according to the author.  
1 G. coriacea (Blum. l. c.).  

Coriaceous-leaved Gynochthodes. Shrub cl.  

Cult. For culture and propagation see Paradella, p. 561.

L. syst. Tetra-Pentandria, Monogynia. Limb of calyx urceolate, quite entire, deciduous. Corolla with a short tube, and a spreading 4-5 cleft limb; lobes oblong-linear. Stamens 4-5, exserted; filaments inserted in the throat; anthers long, linear, incumbent. Style perforating the disk. Stigma bifid, exserted. Drupe globose, umbilicate, containing 4 1-seeded chartaceous arillate pyrene, which are hollow inside, and gibbous on the outside. Embryo albuminous, erect.—Glabrous climbing shrubs, with terete branches. Leaves opposite, petiolate. Stipulas broad, short, truncate. Coryms or umbels axillary and terminal, simple or compound. This genus is nearly allied to Gynochthodes, but differs from it in the stamens being exserted.  
1 C. scasdens (Blum. bijdr. p. 468.) leaves oval, acute; flowers subumbellate, exceeding the upper leaves.  
73. Native of Java and the island of Nusa-Kambanga, on the moutains, climbing upon trees, where it is called Sambon and Tjionkankan.  

Climbing Celespernum. Shrub cl.  
2 C. Corinebousum (Blum. herb. ex D. C. prod. 4. p. 468.) leaves oblong, acuminate at both ends; flowers subumbellate, 3 times shorter than the upper leaves.  
73. Native of Java.
Corymbosa-flowered Celospernum. Shrub el.  
Cult. See Poedéria, p. 561. for culture and propagation.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a 5-parted limb (f. 103. d.); lobes acute. Corolla tubular, incurved (f. 103. b.), with the tube widened at the apex, and an irregular 5-lobed limb (f. 103. c.). The 2 superior lobes the longest, all ending in callous points. Anthers 6, sessile at the throat (f. 103. c.). Stigma thick, terete, 5-lobed at the apex (f. 103. d. e.). Ovarium 5-lobed (f. 103. g.); cells 1-seeded.  
—A shrub, with villous branchlets. Leaves elliptic, obtuse, puberulous, on short pedioles, reticulate beneath. Stipulas coriaceous, acute, spreading at the base. Flowers 1-3 together, on short pedicels, axillary, spreading, bracteolate, hairy.—From the stigma and lobes of the corolla this genus agrees with Cucuria.  
1 P. Rubiginosa (Desf. l.c.) f. S. Native of Angola, on the western coast of Africa. (f. 103.)  
Rusty Ancylanthus. Shrub 2 to 3 feet.  
Cult. For culture and propagation see Hamiltioni, p. 555.

—Nearly allied to Cucuria.  
1 P. horizontalis (Schum. pl. guin. p. 112.) branches horizontal, unarmed; peduncles umbellate. f. S. Native of Guiana. Stigma conical, and as if it was furnished with a reflexed membrane from the very loose margin, truncate at the apex.  
Horizontal-branched Phallaria. Shrub.

2 P. Spirosha (Schum. pl. guin. p. 113.) branches spinose; peduncles racemose. f. S. Native of Guiana. Stigma of a capitate conical form, bident at the apex, ex Schum.  
Spinose Phallaria. Shrub.  
Cult. See Hamiltioni, p. 555, for culture and propagation.

Lin. syst. Pentandria, Monogyina. Calyx with a short hemispherical tube, and a 5-toothed limb. Corolla funnel-shaped, with a long tube, and 5 roundish reflexed lobes. Anthers 5, almost sessile in the throat. Style thick at the base, 5-furrowed; stigma cylindrical, truncate at the base and apex, 5-furrowed. Drupes dry, containing a 2-celled rugose nucleus; cells 1-seeded, but one of them is usually abortive.—A shrub. Leaves opposite, on short pedioles, ovate-oblong, attenuated at both ends, glabrous. Stipulas unknown. Corymb terminal; pedicels 2-3-flowered. Flowers white. This genus is nearly allied to Paliciera, if the fruit be 2-celled, but if it be 5-celled it is more nearly allied to Nonaelia; but in the form of the stigma it agrees with Cucuria.  
1 H. Ovarianese (Beauv. l.c.) f. S. Native of Western Africa, in the kingdom of Warce in deserts.  
Warce Hyalacium. Shrub.  
Cult. For culture and propagation see Hamiltioni, p. 555.

Lin. syst. Pentandria, Monogyina. Calyx with a short tube, and a 5-parted limb: lobes linear, acute, foliaceous, spreading, 3 times longer than broad. Corolla campanulate, 5-cleft: lobes linear, very acute, hardened, and therefore spinaceous? Anthers 5, inclosed in the throat; filaments very short. Stigma large, dilated, cup-formed, obtuse, and somewhat pentagonal, with reflexed edges. Fruit baccate, 5-celled; cells 1-seeded.—A glabrous shrub, with diverging branches. Leaves oval-oblong, acute, almost sessile. Stipulas combined into a short bidentate sheath. Panicles terminal, corymbosus. The corolla has a membrane which is separable from it, and this membrane is probably furnished with the stamens. Ovarium destitute of the urceolus at the apex.  
1 C. Acutiflora (D. C. l. c.) f. S. Native of Sierra Leone, where it was collected by Smeathman. Cuviera Africana, Spreng. syst. 1. p. 760.  
Aeoe-flowered Cuviera. Shrub 3 to 4 feet.  
Cult. For culture and propagation see Hamiltioni, p. 555.

CXXXIII. DONDISIA (named after James de Dondis, who was among the first who illustrated the descriptions of plants by figures). D. C. prod. 4. p. 469. but not of Adans. nor Scop. nor Rebb.  
Lin. syst. Pentandria, Monogyina. Calyx with a turbinate tube, which is adnate to the ovary, and a very short hardly 5-toothed limb. Corolla with a short broad tube, furnished with one series of retrograde scarious stiff hairs inside, which is perhaps the loose jagged part of a membrane inside the tube; lobes 5, acuminate, valvate in restitution, but at length spreading. Stamens 5, inserted in the throat of the corolla between the lobes; filaments short, slender. Style filiform, tumid in the middle, and hispid. Stigma ovate, truncate at the base, almost cup-shaped. Ovarium 1-celled? many seeded? Fruit unknown.—A glabrous shrub, native of India, with slender branches. Leaves oblong, acuminate, acute at the base, on very short pedioles. Stipulas acute, short, deciduous. Racemes 5-4-flowered, short, axillary or rising from very short branchlets, bracteolate, much shorter than the leaves.—This genus is nearly allied to Cucuria and Stigmantis, but differs both from both in the truncate calyx, which is 5-parted in those genera; from Cucuria in the limb of the corolla being unarmed, in the tube being plose inside, not clothed by a membrane, in the form of the stigma, and perhaps of the fruit; and from Stigmantis in the tube of the corolla being short, not long, in the style being tumid in the middle, and in the ovary being turbinate, not roundish.  
1 D. Leschenaultii (D. C. prod. 4. p. 469.) f. S. Native of the East Indies, on mountains, where it was collected by Leschenault.  
Leschenault's Dondisia. Shrub 4 to 5 feet.  
Cult. For culture and propagation see Hamiltioni, p. 555.

LIN. SYST. Pennandria, Monogynia. Calyx with a short tube, a 5-parted limb, and filiform segments. Corolla funnel-shaped, with a long tube, and 5 ovate-oblong spreading lobes. Stamens 5; filaments very short; anthers reflexed. Style filiform, longer than the corolla; stigma ovate, furrowed, large. Berry dry, tubercular, compressed, 1-celled. Seeds many, bony.—A climbing shrub, with glabrous lanceolate leaves. Cymes large, axillary, and terminal. Flowers white.—This genus is not sufficiently known; it differs from Cuviera in the 1-celled fruit; and from Donisia in the 5-parted calyx. Perhaps both this genus and Donisia are referrible to Tribe Gar- deniaceae, subtribe Gardenieae.

1 S. cy'ssosus (Lour. l. c.). G. Native of Cochín-china, in woods on the mountains. Cuvieriana Asiatica, Spreng. syst. 1. p. 760.

LIN. SYST. Pentandria, Dicy'nia. Limb of calyx campanulate, cleft in 5 parts beyond the middle; lobes acuminate. Corolla sub-campanulate, deeply 5-parted, with hardly any tube, but with erectish lanceolate lobes or segments, which are somewhat reflexed at the apex. Stamens 5; filaments very short, inserted in the bottom of the corolla, connate; anthers combined into an ovate-oblong somewhat pentagonal tube, which is 5-celled inside; cells regularly disposed, 3 external and 2 internal. Style length of stamens. Stigma bifid; with the lobes erect and obtuse. Ovarium 2-celled; cells 1-ovulate. Drupe pea-formed, umbilicate, containing a 2-celled globose nucleus, rarely 1-celled from abortion.—A small shrub with a short stem. Leaves fleshy, 5 in a whorl, linear, obtuse, with revolute margins. Stipulas interdeltiolar. Flowers small, disposed in short, nearly simple axillary racemes: having 2 opposite scale-formed bracts under each flower.

1 S. marita'ma (Jacq. l. c.). G. Native of Curacoa, on rocks by the coast. The leaves resemble those of rosemary, and the stipulas are blackish. Flowers small. The whole plant has a disagreeable smell.

Sea-side Strumpfia. Shrub 3 feet. Cult. For culture and propagation see Hamiltonia, p. 555.

CXXXVI. BILLO'TIA (named by Aloysia Colla, of Turin, after his daughter, Madame Teofila Billioti, a famous botanical artist). D. C. prod. 4. p. 618. but not of Colla.—Viviania, Colla. ann. soc. lin. par. 1825. but not of Cav. nor Raddi nor Rafin.—Melanolipodium, Cels. hort. but not of Poit. LIN. SYST. Penta-Hy'pantria, Monogynia. Calyx with the tube adhering to the ovary, and a 5-7-parted limb. Corolla salver-shaped: having the tube bearded with bristles inside, and a 5-7-parted limb. Stamens 5-7, adnate to the tube. Ovarium crowned by a nectiferous ureculus. Style 1; stigmas 4. Drupe 1-seeded by abortion.—A smoothish shrub. Leaves ovulate, with ciliate villous on the pe- tioles, margins, and the nerves on the under side of the leaves, the rest glabrous. Stipulas solitary at each of the nodi, probably formed of 4, which are combined into a sheath, which is cleft on one side, and denticulated at the apex, downy when young, brown in the adult state, falling off at length in a circular manner at the base.

Tribe VIII.

PEDERIE'E (this tribe agrees with Pederia in important characters). D. C. prod. 4. p. 470.—Lygodysodeae, Bartl. in herb. Hanke, ex D. C. prod. 4. p. 470. Fruit 2-celled, indehiscent, hardly fleshy, and the rind is easily separated from the carpels or nuts, which are compressed, 1-seeded (f. 104. f.), and hanging from the central filiform axis, Albumen fleshy.—Climbing shrubs, with opposite leaves and interpetiolar stipulas.

LIN. SYST. Pentandria, Monogynia. Calyx with an ovate globose tube, and a 5-toothed acute, permanent limb (f. 104. a.). Corolla having the tube much longer than the teeth of the calyx (f. 104. b.), with a hairy throat, and 5 somewhat revolute lobes (f. 104. c.). Anthers oblong, sessile within the tube (f. 104. c.). Style equal in length to the tube; stigmas 2, slender (f. 104. d.), exserted. Fruit indehiscent, oval, somewhat compressed, shining, crowned by the calycine teeth (f. 104. g.); the rind is crustaceous, and at length becomes brittle and breaks irregularly, and therefore is easily separated from the carpels or seeds. Carpels or seeds 2 in each fruit, indehiscent, oval, applied together, girded by a nerve-formed winged margin, hanging by a thread from the base of the fruit, and when the rind has been separated from them appear pendulous. Albumen a thin fleshy membrane, combined with the tegument of the carpella or wanting altogether. Embryo straight, with an inferior terete radicle, corydace foliaceous flat cotyledons, and an inconsiderable plumule.—Smoothish twining shrubs, holding the same station in America as the genus Pederia does in Asia. Stems terete or compressed. Leaves opposite, petiolate, cordate or ovate, acuminate. Stipulas very short, rather truncate, combined with the petioles. Panicles few-flowered, loose, terminating in few-leaved, axillary branchlets, or axillary and leaf.—This genus comes very near Pederia, and might probably form a distinct order with it from the distinct calyx and carpels.

Lin. syst. Pentandria, Monogynia. Limb of calyx 5-parted; lobes subulate, spreading. Corolla with a longish terete tube, and a 5-parted limb. Stamens 5, inserted in the throat, which is naked, almost sessile; anthers oblong, exerted. Style simple; stigma 2, linear, recurved. Ovary 2-celled, 2-seeded. Fruit compressed, crowned, a little striated; rind coriaceous, membranous, bursting from the carpel or seeds at the base. Carpels compressed, 1-seeded, with winged margins, hanging each from the top of a thread, which rises from the base of the fruit. Seeds erect. Embryo straight, in fleshy albumen, with a short radicle, and longer obtuse cotyledons.—Small climbing shrubs, natives of Madagascar. Leaves opposite, petiolate, tomentose. Stipulas undivided. Flowers almost sessile, disposed in spikes; spikes in fascicles, erect, or incurved, rising from the top of a common axillary peduncle.

1 L. Arge studenta (A. Rich, l.c.) leaves oval, abruptly acuminated, obtuse at the base, clothed with silvery tomentum beneath; spikes erect, in fascicles, elongated; flowers distant; fruit oblong-ovate. h. \(\_\) S. Native of Madagascar.

Silvery-leaved Lecontea. Shrub cl.

2 L. bojeriana (A. Rich, l.c.) leaves heart-shaped, tomentose, abruptly acuminated at the apex; spikes in fascicles, very short, recurved; flowers approximate; fruit nearly orbicular. h. \(\_\) S. Native of Madagascar. Lygodysidea Lingun, Bojer?

Cult. For culture and propagation see Pededia, p. 562.

Lin. syst. Pentandria, Monogynia. Calyx with an ovate tube, and a small 5-toothed persistent limb. Corolla funnel-shaped, hairy inside, 5-lobed, plicate in aestivation. Stamens 5, sometimes abortive; anthers oblong, almost sessile in the middle of the tube. Style not exerted; stigma bifid. Berry small, ovate-globose, 2-celled, 2-seeded; the rind at length becoming brittle, and easily separated. Albumen fleshy. Embryo straight, with a terete inferior radicle; flat, foliaceous, large cotyledons, and an inconspicuous placenta.—Sarmentose shrubs, rarely erect. Leaves opposite, petiolate, lanceolate, ovate or cordate, acute. Stipulas solitary on both sides. Peduncles terminal and axillary, branched, somewhat corymbose. Flowers small, white, usually unisexual.

* Climing shrubs.*

1 P. FÆTIDA (Lin. mant. p. 52.) leaves oblong or lanceolate, cordate at the base, glabrous; panicles axillary, opposite, short, few-flowered, rarely terminal; bracteoles minute; anthers inclosed; berry ovate, a little compressed. h. \(\_\) S. Native of the East Indies, very common in many places, as well as of Japan, and the Moluccas, among bushes. Lam. dict. 2. p. 257. ill. t. 166, f. 1. Thunb. jap. 107. Roxb. in Wall. fl. ind. 2. p. 517. Sieb. flan. mar. 2. no. 82. Apocynum foetidum, Burm. fl. ind. p. 71.—Rumph. amb. 5. p. 160.—Kumpf. icon. sel. t. 9.—Somarajj. asiat. res. 4. p. 261. Stipulas broad, cordate. Panicles axillary, bractiuate. Flowers numerous of a deep pink colour. Seeds compressed, bordered by a membranous wing. The leaves vary much in form. The whole herb has a fetid smell, when bruised. The roots are used as an emetic by the Hindoos.

2 P. Recurvâ (Roxb. fl. ind. 2. p. 518.) leaves lanceolate, acuminate, glabrous; corymbs terminal, recurved, villous; anthers inclosed; berries globose, dry, striated a little. h. \(\_\) S. Native of the East Indies, at Chittagong. Leaves 6 inches long and from 2-3 broad. Stipulas with a subulate hairy point. Stigma simple, linear, clavate. Berry size and colour of a black currant.

Recurved-corymbed Pederia. Shrub cl.

3 P. MACROCARPA (Wall. cat. no. 7392.) leaves broad, cordate, acuminate, downy above and woolly beneath; racemes long, axillary, panicled, downy; fruit oblong, compressed, with a polished rind. h. \(\_\) S. Native of the Burmese Empire, at Rangoon.

Large-fruited Pederia. Shrub tw.

4 B. LANIGOSA (Wall. pl. asiat. rar. 2. p. 52. t. 165.) leaves broad-obovate, and acute-lanceolate, acuminate, sagittately cordate at the base, downy above and woolly beneath; stamens long, axillary and terminal, panicled, downy or pilose as well as the petals; fruit roundish, compressed. h. \(\_\) S. Native of the Burman Empire, on the banks of the river Abran. Flowers green and purple.

Woolly-leaved Pederia. Shrub tw.

5 P. Tomentosa (Blum. bijdr. p. 968.) leaves ovate-cordate, acute, tomentose beneath; panicles axillary and terminal, elongated, leafy. h. \(\_\) S. Native of Java, among bushes on the mountains, common.

Tomentose-leaved Pederia. Shrub tw.

6 P. VERTICILLATA (Blum. bijdr. p. 968.) leaves 3 in a whorl, elliptic-oblong, acuminate, glabrous; panicles axillary and terminal, elongated, leafy. h. \(\_\) S. Native of Java, on Mount Salak.

Wheeled-leaved Pederia. Shrub tw.

* Erect shrubs, which probably do not rightly belong to the genus.*

7 P. ERECA (Roxb. fl. ind. 2. p. 519. but not of Spreng.) erect; leaves almost sessile, broad-lanceolate, smooth; panicles terminal, erect, in the forks of the branches; stamens exerted a little. h. \(\_\) S. Native of the East Indies, in Silhet. Leaves 4 inches long and 1½ broad. Flowers numerous, small, white, inodorous. Berries the size of a pea, when ripe highly polished, black, smooth.

Erect Pederia. Shrub 2 to 3 feet.

8 P. TIRANA (Wall. in Roxb. fl. ind. 2. p. 520.) erect, trichotomous, smooth: with triangular branchlets; leaves 3 in a whorl, oblong-lanceolate; corymbs axillary, trichotomous, erect, shorter than the leaves; limb of calyx campanulate, obscurely 5-toothed. h. \(\_\) S. Native of the East Indies, on the Juyuntiappoara mountains bordering on Silhet. Flowers rather large, large-leaved, white, on long filiform pedicels, each pedicel having a pair of linear ciliated bracteas above the middle. The flowers are said to be fragrant when quite fresh, but they emit a very offensive smell on being steeped in water after they have been dried. Corolla fleshy, half an inch long, with a 5-cleft, rarely 4-cleft border. Fruit unknown.

4C
Ternate-leaved Pæderia. Tree small.

Species not sufficiently known.

9 P. V al’11i-kâ’ra (Juss. mem. mus. 6. p. 381.) climbing; branches terete, villously tomentose; leaves broad-ovate, acute, somewhat cordate, rather pilose above, and rather woolly beneath; corollas axillary, many-flowered. h. . S. Native of Maha-

Rhee. Field. mal. 7. p. 35. t. 18. Holmbesben, Adams, fam. 2. p. 155. Berry globose, green, probably 1-seeded. Flowers 5-cleft, according to the figure, but tetraandrous according to the description.

T’ali-kara Pæderia. Shrub cl.

10 P. sessiliflora (Poir. suppl. 2. p. 440.) stems ascending; leaves lanceolate, glabrous; petioles geniculated at the base; racemes rather longer than the leaves, brachiate, pilose; flowers sessile, sub-second. h. S. Native of the Mauritian. Said to be allied to P. jectida, but is probably a species of Laugeria.

Seissile-flowered Pæderia. Shrub ascending.

11 P. Brazili’ana (D. C. prod. 4. p. 472.) leaves cordate-ovate, pilose beneath and on the branches; panicles terminal, much branched; flowers pedunculate. h. S. Native of Brazil in the province of Minas Geraes. Anthers included. Berry dry, containing 2 pyrenees. Pæderia ereta, Spreng. neun. entd. 3. p. 34. but not of Roxb. 

Brazilian Pæderia. Shrub 3 to 4 feet.

Cult. The species of Pæderia are free growers, and will thrive in any kind of rich light soil; and cuttings strike root readily in the same kind of soil, under a hand-glass.

Tribe IX.

COFFEA’CEAE (this tribe agrees with the genus Coffea in the fruit being baccate, and in containing 2 hard 1-seeded nuts). D. C. diss. 1806. H. B. et Kunth, nov. gen. amer. 3. p. 352. exclusive of some genera. A. Rich, ex D. C. prod. 4. p. 472.—Psychotriacæe and Cephalacæe, Cham. et Schlécht. in Linnea, 4. p. 4. and p. 133. Fruit 2-celled (f. 105. k. f. 107. c.), baccate, containing 2 bony or crustaceous nuts (f. 107. d.), which are flat inside and usually marked by a furrow on the outside; rarely containing only 1 nut from abortion. Nuts adhering by the inner sides. Albumen horny.—Trees or shrubs. Leaves opposite. Stipulas inter-petiolare, with 2 on each side, which are either combined or distinct.

Sub-tribe I. Coffeaceae (this sub-tribe contains shrubs agreeing with the genus Coffea in having distinct flowers). D. C. prod. 4. p. 472.—Psychotriacæe, Cham. et Schlécht. 4. p. 4. Flowers distinct, not combined.

Lin. syst. Tetraandria, Monogy’nia. Calyx with an ovate tube, and a short 4-5-toothed limb. Corolla with a short tube, a bearded throat, and 4-5 spreading lobes. Anthers 4-5, inserted at the throat, hardly exserted. Style filiform, exserted; stigma undivided, thick, ovate-globose, or mitre-formed. Berry globose, or didymous, fleshy, crowned by the calycine teeth, 2-celled. Seeds solitary in each cell, inserted towards the apex, incurved, incurved. Albumen fleshy. Embryo central, with a long superior radicle.—Asiatic or African shrubs, with spinose or unarmed branches. Leaves opposite, rather coriaceous. Stipulas interpetiolate, solitary on both sides. Peduncles axillary, short, many-flowered.

Sect. I. Eucanthum (from eu, well or good, and canthum; this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 473. Mature fruit 2-celled, terminated by an umbilicus.

* Unarmed shrubs, with pentandraous flowers.

1 C. Corne’lia (Cham. et Schlécht. in Linnea 4. p. 14.) branches unarmed; peduncles, calyces, and petioles villous; leaves ovate, obtuse at the base, acute at the apex, rather villous on both surfaces; peduncles biform; cymes dense, many-flowered. h. S. Native of Senegal. Pavetta Cornelia, Reichb. in Sieb. fl. seneg. exsic. no. 21. Fruit unknown. Flowers white. Corne’lia Canthium. Shrub 4 to 5 feet.

2 C. Juc’cubana (D. C. prod. 4. p. 473.) unarmed; leaves ovate, rather cordate, acutish, downy beneath, as well as on the branches; peduncles biform, cyme, many-flowered; fruit a little compressed and rather cordate. h. S. Native of Senegal, in...
humid places; and of Gambis, near Albreda, where it was collected by Leprieur and Perrotte. Flowers smaller than in any other species of the genus. Stigma ovate. Fruit almost like that of the following.

**Subcordate-leaved Canthium.** Tree.

3 C. *didymum* (Gartn. fil. carp. 3. p. 94. t. 196. exclusive of the syn. of Rheed.) shrubby, unarmed, glabrous, and smooth; leaves on short petioles, obtuse, and oval, glandular in the axils of the veins beneath; cymes axillary, on short peduncles; fruit didymous.  S. Native of Coromandel, the Rest unknown.

*Didymous*-fruited Canthium. Shrub.

4 C. *moluccanum* (Ronb. fl. ind. 2. p. 172.) shrubby, unarmed; leaves oblong; tube of corolla gibbous, length of style; stigma turbinate.  S. Native of the Moluccas. The Rest unknown.

**Holoca Canthium.** Shrub.

5 C. *fasciculatum* (Blm. bijdr. p. 967.) arboreous, unarmed; leaves elliptic-lanceolate, glabrous; flowers in axillary fascicles.  S. Native of the west of Java, in mountain woods. Said to be allied to C. *didymum*.

**Fascicled**-flowered Canthium. Tree.

6 C. *glabrum* (Blm. bijdr. p. 967.) arboreous, unarmed; leaves ovate, or elliptic-oblong, obtuse, acutish at the base, glabrous; cymes axillary, branched, many-flowered.  S. Native of Java, in woods on the mountains.

Var.  β, *puberulum* (Blm. l. c.) leaves roughish above and puberulous beneath.  S. Native of Java, at the foot of Mount Salak.

**Glabrous Canthium.** Tree.

7 C. *nive* (Bartl. in herb. Hænke, ex D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, ovate, acuminate, glabrously, in the axils of the veins beneath; cymes axillary, loose, 3 times shorter than the leaves.  S. Native of the Island of Luzon, one of the Philippines. Stipulas acuminate. Cymes bipartite, with diverging branches, and many-flowered branches. Calyx 5 short, acute teeth.

**Mild Canthium.** Shrub.

8 C. *lepiño* (Hook. et Arn. in Beech, voy. pt. bot. p. 65.) branches unarmed; leaves on short petioles, elliptic, obtuse, attenuated a little at the base, coriaceous, shining above, pale beneath; cymes petiolate, ovate, nearly globose.  S. Native of the Society Islands. Calyx 4-5-toothed. Corolla 4-5-lobed. Stamens 4-5. Closely allied to C. *glabrum* and C. *niten*.

**Lucid-leaved Canthium.** Shrub.

**Unarmed shrubs, with tetrandrous flowers.**

9 C. *niten* (D. C. prod. 4. p. 474.) unarmed, glabrous; leaves petiolate, broad-ovate, bluntish, shining and glossy above; racemes compound, axillary, many-flowered, a little longer than the pedicels.  S. Native of the East Indies, where it was collected by Lechenault. Petioles 8 lines long. Stirpulas triangular, deciduous. Peduncles disposed in dense panicules. Tube of corolla a little longer than the lobes, which are oval and obtuse. Stigma thick, ovate, much exserted.

**Shining-leaved Canthium.** Shrub.

**Spinose shrubs, with tetrandrous flowers.**

10 C. *parviflorum* (Lam. dict. 1. p. 602.) shrubby; branches glabrous; spines opposite, horizontal, supra-axillary; leaves ovate, on short petioles, smooth, longer than the spines, usually in fascicles; racemes rising beneath the spines at the axils; berries nearly globose.  S. Native of Coromandel, frequent. Ronb. cor. 1. p. 39. t. 51. fl. ind. 2. p. 170. Gartn. fil. carp. 2. p. 196. f. 3?; Webéra tetráandra, Wild. spec. 1. p. 1224. Kandem-kara, Rheed. mal. 5. p. 71. t. 36. When the plant is in luxuriance, the spines are sometimes threefold. Flowers small, yellow. Berries yellow, obcordate, compressed laterally, size of a cherry. The bush makes excellent fences. The leaves are universally eaten in curries; on this account the plant has the name of Balusoo-kura, which latter word means esculent.

**Small-flowered Canthium.** Shrub 5 to 6 feet.

11 C. *herbulaeum* (D. C. prod. 4. p. 474.) shrubby; branchlets velvety; spines opposite, rising from an acute angle; leaves obovate, glabrous, hardly longer than the spines; pedicels numerous, 1-flowered, axillary.  S. Native of the Island of Luzon, one of the Philippines. C. *parviflorum*, Bartl. in herb. Hænke, but not of Lam.

**Downy-branched Canthium.** Shrub 5 to 6 feet.

---

**Spinose shrubs, with pentandrous flowers.**

12 C. *Mundita* (Cham. et Schlcht. in Lam. 4. p. 131.) a small erect shrub; with opposite spinaceous branches; leaves ovate-oblong, of the same colour on both surfaces, membranous; petioles downy inside; cymes axillary, pedunculate.  S. G. Native of the Cape of Good Hope, at Plittenberg's Bay. Habit of *Plectinia cortiandá*, but the cymes are on longer peduncles; the flowers are smaller, and the stipulas are glabrous inside, not leaving a margin of white wool on falling, as in that.

**Var.** β, *pubé-cens* (D. C. prod. 4. p. 474.) leaves downy on both surfaces.  S. G. Growing along with the species.

**Mundita Canthium.** Shrub 4 to 5 feet.

13 C. *horsildium* (Blm. bijdr. p. 966.) shrubbery, erect; spines spreading, straight; leaves small, almost sessile, ovate-oblong, acutish, downy on both surfaces, as well as the branches and stipulas; flowers twin or tern, axillary, on very short peduncles.  S. Native of Java, among bushes about Putienzorg. Branches spreading, opposite.

**Horrid Canthium.** Shrub 5 to 6 feet.

14 C. *parviflorum* (Ronb. fl. ind. 2. p. 170.) shrub thorny and hairy; leaves oval, hairy beneath; flowers axillary, crowded; tube of corolla gibbous.  S. Native of the East Indies. The inside of the tube of the corolla is surrounded by a circle of straight white bristles of its own length, inserted round its mouth, and pointing to its bottom. The figure in Pluk. alm. 27. t. 133. f. 3. so often referred to as this plant, has nothing to do with it; consequently it is neither Manétia dicéantia, Wildd. spec. 1. p. 670, nor Azima dicéantia, Lam. dict. 1. p. 343.

**Small-leaved Canthium.** Shrub 5 to 6 feet.

15 C. *angustiflórum* (Ronb. fl. ind. 2. p. 169.) shrub thorny; leaves lanceolate, glabrous, and shining, on short petioles; flowers numerous, axillary, on short pedicels; berries roundish, retuse.  S. Native of the East Indies, on hills, in the vicinity of Chittagong, Silhet, and the whole eastern frontier of Bengal. Branches glabrous. Flowers small, greenish-yellow. Corolla with a short gibbous tube, and 5 lanceolate segments. Drupes roundish, when ripe yellow.

**Narrow-leaved Canthium.** Shrub.

16 C. *Rheed* (D. C. prod. 4. p. 474.) shrub thorny; leaves ovate-lanceolate, acuminate, on very short petioles; shining; flowers numerous, axillary, on short pedicels; berries roundish-ovate, compressed.  S. Native of Malabar, where the Brachmanns called it *Cauti*, hence the generic name. Tsjeron-kara, Rheed. mal. 5. p. 73. t. 37. Root reddish, bitter. Flowers small, greenish. Berries green. It differs from *C. pareflórum* in the flowers being 5-cleft and pentandrous.

**Rheed's Canthium.** Shrub.

17 C. *pedunculáre* (Cav. icon. 5. p. 21. t. 436.) shrub thorny; leaves ovate, acute, almost sessile, downy; peduncles
axillary, solitary, longer than the leaves. Ę. S. Native of the Island of Luzon, one of the Philippines. Teeth of calyx subulate. Corolla pale purple, with a woolly throat, and 5 lanceolate, very acute segments. Filaments shorter than the corolla. Berry ovate, sub-compressed. This shrub is perhaps generically distinct from Caithium.

Peduncular Caithium. Shrub 8 to 10 feet.

18 C. lycochle (A. Rich. disb. p. 108.) Spines supra-axillary; simple; leaves small, oblong-oval, acuminate, rather hairy; stipulas broad, ending in a long abrupt point at the apex; flowers axillary, pedunculate, solitary. Ę. S. Native of Manila. Habit of a species of Lycium. The rest unknown.

Lycium-like Caithium. Shrub.

19 C. C:`hin`e`cke (Pers. ench. 1. p. 200.) shurb thorny; leaves obovate; flowers sessile, hairy. Ę. G. Native of China, at Macao; and of Madras. Gardénia spinosa, Thumb. disb. gard. no. 7. t. 2. f. 4. exclusive of the synonyms. Wild. spec. 1. p. 1289. Rándia spinosa, Poir. dict. 2. p. 829. Leaves many from the buds under the spines, glabrous, Corolla white, a little longer than the calyx, with ovate, obtuse, spreading segments. Stigma clavate. This plant does not probably belong to Caithium.

20 C. scändens (Blum. beijd. p. 966.) climbing; spines divaricate or recurved; leaves on short petioles, oblong, acuminate, downy beneath as well as on the branches; flowers disposed in axillary fascicles; fruit divided. Ę. S. Native of the Island of Nusa-Kambang, near Java, among bushes. Thorns much shorter than the leaves, straight, or a little recurved, but sometimes wanting on the branchlets. Fruit rather rugose, like that of Psy'draxis.

Climbing Caithium. Shrub cl.

Sect. II. Pleuroga'ster (from πλευρός, pleuron, a side, and γάστρα, gaster, a belly; the cicatrice occasioned by the falling of the flower is left at one side of the fruit). D. C. diss. med. acad. sc. par. 1806. prod. 4. p. 475. Mature fruit 1-celled, furnished with the floral cicatrice on one side at the base.

21 C. anoma`co`rum (D. C. prod. 4. p. 475.) glabrous; branches divaricate, and probably at length becoming spinescent; leaves oval, acuminate, on short petioles; pedicels slender, elongated, 1-flowered, corymbose, usually deflexed, rising from the axis of the superior leaves. Ę. S. Native of Sierra Leone, where it was collected by Smeathmann; and of the Gambia, at Alhreda. This plant comes near to Plectrónia ven'tósa, from the singularity of the fruit.

Anomalous-fruited Caithium. Shrub.

Cult. For culture and propagation see Chióco'ca, p. 569.

Lin. syst. Tetrádria, Monógy'nia. Calyx with an obo vate or oblong tube, and a 5-toothed limb. Teeth very short, acutish. Corolla short, rather funnel-shaped, with a 5-parted limb, and a bearded throat; segments acute. Stamens 5, inserted in the throat, a little exserted. Style short; stigma sub-capitate, of 2 approximate lamelae. Berry dry, naked at the apex, emarginate, obovate-oblong, compressed, duallynose, containing 2 chartaceous coriaceous, 1-seeded, indeliscent pyrene, which are flat inside. —Small African trees, with opposite, sub-obsessive branches. Leaves opposite, petiolarate, elliptic, acute at both ends, rather coriaceous, pale beneath. Stipulas solitary on each side, apicululate. Pedicels axillary, short, solitary, racemose, or coriaceous; pedicels about equal in length to the fruit, slender.—This genus, along with Damna'cántus, Psy'draxis, and Caithium ought probably to be united.

Windy Plectrónia. Cir. 1816. Tree.

2 P. Ma'dagascari'è'nsis (A. Rich. in mem. soc. hist. nat. Par. 5. p. 189.) branches glabrous, compressed; pedicels axillary, 1-flowered. Ę. S. Native of Madagascar, where it was collected by M. Clapiéler. The whole shrub is glabrous. Leaves oval, attenuated at the base, petiolate. Stipulas short, acuminate, deciduous. Flowers unknown. Fruit obovate, emarginate at the apex, and probably obovate and compressed, usually 1-celled by abortion.

Madagascar Plectrónia. Shrub or tree.

3 P. hi'su'uta (D. C. prod. 4. p. 476.) branches villous; leaves villous beneath; stipulas length of petioles. Ę. S. Native of Senegal, by the sides of woods near Dagana, where it was collected by Leprieur and Perrottet. Caithium Senegalisense, A. Rich. l. c. p. 188. Branches terete, divaricate, spreading, forming straight angles. Peduncles axillary, villous, compressed, coriaceous at the apex. Berry 2-celled, emarginate at the apex; but one of the cells is usually abortive, in this case the fruit becomes 1-celled, and the umbilicus lateral, which is indicated by the permanent 5-toothed calyx.

Hairly Plectrónia. Shrub 4 to 6 feet.

Cult. See Chióco'ca, p. 569, for culture and propagation.

Lin. syst. Pe'tánt`dría, Monógy'nia. Calyx with an obovate tube, and a 5-toothed deciduous limb. Corolla with a short tube, a hairy throat, and 5 oval acute reflexed lobes. Stamens included, inserted at the throat. Style much exserted; stigma bilamellate. Berries fleshy, areolate at the apex, obovate, compressed, wrinkled from tubercles, marked by a furrow on both sides, 2-celled, containing usually 2, rarely 3 pyrenes; pyrene oblong, scarious from wrinkles, 1-seeded, marked by a linear furrow, and an umbilicus in the middle. Seeds bony, filling the pyrene. Alburnum amygdalaceous, scrobiculate. Embryo inverted, filiform, curved into the form of a Greek sigma, with linear cotyledons. —Shrubs, with opposite ovate leaves, and axillary racemes of small flowers. This genus, from the hard fruit being often 5-celled, and from the form of the embryo, almost agrees with the tribe Guettárdáceae.

1 P. dic'co'cos (Gaertn. fruct. 1. p. 125. t. 26. f. 29.) leaves elliptic, long-acuminated, gradually tapering into the short petioles at the base; stipulas lanceolate, acute, permanent; cymes pedunculate, branched; fruit rather heart-shaped. Ę. S. Native of Ceylon.

Two-seeded Psy'draxis. Shrub.

2 P. ma'jór (A. Rich. l. c. p. 191.) leaves elliptic, on short petioles, short-acuminate; stipulas semi-oval, blunish; cymes pedunculate, simple; fruit heart-shaped. Ę. S. Native of Madagascar. Very like the preceding species, but differs in the broader leaves with shorter points, caducous stipulas, simple cymes, and larger fruit.

Larger Psy'draxis. Shrub.
CXLVII. Diplospora. CXLVIII. Epithinia, &c.

with a wide tube, which is shorter than the lobes, a pilose throat, and 4 ovate fleshy spreading lobes. Anthers 4, sessile at the throat, semi-exserted. Style length of the tube; stigma bifid. Ovarium 2-celled; cells 2-seeded; ovula collateral, ascending. Fruit and seeds unknown.—A glabrous shrub, native of China, with tetragonal branches. Leaves opposite, petiolate, oblong-lanceolate, acuminate at both ends. Stipulas solitary on both sides, ovate, acuminate, persistent. Flowers axillary, crowded, almost sessile, yellowish-green, calcareous by combined bracteae at the base. This genus agrees with Epithinia in the cells of the ovarium being bicellular, but differs in the ovula being collateral, not one on the top of the other.

Cult. See Chiococca, p. 569. for culture and propagation.

CXLVII. Epithinia (from ἐπίθεν, upon, and θυάν, the seashore; the shrub grows among mangroves on the seashore). Jack, in mal. misc. 1. no. 2. p. 12. D. C. prod. 4. p. 477.

Peduncles axillary, dichotomous, many flowered, with a solitary flower in the fork. Flowers white.—This genus is said to be allied to Mallotus, but differs in the cells of the fruit being 2-seeded, and from all other Rubiaceae plants in the want of stipulas.

1 E. Malaya'na (Jack, l. c.) t. S. Native of the islands of Malacca, Singapore, in marshes among mangroves.

Malay Epithinia. Shrub.

Cult. For culture and propagation see Chiococca, p. 569.

CXLVIII. Epithinia, &c.

Lin. syst. Tetrandria, Monogyânia. Calyx with a subglobose tetragonal tube, and a very small 4-toothed limb. Corolla with a long terete tube, which is hardly widened at the apex, a glabrous shrub, 4 oval roundish bluish spreading lobes. Anthers 4, sessile in the throat of the corolla, oblong, hardly exserted, one-half shorter than the lobes of the corolla. Stylo biform at the apex, length of the corolla. Berry dry, nearly globose, naked at the apex, 2-celled, 2-seeded. Seeds convex on the outside, concave inside, and furnished with a circular areola as in Bacchus. Albulum cartilaginous. Embryo unknown.—Glabrous hard-wooded trees, natives of South America. Branches terete, but tetragonal when young, as well as the pedicels. Leaves opposite, oval-oblong, acute, rather coriaceous, petiolate. Stipulas solitary on both sides, apiculate by a short point. Peduncles axillary, trifid or trichotomous. Flowers rose coloured on the outside, and white inside. This genus is nearly allied to Coffea.

1 S. trifo'rum (Vahl, eel. 1. p. 10.) peduncles twin, axillary, 3-flowered. t. S. Native of the islands of Montserrat and Martinique, where it is called bois de fer or iron-wood. S. fereum, Lam. ill. p. 282. Sideroxylonoides féreum, Jacq. amer.
Cl. EUMACHIA (Eumachus, an author cited by Theophras-

**LIN. SYST.** Tetrandria, Monogyinia. Calyx with an obovate tube, and a 4-toothed deciduous limb. Corolla funnel-shaped, with a short tube, a naked throat, and a 4-parted limb; lobes roundish, spreadingly reflexed. Stamens inserted in the bottom of the tube; filaments short; anthers oblong in the throat. Stigma bifid, having the lobes long and acute. Berry globose, naked at the apex, 2-celled; cells 1-seeded. Seeds convex on the back, and flattish in front, with a moon-shaped umbilicus. Albumen cartilaginous. Embryo unknown.—A glabrous Australian tree. Branches terete. Leaves opposite, petiolate, smooth, oblong-lanceolate. Cymes terminal and axillary, tridif. Corolla flesh colored. Embryo unknown.—S. Native of the island of Namoka, one of the Friendly Islands. Petésia carnea, Forst. 2. no. 51.

**Flesh-coloured-flowered Eumachia. Tree. Cult.** For culture and propagation see Chioécœa, p. 569.

**LIN. SYST.** Tetrandria, Monogyinia. Calyx with an obovate tube, and a 4-parted limb (f. 105. b.). Corolla funnel-shaped (f. 105. g.), with a terete tube (f. 105. f.), a bearded throat, and 4 spreadingly reflexed lobes. Stamens 4, inserted in the throat; filaments filiform; anthers linear, fixed by the middle, exserted (f. 105. c.); stigma bifid (f. 105. c.). Berry nearly dry, 2-celled, subdibitary, compressed (f. 105. h.), crowned by the permanent calyx (f. 105. b.), containing 2 chartaceous coriaceous 1-seeded pyrenes. Albumen horny. Embryo unknown.—Shrubs, rarely herbs, natives of America. Stems erect, tetragonal when young. Leaves opposite or in whorls, nearly sessile. Stipulas small, interpetiolar. Corymb terminal, tripartite, bracteate, with dichotomous branches. Flowers white, lateral and sessile, or terminal and pedunculate, bihulate.

1 D. chiococcoides (H. B. et Kunth, nov. gen. amer. 3. p. 355. t. 281.) shrubby, glabrous; leaves opposite, sessile, oblong-lanceolate, acute, cuneated at the base, with rather revolute edges; corollas sessile, tripartite; stamens about equal in length to the lobes of the corolla. & S. Native of New Andalusia, on the banks of the Orinoco, near the monastery of Caripé: and of Rio Janeiro, ex Cham. et Schlecht. in Linnaea. 4. p. 112. Houstrônia fruticosa, Wild. miss. in Röem. et Schultes, syst. 3. p. 327. Shrub 4 feet high. Flowers white. (f. 105. c.)

**Chiococcoid-like Declieuxia. Shrub.**

2 D. MEXICANA (D. C. prod. 4. p. 479.) suffrutficose, glabrous; leaves opposite or 3 in a whorl, sessile, oblong-lanceolate, obtuse at the base, acute at the apex; corollas pedunculate, 4-5-parted; stamens about equal in length to the lobes of the corolla. & S. Native of Mexico. D. chiococcoides, Bartl. in herb. Hanke. Flowers white.

**Mexican Declieuxia. Shrub 1 ½ foot.**

3 D. THYMBOIDEA (Mart. et Zucc. in Röem. et Schultes, mant. 3. p. 111.) shrub much branched; leaves disposed in verticillate fascicles, sessile, linear, acute, attimated at both ends, and are, as well as the branches, roughish; flowers solitary or few together on the tops of the branches. & S. Native of Brazil.

**Thymbro-like Declieuxia. Shrub.**

4 D. SATURIOIDEA (Mart. et Zucc. in Röem. et Schultes, mant. 3. p. 111.) shrub much branched; leaves linear-lanceolate, attenuated at the base, sessile, opposite or 6 in a whorl, and are, as well as the branches, scabrous from hairs; flowers axillary, solitary. & S. Native of Brazil. The rest unknown.

**Savory-like Declieuxia. Shrub.**

5 D. GALIÓIDES (Pohl, in litt. under the name of Psylocárpus) plant subherbaceous, glabrous; branches terete; leaves 3 in a whorl, linear; whorles distant; panicles terminal, having the branches disposed 3 in a whorl, cymose. & S. Native of Brazil, where it was collected by Pohl.

**Galian-like Declieuxia. Shrub 1 foot.**

6 D. SPARGÜLÍDÆA (Mart. et Zucc. t. c.) shrubby, glabrous; leaves linear-subulate, opposite, sessile; racemes dichotomous; terminal. & S. Native of the south of Brazil. Cham. et Schlecht. in Linnaea. 4. p. 6. Panicle terminal, dichotomously compound from cymes; having the branchlets capillary, elongated, and erect, with alternate flowers. Flowers twin, one of each pair sessile. Staminodes inclosed. Cham. et Schlecht.

**Spurry-like Declieuxia. Shrub.**

7 D. MARIÓIDES (Mart. et Zucc. t. c.) shrubby; stem and branches clothed with soft down; leaves 3 in a whorl, rarely 4, ovate-lanceolate, almost sessile, glabrous, with revolute edges; flowers axillary, almost terminal. & S. Native of Brazil.

**Cat-thyme-like Declieuxia. Shrub.**

8 D. CENANTHOIDES (Mart. et Zucc. t. c.) plant herbaceous, glabrous; stem nearly simple; leaves 4 in a whorl, sessile, remote, linear-lanceolate, acute; racemes bifid, forming a terminal panicle. & S. Native of the south of Brazil. Panicle, ex Cham. et Schlecht. in Linnaea. 4. p. 5. terminal, from whorles
of branches, usually twin, and forming a terminal umbel, with a central flower. Flowers sessile.

**Ginanche-like Declieuxia.** Shrub. 9. S. rodriguezii (Pohl, in litt. under the *Psyllocarpus*) shrubby, scabrous in every part; branches tetragonal; leaves opposite, linear-oblung, acuminate at both ends, revolute at the margin while young; cymes terminal, few-flowered. 5. S. Native of Brazil, where it was collected by Pohl. In the axils of the leaves there are two young leaves, and therefore at first sight appear 6 in a whorl.

**Leafy Declieuxia.** Shrub. 10. D. cordifera (Mart. et Zucc. l. c.) suffrutescent, nearly simple, clothed with roughish pubescence; leaves opposite, decussate, approximate, sessile, ovate-cordate, acute, concave on the back; racemes bifid, terminal, crowded into a dense panicle. 5. S. Native of Brazil within the tropic. V. S. Native of Brazil within the tropic. Very nearly allied to the preceding species.

**Glaucous Declieuxia.** Shrub. 12. D. passerina (Mart. et Zucc. in Rœm. et Schultes, mant. 3. p. 112.) shrubby, glabrous, pruinously glaucous; leaves opposite, sessile, ovate, very acute, crenately serrate, coriaceous; peduncle terminal, erect, nearly globose, dense. 5. S. Native of Brazil within the tropic.

**Passerina-like Declieuxia.** Shrub. 13. D. dahnioides (Mart. et Zucc. l. c.) shrubby; branches twiggy; leaves opposite, decussate, somewhat imbricating in 4 rows, sessile, ovate-cordate, acute, rather concave above, scabrous from hairs beneath, 7-9-nerved; peduncles axillary, few-flowered. 5. S. Native of Brazil. The rest unknown.

**Daphne-like Declieuxia.** Shrub. 14. D. imbricata (Pohl, in litt. under the name of *Psyllocarpus*) shrubby, glabrous; branches terete; leaves opposite, decussate, erect, ovate, hardly subcordate, cuspidate, stiff, having 4 small ribs on each side of the midrib; peduncles axillary, few-flowered. 5. S. Native of Brazil.

**Imbricated-leaved Declieuxia.** Shrub. 15. D. rhexioides (Mart. et Zucc. l. c.) shrubby, glabrous; young branches subumbellate, twiggy; leaves opposite, decussate, sessile, crenately spreading, imbricating in 4 rows, orbicularly ovate, acute, 5-nerved; flowers axillary, almost solitary. 5. S. Native of Brazil.

**Rhexia-like Declieuxia.** Shrub. 16. D. origanooides (Zucc. l. c.) shrubby, clothed with roughish hairs; branches dichotomous, terete; leaves opposite, rather remote, on short petioles, nearly orbicular, acute, many nerved; flowers terminal, thyroidea. 5. S. Native of Brazil. Leaves like those of *Origana Dictamnus*.

**Origanos-like Declieuxia.** Shrub. 17. D. rosea (Zucc.) shrubby; leaves opposite, ovate-lanceolate, somewhat rhomboid, acute, tapering into the short petiole at the base, with ribbed veins, clothed with villi; flowers terminal, disposed in dichotomous panicles. 5. S. Native of Brazil.

**Soft Declieuxia.** Shrub. 18. D. lysiachoides (Zucc. l. c.) plant herbaceous or suffrutescent, downy; branches simple, erect; leaves 3 in a whorl, ovate, attenuated at both ends, acute; flowers terminal, dichotomously panicled. 5. S. Native of Brazil.

**Lysimachia-like Declieuxia.** Shrub. 19. D. rubioides (Zucc. l. c.) shrubby, glabrous; leaves opposite, decussate, ovate, acute, rounded and cordate at the base, shining above; flowers terminal, disposed in dichotomous panicles. 5. S. Native of Brazil.

**Rubia-like Declieuxia.** Shrub. 20. D. alba (Zucc. l. c.) shrubby, scabrous; leaves opposite, decussate, ovate, acute, sessile, rounded at the base; racemes terminal, bifid, disposed in dichotomous cymes. 5. S. Native of Brazil.

**White Declieuxia.** Shrub. 21. D. divergentiflora (Pohl, in litt. under *Psyllocarpus*) suffrutescent; branches terete, clothed with velvety hairs; leaves opposite, sessile, ovate, acutish, nerves, clothed with fine velvety down on both surfaces; cyme terminal, on short peduncles, of 6 diverging rays; corollas glabrous. 5. S. Native of Brazil, where it was collected by Pohl.

**Diverging-flowered Declieuxia.** Shrub. 22. D. pulvrella (Mart. et Schlecht. in Linn. 4. p. 7.) shrubby, glabrous, clothed with short dense hairs in every part except the corollas; leaves usually 3 in a whorl, rarely opposite, sessile, ovate, acute or acuminate; cymes terminal, of many rays, subruficent. 5. S. Native of Brazil within the tropic.

**Powdery Declieuxia.** Shrub. 23. D. polygaloides (Zucc. in Schultes, mant. 3. p. 113.) suffrutescent; branches twiggy, erect; leaves 3 or 4 in a whorl, sessile, lanceolate, acute, erect, smoothish; flowers terminal, panicled. 5. S. Native of Brazil. The rest unknown.

**Polygaloid-like Declieuxia.** Shrub. 24. D. vincooides (Mart. et Zucc. l. c.) shrubby, glabrous; leaves opposite or 3 in a whorl, ovate, attenuated at both ends, acute, sessile, shining; flowers terminal, disposed in dichotomous panicles. 5. S. Native of Brazil.

**Vincelike Declieuxia.** Shrub. 25. D. trunca (Pohl, in litt. under *Psyllocarpus*, D. C. prod. 4. p. 481.) suffrutescent, glabrous, glaucous; branches terete; leaves opposite, sessile, orbiculary ovate, mucronate; cymes terminal, trichotomous, on short peduncles, fastigate. 5. S. Native of Brazil.

**Frosted Declieuxia.** Shrub. 26. D. mucronulata (Mart. et Schlecht. in Linnaea. 4. p. 110.) shrubby, glabrous; leaves opposite, sessile, elliptic or obovate, cuneate at the base, mucronate at the apex; the mucrone usually reflexed; cymes terminal, on short peduncles, somewhat fastigate. 5. S. Native of Brazil within the tropic. Stem and branches terete, furnished with 2 slight wings. *Psyllocarpus* trichotomus, Pohl, in litt. may be referrible to this, but the mucrones of the leaves are not reflected in the specimens of that plant collected by Pohl.

**Mucronate-leaved Declieuxia.** Shrub. 27. D. glabra (D. C. prod. 4. p. 481.) plant suffrutescent, glabrous; stem somewhat tetragonal; leaves opposite, petiolar, elliptic-oblung, acuminate at both ends, but not mucronate; cymes terminal, of many rays, subumbellate. 5. S. Native of Brazil, Pohl; about Caracas, Vargas. *Psyllocarpus* glaber, Pohl, in litt. Very similar to the preceding.

**Glabrous Declieuxia.** Shrub. 28. D. ? psychotroides (D. C. prod. 4. p. 481.) suffrutescent, glabrous; leaves opposite, on short petioles, elliptic, long-acuminated, acute at the base; cymes terminal, on short peduncles, trichotomous, one-half shorter than the leaves. 5. ? S. Native of Cayenne, where it was collected by Patris; and of Panama and Mexico, according to Hamke. herb. Coffea didy-
Rubia. Barb. in herb. Hanke. Flowers unknown. Stipulas

**Rubiaceae.** shrub.

D. **Herráza** (Cham. et Schlecht. in Linna. 4. p. 11.) plant herbaceous, glabrous; branches straight, glabrous, terete, a little winged; leaves opposite, petiolate, ovate-lanceolate, attenuated, acute; cymes axillary, on long peduncles, of 5 spreading rays. 2. S. Native of Brazil, about Rio Janeiro. Knöxia Brasiliensis, Spreng. syst. 1. p. 406. Habit of *Borriéria laxa*. Corolla a long line. Fruit nearly dry. This plant ought probably to be excluded from the present genus, according to Martinus in Linnaea. 1. e.

**Herbaeous Dechlieuxia.** shrub.

**Cult.** For culture and propagation see *Chicóecca*, p. 569.

**Cl. II. Tertrea** (named after J. B. du Tertre, a traveller in the French West Indian Islands, and who has written a general history of them). D. C. prod. 4. p. 481.—Schiéuda, A. Rich. mem. soc. hist. nat. Par. 5. pt. 1. p. 186 (1830) but not of Schlecht. in 1826.

1 T. Martincinensis (A. Rich. l. c.) 2. S. Native of Martinico.

**Martincino Tertrea.** shrub 1 to 2 feet.

**Cult.** For culture and propagation see *Chicóecca*, p. 569.

Lin. syst. *Pentándria, Monogynia.* Calyx with an ovate tube, and an acutely 5-toothed permanent limb. Corolla funnel-shaped, with an obtcolcal tube or throat, and 5 acute lobes. Stamens with the filaments hardly adnate to the bottom of the corolla, downy, and shorter than the anthers, which are inclosed and linear. Style rather chavate at the apex, entire or slightly 2-lobed. Berry somewhat dailyums, compressed, crowned by the teeth of the calyx, containing 2 chartaceous 1-seeded pyrene. Seeds pendulous. Embryo with a long superdural radicle. Albumen cartilaginous.—Shrubs generally with a somewhat climbing habit. Leaves opposite, ovate or oblong, acute, glabrous. Stipulas broad at the base, permanent, more or less apiculate. Racemes axillary, opposite, simple or panicked. Flowers pedicellate, of a yellowish white colour. Roots emetic and alexiteric.

1 C. racemosa (Jacq. amer. p. 68. Lin. spec. 246.) leaves ovate, acuminate at both ends, smooth; stipulas broad at the base, and apiculated by a long point at the apex; racemes many flowered; corolla much longer than the teeth of the calyx; filaments of stamens downy. 2. S. Native of the West India islands, Mexico, and Carthagena, on hills. Swartz, obs. p. 76. Andr. bot. rep. t. 284. Tratt. tab. t. 631. Hook. fl. exot. t. 93.—Sloane, hist. t. 188. f. 3.—Dill. Hort. elth. t. 228. f. 295. and therefore the Lonicéa alba, Lin. spec. ed. 1. p. 175. A very variable shrub. Corollas at first white and scentless, but at length becoming yellowish and sweet-scented. Leaves shining on the upper surface. Berries snow white, hence the English name snow-berry, and the Greek one *Chicóecca*. The stamens are glabrous in the figure given by Hooker, and the stigma is tridit in that given by Andrews, variations which have never been seen in nature. The root has much the same acrid bitter taste as snake-root, and has been long used as a strong resolutive or anties. it is administered with great success in obstinate rheumatisms, and old syphilitic taints. It is best given in decoction; it is also an excellent emetic, and may be used as ipecacuanha.

**Var. β, scándiosa** (Pers. ench. 1. p. 209.) branches very slender, and evidently climbing; leaves oblong; racemes shorter than the leaves, simple. 2. S. Native of Jamaica, and the island of Santa Cruz.—Browne, jam. p. 164. no. 2. Swartz, obs. 76. var. β.

**Var. γ, laziófora** (D. C. prod. 4. p. 482.) climbing; leaves oblong; racemes panicked, longer than the leaves. 2. S. H. Cultivated in the botanical garden at Calcutta.

**Var. e, longifóra** (D. C. prod. 4. p. 482.) leaves oblong, long-acuminate; racemes simple, equal in length to the leaves. 2. S. Native of Guadaloupé, where it was collected by Badier.

**Var. α, florídanus** (D. C. l. c.) leaves elliptic, hardly acuminate; racemes simple, a little longer than the leaves. 2. S. Native of Florida and Mexico by the sea side. Chicóecca race-

**Musa,** Michx. fl. bor. amer. 1. p. 103.

2 C. densíflóra (Mart. spec. med. bras. p. 17. t. 6.) leaves ovate, rather coriaceous; stipulas broad at the base, apiculated by a longish point; racemes many flowered; corolla much longer than the teeth of the calyx; filaments densely bearded. 2. S. Native of Brazil, in woods at Almadas and Ferradas, on the mountains of Bahia; and at the Port of St. Catharine, ex Cham. et Schlecht. in Linnaea. 4. p. 13. Racemes simple. Flowers white, sweet-scented. This species grows plentiful about Bahia, where we have seen it either with loose or crowded branches and leaves.

**Var. β, Cubeníus** (D. C. prod. 4. p. 482.) leaves ovate, subcordate; racemes rather compound; filaments bearded. 2. S. Native of Cuba.

**Dense-flowered Snow-berry.** Shrub 3 to 4 feet.

3 C. angúflóga (Mart. spec. med. bras. p. 17. t. 5.) leaves ovate, acuminate; stipulas very broad, short, each ending in a short point; racemes panicked; corolla hardly 3 times longer than the calycine teeth. 2. S. Native of Brazil in woods, French Guiana, Trinidad, Peru, Cobo, and about Cutmana; on the Spanish Main. Cham. et Schlecht. in Linnaea. 4. p. 13. C. brachiáta, Ruiz et Pav. fl. per. 2. p. 67. t. 219. f. 3. C. racemosa, H. B. et Kunth, nov. gen. amer. 3. p. 352. Sieb. fl. lin. exsic. no. 38. C. parviflóra and C. paniculáta, Wildk. in Rom. et Schultes. syst. 5. p. 203. Pedicels and branchlets glabrous. Flowers white. Root diuretic, and is called by the Brazilians Cainca.

4 C. omoana (Hook. et Arn. in Beech. voy. pt. bot. p. 65.) leaves broad-oval, rather coriaceous, very blunt, acute at the base, and running down the short petioles; peduncles axillary, solitary, 3-4-flowered; corolla with a bearded throat. 2. S.
Native of Elizabeth Island, one of the Society Islands. Coffea odorata, Forst. prod. 1. p. 94. The flowers are described as fragrant, and smelling like cows' milk. Sugar-scented Snow-berry. Shrub.

6 C. JAY'ANA (Blum. bijdr. p. 968.) shrub parasitical; leaves oblong-lanceolate, acuminated at both ends, glabrous, velvety and shining above; corymbs terminal, trichotomous. S. Native of Java, in woods on the mountains upon trees. Coffea Javanica, Blum. cat. hort. but. p. 46. Perhaps a species of Psychotria.

Jayae Snow-berry. Shrub parasitical. Cult. A mixture of loam, peat, and sand is the best soil for the species of Chiococca; and cuttings strike root freely in sand under a glass in heat.

CLIV. MARGARIS (from παχύς, margaron, a pearl; the berries are white and shining in M. nudiflora, and are called perlitas, or pearls, by the Mexicans). D. C. prod. 4. p. 483.—Desclia'a, Moc. et Sesse, fl. mex. icon. ined. ex D. C. l. c.

Lin. syst. Pentandria, Monogyna. Calyx with a globose tube, and a somewhat turbinate semi-5-clet limb; teeth acute, permanent. Corolla funnel-shaped, with an obconical tube, which is 5-toothed or with 5 short lobes at the apex. Stamens 5, inserted in the middle of the tube; filaments a little shorter than the corolla; anthers ovate. Stigma capitato, uniliaved or slightly 2-lobed. Berry globose, crowned by the calyx, 2-celled, 2-seeded. Seeds semi-ovate, acute at one end.—Shrubs, with slender branches. Leaves opposite, ovate, glabrous, about the size of those of the common myrtles. Stipulas small, solitary on both sides. Pedicels axillary, opposite, short, 1-flowered. Flowers white, usually second, bibracteolate under the calyx. Berries white.

2 M. NUDIFLORA (D. C. prod. 4. p. 483.) leaves mucronate; corolla glabrous inside. S. Native of Mexico, about Tapelja. Chiococca axillaris, Moc. et Sesse, fl. mex. icon. ined. Desclia'a margaritaria, Moc. et Sesse, fl. mex. icon. ined. Shrub 8 feet high. Berries ovate, globose, a little smaller than a pea, white and shining, hence they are called perlitas by the Mexicans. Naked-flowered Pearl-berry. Shrub 8 feet. Cult. See Chiococca above for culture and propagation.

Lin. syst. Tetrandria, Monogynia. Calyx with a short ovate tube, and 4 linear-lanceolate acute lobes. Corolla tubular, somewhat tetragonal before expansion; the tube somewhat quadranular at the apex; lobes 4, ovate, acute, revolute. Stamens having the filaments downy and adnate to the tube at the base; anthers linear, not exserted. Stigma 2, ovate, hardly longer than the tube. Drupes nearly globose, crowned by the calyx, containing a 2-celled, 2-seeded nucleus, ex Rich., or very often 1-celled and 1-seeded by abortion.—West Indian shrubs, with the habit of Catesbaea or Justicea spinosa. Leaves small, almost sessile, oblong or obovate, coriaceous, opposite, usually disposed in fasicles in the axils. Stipulas small, interpetiolar. Peduncles 1-flowered, axillary, 4-1-together, and sometimes they are hardened into simple bifid or trifid spines, which are usually naked, rarely floriferous. Flowers small, purple or saffron coloured.

1 S. versa'color (Vahl, ckl. amer. 1. p. 11. t. 10.) leaves obovate, shining above; spines simple, bipartite or twin. S. Native of Santa Cruz and Porto Rico. Chimélia versicolor, Spreng. syst. l. p. 110. Catesbaea parviflora, Lam. ill. t. 67. f. 2. Leaves 3 lines long. Spines commonly in pairs from each alternate axil, combined at the base, for the most part a little longer than the leaves, stiff, purplish, often bearing a flower at one of the points; they are the peduncles which have hardened, and keep growing on after the flowers have fallen. Flowers on short peduncles; those from the tops of the spines solitary, usually drooping, purple and abortive; others are axillary, solitary, or more rarely 2-4-together, erect, saffron coloured, and fertile. Fruit snow white. Party-coloured-flowered Scolosanthus. Shrub 3 to 4 feet. 2 S. triaca'nthus (D. C. prod. 4. p. 484.) leaves oblong, rather glaucous; spines for the most part trifid. S. Native of St. Domingo, where it was collected by Bertero. Catesbaea triacanthus, Spreng. syst. l. p. 416. Leaves 4-5 lines long. Flowers and fruit not sufficiently known, but the habit is that of Catesbaea. Three-spined Scolosanthus. Shrub. Cult. See Ixora, p. 574. for culture and propagation.

Lin. syst. Tetrandria, Monogynia. Calyx with a turbinate tube, and a permanent limb, which is 4-toothed to the middle. Corolla salver-shaped, with a long slender tube, a glabrous throat, and 4 spreading lobes, which are shorter than the tube. Antlers 4, sessile, or on short filaments, inserted at the throat of the corolla. Style bifid at the apex, situated among the anthers. Drupes ovate, crowned, containing a 2-celled (or 1-4 D

Vol. III.
celled from abortion) nucleus; cells 1-seeded. Seeds pendulous in the cells, oblong.—American shrubs, usually spineless, glabrous or downy. Leaves opposite on short petioles, stiff, coriaceous. Stipulas short, interpetiolar. Pedicels peduncles and pedicels and style of corolla acute. \( S. \) Native of South America, in woods, and probably of St. Domingo. \( S. \) floribunda, Lam. dict. 3, p. 344. Flowers white, fragrant at night, 11/2 inch long.

**Spring** Chomelia. Clt. 1793. Shrub 8 to 12 feet.

3. C. **obtusa** (Cham. et Schlecht. in Linnaea. 4. p. 185.) leaves elliptic, acute, at the base, glabrous, on short petioles; peduncles axillary, 1-3-flowered; lobes of calyx and corolla obtuse. \( S. \) Native of the south of Brazil. Flowers white.

**Blunt-calyxed** Chomelia. Shrub 4 to 5 feet.

4. C. **pericicums** (Cham. et Schlecht. in Linnaea. 4. p. 187.) leaves ovate, acute, on short petioles, plicate on the nerves above, and silky beneath; peduncles axillary, 1-flowered. \( S. \) Native of Brazil within the tropic. Perhaps the same as C. brasiliensis. A. Rich. short. loc. hist. nat. Par. 5. p. 183.

**Downy** Chomelia. Shrub. Cult. See \( S. \) mus, p. 574. for culture and propagation.

**LIN. SYST.** Tetradria, Monogynia. Calyx with a very short tube, adnate to the ovary at the base, and a bluntly 4-cleft limb. Corolla funnel-shaped, with a short terete tube, a bearded throat, and 4 oblong acute lobes, which are longer than the tube, and twisted in ascription. Anthers 4, linear, almost sessile, erect, situated at the throat between the lobes, and a little shorter than them, at length twisted spirally. Style filiform, exserted; stigma undivided, or hardly 2-lobed. Disk thick, crowning the ovary. Berry dry, 2-celled, 2-seeded. Seeds globaceous. Albumen cartilaginous. Embryo erect, nearly terete. A glabrous African shrub. Leaves opposite, petiolate, oval, acuminate at both ends. Stipulas connate, sheathing, short. Corymb terminal, triatomic. Flowers white.

**This genus is nearly allied to \( S. \) ixora, but differs in the tube of the corolla being shorter; and to Polygosia, but differs in the stigma being undivided.**

1. B. **corymbosa** (D. C. diss. ind. t. 1. ann. mus. 9, p. 219.) \( S. \) Native of Sierra Leone, where it was collected by Smeathman. Verulamia corymbosa, Poir. dict. 8. p. 543. \( S. \) mus, Schum. pl. guin. p. 77.

**Var. \( \beta \), augustifolia** (D. C. prod. 4. p. 485.) leaves narrower than in the species, and more acuminate at both ends. \( S. \) Native of Gambia and Cayor, in humid places, where it was collected by Leprieur and Perrottet.

**CLIX. IXORA.** (The name of a Malabar idol, to which flowers of the same species are offered.) Lin. gen. no. 131. Juss. gen. p. 203. mem. mus. 6. p. 375. Gaertn. fruit. p. 1. p. 117. t. 25. D. C. prod. 4. p. 485.—Pavetta sect. IXORA. Blum. bijdr.—IXORA species of Lam, and Roxb.—Pavetta species, A. Rich. LIN. SYST. Tetradria, Monogynia. Calyx with an ovate tube, and a small 4-toothed limb (f. 106. a.). Corolla salver-shaped (f. 106. b.), with a slender terete tube (f. 106. d.), and a 4-parted spreading limb (f. 106. b.); tube longer than the lobes. Anthers 4, almost sessile in the throat, exserted a little. Style equal in length to the tube of the corolla, or a little longer, but shorter than the corolline lobes, bifid at the apex (f. 106. e.); lobes of stigma diverging or revolute. Berry drupaceous, nearly globose, crowned by the permanent calyx, 2-celled, containing 2 carthayas 1-seeded pyriform, which are flat or hollow inside, and gibbous on the back. Albumen cartilaginous. Embryo dorsal, erect, incurved, with foliaceous cotyledons, and a long radicle.

—Shrubs, sometimes rising to the height of small trees, natives of Asia, rarely of Africa. Leaves opposite. Stipulas broad at the base, acute at the apex, or ending in a bristle-like awn. Corymb terminal, usually trichotomous. Flowers scarlet, rose-coloured, flame-coloured or white, usually fragrant.

* Flowers scarlet, flame-coloured, rose-coloured, or flesh-coloured.

1. I. **grandiflora** (Ker. bot. reg. t. 154.) leaves sessile, coriaceous, oblong, acute, shining; lobes of calyx acute; lobes of corolla ovate-lanceolate, acute; corymb umbellate; style hardly exserted; berry crowned by the lobes of the calyx. \( S. \) Native of the East Indies, at Tannore; and of China and Ceylon. —Burnm. fl. zeyl. t. 57.—Pluk. alm. t. 59. f. 2. I. coccinea, Lin. spec. 159. exclusive of the synonyms. Roxb. fl. ind. 1. p. 355. Smith in Rees' cyc. no. 1. Pavetta coccinea, ex Blum. bijdr. 950. An elegant shrub. Flowers scarlet, disposed in ample corymb. Tube of corolla almost 2 inches long.

**Great-flowed** IXORA. Fl. Aug. Clt. 1814. Sh. 3 to 4 feet.

**Bandhüca IXORA.** Fl. July. Clt. 1815. Shrub 2 to 4 feet.

3. I. **PROPQUIA** (R. Br. in Wall. cat. 6119.) leaves almost sessile, ovate or oblong, coriaceous at the base, coriaceous, glabrous, mucronate or acuminate; corymb compound, sessile, 1

**Aliiced Ixora.** Shrub.

6 I. coccinea (Lindl. bot. reg. 782.) leaves firm, rather coriaceous, oval-lanceolate, much attenuated; corymb many-flowered, decomposed, crowded, fastigate; teeth of calyx ovate, acute, short; lobes of corolla obvolute-curved, 3 times or more shorter than the tube; style a little exserted, rather hairy in the middle. *S.* Native of China. I. Chinensis, Lam. dict. 3. p. 344. Flowers orange coloured. Tube of corolla 15 lines long. The species is very nearly allied to *I.* stricta; but differs in the leaves being straight, and in the tube of the corolla being twice the length.

7 I. amenz (Wall. cat. no. 6121.) leaves oblong-lanceolate, glabrous, petiolate; stipulas cruspatid at the apex; corymb on short peduncles; lobes of calyx acute; lobes of corolla oval-oblong, acute. *S.* Native of the Moluccas, and now cultivated in Java. Lodg. bot. cab. t. 1048. Pavetta incarnata, Blum. bijdr. p. 950. The flowers are either pale rose-coloured, flesh-coloured or white; but in the British gardens there is only the pale red variety to be found. Tube of corolla 10–11 lines long.

** Flesh-coloured-flowered Ixora.** Shrub 2 to 3 feet.

7 I. pulchra (Roxb. fl. ind. 1. p. 387.) leaves almost sessile, lanceolate, acute; corymb terminal, compound; lobes of calyx obtuse, lobes of corolla lancedolate, acute; berry 2-lobed. *S.* Native of the Moluccas. I. lanceolata, Lam. dict. 3. p. 343. I. longifolia, Curt. bot. mag.—Rumph. amb. 4. t. 46.? and therefore I. longifolia, Smith in Rees' cycl. no. 3. ? Branches weak. Flowers deep scarlet. Berries deep purple. Perhaps the Bem-Schetti, Rheed. mal. 2. t. 57. is a paler variety of this or a nearly allied species.

**Fulgent Ixora.** Fl. June, Aug. Clt. 1825. Shrub 2 to 5 ft.

9 I. notonia (Wall. cat. no. 6182.) leaves ovate-oblong or oblong, acuminate, coriaceous, glabrous; panicles terminal, with the branches coriaceous and dense; lobes of corolla obtuse; stigma exserted, undivided; stipulas much acuminate. *S.* Native of the East Indies, on the Nelligherry mountains. Flowers apparently red or scarlet.

**Nutan's Ixora.** Shrub.

10 I. tenueflora (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, obtuse, smooth; panicules terminal, corymbose, contracted; lobes of calyx oblong, obtuse; corolla with a long slender tube, and oblong-obtuse lobes, which are longer than the erect style or stamens. *S.* Native of the Moluccas. Flowers scarlet. Allied to *I.* fulgens.

**Slender-flowered Ixora.** Shrub 2 to 4 feet.

11 I. coccinea (Roxb. fl. ind. 1. p. 397.) leaves on short petioles, oblong, coriaceous, acuminate, with coarse parallel veins; corymb terminal, short; flowers almost sessile; teeth of calyx bluntnish; lobes of corolla oblong, obtuse; stigma exserted. *S.* Native of the Moluccas. Flowers scarlet. Allied to *I.* fulgens.

**Crowed-flowered Ixora.** Shrub 2 to 4 feet.

12 I. penuculata (Jack, mal. misc. no. 2. p. 11.) leaves broad-lanceolate, quite glabrous, pale beneath; branches compressed; corymb on long trichotomous peduncles, pendulous; lobes of calyx small, acutish; lobes of corolla narrow; stigma exserted. *S.* Native of Pulo-Penang, where the most of the Malay Ixoras are called Ixora jenavam, Flowers red.

**Pendulous Ixora.** Shrub 2 to 4 feet.

13 I. elongata (Heyne, ex Wall. cat. no. 6131.) leaves petiolate, broad-ovate, tapering much to the base, glabrous; floral ones ovate, sessile, coriaceous of the base, and clasping the stem; peduncles terminal, trichotomous, with the branches corymbose; corymb hairy; corolla with a smooth tube, but the segments are downy on the outside, particularly in aestivation; lobes of corolla acute; stigma exserted. *S.* Native of the East Indies. Flowers apparently red or scarlet.

**Elongated-peduncled Ixora.** Shrub.

14 I. rosea (Wall. in Roxb. fl. ind. 1. p. 398.) leaves almost sessile, oblong, acute, acuminate, contracted at the base and somewhat emarginate, rather downy on the nerves beneath, as well as the branches; corymb terminal, decomposed, large, loose; lobes of calyx acute, rather ciliated; lobes of corolla oblong-cuneated, acute; stigma exserted. *S.* Native of Bengsl, on the hills of Silhet. Ker, bot. reg. t. 540. Sims, bot. mag. 2428. Lodg. bot. cab. t. 729. Flowers rose coloured. Tube of corolla about an inch long. There is a variety of this plant having the leaves glabrous beneath.

15 I. parviflora (Vahl, symb. 3. p. 11. t. 52. but not of Lam.) leaves on short petioles, coriaceous, lanceolate-oblong, obtuse, coriaceous of the base, glabrous; stipulas triangular, acute; corymb compound, trichotomous, divaricate; lobes of calyx and corolla acute. *S.* Native of Amboyna. Pavetta Ambonica, Blum. bijdr. p. 949. Leaves larger than any other of the genus.

**Ambonica Ixora.** Shrub.

**Ambonya Ixora.** Shrub 4 feet.

17 I. eubreokens (Wall. cat. no. 6143.) leaves oblong, blunt at both ends, glabrous, on short petioles: upper ones sessile; corymbes long; lobes of corolla linear; stigma exserted. *S.* Native of the Burmese empire, on the banks of the Atrace. Flowers reddish. I. affinis, Wall. cat. no. 6143. does not ap-
pear to differ from this species, except in the more acuminate leaves.

Reddish-flowered Ixora. Shrub.
18 I. Javatica (D. C. prodr. 4. p. 487.) leaves on short petioles, oblong, acuminate, acute at the base, glabrous; cymes on short peduncles, trichotomous, divaricate; segments of the calyx oblong, of the corolla oval and rounded. 5. S. Native of Java, on the mountains in woods. Pavetta javanica, Blum. bijdr. p. 949. Flowers of a deep vermillion colour. Habit of I. coriacea and I. incarnata.

Java Ixora. Shrub 3 to 4 feet.
19 I. PAECIFLORA (D. C. l. c.) leaves on short petioles, oblong, acuminate, acute at the base, glabrous; cymes on short peduncles, tripartite, few-flowered; teeth of calyx acute; lobes of corolla oval, acute. 5. S. Native of the west of Java, on Mount Pangaranga, in woods. Pavetta paeciflora, Blum. Flowers of a vermilion colour. Allied to I. Javatica, but differs in the cymes being fewer-flowered, and on shorter peduncles; and in the teeth of the calyx being acute.

Few-flowered Ixora. Shrub.
20 I. SALICIFOLIA (D. C. prodr. 4. p. 487.) leaves on short petioles, linear-lanceolate, acuminate, glabrous; cymes bracteate; calyce segments acute; segments of corolla lanceolate, acuminate. 5. S. Native of Java, on the mountains. Pavetta salicifolia, Blum. bijdr. p. 951. Flowers scarlet. A very beautiful species. Leaves 9-10 inches long, and 6 lines broad.

Willow-leaved Ixora. Shrub 3 to 4 feet.
21 I. FINLASONYA (Wall. cat. no. 6166.) leaves obovate-lanceolate, glabrous, tapering much to the base, obtuse, and mucronate at the apex, petiolate; cymes terminal, compound; lobes of calyx membranous; lobes of corolla obtuse; stigma exerted. 5. S. Native of the East Indies. Flowers apparently red.

Finlayson’s Ixora. Shrub.

* * * Flowers white.

22 I. BLANDA (Ker. bot. reg. t. 100.) leaves oval or ovate-lanceolate, almost sessile; cymes trichotomous, compound, contracted, many-flowered; teeth of calyx short, bluntish; lobes of corolla obovate, reflexed; style a little exserted. 5. S. Native of the East Indies. 1. alba, Roxb. fl. ind. 1. p. 389. but not of Lin. Nearly allied to I. stricla, but differs in the corolla being white. Peduncles and calyces red. Stigma exserted, but shorter than the lobes of the corolla. Tube of corolla 10 lines long. Flowers at first white, but becoming yellow as they fade. Stipulas broad at the base, and ending in an awn.

23 I. MACROPHYLLA (Bard. in herb. Haenke, ex D. C. prodr. 4. p. 487.) glabrous; leaves cuneate-obovate, or oblong-oblanceolate, acute, on short petioles; pedicels elongated, bracteolate at the base, and trichotomously corymbose at the apex; teeth of calyx acute, hardly perspicuous; stigma exerted, with reflexed lobes; fruit nearly globose. 5. S. Native of the Island of Manilla. Allied to I. cuneifolia. Flowers blackish in the dried state, but probably white in the recent state.

Large-leaved Ixora. Shrub.

24 I. SESSILLIS (Wall. cat. no. 6139.) leaves oblanceolate, tapering to both ends, petiolate, glabrous; corymbs almost sessile, dense; lobes of calyx subulate; lobes of corolla acute; stigma exserted. 5. S. Native of Silhet, on the mountains. Stipulas subulate at the apex. Flowers apparently white.

Almost-sessile-corymbed Ixora. Shrub.

25 I. CUNEIFOLIA (Roxb. fl. ind. 1. p. 396.) leaves broadly ovate-lanceolate, acuminate, glabrous; corymbs terminal, on long peduncles, panicled; flowers crowded; lobes of calyx oblong, conical; lobes of corolla oblong, obtuse; stigma exerted. 5. S. Native of the East Indies, about Dacca and Scaramore. Ker. bot. reg. 648. Lodg. bot. cab. t. 1215. Corolla white, with the tube about 6-7 lines long. Berries turbinate, red. Down very minute on the peduncles, branchlets, and usually on the nerves of the leaves underneath.

26 I. BARVATA (Roxb. fl. ind. 1. p. 394.) leaves oblong, on short petioles, shining; upper ones almost sessile, and roundly cordate at the base; panicle spreading, loose, sub-corymbose; lobes of calyx acutish; lobes of corolla oblong, bearded with long white hairs at the throat; stigma exerted. 5. S. Native of the East Indies. Smith, in Rees’ cycl. no. 6. Sims, bot. mag. 2505. Brem. Schett. Rheed. mal. 2. t. 13. ? Flowers white. Stigma, according to Roxb. almost at the throat, but in the specimens examined it is exerted. Berries red.

Bearded Ixora. Fl. June, July. Clt. 1823. Sh. 5 to 12 ft.

27 I. OXYPHYLLA (Wall. cat. no. 6159.) leaves elliptic-lanceolate, long-acuminate, glabrous, on short peduncles; stipulas subulate at the apex; lobes of calyx subulate; stigma exerted. 5. S. Native of Silhet, on the mountains. Flowers apparently white.

Sharp-leaved Ixora. Shrub.

29 I. SPECTABILIS (Wall. cat. no. 6133.) leaves broad, elliptic-lanceolate, petiolate, glabrous; upper ones oblong, cordate at the base and stem clasping; pedicelles elongated, trichotomous, having the branches corymbose; teeth of calyx small, acute; lobes of corolla narrow. 5. S. Native of the Burmese Empire, near Martaban. Flowers apparently white.

Shiny Ixora. Shrub.

30 I. LANCEOLARIA (Colebr. in Roxb. fl. ind. 1. p. 397.) leaves approximate, very long, ovate-lanceolate, acuminate, on short petioles, glabrous; corymbs terminal, almost sessile, small; bracteoles coloured; corolla with a filiform tube, and linear-oblong lobes; anthers linear, bifid at the base; style exserted. 5. S. Native of the East Indies, in Travancore. Branches twigg, pendulous, somewhat dichotomous. Stipulas subulate at the apex, rather longer than the petioles. Corolla white, having the tube 9 lines long. Berries red, globose.

Lanceolar-leaved Ixora. Shrub 4 to 6 feet.

31 I. LEUCANTHA (Wall. cat. no. 6148.) leaves ovate-lanceolate, acuminate on short petioles; pedicules and corymbs downy; stipulas subulate at the apex; lobes of calyx, and bracteas subulate; lobes of corolla long and narrow; stigma much exerted; corymbs loose. 5. S. Native of the East Indies, near Travancore. Flowers white.

White-flowered Ixora. Shrub.

33 I. Brachypoda (D. C. prod. 4, p. 488.) glabrous leaves, on very short petioles, elliptic-oblong, bluntly acuminate; stipulas intrapetiolate, combined, truncate, and mucronated on both sides; corymbs terminal, pedunculate, shorter than the leaves; limb of calyx very short, bluntly 5-toothed. \( ^7 \). S. Native of equinoctial Africa, in the woods of Casamancia, where it was collected by Leprieur and Perrottet. Leaves 6 inches long, and 2 broad, and the petioles about 2 lines long. Tube of corolla, almost an inch long. Bracteas small. Flowers pale in the dried specimens, but are probably white in the recent state.

Short-petioled Ixora. Shrub 4 to 5 feet.

34 I. Acuminata (Roxb. fl. ind. 1. p. 393.) leaves petiolate, broad-lanceolate, acuminate, smooth, glaucous: floral leaves stem-clasping, and broader; corymbs supra-decompound, crowded, almost sessile; lobes of calyx ensiform; lobes of corolla ovate-oblong, obtuse; stigma exserted, undivided. \( ^7 \). S. Native of the East Indies, in the province of Silhet, in woods. Flowers large, white, with the tube \( \frac{1}{2} \) inch long. Calyxes white.

Acuminated-leaved Ixora. Shrub 3 to 5 feet.

35 I. Stameensis (Wall. cat. no. 6162.) leaves ovate-oblong, mucronate, coriaceous at the base; upper ones attenuate at both ends; corymbs terminal; lobes of corolla acute; stigma exserted. \( ^7 \). S. Native of Siam, in the East Indies. Flowers white.

Siam Ixora. Shrub.

36 I. Opaca (R. Br. in Wall. cat. no. 6141.) leaves long-lanceolate, acuminate, petiolate, glabrous; corymbs downy; teeth of calyx small; lobes of corolla obtuse; stigma exserted. \( ^7 \). S. Native of Pulo-Penang. Flowers apparently white.

Opaque-leaved Ixora. Shrub.

37 I. Brachialata (Roxb. fl. ind. 1. p. 391.) leaves on short petioles, broad-lanceolate, obtuse, glabrous; panicle brachiate, with remote diverging corymbose branches; tube of corolla filiform, and the lobes are obovate and emarginate; anthers sessile at the throat; stigma exserted. \( ^7 \). S. Native of Bengal, in woods. Flowers small, white. Nearly allied to I. parviflora, Vahl, but differs in the flowers being white. Berries deep purple, rather larger than peas. Petioles about half an inch long.

Brachialata-leaved Ixora. Clt. 1823. Shrub 2 to 4 feet.

38 I. Decipiens (D. C. prod. 4. p. 488.) glabrous; leaves on short petioles, oblong-lanceolate, acutish at the base, acute or obcordate at the apex; stipulas broad at the base, and ending in a subulate awn at the apex; corymbs terminal, tripartite at the base, sessile, with pedicellate branches; lobes of calyx short, bluntish; corolla with a slender tube, and oval, bluntish lobes; style pilose. \( ^7 \). S. Native of Coromandel, on the mountains. I. parviflora, Roxb. fl. ind. 1. p. 393. but not of Vahl, nor Lam. Flowers white, sweet-scented. Tube of the corolla 4 lines long, twice the length of the lobes. Berries roundish, black.

39 I. Brunonis (Wall. cat. no. 6136.) leaves obovate-lanceolate, sessile, coriaceous at the base, acuminate at the apex, downy beneath, but villous on the nerves; peduncles and corymbs villous, as well as the calyxes and corollas outside; bractees and teeth of calyx subulate; lobes of the corolla narrow, acute; stigma exserted. \( ^7 \). S. Native of Pulo-Penang. Flowers apparently white. Allied to I. villosa.

Brown's Ixora. Shrub.

40 I. Villosa (Roxb. fl. ind. 1. p. 392.) leaves broad-cuneate-lanceolate, acuminate, sessile or subulate, on short petioles; corymbs trichotomous, or 6 to 7 times divided, with the branches trichotomous and villous; lobes of calyx oblong, ciliata; corolla with a very long slender tube, and oblong obtuse lobes. \( ^7 \). S. Native of the East Indies, in Silhet. Flowers white, fragrant. Stipulas and branches villous.

Villosa Ixora. Shrub 4 to 5 feet.

41 Puriflora (D. C. prod. 4. p. 489.) leaves sessile, obovate-oblong, cuneate, and somewhat coriaceous at the base, acuminate at the apex, downy on the nerves on both surfaces, as well as the branches, corymbs, and corollas; stipulas long, subulate at the apex; corymbs terminal, dense, sessile; teeth of calyx and alabastra, very acute. \( ^7 \). S. Native of the East Indies. A very distinct species. Leaves 8 inches long and 3 broad. Corolla having the tube about 9 to 10 lines long, and the lobes linear and acute, about 3 lines long.

Downy-flowered Ixora. Shrub.

42 I. Longifolia; leaves broad, elliptic-lanceolate, tapering to both ends, glabrous above, and villous beneath, particularly on the nerves, as well as the branches, petioles, peduncles, panicles and fruit; segments of the calyx subulate. \( ^7 \). S. Native of Pulo-Penang. I. macrophylla, R. Br. in Wall. cat. no. 6105.

Long-leaved Ixora. Shrub.

† Species not sufficiently known.

43 I. Alba (Lin. spec. 160. but not of Roxb.) leaves ovate-lanceolate; flowers fasciculate. \( ^7 \). S. Native of the East Indies, but is a very obscure species, and probably fictitious; the description taken from the figure in Phil. alm. t. 109. f. 2. and Bem.—Schett. Rhed. mal. 2. t. 14. Plukene's plant belongs to I. incarnata, and Rheedle's probably to I. jutigena. The flowers are said to be terminating in small clusters, white, and without scent.

White-flowered Ixora. Shrub 6 to 7 feet.

44 I. Leureiri; leaves ovate-oblong, acute, smooth, nearly sessile; cymes or corimb fasciculate. \( ^7 \). G. Native of Cochin China. I. alba, Lour. coch. 76. Flowers white. Berries red.

Loureiri's Ixora. Shrub 3 to 4 feet.

45 I. Montana (Lour. coch. p. 76.) leaves oblong, broadest at the apex, obtuse, cuneated and coriaceous at the base, nearly sessile, glabrous; corymbs terminal, fastigate. \( ^7 \). G. Native of Cochin China, on the mountains. Flowers scarlet.

Mountian Ixora. Shrub 3 to 4 feet.

46 I. Novemervia (Lour. coch. p. 76.) climbing; leaves ovate-lanceolate, almost sessile, 9-nerved, rough; cymes terminal, hemispherical. \( ^7 \). G. Native of Cochin China, in uncultivated places. Flowers white, terminating in hemispherical cymes. Tube of the corolla very long and slender. Stigma ovate, bifid. Berry 1-seeded.

Nine-nerved-leaved Ixora. Shrub cl.

47 I. Violacea (Lour. coch. p. 76.) climbing; leaves lanceolate, almost sessile, pilose, 9-nerved; cymes axillary. \( ^7 \). G. Native of Cochin China, in uncultivated places, climbing over trees. Flowers violaceous. Berry 1-seeded. Seed ovate, rough.

Violaceous-flowered Ixora. Shrub cl.

48 I. Thrysiandra (Poir. suppl. 3. p. 203.) leaves almost sessile, ovate-cuneated, obtuse, glabrous on both surfaces, hoary beneath; stipulas ovate, acute; thyrses terminal, crowded; teeth of calyx acute, somewhat setaceous; corolla with a slender tube, and oval obtuse lobes, which are shorter than the tube. \( ^7 \). G. Native of the Cape of Good Hope.

Thyrsce-flowered Ixora. Shrub.

49 I. Laxiflora (Smith, in Rees' cyclo. vol. 19. no. 8.) leaves elliptic-oblong, acute, tapering into the petioles at the base: upper ones rounded at the base, almost sessile; panicles corymbose, loose, longer than the leaves; lobes of the corolla convex, spreading, bearded in the disk above; style nearly the length of
the limb. l. S. Native of Sierra Leone. This plant does not probably belong to the genus.

Loose-flowered *Ixora*. Shrub.

N. B. C. *multiflora* (Schwartz, prod. 30. fl. ind. oce. p. 240.) should be excluded from the order altogether, from the leaves being alternate, and crowded into fascicles; in the want of stig-}

Cult. Most of the species of this genus are truly beautiful when in blossom, and are therefore worth cultivating in every collection. They require to be kept in a moist heat, but the pots should never be plunged in the mouth of the tube of the corolla, even exceeding the segments of its limb, elevate at the apex, nearly entire, or the lobes of the stigma are so close as scarcely to be distinguished. Flowers white.—All the species are either natives of Africa or Asia.

* Asiatic species, especially from India and Arabia.*

1 P. *Indica* (Lin. spec. 160.) leaves oval-oblong, acuminate at both ends, petiolar; stipular broad, acute, somewhat concrete; panicule terminal, suberosembose, with opposite branches; teeth of calyx acute; lobes of corolla one-half shorter than the tube; style very long. l. S. Native of the East Indies, frequent in hedges, and among bushes. Gartn. fr. 1. t. 25. P. álba, Vahl, symb. 3. p. 11. *Ixora paniculátum*, Lam. dict. 5. p. 344. *Ixora Pavetta*, Roxb. fl. ind. 1. p. 395. *Pavetta* polynamhos, Washington, 11. cat. no. 6176. *Pavetta*, Rheed. mad. 5. p. 10. —Burmb. ind. t. 13. f. 3. Paváté, Rain, hist. 1581. Flowers white. There are varieties of this species with either glabrous branches and leaves, or the branches and under surfaces of the leaves are downy.

2 P. *arenósa* (Lour. coch. p. 73.) branches brachiate; leaves lancelolate, tabular, shining; flowers terminal, fasti-

3 P. *tomentosa* (Roxb. ex Smith in Rees' cyc. vol. 26. but not of Rich.) leaves petiolar, oblong, villous on both surfaces, but particularly beneath; panicles terminal, broad, tomentose, with trifid branches. l. S. Native of the East Indies. Ixora mentóstósa, Roxb. fl. ind. 1. p. 396. *Pavetta* tomentósa, Roth, nov. spec. p. 89. *Pavetta* velutina, Wall. cat. no. 6174. Flowers numerous, white, fragrant. Style twice the length of the tube of the corolla; stigma clavate, undivided. Berry globose.

Tomentose Pavetta. Shrub.

4 P. *montana* (Reinw. in Blum. bid. p. 952.) leaves on long petioles, oblong-lanceolate, much acuminate at both ends, downy, as well as the corollas, which are terminal, trichotomous, and bracteate; calcicorne teeth acute; segments of corolla acutish. l. S. Native of Java, in woods on the mountains. Very nearly allied to *P. Indica*. Flowers white, having the segments tipped with green.

*Mountain Pavetta*. Shrub 4 to 5 feet.

5 P. *odoráta* (Blum. bid. p. 952.) arboreous; leaves on short petioles, oblong, acute at both ends, but usually bluntish at the apex, coriaceous, glabrous; corollas terminal, trichoto-

6 P. *macrophylía* (Blum. bid. p. 953.) leaves on short petioles, oblong, very blunt, attenuated at the base, coriaceous, glabrous; corollas axillary and terminal, downy, trichotomously fastigate; segments of calyx and corolla blunt. l. S. Native of Java, in mountain woods. Flowers white.

Long-leaved Pavetta. Shrub 4 to 5 feet.

7 P. *reticulátum* (Blum. bid. p. 953.) leaves oblong, acuminate at both ends, coriaceous, glabrous, reticulated beneath; corollas terminal, trichotomous, loose, on long peduncles; segments of calyx acute; segments of corolla lanceolate, acuminate. l. S. Native of Java, on Mount Salak. Flowers white. Stem 4 feet high. Young branches compressed. Fruit didymously globose.

Reticulated-leaved Pavetta. Shrub 4 feet.

8 P. *lóngipes* (D. C. prod. 4. p. 490.) leaves oval-oblong, acuminate, petiolate, glabrous; stipular short, acuminate; peduncles terminal, longer than the leaves, coriaceous at the apex, few-flowered; fruit ovate, didymous, naked at the apex. l. S. Native of the island of Timor. Upper leaves 4-5 inches long, 1½ to 2 broad. Peduncles slender, 6 inches long. Corolla with a slender tube, and 4 oblong spreading reflexed lobes. Anthers linear. Style a little exserted; stigma thick, biseri-

Long-peduncled Pavetta. Shrub 4 to 5 feet.

9 P. *fallúdósa* (Blum. bid. p. 954.) leaves on short petioles, oblong, bluntish, membranous, glabrous; the upper ones oblong-cordate, sessile; corollas terminal, on long peduncles, trichotomous, coloured; teeth of calyx obtuse; segments of corolla oblong, acute. l. S. Native about Batavia, in marshes. Flowers white. Allied to *Ixora barbátá*.

Marsh Pavetta. Shrub 4 to 5 feet.

10 P. *sylväc* (Blum. bid. p. 955.) leaves oblong-lan-

11 P. *breveílio* (D. C. prod. 4. p. 491.) leaves oval, acute, acuminate at the base, on short petioles, rather membran-

Short-petioled Pavetta. Shrub 4 to 5 feet.

12 P. *rotána* (D. C. prod. 4. p. 491.) branchlets and calyces clothed with hoary villi; leaves elliptic, petiolar, rather hairy, but while young clothed with hoary tomentum; stipula-
triangular, glabrous inside; flowers disposed in panicked corymb, bearded; corolla with a long terete tube, which is beard ed at the throat, and oblong obtuse lobes; style setaceous, glabrous. h. s. Native of the East Indies. P. villiosa, Roth, nov. spec. p. 88, but not of Vahl.

Roth's Pavetta. Shrubs 3 to 4 feet.

13 P. SCLEROPHYLLOSA (N. B. in Wall. cat. no. 6171.) villous in every part; leaves oblong-lanceolate, acuminate; corymb terminal; teeth of calyx short, acute; lobes of corolla oblong. h. s. Native of Pulo Penang. Fruit round.

Nauclea-flowered Pavetta. Shrubs.

14 P. BRUNONIS (Wall. cat. no. 6172.) soft and villous all over; leaves obovate; stipulas and bracteas broad, membranous; peduncles trichotomous, having the branches dense and corymbose; lobes of calyx subulate. h. s. Native of the East Indies, on the Nelligbery mountains. Pavetta mollis, Wall. cat. no. 6179. Leaves smoothish above in the adult state.

Bronzi's Pavetta. Shrubs.

15 P. WEDERERIANA (Wall. cat. no. 6182.) leaves broad-lanceolate, glabrous, tapering to both ends; corymbs downy; fruit spherical. h. s. Native of Pulo-Penang and Chittagong.

Weberra-leaved Pavetta. Shrubs.

16 P. SUMATRENsis (Roth, nov. spec. p. 88, and in Roem. et Schultes, syn. p. 176.) leaves petiolate, oblong-elliptic, glabrous, striose on the ribs beneath; corymbis trichotomous; flowers pentandrous, clothed with white tomentum; corolla with a filiform tube, and oblong obtuse lobes; style much exserted; stigma oblong, glabrous. h. s. Native of Sumatra. Flowers white.

Sumatra Pavetta. Shrubs 3 to 4 feet.

17 P. LONGIFLORA (Vahl, symb. p. 13.) leaves lanceolate-elliptic, and are as well as the branches glabrous; stipula pilose inside; flowers disposed in fascicles; teeth of calyx rather long, acute. h. s. Native of Arabia Felix. Ixora occidentalis, Forsk. cat. p. 419. Ixora longiflora, Poir. suppl. 3. p. 208. Flowers white. Berries black. Corolla an inch and a half in diameter.

Far. β, Javeina (D. C. prod. 4. p. 491.) leaves on short petioles, oblong, acute at both ends, coriaceous; corymb terminal, fastigate, trichotomous, downy; tube of corolla very long; lobes of calyx and corolla acute. h. s. Native of Java, in woods on the mountains. Pavetta longiflora, Blum. bijdr. p. 952.

Long-flowered Pavetta. Shrubs.

18 P. Villiosa (Vahl, symb. p. 13.) branches and calyces villos, loamy; leaves on short petioles, elliptic-lanceolate, clothed with canescent villi white; flowers in fascicles. h. g. Native of Arabia Felix. Ixora villiosa, Poir. suppl. 3. p. 208. Leaves smooth on the upper surface in the adult state. Branches 4-cornered. Flowers white. Stipulas, style, and stigma as in P. radula.

Villous Pavetta. Shrubs.

* * African species.

19 P. Owarensis (Beauv. fl. d'ouv. 1. p. 87. t. 52.) leaves on long petioles, ovate-oblong, attenuated at both ends, membranous, glabrous; corymb terminal; lobes of calyx oval, acute; lobes of corolla linear, oblong, almost the length of the tube; style twice as long as the tube, clavate at the apex. h. g. Native of the west coast of Africa, between Warea and Buonopozzo. Ixora Owarensis, Poir. suppl. 3. p. 207. Flowers white. Throat of corolla very villos. Stipulas short, stem-clasping, apiculated by a short point at the apex.

Warea Pavetta. Shrubs 4 to 5 feet.

20 P. Caffra (Thunb. prod. p. 22. fl. cap. 1. p. 555.) leaves obovate, almost sessile, glabrous; stipulas membranous, compate; flowers subumbellate; teeth of calyx setaceous; lobes of corolla oblong, acute, shorter than the tube. h. g. Native of the Cape of Good Hope, in the woods of Krakokamma. Ixora Caffra, Poir. suppl. 3. p. 209. Pavetta corymbosa, Hioutt. ed. 1. p. 11. t. 40. and Cunita Capensis, Hiout. pl. syst. 5. p. 357. t. 40. f. 1. ex. Thumb. and Rehn. syst. 3. p. 175. Ixora albica, Bearn, Herb. Pav. thyrsiflora, Thumb. Herb. Corollas of flowers terminating in shorter branches. Flowers white. Style much exserted, clavate at the apex in flower. This is a beautiful shrub when in flower.

21 P. Parviflora (Afz. rem. guin. p. 47.) leaves oblong, attenuated at both ends; stipulas acute; peduncles dichotomously umbulate; calyces and corollas villous. h. s. Native of Guiana. Flowers white.

Small-flowered Pavetta. Shrubs 4 to 5 feet.

22 P. SMETHVIANI (D. C. prod. 4. p. 492.) leaves oval, short-acuminate, coriaceous, smooth, on short petioles; corymb axillary, on short peduncles; teeth of calyx oblong, ciliated; corolla with a terete tube, and the limb glabrose before expansion. h. s. Native of Sierra Leone. Pavetta parviflora, Smeathman. Perhaps this plant belongs to a different genus.

Smeathman's Pavetta. Shrubs 3 to 4 feet.

23 P. SUBDIAE (Schum. pl. guin. p. 78.) branches terete, nearly glabrous; leaves ovate, acuminate, rather ciliated at the base; petioles rather hairy; stipulas ciliated on the inside, ovate, mucronate; coryms fuscitate, terminal; lobes of calyx lanceolate, acute. h. s. Native of Guinea. Flowers white. Stigma glabrous.

Nearly-glabrous Pavetta. Shrubs 4 to 5' feet.

24 P. Geniephilia (Schum. pl. guin. p. 78.) branches terete, downy; leaves oblong-lanceolate, acuminate, shining, glabrous, downy beneath and on the petioles; stipulas setaceous acuminate; coryms terminal, glabrose; peduncles and calyx hairy. h. s. Native of Guinea. Flowers white.

Genipa-leaved Pavetta. Shrubs 4 to 5 feet.

25 P. Lateriflora; leaves oblong-lanceolate, coriaceous, acuminate, almost sessile, disposed in 2 rows; peduncles axillary, subcorymbose. h. s. Native of Sierra Leone. Flowers white. Berry roundish, containing a 1-seeded nut. Cotyledons long, twisted. Perhaps the same as P. Smeathmanni.

Side-flowered Pavetta. Shrubs 4 to 6 feet.

26 P. Canecephala (D. C. prod. 4. p. 492.) branches clathred with white hairs; leaves elliptic, attenuated at the base, on short petioles, reticulated veined, downy above, and clothed with canescent villi beneath; corymb lateral, many-flowered, almost sessile; pedicels and calyces hairy; corolla with a downy tube, and a glabrous limb; style much exserted, rather clavate at the apex. h. s. Native of the South Western Coast of Africa, in Angola. Pavetta tomentosa, A. Rich. mem. soc. hist. nat. par. 5. p. 181. but not of Roxb. Flowers white.

Canaescent Pavetta. Shrubs.

* * Species natives of Madagascar.

27 P.? Antiochyla (A. Rich. in mem. soc. hist. nat. par. 5. p. 181.) quite glabrous; leaves short, oval, acute, rather fleshy; stipulas broad, short, acuminate, permanent; flowers cymose, terminal, pentamorous; one of the calyces lobes is drawn out into a leaf; anthers inclosed; style much exserted. h. s. Native of Madagascar. Perhaps a proper genus.

Leaf-flowered Pavetta. Shrubs.

28 P. Cineraria (A. Rich. l. c.) shrub clothed with grey tomentum; leaves rather oval, acute, gradually narrowed at the base, clothed with cinereous tomentum, especially beneath; stipulas connate, lanceolate, permanent; cymes terminal, peduncu-
late, branched; flowers tonementose. 1 S. Native of Madagascar.

*Cineraria* Pavetta. Shrub.

29. *P. ora* clis (A. Rich. l. c.) quite glabrous; leaves elliptic-oblong, very acute, almost sessile; stipulas connate, narrow-lanceolate; cymes few-flowered, terminal; flowers very long, slender; stamens exerted; style hardly exserted beyond the tube. 1 S. Native of Madagascar. Perhaps a proper genus.

_**Species natives of the South Sea Islands.**_

*Guilder-rose-like Pavetta*. Shrub.

_Elder-like Pavetta_. Shrub.

_Three-flowered Pavetta_. Shrub.

† *Species not sufficiently known.*

33. *P. angustifolia* (Rœem. et Schultes, syst. 3. p. 175.) leaves linear-lanceolate, attenuated at both ends; cymes terminal, trichotomous, subumbellate; teeth of calyx acute; corolla with a slender tube, and oblong acute lobes. 1 S. Native of the East Indies. Pavetta Índica, Burn. fl. ind. p. 35. t. 13. f. 3. exclusive of the synonyms. Ixora angustifolia, Lam. dict. 3. p. 45. Flowers white. Stigma nearly entire as in Pavetta, and about equal in length to the lobes of the corolla, as in Ixora. _Narrow-leaved Pavetta_. Shrub 3 to 4 feet.

34. *P. amplifolius* (Pers. ench. 1. p. 131.) glabrous; leaves stem-clasping, ovate; segments of corolla acute, lanceolate. 1 S. Native of the East Indies; and is often mixed with _P. Indica_ according to Persoon.

_Stock-clasping-leaved Pavetta_. Shrub 3 to 4 feet.

35. *P. paraútica* (Lour. coch. p. 73.) stem parasitical, much branched; leaves verticillate, ovate, tomentose; clusters of flowers axillary; calyx tetragonal, truncate, villous, corolla with a long tube, and 4 oblong inflexed lobes; style equal in length to the corolla; berry 1-seeded. 1 S. Native of Cochin-china, in gardens, growing upon trees. Flowers small, dusky yellow. This plant should probably be removed from the genus.

_Parasitical Pavetta_. Shrub 1 foot.

_Cult. For culture and propagation see Ixora_, p. 574.

_Lin. syst. Tetrandria, Monogónia_. Calyx with an oval tube, and a small 4-toothed terminal limb. Corolla 4-clét, with a hairy throat. Stamens 4, inserted in the throat of the corolla; filaments short; stigma bifid. Berry oval, smooth, umbilicate, 1-seeded, crowded by the oblong-linear calyx. Embryo erect, in fleshy albumen.—Trees or shrubs, natives of Java. Leaves opposite, glabrous, acuminated at both ends. Flowers crowded, terminal, rarely axillary, sessile. Berry and wood very fetid.—This genus comes very near the following.

1. *S. arborea* (Blum. bijdr. p. 956.) arboreous; leaves pediolate, elliptic-oblong; flowers crowded, terminal, and sometimes axillary. 1 S. Native of Java, in mountain woods.

_TREE SAPRO'SMA_.

2. *S. fruticosum* (Blum. bijdr. p. 956.) shrubby; leaves almost sessile, oblong-lanceolate; flowers crowded, terminal. 1 S. Native of Java, on Mount Parang.

_Shrubby Saprosma_. Shrub.

_Cult. See Ixora_, p. 574. for culture and propagation.

_Lin. syst. Tetrandria, Monogónia_. Calyx with an ovate tube, and a short tubular sinutately 4-toothed limb. Corolla with an elongated terete tube, which is hardly tumin at the apex, and a glabrous throat. Stamens 4, inserted in the upper part of the tube, included; anthers oblong-linear. Style filiform; stigma bipartite, with the lobes linear, and hardly exerted. Berry ovate-globose, hardly fleshy, crowned by the tubular limb of the calyx, 1-celled, 1-seeded. Seed rather globose, fixed to the sides of the parietes. Embryo small, in a pit at the bottom of the albumen, which is horny, with a thick coriaceous radicle, which is longer than the small cotyledons.—Glabrous shrubs, natives of America. Leaves opposite, coriaceous, on short pedi- toles. Stipulas solitary on both sides, acute. Flowers terminal, few, rather crowded, on short pedicels, white.

_Violaceous-berry Coussarea_. Shrub 7 to 8 feet.

2. *C. racemosa* (A. Rich. in mem. soc. hist. nat. Par. 5. p. 177.) leaves elliptic, acuminate; stipulas caducous; flowers small, disposed in terminal pedunculate racemes; fruit ovoid, compressed, white. 1 S. Native of French Guiana.

_Racemose-berry Coussarea_. Shrub.

3. *C. macéoca'ipa* (A. Rich. l. c.) leaves elliptic, acuminate; stipulas caducous; flowers disposed in terminal and axillary, hardly pedunculate racemes; fruit ovoid, black. 1 S. Native of French Guiana. Very like the preceding species.

_Long-fruited Coussarea_. Shrub.

4. *C. squamo'sa* (Lam. ill. p. 281. no. 1462.) leaves ovate-oblong; cymes corymbose, terminal pedunculate; peduncles compressedly angular. 1 S. Native of the island of Trinidad, ex Vahl; and of Porto Rico, where it was collected by Ryan. Frelichia paniculata, Vahl. cefl. pref. 3. Billardiéria paniculata, Vahl. cefl. 1. p. 13. 10. f. 3.
Sipulas very short, rounded, acuminated on both sides, ex Vahl; but in the specimen collected at Porto-Rico by Ryan, the sipulas are conic a little way at the base, and bidentate at the apex; both are, however, probably the same species.

Frodlich's Consarea. Shrub.

Cult. For culture and propagation see "Isora, p. 574.

Lin. Syst. Tetra-Pentandria, Monogynia. Calyx with an ovate tube, and a 4-toothed limb. Corolla, stamens, and style unknown. Berry crowned by the calyx, ovate-oblung, rather coriaceous, 2-celled, rarely 3-celled. Seeds solitary in each cell, plano-convex or angular. Alumnæ rather caralinugous, grossme from chinks and fissures. Embryo erect, small, rather curved, and nearly dorsal, with lanceolate cotyledons.—This genus is hardly known, but from the alumnæ it comes very near to Rutidea; and to Psychotria from the form of the fruit.

1 G. siora (Gärtn. fruct. 1. p. 138. t. 28. f. 2.) berry smooth; teeth of calyx on the top of the fruit, conving and rounded. b. S. Native of Ceylon, where it is called Hogalota. Berries black.

Black-berried Grumilea. Shrub.

2 G. rüctervriatrix (D. C. prod. 4. p. 495.) berry striated lengthwise, crowned by the short tubular truncate limb of the calyx. b. S. Native of the western coast of Africa in Casamania at Iton, where it was collected by Leprieur and Perrottet. Shrub glabrous. Leaves petiole, elliptic, cuneate at the base, acute at the apex, shining. Stipulas solitary on both sides, lanceolate, deciduous. Flowers unknown. Fruit 5-6 together at the tops of the branches, sessile, almost capitake, black, ovate, 2-celled. Seeds ruminated as in Annóna.

Psychotria-like Grumilea. Shrub 4 to 5 feet.

Cult. For culture and propagation see "Isóra, p. 574.

Lin. Syst. Pentandria, Monogynia. Calyx with a globose tube, and a small 5-parted limb; lobes ovate. Corolla funnell-shaped, with a terete tube, which is dilated at the apex, and 5 spreading oval lobes. Anthers 5, sessile in the throat of the corolla, exserted, oblong, but shorter than the lobes of the corolla. Style clavate at the apex; stigmas 5, combined, indiited only by a furrow. Berry nearly dry, globose, crowned by the vestiges of the calyx, 1-celled, 1-seeded. Seed globose, pubescent, at the base, wrinkled on the out-side. Alumnæ large, brown, caralinugous. Embryo oblique, terete.—Shrubs, natives of India and Africa. Branches terete, hispid while young. Leaves opposite, on short petioles, hispid on the nerves and petioles. Stipulas twin on both sides, combined to the middle, subulate at the apex. Spikes raceemose, interrupted, terminal; flowers disposed in almost sessile opposite fascicles. Bracteas and calyxes hispid. Corollas glabrous, becoming black on drying, but probably white in the recent state.

1 R. Firmuloba (D. C. l. c.) branches, petioles, and nerves of leaves on the under surface, rather hispid; leaves elliptic-oblong; spikes terminal, formed of interrupted fascicles of flowers; fruit glabrous. b. S. Native of Sierra Leone, where it was collected by Smeathmann; and of Casamania near Iton, where it was collected by Leprieur and Perrottet.

Small-flowered Rutidea. Shrub 3 to 4 feet.

2 R. moellies (Blum, ex D. C. prod. 4. p. 495.) every part of the plant is clothed with soft hairy tomentum; leaves elliptic.

Vol. III.
oblong, clothed with soft hairs on both surfaces, but most so beneath; coryms terminal, dichotomous; fruit rather villous, globose, 1-seeded. \( S \). Native of the island of Pulo-Penang. The fabric of the seed is unknown.

Soft Rutidean. Shrub.

Cult. For culture and propagation see Isora, p. 574.

CLXVI. FARAMEA (A member does not give the meaning of this name). A. Rich. mem. soc. hist. nat. Par. 5. p. 175. t. 17. f. 1 and 2. D. C. prod. 4. p. 496.—Faramea and Tetramerenium, Juss. mem. mus. 6. p. 376.

LIN. SIST. Tetramerium, Monogyni. Calyx with a turbinate glabrous tube, and a very short 4-toothed or entire limb. Corolla with a short terete tube, a naked throat, and 4 spreading oblong or linear acute lobes, which are longer than the tube. Anthers 4, sessile, inclosed. Style short, bifid at the apex. Berry dry, 2-celled while young, but in the adult state it is glabrous, depressed, 1-celled, and 1-seeded, marked by 8 crenulations at the cicatrice. Seeds fixed to the bottom of the cell, umbilicate at the base, glabrously depressed. Alphanum horný, Embryo lateral, small, horizontal.—Glabbrous, dichotomously branched shrubs, natives of America. Leaves petiolate, oval or oblong-acuminate. Stipules interpetal, solitary on each side, broad at the base, and securately cuspitate at the apex. Flowers corymbose or umbellate, on the tops of the branches or peduncles. Corollas white.

SECT. I. Eufaramea (this section is supposed to contain the true species of the genus). D. C. prod. 4. p. 496.—Faramea, Aubl. guian. 1. p. 102. t. 40. Lam. dict. 2. p. 460. ill. t. 63.—Faramea, Vittm. summ. pl. 1. p. 537. Peduncles terminal, 1-3 together, bearing each a simple umbel of flowers at the apex. Flowers involucrated by caducous bracteae. Stipulas ending in an awn.

1 F. sessile-Flora (Aubl. guian. 1. p. 104. t. 40. f. 2.) umbels terminal, solitary, simple, sessile; calyx 4-toothed. \( S \). Native of Guiana, in the woods called Canwood. Leaves oblong-obovate. Flowers white.

Sessile-flowered Faramea. Shrub 7 to 6 feet.

2 F. sessiliflora (D. C. prod. 4. p. 496.) peduncles terminal, solitary, nearly terete, bearing a simple umbel of flowers at the apex; calyx truncate. \( S \). Native of Cuba, about the Havana. Branches slender, dichotomous. Leaves oblong, acuminate at both ends.

Gardenia-bearing Faramea. Shrub.

3 F. truncata (D. C. prod. 4. p. 496.) peduncles terminal by threes, compressed at the apex, bearing each a simple umbel of flowers; calyx truncate. \( S \). Native of French Guiana. Very like the following species, but differs in the calyx being truncate. Corolla marcescent. Fruit pale, but exactly like those of F. odoratissima.

Truncate-calycyed Faramea. Shrub 4 to 6 feet.

4 F. corolea (Aubl. guian. 1. p. 102. t. 40. f. 1.) peduncles terminal by threes, compressed at the apex, each bearing a simple umbel of flowers; calyx 4-toothed. \( S \). Native of French Guiana, in the woods called Canwood. Lam. ill. t. 63. Flowers white.

Corolea-flowered Faramea. Shrub 7 to 5 feet.

Stipulae ending in an awn.

5 F. odoratissima (D. C. prod. 4. p. 496.) leaves oblong-oblong, acute at the base, and abruptly acuminate at the apex; stipulas broad, ending in a subdorsal awn; coryms terminal; limb of calyx very short, truncate, ten times shorter than the tube of the corolla; berry crowned by the very short bluntly 4-toothed limb of the calyx. \( S \). Native of the West Indian islands, as in St. Domingo, Jamaica, Porto-Rico, Guadaloupe, Cayenne, Panama, and probably of Mexico. Plum. ed. Burm. t. 156. f. 2. P. Brown, Jam. t. 6. f. 1. but not fig. 2.—Coiffsia occidentalis, Jacq. amer. t. 47. Lin. spec. p. 246. Isora Americana, Lin. amerc. acad. 5. p. 593. ex Swartz. Tetramerenium odoratissimum, Gurt. fil. carp. 3. p. 90. t. 196. Tetramerenium deciduale, Nees et Mart. nov. act. nat. cur. 12. p. 13. Flowers white, sweet-scented, about the size of those of the jamine; hence it is called jamina in Jamaica.

Very-sweet-scented-flowered Faramea. Ch. 1793. Sh. 6 ft.

6 F. latifolia (D. C. prod. 4. p. 497.) leaves oval, abruptly acuminate; stipulas broad, ending in a subdorsal awn; coryms terminal; tube of calyx slightly tetragonal, somewhat 4-toothed, 5 times shorter than the tube of the corolla. \( S \). Native of Brazil, in the province of Rio Janeiro. Tetramerenium latifolium, Cham. et Schlecht. in Linnaea. 4. p. 30. Flowers white. Leaves and indorecence almost like those of F. odoratissima; but the limb of the calyx on the fruit is very different.

Mocote-Video Faramea. Shrub 6 to 7 feet.

7 F. montevideensis (D. C. prod. 4. p. 497.) leaves oblong, acuminate at both ends; stipulas broadish at the base, ending in a subdorsal awn at the apex; coryms terminal; berries crowned by the limb of the calyx, which is tubularly cup-shaped and subtruncate. \( S \). Native of Brazil, about Monte-Video; and of Porto-Rico. Tetramerenium Montevideense, Cham. et Schlecht. in Linnaea. 4. p. 29. Flowers white. Leaves and indorecence almost like those of F. odoratissima; but the limb of the calyx on the fruit is very different.

Tetramerium Faramea. Shrub 4 to 6 feet.

8 F. stipulacea (D. C. prod. 4. p. 497.) leaves oblong, attenuated at the base, and acute at the apex; stipulas broad at the base, and ending in a dorsal awn at the apex; coryms terminal; limb of calyx acutely 4-toothed; berry globose, crowned by the short limb of the calyx. \( S \). Native of Brazil, within the tropic. Tetramerenium stipulaceum, Cham. et Schlecht. in Linnaea. 4. p. 31. Flowers white. Habit of F. jasminoïdes, but differs in the dorsal awn to the stipulas.

Stipulaceous Faramea. Shrub 4 to 6 feet.

9 F. corolea (D. C. l. c.) leaves ovate-elliptic, acute at both ends; stipulas dilated at the base, and ending in a short awn at the apex; peduncles axillary, usually 3-flowered; limb of calyx acutely 5-toothed, 6 times shorter than the tube of the corolla. \( S \). Native of Brazil. Tetramerenium coroleum, Nees et Mart. nov. act. bann. 12. p. 12. Peduncles and branches 2-edged. Corolla of an amethyst colour, with lanceolate segments.

Blue-flowered Faramea. Shrub 5 to 6 feet.

10 F. axillariflora (D. C. prod. 4. p. 673.) leaves sessile, ovate-oblong, cordate at the base, acuminate at the apex; stipulas ending in a long-awned aceamen; branches much compressed; flowers on short pedicles, in fascicled coryms from the axils of the leaves. \( S \). Native of Brazil, about Bahia, where it was collected by Salzmann, G. Don, &c. Flowers white. Fruit exactly like that of F. odoratissima. Leaves 7-8 inches long, and about 3 broad.

Azathy-flowered Faramea. Shrub 4 to 6 feet.
minal, trichotomous, divaricate. \( S. \) Native of Guayaquil. Tetranérium multiflorum, Bartl. in herb. Henke. Flowers white? Stipulas different in form from any other species.

Guayaquil Farama. Shrub 4 to 6 feet.

** Stipulas never ending in an ann.

12 F. Jasmaioïdes (D. C. prod. 4. p. 497.) leaves elliptic-oblong, acuminate at both ends; stipulas ovate, large, acute; coryms terminal; calyx urceolate, with 4 long teeth; berry globose, crowned by the short limb of the calyx. \( S. \) Native of New Granada, near Ibagué. Tetranérium jasmaioïdes, H. B. et Kunth, nov. gen. ann. 3. p. 373. t. 287. Coffèa flavicans, Wild. mss. in Roem. et Schult., syst. 5. p. 201. Branches tetragonally. Leaves pale green, yellowish beneath. Lobes of corolla one-half shorter than the tube. Flowers white.

Jasmine-like Faramea. Shrub.

13 F. ? sessilifolïa (D. C. l. c.) leaves oblong, acuminate, cordate, sessile; stipulas ovate, acuminate subulate; coryms terminal, trichotomous; limb of calyx urceolate, 4-toothed. \( S. \) Native in woods on the banks of the Orinoco, between Maypure and St. Fernando de Atabapo. Tetranérium sessilifolium, H. B. et Kunth, nov. gen. ann. 3. p. 374. Ixora sessilifolia, Sprøng. syst. 1. p. 409. Flowers white. Anthers probably exserted. From the fruit being unknown, it is doubtful whether it belongs to the present genus.

Sessile-leaved Faramea. Shrub.

14 F. Multiflora (A. Rich. in mem. soc. hist. nat. Par. 5. p. 176.) leaves oval-elliptic, acuminate, abruptly petiolate; stipulas interpetiolar, connate, sheath-formed, acuminate; flowers corymbose, terminal. \( S. \) Native of French Guiana.

Many-flowered Faramea. Shrub.

15 F. Calyciflua (A. Rich. l. c.) leaves elliptic, acuminate; stipulas interpetiolar, accuminated; flowers spicate; spikes terminal, pedunculate; limb of calyx tubular, large, permanent. \( S. \) Native of French Guiana. From the calyx being permanent, it does not probably belong to the present genus.

Calyx-flowered Faramea. Shrub.

Sect. III. Faramedoïdes (from faramea, and, idea, like; but is meant only as an alteration of the generic name). D. C. prod. 4. p. 498. Panicles thyrsoidal, terminal.

16 F. Alleæcens (D. C. prod. 4. p. 498.) panicle terminal, pedunculate, having its branches bearing umbels of flowers at the apex; calyx truncate. \( S. \) Native of French Guiana. Branchlets compressively angular. Leaves oblong, acuminate at both ends, shining on both surfaces, pale green. Stipulas acute, deciduous while young. Peduncles 2-edged, furnished with 3-4 pairs of branches. Panicles white, one-half shorter than the leaves. Corollas elongated, very like those of F. truncata.

Whitish-paniced Faramea. Shrub 4 to 6 feet.

17 F. Martini (D. C. l. c.) panicles terminal, on short peduncles, shorter than the leaves; branches corymbose at the apex; calyx hardly toothed: leaves large, oval; anthers exserted at the throat. \( S. \) Native of Guiana, at Mount Kaw, where it was collected by Martin. Branchlets compressed. Stipulas broad, short, permanent. Leaves glabrous, membranous, attenuated at the base. Lobes of corolla 4, a little longer than the tube. Calyx urceolate. Fruit unknown.

Martin's Faramea. Shrub 4 to 6 feet.

Cult. For culture and propagation see Coffèa, p. 584.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an obovate-globose tube, and a campanulately tubular 4-5-toothed limb. Corolla tubular, terete, with a 4-5-parted spreading limb, lanceolate acute segments, and a naked throat. Stamens inserted in the middle of the tube; filaments beset with short hairs in the free part; anthers linear, inclosed. Fruit ovoid, striated, fleshy, crowned by the tubular limb of the calyx, containing 2 many 1-seeded indischent nuts, which are flat on the inside, and furrowed in the middle. Seed erect. Embryo nearly terete.—A Guiana shrub. Leaves opposite, elliptic. Stipulas fringed. Flowers sessile, umbellate on the tops of the peduncles.

1 S. Guianæensis (A. Rich. l. c.) \( S. \) Native of French Guiana.

Guiana Strempelia. Shrub.

Cult. For culture and propagation see Coffèa, p. 584.

Lin. syst. Tetra-Pentandria, Monogynia. Calyx with an ovate, globose or turbinate tube, and a small 4-5-toothed limb (f. 107. a.). Corolla tubular, funnel-shaped, with a spreading 4-5-parted limb (f. 107. b.), and oblong lobes. Stamens 4-5, rising from the middle of the tube of the corolla, or from its apex, exserted or inclosed. Style bident at the apex, having the lobes rarely combined. Berry umbilicate (f. 107. A), naked or crowned, containing 2 1-seeded nuts of the persistence of parchment, which are convex on the outside, and flat inside, and marked by a longitudinal furrow. Embryo erect, in horny albumen with a terete, radicle, and foliaceous cotyledons.—Trees and shrubs. Leaves opposite. Stipulas interpetiolar. This genus is probably divisible into several genera, but that has not been attempted on account of specimens of the greater number of the species being rare in European collections.

** Peduncles axillary. Flowers 5-7-cleft, pentandrous or hesperandrous.

1 C. Ara’ica (Lin. spec. p. 245.) leaves oval-oblong, acuminate, glabrous, shining on the upper surface; peduncles axillary, short, aggregate; corolla 5-cleft: anthers exserted; berries ovate. \( S. \) Native of Arabia Felix and Ethiopía, from whence it has been carried to almost all parts of the world within the tropics. Gaertn. fruct. 1. t. 25. Sims, bot. mag. 1303. Tratt. tab. t. 400. Tuss. ant. t. 18. Deulam. herb. amat. t. 285. Church. ad Steph. med. bot. 4. t. 182. C. laurifolia, Salisb. prod. p. 692. 2 cleft. RUBIACEÆ. CLXVIII. COFFEA.

herb. t. 337. Plench. icon. t. 130. Stipulas awl-shaped, undivided. Leaves wavy, dark-green and shining above, paler beneath. Flowers white, sweet-scented, disposed in axillary clusters of 4-5. Berries red, cherry-formed. The seeds or nuts are involved in a thin elastic pellucid aril. The coffee-tree is frequently cultivated in the hot-houses of our gardens for ornament, where it both flowers and ripens its fruit. It is propagated by the berries, which must be sown soon after they are gathered, or they will not vegetate. Cotyledons transversely ovate, 3-nerved at the base, and emarginate at the apex.

Few vegetable substances have been more generally esteemed for their medicinal and dietetic properties than the berries of the coffee-tree. The plant is fully described by Ellis and several other writers. The coffee-tree is generally regarded as a native of Arabia, but Bruce says it derives its name from Coffee, a province of Narea, in Africa, where it grows spontaneously in great abundance. The plant does not appear to have been known by the Greeks or Romans, nor are there any facts respecting its origin in the East. It has been well ascertained, however, that the berries were imported into every part of Europe, and used as a favourite beverage, long before it was known of as a plant; they were the product. Prosper Alpinus has seen the coffee-tree, without fruitication, in some gardens in Egypt; but the first intelligible botanical account was published by Ant. de Jussieu, in the Mem. Acad. Scienc. Paris, in 1713. We are informed by Borrhave, in his Index to the Leyden Garden, that it was first introduced into Europe by Nicholas Wisten, a burgomaster of Amsterdam, and chairman of the Dutch East India Company, who gave directions to the governor of Batavia to procure seed from Mocha, in Arabia Felix. These seed were sown in the Island of Java, several plants were procured, and one was transmitted by Wisten, about the year 1610, to the botanic garden at Amsterdam. From the progeny of this plant, not only the principal botanic gardens in Europe, but also the West India Islands, were supplied with this valuable tree. Soon after its introduction into Holland, it was cultivated by Bishop Compton, at Fulham.

In Arabia the fruit is dried in the sun upon mats, and the outer coat is separated by means of a large stone cylinder. It is again placed in the sun, winnowed, and packed up in bales. In the West India Islands, as soon as the fruit is of a deep red colour, it is reckoned to be ready for being gathered. Large linen bags, kept open by means of hoops round their mouths, is suspended by the negroes from their necks, who pull the berries with their hands, and, after filling the bags, empty them into a large basket. A single negro can easily collect three bushels in a day. As the berries do not ripen together, they are collected at three different gatherings. One thousand pounds of good coffee are produced from one hundred bushels of the berries just from the tree. The coffee-berries may now be dried in two different ways. The first method is to place them in the sun, in layers of four inches thick, on inclined planes. In a few days the pulp is discharged by fermentation, and in about three weeks the coffee is completely dry. The skin of the berries, already broken, is removed by mills, or in wooden mortars. The second method is to separate the grain from the pulp at once, by means of a mill, and the grains are then left to soak in water for twenty-four hours. They are afterwards dried, and then stripped of the pellicle, or parchment, as it is called, by means of appropriate mills. The grains of coffee are afterwards winnowed, and mingled with the grindings and dust of the parchment, in which state they are put up into bags for sale.

Culture.—The coffee-tree is less cultivated in Jamaica than in Barbadoes, St. Domingo, and some other islands in the West Indies. Richness of soil lessens the flavour of the seeds; on this account, coffee produced in the dry, hot, arid climate of Arabia is always better than that from the West India Islands. In cultivating the coffee in the West Indies, the berries are sown immediately after being gathered, as they are found to retain their vegetative quality only a few weeks. In three months the seeds so sown produce plants fit for transplanting to the final plantation. In the low lands they are planted five feet apart, and in the mountains ten feet or more. In three years the plants will produce a crop, and continue bearing a number of years. The berries are gathered when they are just about to drop.

Qualities and chemical properties.—When the seeds of coffee are roasted, a portion is converted into tannin by the action of heat, and an agreeable aromatic substance is developed, the nature of which has not been ascertained. The same principle is also developed by roasting barley, beans, and many other vegetables, which, on that account, are occasionally employed as substitutes for coffee, and suit some stomachs better. The infusion of unroasted coffee in boiling water is of a yellowish green colour; but the decoction, by continuing the boiling, becomes brown, and turbid on cooling. From experiments made chiefly by Cadet, it appears that coffee contains an aromatic principle, a little oil, gallic acid, mucilage, extractive and bitter principle. Other analyses have been made by chemists. M. Grindel found it to contain kinic acid, and M. Paysses has discovered what he has endeavoured to show as a peculiar acid, to which he has given the name of coffee acid. More recently, M. Robiquet is said to have demonstrated another principle, which he names Caffeine. It is in silk-like acicular crystals, bearing a resemblance to Benzoic acid. It liquefies by the aid of a gentle heat; in close vessels it volatilizes, and sublimes in needles. Caffeine is neither acid nor alkaline; it furnishes a great quantity of azote; it dissolves with difficulty in ether, but quickly in water and alcohol.

Medical properties and uses.—It is evident that we are indebted to the Arabians for our use of this pleasant beverage, as the first rite of Eastern hospitality is the presentation of a bowl of coffee. In Europe it is said to have been first used in Italy, in the year 1650; and, according to Dalaine, was introduced at the court of Paris, in 1669, by Soliman Aga, ambassador from the Porte. An Armenian, named Pascil, opened the first Café, and Procope the second, in "Rue des Fossés, Saint Germain des Prés." Nearly at the same time coffee was introduced into London.

By some, coffee is supposed to be best suited to the aged; and its abuse, as when taken too strong, is said to impair digestion, instead of promoting it; and it stimulates, heats, and produces watchfulness in certain constitutions. The Mahometans of India, who use a great deal of coffee in the same way as we do, with the exception of combining milk with it, believe it to have the effect of soothing and allaying nervous irritations, and prescribe it to stop the vomiting in cholera morbus. Dr. Ainslie also states, that it is often employed for the same purposes by the Spaniards at Manilla. It is said that Sir John Floyer, during his residence in Lichfield, found great benefit in his own person by the use of coffee in asthma. Sir John confirms its success in a letter to Dr. Percival; "On reading the section of coffee," says he, "in the second volume of your essays, one quality occurred to me which I had observed of that liquor, confirming what you had said of its sedative powers. It is the best abater of periodic asthma that I have seen. The coffee ought to be the best Mocha, newly burnt, and made very strong immediately after grinding it. I have commonly ordered an ounce for one dish, which is to be repeated afresh after the interval of a quarter of an hour, without milk or sugar." Percival's Essays, vol. iii.

As a general palliative, strong coffee is often serviceable in various kinds of head-ache; and where its own sedative power
is unavailing, it forms one of the best vehicles for the administration of laudanum. It diminishes in some degree the hypnotic power of the latter, but counteracts its distressing secondary effects. When laudanum is intermixed with strong coffee for the cure of many modifications of head-ache, tranquility and ease are produced, though there may be no sleep; when laudanum, on the contrary, is taken alone, sleep will, perhaps, follow, but is mostly succeeded by nausea and a return of pain. Hence the Turks and Arabsians make strong coffee their common vehicle for opium, from its tendency to counteract the narcotic principle of the latter; and on the same account it is plentifully administered, after the stomach has been evacuated of its contents, in cases of poisoning by opium.

For common purposes, infusion of coffee is the most agreeable method of preparing it, as the aromatic and volatile principles are dissipated by boiling.

Coffee is named by the Persians Coleha and Coho, by the Turks, Chauhe and Cahye, by the Arabsians, Cacahu, Cauoa, Caffiaye, and Cahowah; and by the Egyptians, Elecre. In Germany it is called Arabische Kaffeebaum, in Cochín China, Cay-caphe.

The Gallá, a wandering nation of Africa, in their incursions in Abyssinia, being obliged to traverse immense deserts, and being also desirous of falling on the Abyssinians without warning, that they may be encumbered as little as possible with baggage, carry nothing with them to eat, but coffee roasted till it can be pulverized, and then mixed with butter into balls, and put into a leathern bag; one of these, about the size of a billiard-ball, keeps them, they say, in strength and spirits during a whole day's fatigue, better than a loaf of bread, or a meal of meat.

2 C. Mauritia'na (Lam. dict. 1. p. 550. ill. t. 160. f. 2.) leaves oval, acute at both ends, reticulately veined; peduncles axillary, solitary, 1-flowered, very short; berries oblong, acute at the base, native of the Island of Bourbon, in the woods. C. Arábiga β, Wildl. spec. 1. p. 974. C. sylvéstris, Wildl. msn. in Reem et Schultzs, syst. 5. p. 201. "Flowers white.

This species is known in the Island of Bourbon under the name of Café-Marron, but should not be confounded with the variety of C. Arábiga, known in commerce under the name of Café Bourbon, or Bourbon Coffee.

Mauritian Coffee-tree. Shrub 4 to 5 feet.

3 C. Bengale'nsis (Roxb. hort. beng. p. 15. fl. ind. 2. p. 194.) leaves oval-oblong, acuminate at both ends; flowers axillary, rather aggregate, sessile; stipulas undivided, subulate, much acuminate; corolla 5-cleft, with oblong lobes; anthers inclosed. S. Native of Bengal, but chiefly about Silhet; and of Nipaul. Roth. nov. spec. 148. Reem et Schults, syst. 5. p. 206. Branches so placed as to form a bush of a pyramidal form. Leaves from ovate to oblong, glabrous. Flowers 1-3 together or more, axillary, white, sweet-scented. Berry black, size of a small cherry. It was for some time much cultivated in Bengal, under the idea of its being the Arabian Coffee; it is now neglected, being of inferior quality, and not productive; however, the number of its flowers entitle it to a conspicuous place in the flower-garden.

Bengal Coffee-tree. Shrub 4 to 6 feet.

4 C. Shtenyphüllal leaves oblong-lanceolate, acuminate; peduncles almost sessile, axillary, 2-3-flowered. S. Native of Sierra Leone, where it is cultivated. Flowers white. Berries oblong, black. The seeds of this species are roasted and used as the common coffee, and are even considered superior to it.

Narrow-leaved Coffee-tree. Shrub 4 to 6 feet.

5 C. hisruf'tus; leaves ovate, acuminate, on short peduncles; young branches, petioles, and veins of leaves hairy; peduncles axillary, 3-flowered. S. Native of Sierra Leone, in the low lands. Flowers white.

Hairy Coffee-tree. Shrub 4 to 5 feet.

6 C. ? microcarpap (D. C. prod. 4. p. 499.) leaves elliptic-oblong, short-acuminate, and are, as well as the branches, quite glabrous; flowers in fascicles along the branches, after the falling of the leaves, and therefore they appear as if they were disposed in interrupted racemes, but in fact the flowers are merely in fascicles from the axils of the fallen leaves; fruit elliptic, 3 times longer than their pedicels, and crowned by the cup-shaped limb of the calyx. S. Native of Africa in Casamannia, in woods, at Cape Rouge, where it was collected by Perrotet and Leprieur. Leaves 2½ inches long, and 8-9 broad. Stipulas solitary, undivided, acuminate subulate, deciduous. Flowers white.

Small-fruited Coffee-tree. Shrub 4 to 5 feet.

7 C. laurina (Sneath. in herb. L'Her. et D. C. prod. 4. p. 499.) leaves oblong-lanceolate, mucronate, cuneated at the base, coriaceous, quite glabrous; racemes axillary, crowded with flowers, much shorter than the leaves; corolla 5-cleft, with a villous throat; anthers exerted, but rather shorter than the lobes of the corolla; berries glabrous. S. Native of Sierra Leone. P. Laurina. 2 p. 14. Leaves yellowish in the dried state. Calyx truncate. Corollas white.

Laurel-like Coffee-tree. Shrub 4 to 5 feet.

8 C. stipulacea (D. C. prod. 4. p. 492.) leaves elliptic or oblong, petiolate, acuminate at both ends; stipulas foliaceous, oblong, acute, striated lengthwise, deciduous; peduncles axillary, very long, coriaceous at the apex, trichotomous. S. Native of French Guiana, where it was collected by Patris. Limb of calyx obscurely but acutely 5-toothed. Flowers unknown. Berries ovate, not crowned. Peduncles 6 inches long.

Stipulacea Coffee-tree. Shrub 4 to 6 feet.

9 C. pedunculatap (Roxb. fl. ind. 2. p. 195.) leaves elliptic, almost sessile, smooth; peduncles terminal and axillary, in fascicles, long, 1-flowered; tube of the corolla slender, smooth; stamens inclosed. S. Native of the Moluccas.

Pedunculated Coffee-tree. Shrub.

** Peduncles axillary. Flowers tetramerous and tetraandrois.

—Leôra species, Spreng.

10 C. Guiananeps (Abul. guian. 1. p. 150. t. 57.) leaves ovate-oblong, bluntly acuminate, quite glabrous; peduncles axillary, aggregate, very short, 1-flowered; corollas 4-cleft, with acute lobes; anthers inclosed; berries glabrous, small. S. Native of French Guiana, and of the Island of Trinidad, ex Sieb. fl. trin. no. 44. Léôra Guianasén, Spreng. syst. 1. p. 409. Flowers small, white. Berries violaceous.

Guiana Coffee-tree. Shrub 1 to 3 feet.

11 C. rôsêa (Moc. et Sesó, fl. mex. icon. ind. ex D. C. prod. 4. p. 499.) leaves ovate-oblong, acuminate at both ends; glabrous; peduncles axillary, 5-flowered, much shorter than the leaves; corollas 4-cleft, with revolute lobes; anthers exerted; berries glabrous. S. Native of Mexico. Corollas rose-coloured. Berries reddish, size of a pea.

Rose-coloured-flowered Coffee-tree. Shrub 4 to 6 feet.

12 C. obovatap (Cham. et Schleich. in Linnaea. 6. p. 412.) glabrous; leaves obovate, cuneated, acuminate, acute, feather-veined; cymes axillary, almost sessile, aggregate, short, many-flowered; stipulas ovate-triangular, caducous. S. Native of Mexico, in shady places, near Masaule. Leaves half a foot long. Tube of the calyx ovate, with short acute teeth. Corolla with a short tube and a naked throat. Anthers linear, exerted.
Obovate-leaved Coffee-tree. Shrub.
13 C. lanceolata (Cham. et Schlcht. in Linn. 6. p. 412.) stems, petioles, nerves, and primary veins of leaves underneath downy; leaves lanceolate, glaucous beneath, feather-veined; cymes axillary, usually solitary, few-flowered, on short peduncles; stipula small, ovate-triangular, caducous. ½. S. Native of Mexico, near Jalapa. Leaves 2-3 inches long, acuminate. Calyx with a clavate tube, and small acute teeth. Anthers linear, exerted.
14 C. tetraérra (Roxb. fl. ind. 2. p. 198.) leaves broad-lanceolate, acute, shining; stipulas bifid; peduncles axillary and terminal, in fascicles, long, slender, 1-flowered; corolla usually 4-cleft, with a long slender tube; anthers inclosed; berries globose. ½. S. Native of Silhet and Chattagong, and the whole east border of Bengal. Leaves 4-5 inches long, and hardly 2 broad. Corolla with a 4-5-cleft border. Stamens 4-5. Berries size of a small cherry, blackish-purple when ripe, 1 or 2-seeded. An erect slender-branched Shrub.
Tetrandra-flowered Coffee-tree. Shrub.
15 C. densiflora (Blum. bijdr. p. 965.) leaves oval-oblong, acuminate, clothed with fine down on the veins beneath; flowers crowded, axillary; corollas 5-cleft. ½. S. Native of Java, on Mount Salak. There are varieties of this with smaller and larger flowers.
Dense-flowered Coffee-tree. Shrub.
16 C. Angustifolia (Roxb. fl. ind. 2. p. 198.) leaves lanceolate, stiff, shining; panicles axillary; throat of corolla bearded; lobes of corolla linear, longer than the tube, but equal to the anthers, which are filiform and exerted. ½. S. Native of Pigeon Island, one of the Malay Archipelago.
Narrow-leaved Coffee-tree. Shrub.
17 C. racemosa (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. a. but not of Lour.) leaves oblance-oblong, acuminate, glabrous; stipula bifid; racemes axillary and terminal, drooping while in flower, but erect in the fruit-bearing stage; flowers almost sessile, 5-cleft; anthers exerted; berry oval. ½. S. Native of Peru, in groves at Patai and Macora, where it is called Café. Rúdiga racemosa, Spreng. syst. 1. p. 755. Flowers white.
Raceenose Coffee-tree. Shrub 4 to 6 feet.
18 C. Zanquebarica (Lour. coch. p. 145.) leaves ovate-lanceolate, glabrous; peduncles axillary, many-together, short, 1-flowered; corolla 6-7-cleft; berries oblong-ovate, angularly serrated. ½. S. Native of Africa, on the coast of Zanquebar, in woods. Amajoga Africana, Spreng. syst. 2. p. 126. Flowers white. This species is cultivated near Mozambique in gardens along with C. Árboica, and where the seeds are used as a substitute for the common coffee.
Zanquebar Coffee-tree. Shrub 5 to 6 feet.
19 C. Índica (Poir. suppl. 2. p. 14.) leaves ovate-oblong, acuminate, glabrous; stipula very short, undivided; panicles short, divaricate, terminal; pedicels elongated; fruit small, obovate, not crowned by the calyx. ½. S. Native of Java. Flowers unknown.
Indian Coffee-tree. Shrub.
* * * Panicles terminal. Flowers 4-5-parted, tetradraous or pentadraous.
20 C. paniculata (Aubl. guian. 1. p. 152. t. 58.) leaves ovate-oblong, acuminate, shining; branches tetragonal; stipulae acute, caducous; panicles terminal, divaricate; flowers 4-cleft; anthers inclosed. ½. S. Native of Guiana, in woods. Tetramérium paniculatum, Spreng. syst. 1. p. 409. Flowers white, sweet-scented. Berries ovate-globose, bluish, containing 2 seeds or nuts, one of which is usually abortive.
Panicled-flowered Coffee-tree. Clt. 1822. Sh. 6 to 8 feet.

Mozambique Coffee-tree. Shrub 4 feet.
22 C. semisséssilis (Colebr. in Roxb. fl. ind. 2. p. 195.) leaves oblong-lanceolate, acuminate; corysts terminal. ½. S. Native of Bengal, in Silhet. Berries purple, size of large peas.

Sect. II. Hórnia (named after M. Van Horn, who, in the year 1690, carried coffee from Arabia to Batavie, and in the year 1710 to the gardens of Amsterdam). D. C. prod. 4. p. 500. Tube of calyx increasing after the flowers have fallen, and crowning the berry by a neck, having the teeth almost obsolete. Flowers 5-cleft. Stigma bifid. Throat of corolla glabrous. Berry ovate or globose, usually 1-seeded from abortion.—Shrubs, natives of Peru. Inflorescence axillary or terminal. Stipulas solitary on both sides, undivided, never toothed nor ciliated.
23 C. susse'ssislis (Ruiz et Pav. fl. per. 2. p. 64. t. 215. lower figure,) leaves glabrous, coriaceous, sessile, oblong-lanceolate, acuminate, excavated at the base; stipulas ovate; racemes axillary, trichotomous, shorter than the leaves. ½. S. Native of Peru, on the Andes in forests at Chinchao, Quebrada, and Pati. Coffea macrophylla, Dietr. nacchr. 2. p. 544. Leaves a foot long, shining above. Peduncles quadrangular. Berries ovate, at first red, but at last becoming purplish, ovate, 1-seeded, size of cherries. Probably a species of Parâmea.
Sessile-leaved Coffee-tree. Shrub 5 to 6 feet.
24 C. umbellata (Ruiz et Pav. fl. per. 2. p. 64. t. 215. upper figure,) leaves glabrous, coriaceous, petiolate, oblong, acuminate, nervled by transverse veins; stipulas roundish; peduncles terminal, usually by three; flowers crowded, umbellate, involucrated. ½. S. Native of Peru, on the Andes in forests. Branches dichotomous, rather tetragonal. Involucrum 4-leaved, and involucels 7-leaved. Berries red, ovate.
Umbellate-flowered Coffee-tree. Shrub 10 to 12 feet.
25 C. ? acuminata (Ruiz et Pav. fl. per. 2. p. 64. t. 214. f. b.) leaves petiolate, oval, acuminate, glabrous, villous in the axils of the veins; stipulas ovate, deciduous; racemes terminal, 4-flowered. Flowers white. This species is cultivated on the Andes in forests. Branches tetragonal, a little compressed. Corollas white, 5-cleft (ex descript.), with revolute segments. Berries oval, red, 1-seeded, size of cherries, blunt at the apex, crowned by the tubular limb of the calyx.
Acuminated-leaved Coffee-tree. Shrub 5 to 6 feet.

Sect. III. Pancra'sia (named after M. Pancras, who first transmitted the coffee-tree from the gardens of Amsterdam to those of Paris, in the year 1713). D. C. prod. 4. p. 501. Throat of corolla bearded. Berries crowned by the vestiges of the calyx. Racemes or corymbs terminal. Stipulas usually fringed or ciliate toothy, as in Rúdiga, but differs from that genus in the calyx not being parted, and in the lobes of the corolla not being horizod. Flowers 5-cleft.—Glabrous Peruvian shrubs.
* Stipulas ciliated.
26 C. cilia'ta (Ruiz et Pav. fl. per. 2. p. 65. t. 216. f. a.) leaves oblong, acuminate; stipulas truncate, ciliated; racemes subpandial, terminal; flowers aggregate, sessile, 4-5-cleft;
anthers exerted. ñ. S. Native of Peru, in forests on the Andes. Rudgea ciliata, Spreng. syst. 1. p. 755. Branches thickened at the nodi. Bracteas small, subulate, at the ramifications of the panicle. Corollas white, with reflexed segments. Berries red, globose. Perhaps the same as C. ciliata of Brazil, which was collected on the road to Felisbert, by the Prince de Neuwied, but according to Nees and Martius, in nov. act. bon. 12. p. 13., it differs from the Peruvian plant in the racemes being shorter.

Pitted-leaved Coffee-tree. Shrub. 28 C. MEXICANA (D. C. prod. 4. p. 501.) leaves oblong, acuminate, reticulately veined beneath; stipulas ciliate; coryms terminal, trifid; limb of calyx truncate, obtuse. ñ. S. Native of Mexico. Rudgea Mexicana, Bartl. in herb. Hænke. Branches dichotomous. Fruit dry, indiscernible, chartaceous, the nuts separating at length from each other. Seeds hemispherical, having a very narrow furrow in front. It differs from R. dégea in the limb of the calyx not being 5-parted, but quite entire.

Shining-leaved Coffee-tree. Shrub 5 to 6 feet. 30 C. LAURIFOLIA (H. B. et Kunth, nov. gen. amer. 3. p. 372. but not of Salisb.) leaves oblong, somewhat acuminate, coriaceous, shining; stipulas ciliately multilobed; coryms terminal; berries elliptic. ñ. S. Native of South America, in shady humid places at the Missions of the Orinoco. Coffea coriacea, Willd. ms. in Roem. et Schultes, syst. 5. p. 201. ex Kunth. Corolla and stamens unknown. Perhaps a species of Psychotria, ex A. Rich.?

Whorled-panicle Coffee-tree. Shrub 4 to 6 feet. ** Stipulas undivided or bidentate, but never ciliated. 32 C. LONGIFOLIA (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. a.) leaves oblong-lanceolate, repandely undulated; stipulas ovate, undivided; panicles terminal; anthers exerted. ñ. S. Native of Peru, in forests on the Andes. Leaves shining above, a foot long. Corolla white with reflexed segments. Berries globose, red.

Long-leaved Coffee-tree. Shrub. 33 C. MICROarpa (Ruiz et Pav. fl. per. 2. p. 66. t. 218. f. b.) leaves lanceolate, acute; stipulas bidentate on both sides; cymes axillary and terminal, spreading; anthers hardly exerted. ñ. S. Native of Peru, on the Andes in forests. Branches a little compressed at the apex. Bracteas subulate. Corollas white, downy on the outside. Berries reddish, globose, size of black pepper. Perhaps belonging to a different section.

SECT. IV. STRAUSSIA (named after Laurence Strauss, who was the first, in 1666, to recommend coffee as a beverage). D. C. prod. 4. p. 502. Berries turbinate or acuminate at the base. Stipulas ovate, deciduous, ciliate on the lower margin of the cincinni. Flowers 4-6-cleft. Stamens 4-6. Stigma bifid. Berries globose or oval.—Shrubs, natives of the islands in the South sea. Cymes terminal.

36 C. LUZONIENSIS (Cham. et Schlecht. 4. p. 32.) leaves lanceolate, acute at both ends, with rather reflexed margins; stipulas ovate-oblong, rather scarce, deciduous, with the cincinni rather ciliate at the margins; cymes terminal, sessile, contracted while young; flowers 4-6-cleft; throat of corolla bearded. ñ. S. Native of the Island of Luzon. Corolla white, glabrous. Anthers exerted a little. The central flower is 5-cleft, and the rest either 4 or 5-cleft. Berries almost globose, acute at the base, sometimes 1-seeded by abortion. Branches fistular.

Luzon Coffee-tree. Shrub 5 to 6 feet. 37 C. KARUANA (Cham. et Schlecht. in Linnaea. 4. p. 33.) leaves cuneate-obovate, somewhat scrobiculate in the axils of the veins, with reflexed margins, usually clothed with rufous down beneath; stipulas ovate, acute, caducous, the inner margins of the cincinni ciliate; cymes terminal, on long peduncles, of 5 rays, 4 of which are disposed in a whorl around the other, which is central; corolla 5-cleft, with a naked throat. ñ. S. Native of the Sandwich Islands, particularly in O-Wahu. Berry elliptic, attenuated at the base, rarely 1-seeded by abortion. Branches compressed. Mr. Arnott remarked, that the segments of the calyx are not ciliate as stated by the authors, although the bracteas are.

Kauai's Coffee-tree. Shrub 4 to 5 feet. 38 C. CHAMISSONI (Hook. et Arn. in Beech. voy. pt. bot. p. 86.) leaves elliptic-oblong, scrobiculate in the axils of the veins, with reflexed margins, quite glabrous on both surfaces; stipulas ovate, caducous, having the inner margins of the cincinni glabrous; cymes on long peduncles of 5 rays, which are disposed in a whorl; corolla 5-cleft, with a naked throat. ñ. S. Native of the Sandwich Islands. Very like the preceding.

Chamissoni's Coffee-tree. Shrub 4 to 6 feet. 39 C. MARINANA (Cham. et Schlecht. in Linnaea. 4. p. 55.) leaves elliptic, acute at both ends, scrobiculate in the axils of the veins; stipulas ovate, deciduous, with the inner margins of the cincinni ciliate; cymes terminal, pedunculate, with the branchlets decussate; corolla 5-cleft, with a bearded throat.
Native of the Island of O-Wahu, in forests on the mountains. Branches and branchlets of panicle compressed.

Marina's Coffee-tree. Shrub 4 to 6 feet.

Cult. All the species of Coffea thrive well in a mixture of turfy loam, turfy peat, and sand. They require to be watered a good deal, and to have plenty of pot-room to thrive well. Ripe cuttings strike root freely in sand under a hand-glass in a moist heat; and the young plants so raised, produce flowers and fruit more readily than those raised from seed. As the plants are apt to be infested by insects, particularly the mealy bug, they should be examined often, and the insects rubbed off with a brush, otherwise the plants will look unsightly.

LIN. SYST. Pentandria, Monogynia. Calyx with an ovate-globose tube, and a 5-parted limb; lobes acute. Corolla with a long slender terete tube, 5 linear spreadingly recurved segments, which are hooked on the back and acute, and a naked throat. Anthers sessile, within the throat, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded. — Trees or shrubs, natives of Guiana. Branchlets and petioles clothed with cinereous down. Leaves opposite, large, smoothish. Stipulas intercalar, large, ovate, fringed, deciduous. Panicles terminal, dense, baccateolate, with the branches opposite. Flowers blackish in the dried state, but most probably white in the recent state. Fruit not sufficiently known.

1 R. lanceolata (Salis. l. c. t. 18.) leaves lanceolate, acuminate; tube of corolla 10 times longer than the lobes of the calyx. S. Native of French Guiana. Leaves 10 inches long, and about 3 broad. Corolla downy outside.

Lance-leaved Rudgea. Shrub or tree.

2 R. ovalifolia (Salis. l. c. t. 19.) leaves oval, acuminate; tube of corolla 6 times longer than the lobes of the calyx. S. Native of French Guiana. Leaves 4-5 inches broad, and 7-8 long. Corolla downy outside.

Oval-leaved Rudgea. Shrub or tree.

Cult. See Coffea above for culture and propagation.

CLXIX. ANTHEURRA (from arbo's, anthera, an anther, and e'o ra, a tail; the anthers end in a long tail each). Lour. coch. p. 144. D. C. prod. 4. p. 503.—Psychotria species, Wild. Poir.

LIN. SYST. Pentandria, Monogynia. All as in Psychotria, but the corolla is rotate and 5-parted; the anthers sagitate at the base, and furnished with a long reflexed tail at the apex; the style subulate, and longer than the corolla, and the stigma simple.—A glabrous shrub, with reddish diffuse branches. Leaves opposite, ovate-lanceolate, on short petioles. Panicles terminal, erect, loose, racemose. Flowers white, with red filaments. Berries ovate, brownish red. Stipulas unknown.

Cult. For culture and propagation see Coffea above.

LIN. SYST. Pentandria, Monogynia. Calyx with an ovate tube, and a small 5-toothed limb. Corolla oblong, rather funnel-shaped, with 5 spreading acute lobes, and a naked throat. Anthers 5, oblong, inclosed. Stigma bilamellate. Berry ovate, umbilicate, containing 2 1-seeded nuts, which are flat inside, and convex outside.—Glabrous shrubs, natives of Guiana. Leaves ovate, acute, on short petioles. Stipulas solitary on both sides. Peduncles axillary, 2-6-flowered, shorter than the petioles. Flowers small, white. Bracteoles 2 under each flower.—Allied to Psychotria, but differs in the berries not being ribbed. Perhaps the species of Psychotria with axillary peduncles ought to be joined to this genus.

Bread-leaved Ronabea. Shrub 2 to 3 feet.

Erect Ronabea. Shrub 1 to 2 feet.

3 R. myode'ndron (A. Rich. in mem. soc. hist. nat. 5. p. 270.) leaves linear-lanceolate, very acute, petiolate; flowers disposed in few-flowered terminal corymbs; fruit didymous, hardly umbilicate. S. Native of Brazil, where it is called Herba de raio. Flowers white.

Rat-tree Ronabea. Shrub.

4 R. moringoides (A. Rich. l. c.) leaves elliptic, acuminate, petiolate; flowers small, crowded into many terminal pedunculate pea-formed heads; fruit pea-formed, rather umbilicate at the apex; seeds chinky outside. S. Native of French Guiana. Flowers white.

Moringa-like Ronabea. Shrub.

57 R. didymocarinus (A. Rich. l. c.) leaves elliptic, acuminate, on short petioles; stipulas connate inappreciably truncate, furnished each with 2 bristles; flowers disposed in a terminal cyme; fruit didymous, umbilicated by a terminal dot. S. Native of French Guiana. This and the two preceding are very doubtful species of Ronabea, from the flowers being terminal, and ought perhaps on that account to be joined with Psychotria.

Twin-fruited Ronabea. Shrub.

Cult. For culture and propagation see Coffea above.

LIN. SYST. Pentandria, Monogynia. Psychotria with an ovate tube, and a short 5-lobed 5-toothed or nearly entire limb. Corolla short, funnel-shaped, 5-cleft, regular; limb spreading or reflexed; throat bearded or glabrous. Stamens 5; anthers exerted or inclosed in the throat. Stigma bifid. Berry drupaceous, crowned by the limb of the calyx, furnished with 10 blunt ribs in the dried state, containing 2 1-seeded chartaceous-coriaceous ribbed pyræae. Seed erect, with cartilaginous alburnum, and a small basilar embryo. — Small trees or shrubs, rarely
of the tropics. Leaves opposite, petiolate. Stipulas variable. Peduncles sometimes axillary, but usually terminal. Flowers disposed in panicles or corymbbs, rarely tetramerous, but almost always pentamemrous; sometimes, however, there are tetramerous and pentamemrous flowers to be found at the same time, and on the same plant. The species are very numerous and truly intricate, therefore difficult to define.

§ 1. Peduncles axillary.—Perhaps all the species belonging to the present section belong to the genus *Rombea*.

* Species natives of South America.*

1 P. *exclamans* (H. B. et Kunt. nov. gen. amer. 3. p. 355. t. 281.) arboreous; branchlets terete, downy; leaves oblong, acuminate, narrowed at the base, membranous, glabrous; stipulas deciduous; peduncles axillary, few-flowered; flowers tetramerous and tetraronds.  

2 P. *emeticus* (Muts, in Linn. fil. suppl. p. 144. exclusive of the synonyms of Maregrave and *Ps. B.)* plant suffrutescent, erect, simple, pinnately tomentose; leaves oblong, acuminate, narrowed at the base, membranous, ciliated, rather pilose beneath; stipulas ovate, acuminated, very short; peduncles axillary, few-flowered, sublaeosterrae.  

3 P. *Native of New Granada, near Nares on the banks of the Magdalena, and in the province of Girone.*  

4 P. *emeticus* (Mutis, Pers. ench. 1. p. 203. Ipecacuanha noir, Rich. dict. sc. med. 26. p. 4. with a figure. Ipecacuanha, fl. med. 4. p. 201. Flowers white. Berries bluish, ovate-globose, smooth, not furrowed; hence it is probably a species of *Rombea.* Throat of corolla closed by villi. Root perpendicular, knotted, branched, ciliate, with a slender axis and thick friable bark; and it is the *Ipecacuanha* supplied by Spanish America, but not that supplied by Brazil, which is *Cephalis Ipecacuanha.*

**Emetic Psychotria** or Spanish American *Ipecacuanha.* Sh. 1 to 1½ foot.

3 P. *hetera* (Wild. in Rom. et Schultes, syst. 5. p. 191.) branches, peduncles, petioles, and under side of leaves hairy; leaves ovato-oblong, acuminate at both ends; stipulas ovate, obtuse; peduncles axillary, 3-flowered.  

4 P. *macrophylla* (Ruiz et Pav. fl. per. 2. p. 56. t. 202. f. a.) plant herbaceous, glabrous; branches terete; leaves ovate-lanceolate, acuminated, large, membranous; stipulas broad-ovate, unidentate, short-acuminate; panicles axillary, on short peduncles, with opposite dichotomous branches; fruit oval.  

5 P. *willdenoii* (D. C. prod. 4. p. 505.) leaves oblong, attenuated at the base and apex, petiolate, coriaceous, shining, downy beneath; stipulas 2-lobed; panicles axillary, very short, sessile.  

6 P. *liginosa* (Swarz, prod. p. 43. fl. ind. occ. p. 421.) plant subherbaceous, simple, erect, glabrous; leaves lanceolate-oblong, acuminate, shining; stipulas connate, acute, convex; cymes pedunculata, tripartite, opposite on the axils of the upper leaves; flowers sessile; corolla with a villous tiorut; berries spherical; seeds erect on the outside.  

7 P. *levis* (D. C. prod. 4. p. 505.) glabrous; leaves oval, acute at the base, and ending in a short cuspidate point at the apex, smooth above, almost nerveless; stipulas thick, with a reflexed auricule; peduncles axillary, compressed, shorter than the leaves, trifid at the apex, and each of the branchlets bearing few-flowered sessile flowers; fruit nearly globose, not crowned.  

8 P. *Native of Porto-Rico, where it was collected by Bertero.*  

9 P. *hookei*; shrubby, glabrous; branches tetragonal; leaves lanceolate, tapering into the short pedicles, coriaceous, membranous, with finely reflexed margins, pale and reticulated beneath; stipulas oval, acute, deciduous; peduncles axillary, short; flowers on short pedicels, bracteate at the base; bracteas small, convolute, toothed; flowers dioecious; fruit oval, crowned by the limb of the calyx, which is tubular, and minutely 5-toothed at the apex.  

10 P. *Native of Juan Fernandez.*  

11 P. *triflora.*  

12 P. *Trichocentron.*  

13 P. *Native of Porto-Rico.*

Some of the species become more or less difficult to place in the same genus according to Arnott.

**Leaves:**

1 P. *agriata* (D. C. prod. 4. p. 505.) leaves narrow, oblong, attenuated at both ends, shining above, hairy beneath, and bearded on the mid-rib on both surfaces; stipulas acutely bidentate; peduncles axillary, coriaceous at the apex, downy; flowers crowded on the tops of the branches of the peduncles; fruit nearly globose.  

**Kindred Psychotria.** Shrub.

1 P. *neurotrichia.* (D. C. 1. c.) leaves elliptic-oblong, acuminate at both ends, glabrous, except the middle nerve, which is beget with a series of hairs on both surfaces; stipulas acutely bidentate, permanent; panicles axillary, rather deflexed, racemose, and rather pilose; flowers sessile, crowded on the tops of the lateral short branches of the panicle; fruit subobovate.  

2 P. *Native of Porto-Rico.*

3 P. *Trichocentron.* Bracteas broad, ovate, permanent, under the flowers. Berries glabrous. Flowers unknown.

**Hair-colored-leaved Psychotria.** Shrub.

* * Species natives of Africa.*

12 P. *triflora.* (Schum. pl. gein. p. 108.) shrubby; branches brachiate; branchlets rather tetragonal, pilose; leaves ovate; 4 F
bluntly acuminate, downy beneath; stipulas reniformly cordate, acute, entire; peduncles very short, axillary, 3-flowered. ½. S. Native of Guinea. Flowers white.

*Three-flowered Psychotria.* Shrubs 3 to 4 feet.

13 P. multiflora (Schum. pl. guin. p. 108.) plant shaggy, decumbent or scendent, quite glabrous; branches rather tetragonal; leaves oblong-ovate, attenuated at the apex, on short petioles; stipulas entire, acuminate; panicles axillary, subcapitate; peduncles length of the petioles. ½. S. Native of Guinea, at Asiana. Corolla white, downy inside.

*Multi-flowered Psychotria.* Shrub decumbent.

14 P. umbellata (Schum. pl. guin. p. 108.) shrub much branched, glabrous; branches alternately compressed; leaves hardly petiolate, lanceolate; stipulas acuminate, cleft at the apex, deciduous; peduncles axillary, angular, trillid at the apex, umbelliferous; berries globose, umbilicate at the apex. ½. S. Native of Guinea. Leaves 2-4 inches long. Peduncles 2 inches long. Corolla white.

*Umblellate-Flowered Psychotria.* Shrub 3 to 4 feet.

15 P. Kolly-Tjo (Schum. pl. guin. p. 110.) shrubby, glabrous; branches compressed; leaves petiolate, ovate-elliptic, acute, of a different colour beneath; stipulas ovate, acutish; corymbs axillary and terminal, fastigate; tube of corolla cylindrical. ½. S. Native of Guiana, where it is called Kolly-Tjo by the natives.

*Kolly-Tjo Psychotria.* Shrub 3 to 4 feet.

16 P. evallata (Schum. pl. guin. p. 111.) plant herbaceous, creeping; petioles elongated, rather hairy at the apex; leaves oblong, cordate, obtuse, glabrous; stipulas ovate, acutish; peduncles almost axillary, usually 5-flowered; flowers girdled by a foliaceous 4-leaved involucre. ½. S. Native of Guinea, at Aquapim.

*Evallate-Flowered Psychotria.* Flowers white.

**Species natives of Asia.**

17 P. philippensis (Cham. et Schlecht. in Linnaeus. 4. p. 21.) glabrous and resinous; branches tetragonal; leaves ovate, very blunt, petiolate, coriaceous; stipulas very short, inflato-foliaceous, permanent; cymes opposite, axillary or supra-axillary, 3 times shorter than the leaves, dichotomous; ovary cylindrical, crowned by the truncate limb of the calyx. ½. S. Native of the Island of Luzon, about Tierra Alta by the sea side.

*Philippine Psychotria.* Shrub.

§ 2. Peduncules terminal.

*Species natives of Peru.*

18 P. reticulata (Ruiz et Pav. 2. p. 56. t. 212. f. b.) plant herbaceous, downy; branches tetragonal, glabrous; leaves ovate-lanceolate, acuminate, reticulately veined, rather coriaceous; stipulas subconcrete at the base, bifid beyond the middle, with the lobes linear-lanceolate and acuminate; panicles terminal, longer than the leaves, with opposite spreading hairy-velvety branches, and crowded flowers. ½. S. Native of Peru, on the Andes in groves. Leaves a foot long, downy beneath, and having the nerves purplish. Corolla small, yellow, downy outside, with a villous throat.

*Reticulated-leaved Psychotria.* Pl. 7 to 8 feet.

19 P. acutiflora (D. C. prod. 4. p. 506.) leaves oblong, acuminate, dilated, downy beneath, rather scabrous above, clothed with hairy tomentum on the mid-rib on both surfaces, as well as the branches; panicles terminal, erect, rather hairy, longer than the leaves, with cymosely bifid branches; segments of corolla mucronately cuspidate. ½. S. Native of Guayaquil, where it was collected by Haecke. Guettardà acutiflora, Bartl. in herb. Haeke. Nearly allied to P. deflexa. Stipulas connate, sheathing, ending each in a subapiculate acumen.

*Acute-flowered Psychotria.* Shrub.

20 P. pilosa (Ruiz et Pav. fl. per. 2. p. 60. t. 208. f. a.) suffruticosae, pilose; branches tetragonal; leaves oblong, acuminate at both ends; stipulas bifid, with lanceolate acute lobes, which are about the length of the petioles; panicles short, terminal, on short peduncles, with opposite branches; bracteae lanceolate, acute, ciliolate; teeth of calyx acute. ½. S. Native of Peru, on the Andes in humid parts of forests. Leaves 4 inches long. Inflorescence as in Aspirata. Bracteas bluish. Peduncules hairy. Berries blue, about the size of peas.

*Pilose Psychotria.* Shrub 2 feet.

21 P. cymosa (Ruiz et Pav. fl. per. 2. p. 59. t. 206. f. b.) suffruticosae, glabrous; branches compressedly tetragonal; leaves oblong-lanceolate, acute, shining above; stipulas bipartite, with the lobes linear-subulate and distant; cymes terminal, on short peduncles, of 5 rays; segments of the calyx long, subulate; tube of corolla villous at the base; berries oval. ½. S. Native of Peru, in groves on the Andes. Leaves 6 inches long. Peduncles compressed. Corolla purplish. Berries violaceous. Calyx almost as in Gréphilà.

*Cymose-flowered Psychotria.* Shrub 3 to 4 feet.

22 P. magnolifolia (H. B. et Kunth, nov. gen. amer. 3. p. 360. but not of Willd.) glabrous; branches compressed; leaves elliptic, blunting at both ends, rather membranous; stipulas oblong, obtuse, length of the pedicels; cymes pedunculate, of 4 spreading rays; flowers sessile, usually by threes. ½. S. Native about Quito. Fruit unknown. Said to be allied to P. aridifolia. Leaves 7-8 inches long and 4-5 broad, on pedioles 8-9 inches long. ½. S. Native of the temperate parts of Peru.

*Wrinkled-leaved Psychotria.* Shrub.

23 P. glomerata (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branches compressed; leaves lanceolate, long-acuminated, rather coriaceous, narrowed at the base, a little wrinkled, foveolate in the axils of the veins beneath; stipulas lanceolate, acuminate; panicles pedunculate, having the lower branches 4 in a whorl, and spreading; fruit nearly globose, dillymous. ½. S. Native of the temperate parts of Peru.

*Glomerate Psychotria.* Shrub.

24 P. ruggosa (H. B. et Kunth, nov. gen. amer. 3. p. 556.) glabrous, branches compressed; leaves lanceolate, long-acuminated, rather coriaceous, narrowed at the base, a little wrinkled, foveolate in the axils of the veins beneath; stipulas lanceolate, acuminate; panicles pedunculate, terminal, with opposite branches; flowers crowded, sessile; berry globose. ½. S. Native of Peru, in groves on the Andes. Palicuriæ viridis, Rom. et Schultes, syst. 5. p. 195. Corollas small, green, with a hairy throat. Anthers inclosed. This has nothing to do with Palicuriæ tinctoria, with which it has been confounded by Sprengel.

Leaves 3-4 inches long. ½. S. Native of the temperate parts of Peru.

*Green-flowered Psychotria.* Shrub 6 to 7 feet.
587

RUBIACEÆ. CLXXI. PSYCHOTRIA.

S. Native of Peru, on the Andes in groves. Corolla small, yellow, with a villous throat. Berries size of pepper-corns, purple.

Repetund-leaved Psychotria. Shrub 4 to 6 feet.

27 P. foveola (Ruiz et Pav. fl. per. 2, p. 59. t. 207. f. b.) leaves narrow-lanceolate, acuminate at both ends, hardly petiolate, with the axis of the upper veins often glandularly foveolate, but downy on the veins beneath, as well as the branchlets and peduncles; stipulas ovate, deciduous; panicles pedunculate, having the branchlets dropping while bearing the fruit; flowers 3-5, sessile at the top of each branch of the panicle. S. Native of Peru, on the Andes in groves, at Chinchao and Cachero, ex Ruiz et Pav.; and on the mountains about the Guanoco, ex Herb. Hauke. P. foveola, Spreng. syst. 1. p. 743. no. 39. exclusive of the synonyms. Branches rather tetragonal. Corolla small, cream-coloured. Berries ovate, purplish-green, ex Bartl, globose and rufous, and about the size of pepper berries.

Foveolate-leaved Psychotria. Tree 18 feet.

28 P. divaricata (H. B. et Kunth, nov. gen. amer. 3. p. 362. but not of Willd.) glabrous; branchlets terete; leaves lanceolate-oblong, acute, narrowed at the base, membranous, foveolate in the axis of the veins beneath; panicles pedunculate, rather ovate, with opposite spreading branches; flowers pedicellate. S. Native of Peru, on the Andes in temperate places about Quito. Very nearly allied to P. foveola. There is a variety of this with tetramerous tetrandrous flowers.

Divaricate Psychotria. Shrub.

29 P. virgata (Ruiz et Pav. fl. per. 2, p. 60. t. 209. f. a.) glabrous; leaves oblong or elliptic, acuminate, coriaceous, reticulately-veined beneath; stipulas bluntly bifid, length of the petioles; cymes on short peduncles, trichotomously, crowded with flowers; flowers almost sessile, on the tops of the branches of the cyme; fruit ovate. S. Native of Peru, on the Andes in cold mountain forests. Leaves 4 inches long, with red nerves, and reflexed margins, bitter, and supplying a yellow colour when dried. Corollas sulphur-coloured, with a villous throat. Berries ovate, deep blue, size of peas. P. virgata Jamaicaensis. Spreng. syst. 1. p. 742. is perhaps a very distinct species from the present.

Triggy Psychotria. Shrub. 9 to 10 feet.

30 P. cuneifolia (D. C. prod. 4. p. 507.) glabrous; leaves obovate, cuneate at the base, and ending in a short cuspitate point at the apex; stipulas small, deciduous; panicles erect, shorter than the leaves, with opposite branches. S. Native of Peru, at Guayaquil. P. glabra, Bartl. in herb. Hauke, but not of Swartz. Flowers unknown. Berries ovate-globose, 10-striped in the dried state. Seeds semi-ovate.

Wedge-leaved Psychotria. Shrub.

31 P. Henkea (D. C. prod. 4. p. 507.) glabrous; leaves oval-oblong, acuminate at both ends; stipulas bifid on both sides, acuminate; peduncles a little shorter than the leaves; cymes contracted. S. Native of Guayaquil, and probably of Mexico. P. pedunculata, Bartl. in herb. Hauke. Allied to P. pedunculata, Swartz, but differs in the stipulas being much more acuminate, in the leaves being narrower, and more acuminate at both ends. Cymes obconical. Flowers and fruit unknown.

Henke’s Psychotria. Shrub.

32 P. rufina (Ruiz et Pav. fl. per. 2, p. 60. t. 209. f. b.) smoothish; branchlets bluntly tetragonal; leaves lanceolate, acuminate, shining above, but downy along the nerves and veins beneath; stipulas cuneate at the base, acutely bifid at the apex; cymes sessile, tripartite, with the branches again trifid; flowers sessile, by threes at the tops of the branchlets of the cyme; corollas downy; berries roundish-turbinate. S. Native of the Andes of Peru, in mountain groves. Leaves 3 inches long. Throat of corolla villous. Berries black.

Triplet-cyned Psychotria. Tree 18 feet.

33 P. capitata (Ruiz et Pav. fl. per. 2, p. 59. t. 206. f. a,) smoothish; branchlets slightly tetragonal; leaves oblong, acuminate, very veiny, downy beneath; stipulas bifid, obtuse; panicles shorter than the leaves, ovate, terminal, on short peduncles; peduncles bracteate, opposite; flowers crowded. S. Native of Peru, on the Andes in groves. Cephalis Peruviana, Spreng. syst. 1. p. 719. Stipulas hispid, glabular on the inner side at the base. Bracteae lancelate; bracteoles ovate, acute. Berries ovate, blackish, umbilicate.

Capitate-flowered Psychotria. Shrub. 9 to 10 feet.

34 P. villosa (Ruiz et Pav. fl. per. 2, p. 59. t. 207. f. a.) branchlets, peduncles, petioles, and nerves of leaves clothed with rufous villi; leaves attenuated at both ends, glabrous above in the adult state, downy on the nerves beneath; stipulas ovate-oblong, acute, caducous; panicles pedunculate, with the branches and branchlets opposite; flowers by threes, glabrous. S. Native of the Andes of Peru, in mountain groves. Bartl. in herb. Hauke. Knots of branches pilose. Leaves 4-5 inches long. Bracteae small, acuminate. Berries red, globose, rather compressed, size of small peas. Allied to P. micrantha and P. kirula.

Villosa Psychotria. Shrub. 9 to 10 feet.

35 P. Meraantha (H. B. et Kunth, nov. gen. amer. 3. p. 363. t. 284.) hairy from rufescent villi; branchlets terete; leaves obovate-elliptic, acuminate, cuneate at the base, rather coriaceous; stipulas oblong, awnedly bidentate; cymes pedunculate, of 6 rays, diffuse; flowers glomerate; corollas hairy on the outside; fruit globose-elliptic, hairy. S. Native of Peru, ex Kunth; or at the river Magdalena, ex Willd. P. rufescent, Willd. in Rœm. et Schultes, syst. 5. p. 192. but not of Kunth.

Small-flowered Psychotria. Shrub.

Submexicana Psychotria. Shrub. 4 to 6 feet.

** Species natives of Brazil.

37 P. Alba (Ruiz et Pav. fl. per. 2, p. 58. t. 205. f. a,) smoothish; branchlets compressed; leaves elliptic-oblong, acute at both ends, beset with rows of hairs along the nerves beneath, and often foveolate in the axes of the nerves; stipulas ovate-oblong, undivided, rather crenate; panicles pedunculate, terminal, shorter than the leaves, with the branches opposite; calyx short, truncate; berries ovate. S. Native of South America, especially in tropical Brazil, Guayaquil, and Andes of Peru. Cham. et Schlecht. in Linnæa. 4. p. 19. P. ardisiefolia, H. B. et Kunth, nov. gen. amer. 3. p. 359. Bartl. in herb. Hauke. P. densiflora. Willd. in Rœm. et Schultes, syst. 5. p. 189. P. pâtula, Willd. in Rœm. et Schultes, syst. 5. p. 189. P. ardisiefolia, P. pâtula, and P. alba, Spreng. Leaves 6-8 inches long. Stipulas obovate, hairy at the base. Bracteae conning, ovate, acute. Flowers and berries white.

Var. p. tona (Cham. et Schlecht. in Linnæa. 1. p. 19.) leaves glabrous, nearly obovate, few-veined. S. Native of Brazil, near Rio Janeiro.

White-herbed Psychotria. Shrub 12 feet.

38 P. Lucaca (Cham. et Schlecht. in Linnæa. 4. p. 22.)
smoothish; leaves narrow-lanceolate, acuminate at both ends, membranous; stipulas rather concrete, bidentate on both sides; cymes pedunculate, terminal; with the branchlets slender, opposite or verticillate, downy; flowers tetrandrous, rarely pentandrous; calyx 5-lobed; fruit globose, ribless.  

$\frac{1}{2}$. Native of tropical Brazil.

**Corymbose** (Cham. et Schlecht. in Linnaea. 4. p. 22.) quite glabrous; flowers triandrous or tetrandrous; calyx-cine teeth unequal.  

$\frac{1}{2}$. Native of tropical Brazil. Leaves 3-4 inches long, and 10-18 lines broad. Flowers small, pedicellate. Fruit unknown.

**Bearded-leaved Psychotria.** Shrub 4 to 6 feet.

40 P. *fornosensis* (Cham. et Schlecht. in Linnaea. 4. p. 21.) leaves glabrous, obovate or elliptic, short-acuminated, cuneate at the base, the consistency of parchment; stigmas ovate, acute, small, deciduous; pedicels terminal, pedunculate, loose, longer than the leaves, downy or hairy; lobes of the corolla acute, bearded at the apex.  

$\frac{1}{2}$. Native of tropical Brazil. Very like *P. alba*, and the cicatrizes of the stipules are best with rufous villi, as in it.

**Beautiful Psychotria.** Shrub 6 to 8 feet.

41 P. *cuspidata* (Bred. ex Willd. in Rom. et Schultes. syst. 5. p. 192.) smooth and glabrous; leaves oval, acuminate at the base, acuminate at the apex, scrobiculately villous in the axis when old; stipulas bidentate, truncate; pedicels terminal, pedunculate, 3 times shorter than the leaves, with compressed branches, which are dilated at the ramifications.  

$\frac{1}{2}$. Native of tropical Brazil, and at Caracas. Allied to *P. nonatetlioides* and *P. cornifolia*.

**Cuspidate-leaved Psychotria.** Shrub 5 to 6 feet.

42 P. *nonatetlioides* (Cham. et Schlecht. in Linnaea. 4. p. 26.) smooth and glabrous; branchlets compressed; leaves lanceolate, acute at the base, and long-acuminate at the apex, membranous; stipulas 2-lobed, permanent; cymes racemose, terminal, one-half shorter than the leaves; pedicels 3-flowered; middle flower and one of the lateral ones tribracteate.  

$\frac{1}{2}$. Native of tropical Brazil, and at Caracas. P. involucrata, Willd. herb. Fruit unknown. Habit of *P. cornifolia*.

**Novatetlioid-like Psychotria.** Shrub.

43 P. *novia* (St. Hil. pl. rem. bras. p. 234. t. 21. f. a.) branchlets compressed, furnished with 2 rows of hairs; leaves lanceolate, acuminate, on short petioles, approximate, glabrous; stipulas short, bipartite; flowers 2-4 in a fascicle, sessile, bracteate, terminal, and axillary; bracteas acuminate, ciliolate; fruit elliptic.  

$\frac{1}{2}$. Native of Brazil, in the province of Minas Geraes. This species is supposed to be hurtful to animals who eat it.

**Hurtful Psychotria.** Shrub 5 to 6 feet.

44 P. *elliptica* (Ker. bot. reg. t. 607. but not of Willd.) glabrous; leaves elliptic, attenuated at both ends, shining, membranous; stipulas sheathing, ovate, rather erosely fringed, deciduous; cymes terminal, sessile, tripartite, with trichotomously panicked branches, shorter than the leaves.  

$\frac{1}{2}$. Native of Brazil. Flowers short, white. Calyx cup-shaped, slightly toothed.

**Elliptic-leaved Psychotria.** Fl. May, June. Clt. 1821. Sh. 3-4 feet.

45 P. *chenochricha* (D. C. prod. 4. p. 509.) quite glabrous; branchlets compressed; leaves elliptic, acuminate at both ends, smooth; stipulas short, bifid at both sides; corymbs terminal, sessile, with umbellate branches, much shorter than the leaves, each branch bearing 4-5 flowers at the apex; corollas glabrous on the outside, but villous in the throat.  

$\frac{1}{2}$. Native of Brazil, at Bahia, in sand by the sea-side, where it was collected by Salzmann. Flowers cream-coloured. Anthers copper-coloured, sessile in the throat of the corolla among the villi. Style a little exerted.

**Gaping-haired Psychotria.** Shrub.

46 P. *barbilora* (D. C. prod. 4. p. 509.) quite glabrous; branchlets compressed; leaves oval-ovate, acute at the base, acuminate at the apex, shining above; stipulas combined at the base, biauriculate; peduncles terminal, very short, densely corymbose at the apex, bracteate under the flowers; corolla glabrous outside, with the lobes of the limb hairy above.  

$\frac{1}{2}$. Native of Brazil, on hills about Bahia, where it was collected by Salzmann. Shrub 3 feet high. Flowers white, probably dioecious. Branches compressed.

**Var. a**, *stylosa* (D. C. l. c.) style exerted; anthers inclosed; fruit globose, sub-didymous, hardly furrowed.

**Var. b**, *stamina* (D. C. l. c.) style inclosed; anthers exerted. Perhaps a proper species, or the male variety of the preceding.

**Bahia Psychotria.** Shrub 3 feet.

48 P. *sambulina* (Link, in Rom. et Schultes. syst. 5. p. 188.) glabrous; leaves ovate-lanceolate, acuminate, petiolate; stipulas deciduous; branches of the pedicle glabrous, verticillate.  

3 times shorter than the leaves.  

$\frac{1}{2}$. Native of Brazil. Leaves a span long, and 3-4 inches broad, of a livid black colour in the dried state.

**Elder-like Psychotria.** Shrub.

49 P. *longifolia* (Hoffmanns, ex Willd. in Rom. et Schultes. syst. 5. p. 190.) leaves ovate-oblong, acuminate, catlyately attenuated at the base; stipulas bifid; pedicels terminal.  

$\frac{1}{2}$. Native of Brazil. Leaves a foot long. Perhaps the same as *P. racemosa*.

**Long-leaved Psychotria.** Shrub.

50 P. *grandifolia* (Hoffmanns, ex Willd. in Rom. et Schultes. syst. 5. p. 190.) leaves ovate, acute; stipulas bifid, obtuse; flowers panicked.  

$\frac{1}{2}$. Native of Brazil. Leaves half a foot long. Corollas yellow. Very like *P. latifolia*, but differs in the form of the stipules.

**Great-leaved Psychotria.** Shrub.

**Species natives of Guiana.**

51 P. *mapuaria* (Rom. et Schultes, syst. 5. p. 187.) glabrous; leaves ovate-oblong, each ending in a short blaut acumem, acuminate at the base; stipulas ovate-roundish, deciduous; pedicels terminal, shorter than the leaves; fruit ovate-globose, striated.  

**Mapuria Psychotria.** Shrub 7 to 8 feet.
52. **Psilodendron** (D. C. prod. 4. p. 509.) glabrous; leaves elliptic, cuneate at the base, short-acuminated at the apex; stipulas obovate, foliaceous, deciduous, length of the petioles; panicles rising from the forks of the branches, pedunculate, hardly shorter than the leaves; fruit ovate, striated. ụ S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. Mapórée*, but differs from that species in the above characteristics, besides in the longer leaves, larger stipulas, and in the peduncle of the fruitiferous panicle being 4 inches long.

*Mapouria*-like Psychotria. Shrub 5 to 6 feet.

53. **P. Simira** (Reem. et Schultes, syst. 5. p. 187.) glabrous; leaves elliptic-oblong, abruptly acuminate, with parallel veins, paler beneath; stipulas ovate, acuminate, deciduous; panicles erect, on short peduncles, one-half shorter than the leaves; berries oval. ụ S. Native of French Guiana, in humid parts of woods. *Simira* tinctorea, Aubl. guian. 1. p. 170. t. 65. P. parviflora, Wildl. spec. 1. p. 962. Bark red on the inside. Leaves 14 inches long, and 6 broad, with the nerves red beneath. Branches of the panicle short. Corolla white, with rounded segments, ex Aubl., but acute segments, ex Rich., shorter than the stamens. The bark of this shrub is used to dye silk and cotton of a red colour. *Simira* is the Guiana name of the tree.

*Simira* Psychotria. Shrub 10 to 12 feet.

54. **P. Patrisii** (D. C. prod. 4. p. 510.) glabrous; leaves elliptic-oblong, acuminate at both ends; stipulas elliptic, acutish, deciduous; panicles pedunculate, a little shorter than the leaves, having the branches and branchlets opposite; fruit ovate, striated, terminated by a short conical horn. ụ S. Native of French Guiana, where it was collected by Patris, along with many other species. Branches terete. Leaves 5-6 inches long, and 2 or 2½ broad. From the stipulas and habit, this species comes near to *P. Mapórée*.

*Patris's* Psychotria. Shrub 6 to 8 feet.

55. **P. sorória** (D. C. l. c.) glabrous; leaves elliptic-oblong, acuminate at both ends; stipulas triangularly-elliptic, acute, deciduous; panicles terminal, pedunculate, hardly shorter than the leaves, with the branches and branchlets opposite; fruit nearly globose, striated, truncate at the apex. ụ S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. Patrisii*, but the berries are fewer, and larger round, without horns, and crowned by the 5 small teeth of the calyx.

*Sister* Psychotria. Shrub 6 to 8 feet.

56. **P. ficée'ma** (D. C. prod. 4. p. 510.) glabrous; leaves oval, acuminate at both ends; stipulas oblong, acuminate, deciduous; panicles pedunculate, longer than the leaves, having the branches and branchlets opposite; fruit ovate, striated. ụ S. Native of French Guiana, where it was collected by Patris. The buds and stipulas are oblong and acute, and very much like those of the fig-tree. Peduncle of the panicle 3 inches long. Fruit small. Allied to *P. Simira*.

*Fig-budded* Psychotria. Shrub 5 to 6 feet.

57. **P. racemosa** (A. Rich. act. soc. hist. nat. par. 1792. p. 107.) glabrous; leaves elliptic-oblong, acuminate at both ends, shining beneath; stipulas bidentif, with the lobes acuminate; racemes terminal, pedunculate, straight, one-half shorter than the leaves; rachis of the raceme angular, downy; fruit compressed, coarsely ribbed. ụ S. Native of French Guiana. Leaves 10 inches long and 3 broad, on petioles which are nearly an inch long. Flowers unknown.

* Racemose-flowered Psychotria. Shrub.

58. **P. flexuosa** (Wildl. spec. 1. p. 966.) glabrous, subherbaceous; branches compressed; leaves oval, acuminate, on short petioles, membranous; stipulas bipartite, acuminated, equal in length to the petioles; panicles terminal, racemose, pedunculate, shorter than the leaves; berries globose, compressed, rather didymous. ụ S. Native of Cayenne, in sterile places. *Nonatella paniculata*, Aubl. guian. 1. p. 181. t. 70. f. 2. Flowers white. Berries violaceous.

*Flexuous* Psychotria. Shrub 2 feet.

59. **P. deflexa** (D. C. prod. 4. p. 510.) glabrous; branches and peduncles compressed; leaves ovate-lanceolate, or ovallanceolate, acuminate at the apex, and acute at the base, membranous; stipulas on both sides, lanceolate, hardly joined at the base; panicles pedunculate, shorter than the leaves, with reflexed compressed branchlets, which are bearded in the axils; flowers small, tetraneous. ụ S. Native of French Guiana, where it was collected by Patris. Very nearly allied to *P. flexuosa*, but differs in the flowers being tetraneous and tetransom.

*Deflexed*-peduncled Psychotria. Shrub 1 to 2 feet.

60. **P. paniculata** (Wildl. spec. 1. p. 970.) glabrous; leaves ovate, acuminate at both ends, veiny; stipulas connate, bidentate; panicles terminal, erect; berries globose, compressed, subdidymous. ụ S. Native of Surinam and other parts of South America.

*Panicled-flowered* Psychotria. Tree, tall.

61. **P. bracteata** (D. C. prod. 4. p. 510.) glabrous; leaves oblong, acuminate, almost sessile, stiff, shining above, with revolute margins; stipulas with both sides, linear, acuminate, longer than the petioles, which are very short; cymes trichotomous, on short peduncles; bracteae oblong, many, under the flowers; fruit nearly globose, striated. ụ S. Native of French Guiana, where it was collected by Patris. This is a very distinct species. Leaves 3 inches long, and 5-9 lines broad. Petioles 1-2 lines long. Peduncle of the cyme compressed, 9-10 lines long.

*Bracteate*-flowered Psychotria. Shrub 4 to 6 feet.

62. **P. flaty'oda** (D. C. l. c.) glabrous; leaves oval or oblong, acuminate, with parallel nerves; stipulas connate, short, bidentate on both sides; cymes terminal, 4 parted, on very short peduncles, girded by 4 large ovate bracteae, the branches compressed so much as to be 2-edged, the secondary branches bearing the flowers at their tops; fruit round, depressed, coarsely ribbed. ụ S. Native of French Guiana, where it was collected by Patris. The leaves and peduncles become yellowish on drying. Leaves 3-6 inches long, and 2-3 broad. Petioles 0-6 lines long.

*Braconed*-flowered Psychotria. Shrub 6 to 8 feet.

63. **P. bre'lipes** (D. C. prod. 4. p. 511.) glabrous; branchlets compressed; leaves elliptic, acuminate at both ends, shining above; stipulas on both sides, linear, acuminate, hardly joined at the base; cymes irregularly branched, on short peduncles, rather bracteate; fruit roundish, compressed, profoundly ribbed. ụ S. Native of French Guiana. Fructiferous cymes equal in length to the attenuated part of the base of the leaves. Leaves 5 inches long, and 2 broad. Petioles 1-3 lines long.

*Short-peduncled* Psychotria. Shrub.

** ** ** Species natives of Colombia.

64. **P. Carthagenensis** (Jacq. amer. p. 65. t. 174. f. 22.) glabrous; leaves obovate or elliptic, rather coriaceous, acuminate at both ends; stipulas ovate, rather membranous, rufous, deciduous; peduncles elongated, corymbose, trichotomous, rising from the forks of the branches; throat of the corolla villous;
berries ovate.  $\gamma$. S. Native of Carthagea, among bushes, ex Jacq.; and of St. Domingo, ex Bertero.  P. Carthagenensis, Spreng. ex Balf. Corollas white, having the tube much exceeding the limb, which is said to be 6-7-eleft, and the stamens are 6-7, according to Jacquin. Berries red, crowned by the calyx, which is of the same colour. Wildenow says that the stipulas are emarginate; but they are probably entire and obtuse.

Carthagea Psychotria. Shrub 5 to 6 feet.

65 P. calyglona (H. B. et Kunth, nov. gen. amer. 3. p. 356.) glabrous; branchlets compressed; leaves lanceolate or oblong, long-acuminate, narrow at the base, membranous; stipulas oblong, obtuse; corymb pedunculate, trichotomous, spreading; calyxes cuneate spathaceous, cleft on one side. $\beta$. S. Native of New Granada. Calyx campanulate, 5-toothed, one half shorter than the corolla. On account of the form of the calyx, this plant does not agree with the present genus, but the fruit is unknown.

Two-edgedPsychotria. Shrub.

66 P. saltatio (H. B. et Kunth, nov. gen. amer. 3. p. 360.) but not of Willd.) glabrous; branchlets compressed; leaves lanceolate, acuminate at both ends, membranous; stipulas oblong, acute, fasiccinate; panicles pedunculate, with opposite, much-spreading branchlets; fruit spherical. $\gamma$. S. Native of New Granada.

Willow-leafed Psychotria. Shrub.

67 P. acrs (H. B. et Kunth, nov. gen. amer. 3. p. 360.) glabrous; branchlets 2-edged; leaves oblong, acuminate at both ends, shining above, scrobiculate in the axils of the veins beneath; stipulas ovate, acutish; cymes pedunculate, trichotomous, spreading; flowers sessile, usually by threes; fruit ovate. $\beta$. S. Native of New Granada, in temperate places, near the escarpment of Tequendama.

Two-edged-branched Psychotria. Shrub.

68 P. lucida (H. B. et Kunth, nov. gen. amer. 3. p. 361. t. 288. but not of Willd.) glabrous; branchlets 2-edged; leaves lanceolate-oblong, acuminate at both ends, coriaceous, shining above; stipulas ovate, acute, deciduous; corymb pedunculate, dichotomous, spreading; bracteoles and teeth of the calyx ciliated; fruit nearly globose. $\gamma$. S. Native of New Granada, on the banks of the river Magdalena, near Honda. P. viburnoides, in Roem. et Schultes, syst. 5. p. 189. but not of Kunth. Flowers usually by threes, sessile, about the size of those of the privet.

Shining-leaved Psychotria. Tree 29 feet.

69 P. cornifolia (H. B. et Kunth, nov. gen. amer. 3. p. 362.) glabrous; branchlets terete; leaves almost sessile, ovate-rhomboid, acuminate, cuneated at the base, membranous; corymb pedunculate, terminal, bifid, divaricate; fruit roundish, compressed. $\gamma$. S. Native on the banks of the Orinoco, near Maypures. Stipulas and flowers unknown. Perhaps a distinct genus.

Dogwood-leaved Psychotria. Shrub.

70 P. viburnoides (H. B. et Kunth, nov. gen. amer. 3. p. 361. but not of Willd.) glabrous; branchlets compressed; leaves oblong, acuminate at both ends, coriaceous, shining above; stipulas ovate, acute, deciduous; cymes pedunculate, of 4 rays, spreading; bracteoles and teeth of the calyx ciliated. $\gamma$. S. Native on the banks of the Orinoco, near the escarpment of Atraves. Very like P. lacida.

Viburnum-like Psychotria. Shrub.

71 P. borjessii (H. B. et Kunth, nov. gen. amer. 3. p. 537.) smoothish; branchlets compressed; leaves lanceolate, acuminate at both ends, membranous, with undulated margins, shining a little; stipulas ovate, acute; cymes pedunculate of 5 rays, spreading, the rays clothed with powdery down. $\gamma$. S. Native in woods, on the banks of the Orinoco, near San-Borja. P. ligustrina, Willd. in Roem. et Schultes, syst. 5. p. 188. Nearly allied to P. rugulosa, but the flowers are smaller, &c. Leaves glabrous on both surfaces according to Kunth, but according to Willdenow the leaves are downy underneath.

San-Borja Psychotria. Shrub.

72 P. glucosecentes (H. B. et Kunth, nov. gen. amer. 3. p. 558.) branchlet terete, hairy; leaves oblong or lanceolate-oblong, acuminate, acute at the base, with sub-undulated margins, rather coriaceous, glabrous, glaucescent beneath, foveolate in the axils of the veins beneath, and downy on the veins; stipulas ovate, acuminate; cymes pedunculate of 5 spreading rays; pedicels hairy; fruit nearly globose-elliptic. $\gamma$. S. Native on the banks of the Orinoco, and near the city of Angostura. P. divaricata, Willd. in Roem. et Schultes, syst. 3. p. 191.

Glaucescent Psychotria. Shrub 10 to 15 feet.

73 P. rufo'scens (Spreng. syst. 1. p. 741.) branchlets, stipulas, peduncles, petioles, and nerves of the leaves clothed with rusty hairs; leaves obovate-oblong, acuminate, narrow at the base; stipulas oval, obtuse; cymes sessile, of 3-4 rays or branches, the rays bearing almost sessile, crowded flowers at their tops. $\beta$. S. Native of South America.

Var. a. ferruginea (D. C. pro. 4. p. 512.) branches subtrifolious; flowers congestorate; stipulas acutish, half an inch long. $\beta$. S. Native of New Andalusia, near Caripe. The corolla is said to be white, with a villous throat and reflexed lobes. Fruit unknown. P. rufo'scens, H. B. et Kunth, nov. gen. amer. 3. p. 364. but not of Willd. Bertiéra ferruginea, Willd. in Roem. et Schultes, syst. 5. p. 237.

Var. c. Haenkeana (D. C. l. c.) branchlets compressed; stipulas obtuse, hairy in the young state, and glabrous in the adult state; flowers congestorate; corolla hairy outside; berries ovate-oblong. $\beta$. S. Native of Mexico. P. rufo'scens, Bartd. Rufescens Psychotria. Shrub.

74 P. diervilloides (H. B. et Kunth, nov. gen. amer. 3. p. 358.) clothed with fine hairy tomentum; branchlets compressed; leaves obovate-acuminate, rounded at the base, membranous, glabrous above; stipulas oblong, obtuse; cymes pedunculate of 4 rays; panicle cylindrical. $\gamma$. S. Native of South America, near Angostura. Petioles glabrous. Stipulas equal. Lobes of the corolla revolutely reflexed. Fruit unknown.

Diervillo-like Psychotria. Shrub.

75 P. orinocensis (D. C. prod. 4. p. 512) leaves on short petioles, roundish-ovate, acute, shining; stipulas 2-lobe; corymb divaricate. $\gamma$. S. Native on the banks of the Orinoco. P. cornifolia, Willd. in Roem. et Schultes, syst. 5. p. 191. but not of Kunth.

Orinoco Psychotria. Shrub.

76 P. latifolia (Willd. in Roem. et Schultes, syst. 5. p. 189.) leaves ovate, acute at both ends, ribbed; stipulas acutely bidentate; panicles terminal, elongated. $\gamma$. S. Native on the banks of the Orinoco, in shady places. Kunth, et Bomp. Leaves a foot long, very broad, shining on both surfaces, downy on the veins beneath. Branches of the panicle crowded, erect, ex Spreng. syst. 1. p. 745.

Broad-leaved Psychotria. Shrub.

77 P. levigata (Willd. in Roem. et Schultes, syst. 5. p. 190.) leaves obovate-ovate, petiole, tapering at the base, glabrous; stipulas bidentate; panicle terminal. $\gamma$. S. Native of South
America, at the river Atabapo. *Humb. et Bonpl.* This is said to be the same as *Pallocéara speciosa*, by *Spreng*.

**Smooth Psychotria.** Shrubs.

78 P. Hundens**is** (Wildl. in *Rom. et Schultes*, syst. 5. p. 189.) leaves oblong, acuminate at both ends, rather membranous; stipulas oblong, obuse; panicle trichotomously corymbose. ą S. Native of New Granada, on the banks of the Magdalena, near Honda, or Hunda. *Palicóeara mitis* is joined with this by *Spreng*. but for what reason we know not.

**Honda Psychotria.** Shrubs.

79 **Camunánsis** (Wildl. in *Rom. et Schultes*, syst. 5. p. 191.) leaves oblong; stipulas ovate, acute; cymes few-flowered. ą S. Native of Camuná, Humb. et Bonpl.; and Trinidad, G. Don. Flowers yellow.

*Camuná Psychotria.* Clt. 1824. Shrubs 10 feet.

80 P. **séssili-föra** (Wildl. in *Rom. et Schultes*, syst. 5. p. 191.) herbaceous; leaves oblong, acuminate at both ends; stipulas emarginately bidentate; flowers terminal, crowded, sessile.

2. S. Native on the banks of the Orinoco, Humb. et Bonpl. Herb half a foot high. Flowers white.

**Séssile-flowered Psychotria.** Pl. half a foot.

• • • • • **A species native of Panama.**

81 P. **fúrca-ta** (D. C. prod. 4. p. 512.) smoothish; branches bifurcate, terete; branchlets compressed; peduncles, pedioles, and nerves of the leaves roughish; leaves ovate-oblong, acuminate; stipulas bidentate, small, acute; heads on short peduncles; pedicels thick, very short; bracteas 4, linear, spreading. ą S. Native of Panama, where it was collected by *Haenke*. *Céphélis fúrca-ta*, Bartl. in herb. *Haenke*. Fruit ovate-globose, compressed, furrowed. Flowers unknown. Habit of *Céphélis oblonga*, but the inflorescence and fruit are like that of *P. platypoda*.

**Forked-branched Psychotria.** Shrubs.

• • • • • **Species natives of Mexico.**

82 P. **biaristáta** (Bartl. in herb. *Haenke*, ex D. C. prod. 4. p. 513.) glabrous; branchlets a little compressed; leaves oblong, or ovate-oblong, atteminated at both ends, coriaceous; stipulas short, broadly ovate, bidentate, deciduous; cymes on short peduncles of 3-4 rays, much shorter than the leaves; fruit nearly globose. ą S. Native of Mexico. Leaves 2 inches long, and 9 lines broad. Petioles 1-2 lines long.

**Two-awned-stipulated Psychotria.** Shrubs 1 to 2 feet.

83 P. **mollis** (Poir. dict. 5. p. 702.) Bartl. in herb. *Haenke*, ex D. C. prod. 4. p. 513.) branchlets nearly terete; peduncles and nerves of leaves downy; leaves elliptic-oblong, acuminate at both ends, membranous, when young downy, but in the adult state glabrous above; stipulas ovate, acutely bidentate; panicle corymbose, crowded, pedunculate, shorter than the leaves; corolla with a short tube, blunt erect lobes, and a hairy throat. ą S. Native of Mexico, Allied to *P. horizontalis var. B*. *P. mollis*, Spreng. in herb. *Baill.* should be excluded from the present order.

The plant of *Poir* is probably distinct from that of *Bartl*.

**Soft Psychotria.** Shrubs.

84 P. **herbáclada** (D. C. prod. 4. p. 513.) branchlets, pedioles, panicles, and nerves of leaves downy; leaves elliptic-oblong, acuminate at both ends; stipulas acutely bifid; panicules erect, ovate, with the rachi compacted, and the branches opposite. ą S. Native of Mexico. P. pubescens, Bartl. in herb. *Haenke*. It differs from *P. pubescens* in the stipulas being more acute, in the panicules not being corymbose, in the rachi of the panicules being compressed, and in the bracteoles being shorter. Flowers unknown. Berries globose, compressed, downy, crowned, striated in the dry state.

**Hairy-branched Psychotria.** Shrubs.

85 P. **aureóla** (Bartl. in herb. *Haenke*, ex D. C. prod. 4. p. 513.) clothed with velvety down; branchlets from compressed to terete; leaves oblong-lanceolate, attenuated at both ends; veins parallel, and are as well as the nerve yellowish; stipulas broad, ovate, drawn out each into a setaceous acumen at the apex, which is sometimes undivided, and sometimes bibractitate; corolms pedunculate, trichotomous; calyx 5-toothed, and are, as well as the corollas, downy. ą S. Native of Mexico. Branches and leaves yellowish in the dried state. Leaves 2 or 2½ inches long, and 9-10 lines broad. Pedioles a line long.

**Golden Psychotria.** Shrubs.

86 P. **scabriuscula** (Bartl. in herb. *Haenke*, ex D. C. prod. 4. p. 513.) branchlets a little compressed; young leaves and peduncles clothed with very fine down; leaves oblong-lanceolate, attenuated at both ends, at length glabrous on the upper surface; stipulas ovate, bibractitate, shorter than the pedioles; corolms trichotomous, pedunculate, shorter than the leaves; fruit globose, dilychnous. ą S. Native of Mexico, about Acapulco. Allied to *P. auróla*. Pedioles often changed into lateral elongated pseudo-axillary branches.

**Roughish Psychotria.** Shrubs.

87 P. **Mexicaná** (Wildl. in *Rom. et Schultes*, syst. 5. p. 192.) leaves oblong, acuminate at both ends, rather membranous; stipulas bipartite, acute; panicles narrow, terminal. ą S. Native of Mexico, Humb. et Bonpl. This plant is referred to *Palicóeara fastigiata* by *Sprengel*, who is probably correct.

**Mexican Psychotria.** Shrubs.

88 P. **padifölia** (Wildl. in *Rom. et Schultes*, syst. 5. p. 189.) leaves oblong, acuminate, pilose on the veins beneath; stipulas bipartite, linear-subulate; panicles corymbose, terminal. ą S. Native of Mexico, about Xalapapa, Humb. et Bonpl. **Bird-cherry-leaved Psychotria.** Shrubs.

• • • • • **A species native of Florida.**

89 P. **lanceoláta** (Nutt. in Sill. amer. journ. 5. p. 290.) branches and under sides of leaves clothed with rusty down; leaves lanceolate, acuminate at both ends; stipulas stem-clasping, roundish, deciduous, sphaerulate; corollas terminal, trichotomous from the base. ą S. Native of Eastern Florida. Leaves 2-3 inches long. Berries ovate, red.

**Lanceolate-leaved Psychotria.** Shrubs.

• • • • • **A species native of the Bahamas.**

90 P. **undáta** (Jacq. hort. schönbr. 3. p. 5. t. 260. fragm. 101.) glabrous; leaves oval-lanceolate or oblong, acuminate at both ends, undulate; stipulas connate, ovate, deciduous, a little shorter than the pedioles; cymes terminal, sessile, tripartite, with trichotomous branches; corolla with a naked throat, but the tube is villous at the origin of the filaments. ą S. Native of the Bahama Islands. Leaves acute at both ends, wavy, shining above, 3-4 inches long. Corollas white, with reflexed segments. Berries small, roundish, red.

**Wavy-leaved Psychotria.** Pl. May, June. Clt. 1823. Shrubs 3 to 4 feet.

• • • • • **Species natives of the West India Islands.**

91 P. **florífunda** (H. B. et Kunth, nov. gen. amer. 3. p. 359.) glabrous; branchlets compressed; leaves elliptic-oblong, acuminate at both ends, coriaceous; stipulas oblong, obtuse; cymes pedunculate, of 6 rays, much branched, diffuse; the rays again divided into 4-5 rays; bracteas and calyceal teeth hairy; stamens length of the lobes of the corolla. ą S. Native of South America, in the province of Carthagea near Turbaco? ex
RUBIACEÆ. CLX. PSYCHOTRIA.

Kunth; in the Island of Martinico, ex Sieb.; and of Guadaloupe, ex Perrottet.

**Buddle-flowered Psychotria.** Shrub.

92. *P. tenuifolia* (Swartz, prod. p. 45. fl. ind. occ. 1. p. 403.) glabrous; leaves oblong, acuminate at both ends, membranous; stipules ovate, deciduous, bifid, with acuminate lobes; panicles erect, almost sessile, shorter than the leaves; throat of corolla villous. *T. S.* Native of Hispaniola, among bushes. Leaves with an obtuse acumen, ex Swartz. Panicles trichotomous. Flowers small, white. Berries oblong, glabrous. — *P. glabrata,* Sieb. fl. mart. no. 73, does not differ from the plant of Swartz, unless in the leaves being acutely acuminate. *P. laurifoia,* Bertero, collected in Hispaniola, has the leaves acute at the apex, and the nerves of the leaves beset with rusty down underneath. In both, however, there are rufous cilia in the axils of the leaves and stipulas.

**Thin-leaved Psychotria.** Shrub 3 to 4 feet.

93. *P. nervosa* (Swartz, prod. p. 45. fl. ind. occ. 1. p. 403.) glabrous; leaves ovate, acute at the base, and acuminate at the apex, veined, a little undulated; stipulas oblong, acuminate, emarginate, deciduous; corymb triangular, with trichotomously panicked branches; throat of corolla villous; berries oblong. *T. S.* Native of Jamaica, among bushes. *P. stipulacea,* Swartz, in herb. L'Her. Branches a little compressed. Panicles terminal and axillary, shorter than the leaves. Stipulae large, rusty.

**Nerved-leaved Psychotria.** Shrub 5 to 6 feet.

94. *P. laxa* (Swartz, fl. ind. occ. p. 407, but not of Ruiz et Pav.) glabrous; leaves ovate, acuminate, hardly nerves, very short petioles; stipulas ovate, acuminate, deciduous; corymb terminal, triplicate from the base, trichotomously having the branches and pedicles rather capillary and loose; berries oblong; *T. S.* Native of Jamaica, among bushes on the mountains. Stipula small, subelliptic. Fruit oblong, acuminate at both ends. Branches terete. Leaves 1-2 inches long.

**Loose-corymbosed Psychotria.** Shrub 4 to 6 feet.

95. *P. oligothrichia* (D. C. prod. 4. p. 514.) glabrous; leaves elliptic, acuminate at both ends, membranous, hairy in the axils of the veins; stipulas ovate, membranous, rufous, deciduous; corymb sessile, triplicate, having the branches trichotomous; throat of corolla bearded. *T. S.* Native of Jamaica, Porto-Rico, Martinique, &c. *P. horizontalis,* Spreng. in herb. Balb. It differs from *P. horizontalis* in the nerves of the leaves being glabrous, in the throat of the corolla bearded, not naked; and in the corymb being sessile, not pedunculate. Very nearly allied to *P. undulata* and *P. chimarrhoids.

**Few-haired Psychotria.** Shrub 4 to 6 feet.

96. *P. chimarrhoids* (D. C. prod. 4. p. 514.) glabrous; leaves oblong-lanceolate, acuminate at both ends, membranous; stipulas ovate, obtuse, rusty, deciduous, length of the petioles; cymes terminal, sessile, triplicate; with the branches 3 times shorter than the leaves. *T. S.* Native of Guadaloupe and Trinidad, ex Sieb. fl. trin. no. 256; and of Cuba. Fruit oval, striated, crowned by the 5-toothed calyx. Leaves 3 or 3½ inches long, and 7-9 lines broad. Very nearly allied to *P. undulata,* but differs in the leaves being flat, and one-half narrower; and in the fruit being oval, not spherical.

**Chimarrhis-like Psychotria.** Shrub 5 to 6 feet.

97. *P. capitella* (D. C. prod. 4. p. 514.) branches compressed, glabrous; leaves elliptic, a little cuneate at the base, and acuminate at the apex, membranous, glabrous; stipulas drawn out into 2 setaceous ligulae; peduncles terminal, hairy, bearing three nearly sessile downy bracteate leads of flowers, one-half shorter than the leaves. *T. S.* Native of Trinidad. Sieb. fl. trin. no. 256. Habit different from any other species.

**Capitellate-flowered Psychotria.** Shrub.

**Few-flowered Psychotria.** Shrub 4 to 6 feet.

99. *P. portoricensis* (D. C. prod. 4. p. 515.) branches, pedicles, nerves of leaves, and peduncles clothed with rusty hairs; leaves elliptic, acuminate at both ends, and clothed with velvety down on both surfaces; stipulas ovate, large, membranous, rufous, deciduous; cymes terminal, sessile, tripartite, with the branches trichotomous; throat of corolla villous. *T. S.* Native of Porto-Rico, in woods by the sea-side, where it was collected by Bertero. *P. hirsuta* from Porto-Rico, Spreng. syst. 1. p. 744. It differs from *P. villosa* and *P. hirsuta* in the inflorescence being a sessile cyme, not a pedunculate panicle.

**Porto-Rico Psychotria.** Shrub 5 to 6 feet.

100. *P. berteriana* (D. C. prod. 4. p. 515.) leaves ovate-oblong, acuminate at both ends, glabrous above, downy on the nerves beneath, and branches of the panicle; stipulas twin on both sides, ovate, acute, hardly joined at the base; branches and branchlets of panicle opposite; tube of corolla short. *T. S.* Native of St. Domingo and Porto-Rico. Nonatella pubescens, Spreng. syst. 1. p. 751. Leaves membranous, 7 inches long, and 5 inches broad. Pedicles 9-10 lines long; axils of leaves somewhat ciliated. Fruit globose, furrowed.

**Bertero’s Psychotria.** Shrub.

101. *P. brachiatæ* (Swartz, prod. 45. fl. ind. occ. p. 415.) leaves ovate-oblong, acuminate at both ends, glabrous; stipulas ovate-oblong, bluntly bidentate; branches tetragonal; branches and branchlets of panicle opposite, spreadingly divaricate, downy; ultimate flowers by threes, girdled by a double bracteae. *T. S.* Native of the south of Jamaica, on high mountains, ex Swartz; and of St. Domingo, ex Bertero. Nonatelia officinalis, Spreng. in herb. Balb. Leaves downy on the veins beneath. Flowers dirty white. Fruit deep blue, oblong.

**Brachiate-panicked Psychotria.** Chit. 1793. Sh. 6 to 7 feet.

102. *P. pubescens* (Swartz, prod. 44. fl. ind. occ. 1. p. 424.) branches, pedicles, leaves (especially underneath), and panicles downy; leaves ovate, acuminate at both ends; stipulas with 2 short acute teeth; panicles cymose, spreading, length of leaves. *T. S.* Native of Jamaica and St. Domingo, in hedges and waste places. Psychotriophum, P. Browne, jarn. 161. no. 5. Panicles trichotomous, with usually a sessile flower in each fork. Pedicles furnished with linear opposite bracteae. Flowers greenish yellow, downy outside; throat of corolla villos. Berries downy, roundish, didymous, black, containing bluish juice.

**Downy Psychotria.** Chit. 1812. Shrub 5 to 6 feet.

103. *P. horizontalis* (Swartz, prod. p. 44. fl. ind. occ. p. 410.) branches terete, horizontal, smooth; leaves ovate-lanceolate, acute, downy beneath on the nerves, as well as the pedicles and panicles; stipulas small, ovate, deciduous, minute; peduncles shorter than the leaves; panicles erect, with the branches horizontal, and tripartite at the apex; throat of corolla naked. *T. S.* Native of St. Domingo, in chalky dry places. The leaves are said by Swartz to be downy beneath, and villous on the pedicles and nerves. Flowers small, dirty white; anthers white. Berries oblong.

**Fur. β. cuspizata** (D. C. prod. 4. p. 515.) stipulas broad, short, cuspitate, marcescent; throat of corolla hairy. *T. S.*
Native of St. Domingo, where it was collected by Bertero. Perhaps a proper species.

**Horizontal-leaved Psychotria.** Shrub 3 to 4 feet.

104 P. coriódosa (Swartz, prod. p. 44. fl. ind. occ. 1. p. 423.) glabrous; leaves ovate-lanceolate, acuminate, shining; stipula bidentate; teeth lanceolate; coryms trichotomous, erect, shorter than the leaves; peduncles and pedicels coloured; throat of corolla naked. \( R. \) S. Native of Jamaica, on the mountains, ex Swartz; Hispiola, ex Spreng; and Guadaloupe, ex herb. Balb. Branches terete. Peduncles purple, as well as the bracteas, which are subulate. Corolla purplish, tubular, with a naked white throat. Berries glbose, reddish. Perhaps a species of *Palicóeora*. In the specimen collected by Bertero the tube of the corolla is 4 lines long, and the berries are roundish, didymous, and rather compressed, and crowned by the acute teeth of the calyx.

**Corymbose-flowered Psychotria.** Shrub 6 to 7 feet.

105 P. \( n \)ut\( n \) (Swartz, prod. p. 4. p. 515.) glabrous; leaves lanceolate, acute, nerved; stipulas bidentate, marcescent, deciduous, acute; coryms terminal, pedunculate, trichotomous, shorter than the leaves, erect when bearing the flowers, but nutate when bearing the fruit. \( R. \) S. Native of Hispiola, on arid cretaceous hills. Corollas small, white, with acute segments; anthers yellow. Berries round, scarlet, size of red currants.

**Nodding-corymbed Psychotria.** Shrub.

106 P. corégis\( \text{t}a\) (Spreng. in herb. Balb. ex D. C. prod. 4. p. 515.) glabrous; leaves lanceolate, acute at the base, and acuminate at the apex; stipulas deciduous; panicles pedunculate, trichotomous, loose; ultimate branches of the panicle bearing 3+4 flowers in a head; throat of the corolla bearded; anthers inclosed. \( R. \) S. Native of Jamaica. Leaves 2½ lines long, and 9-10 lines broad. Petioles 2 lines long. In the axils of the leaves and stipules there are rufous ciliate. Panicles longer than the leaves. Flowers small.

**Crowded Psychotria.** Shrub.

107 P. \( f \)ax\( \text{t}e\) (Swartz, prod. p. 45. fl. ind. occ. 1. p. 419.) glabrous; leaves ovate-lanceolate, acuminate, roughish, membranous, distich; stipulas bidentate; peduncles shorter than the leaves; panicles second, with spreading branches; throat of the corolla naked. \( R. \) S. Native of Jamaica, on the higher mountains, and probably of St. Domingo, ex Spreng. syst. 1. p. 746. Young branches compressed. Flowers small, white, with a reflexed limb. Berries roundish, black.

**Spreading-peduncled Psychotria.** Shrub 4 to 5 feet.

108 P. myr\( \text{i}t\)ph\( \text{y} \)l\( \text{u} \)m\( \text{i} \)m\( \text{u} \) (Swartz, prod. p. 44. fl. ind. occ. 1. p. 405.) glabrous; leaves lanceolate-ovate, nerveless, shining, stiff; stipulas ovate, deciduous; branches second; racemes compound, terminal; throat of the corolla villous; berries oblong. \( R. \) S. Native of the north of Jamaica, in logwood forests. Myrtiphyllum, P. Browne, jam. p. 152.—Sloane. jam. hist. 2. p. 102. t. 100. f. 2. The shrub has a habit like the myrtle. Leaves an inch long, deep green, grey beneath from numerous small dots. Branches of racemes trifid. Flowers white. Berries scarlet, with the disepiments usually vanished at maturity.

**Myrtle-leaved Psychotria.** Clt. 1826. Shrub 3 feet.

109 P. para\( \text{r}\)s\( \text{i} \)t\( \text{i} \)ca (Swartz, prod. p. 44. fl. ind. occ. 1. p. 408.) plant sermencose, radicant, and glabrous; leaves ovate, acuminate, veinless, rather succulent; stipulas stem-clasping, retuse, permanent; cymes terminal and axillary, pedunculate; throat of the corolla downy; berries nearly globose. \( R. \) S. Native of Martinique, Menisarrat, St. Christopher, Dominica, Guadalupe, being parasitical upon trees. Viscoles pendulum, Jacq. amer. p. 73. t. 51. f. 1. Branches pendulous. Cymes trichotomous. Flowers small, white, pedicellate. Berries round, scarlet.

110 P. mar\( \text{g\text{.i}n\text{.a}t\text{a}}\) (Swartz, prod. p. 43. fl. ind. occ. p. 404.) glabrous; leaves lanceolate-ovate, acute, margined with cartilaginous bristles; stipulas ovate, acuminate, entire, deciduous, length of pedicels; panicles loose, pedunculate; anthers inclosed; berries ovate. \( R. \) S. Native of the south of Jamaica, in woods; and of Panama and Mexico. B. t. herb. Hauke. Psychotria. P. Browne, jam. 161. no. 6. Leaves shining above, and glabrescent beneath. Branches of panicle opposite, slender, 3-6-flowered. Corollas small, white, glabrous, with a reflexed limb. Berries black.

**Marginate-leaved Psychotria.** Fl. May, June. Clt. 1816. Shrub 3 to 4 feet.

111 P. his\( \text{r\text{.u\text{.t}}\text{a}}\) (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) branches, panicles, pedicels, and leaves clothed with rusty hairs; leaves lanceolate-ovate, acute; stipulas lanceolate, undivided, deciduous; panicles pedunculate, spreading; throat of corolla villous; berries ovate, downy. \( R. \) S. Native of the south of Jamaica, in woods of long standing. Branches of panicles trichotomous. Flowers white. Berries red.

**Daisy Psychotria.** Clt. 1826. Shrub 5 to 6 feet.

112 P. r\( \text{a\text{.t\text{.e}}\text{.n\text{.s}}\text{.e}}\) (Swartz, prod. p. 43. fl. ind. occ. 1. p. 396.) glabrous; leaves lanceolate-ovate, acute; stipulas ovate, acuminate, deciduous, entire; panicles pedunculate, much spreading, with reflexed filiform divisions; throat of corolla villous; anthers oblong, among the villi in the throat; berries oblong. \( R. \) S. Native of the south of Jamaica, in woods on the mountains. Panicle of 4 main branches, the ultimate branches bearing 3 flowers. Flowers small, white. Berries small, oblong, scarlet.

**Stinking Psychotria.** Shrub.

113 P. w\( \text{e\text{.s\text{.t\text{.i}}}}\) (D. C. prod. p. 4. p. 516.) glabrous; branches terete; leaves oblong-elliptic, attenuated at both ends, membranous; stipulas deciduous; coryms pedunculate, trichotomous, loose, diverging; having the ultimate branches 3-flowered; throat of corolla naked; corolla oblong; anthers linear; fruit nearly globose, crowned by the calyx. \( R. \) S. Native of Porto-Rico, where it was collected by West. Leaves 4-5 inches long, and 1-2 broad. Petioles 7-8 lines long. Branches of corybium 2 inches long, but the first branches are diverging, and about an inch long. Calyx 5-toothed. Lobes of corolla acute.

**West's Psychotria.** Shrub.

114 P. f\( \text{\text{.o\text{.l\text{.y\text{.a}t\text{.i}t\text{.h}}}a}}\) (D. C. prod. p. 4. p. 516.) glabrous; stipulas ovate, acuminate; leaves elliptic, acuminated at both ends, stiff, membranous; panicles on long peduncles, trichotonously branched; throat of corolla bearded; stamens glabrous; anthers exserted. \( R. \) S. Native of St. Domingo, where it was collected by Bertero. P. laurifolia, Spreng., in herb. Balb. Superior leaves 10 inches long, and 4 broad, pale beneath. Pe- taleis an inch long. Common peduncle of pedicile 6 inches long. Flowers very numerous, glabrous, except in the throat. Fruit unknown.

**Many-flowered Psychotria.** Shrub.

115 P. citr\( \text{r\text{.i\text{.f\text{.o\text{.l}}}a}}\) (Swartz, prod. p. 43. fl. ind. occ. 1. p. 398.) glabrous; leaves elliptic, acuminated, rather coriaceous; stipulas ovate, acuminated, permanent; peduncles short; branches of panicle opposite, trichotonous; throat of corolla villous; berries oblong. \( R. \) S. Native of the West Indies Islands. Branches compressed a little. Leaves coloured like those of the orange, 5-6 inches long. Corolla white, having the throat and segments villous. Berries large, ribbed. P. brachiata, Spreng. in herb. Balb. Citron-leaved Psychotria. Clt. 1793. Shrub.

116 P. laur\( \text{r\text{.i\text{.f\text{.o\text{.l}}}a}}\) (Swartz, prod. p. 43. fl. ind. occ. 1. p. 399.) glabrous; leaves lanceolate-ovate, thickish, shining; stipulas ovate, acuminated, deciduous; panicles cymose, erect, 4 G
trichotomous; filaments ciliated; anthers inclosed in the bearded throat; berries roundish. 

Native panicles peduncles leaves berries corymbs margin branches

Native S. branches Native Native S. flowers panicles panicles ovate.

Porto-Rico. 

Native American plants, described by Swartz, p. 43. fl. ind. occ. I. p. 417.)

leaves obvate, short-accuminated, cuneated at the base; stipulas deltoid, with revolute margins, subulate at the apex, permanent; branches angular; panicles large, pistillate, with subverticillate branches. S. Native of Jamaica, in the interior and western parts of the island, among bushes on the mountains; and of Mexico, ex herb. Henkel. Leaves a foot and more long, and 3 inches broad. Branches of panicle compressed, usually ternately verticillate. Flowers numerous, small, white. Throat of corolla villous. Berries ovate.

Native of Porto-Rico, S. Native of St. Domingo, where it was collected by Bertero. P. glabra, ex Hispaniola, Spreng. 

Berries ovate.

leaves oblong, acuminate at both ends, shining above, but downy on the veins beneath; stipulas connate, aristately bidentate; panicles terminal, elongated; peduncles and pedicels hairy. ½ S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunta.

**Annu-priced Psychotria.** Shrub.

131 P. spleêndens (Spreng. syst. 1. p. 474.) leaves lanceolate, narrowed at the base, bluntish, shining; stipulas deciduous; corymb few-flowered, pedunculate, terminal. ½ S. Native of South America, at the Rio Negro, where it was collected by Humb. and Bonpl., but is unknown to Kunta. P. lúcida, Willd. in Rœm. et Schultes, syst. 5. p. 189.

**Glittering-leaved Psychotria.** Shrub.

132 P. lampro-viûla (Spreng. syst. 1. p. 474.) leaves narrow-lanceolate, elongated, tapering to both ends, coriaceous, shining above, quite glabrous and veinless beneath; stipulas short, caducous; panicles terminal, tripartite. ½ S. Native of South America. P. salicifolia, Willd. in Rœm. et Schultes, syst. 5. p. 190. The rest unknown.

**Shining-leaved Psychotria.** Shrub.

133 P. attennuâta (Willd. in Rœm. et Schultes, syst. 5. p. 192.) leaves ovate-elliptic, long-acuminate, membranous; stipulas bidentate; cymes terminal. ½ S. Native of South America, where it was collected by Humb. and Bonpl., but is unknown to Kunta. It is joined with P. pedunculata by Sprengel, who is probably right.

**Attenuated-leaved Psychotria.** Shrub.

134 P. ? dicôhôma (Willd. in Rœm. et Schultes, syst. 5. p. 518.) leaves ovate-oblong, acute; stipulas bifid; spikes dichotomous. ½ S. Native of South America, where it was collected by Humb. and Bonpl.

**Dichotomous-leaved Psychotria.** Shrub.

135 P. comûnâta (D. C. prod. 4. p. 518.) leaves elliptic, acute at both ends, rather membranous; stipulas oblong, obtuse, stem-clasping; panicle corymbose, terminal. ½ S. Native of South America. Humb. and Bonpl. P. elliptica, Willd. in Rœm. et Schultes, syst. 5. p. 189, but not of Ker.

**Changed Psychotria.** Shrub.

136 P. membrânacea (Willd. in Rœm. et Schultes, syst. 5. p. 189.) leaves obovate-oblong, acuminate, membranous; stipulas ovate, acute. ½ S. Native of South America, where it was collected by Humb. and Bonpl.

**Membranaceous-leaved Psychotria.** Shrub.

* Species natives of Africa.

137 P. Nûvêra (Caill. et Delîl. pl. afr. p. 66.) leaves elliptic, glabrous above, acutish at both ends, with the nerves on the under surface prominent and downy; stipulas triangular; cymes terminal, with trifid crowded branches, which are downy, as well as the corollas; style much exerted. ½ S. Native of the north of Africa, in Nubia, at Singue. Teeth of calyx 5, obtuse, very short. Stigma turbinate, bifid. Tube of corolla campylate. Fruit unknown.

**Nubian Psychotria.** Shrub.

138 P. ? pâthôroûloa (D. C. prod. 4. p. 518.) glabrous; leaves oblong, acute at both ends, coriaceous, petiolar; stipulas ovate, obtuse, deciduous, 4 times shorter than the petioles; panicles terminal, shorter than the leaves, with opposite branches; calyx truncate; corolla divided beyond the middle. ½ S. Native of the Mauritius, where it was collected by Bory de St. Vincent. The flowers are not well known; and the fruit is perfectly unknown.

**Pathura-like Psychotria.** Shrub.

139 P. ? obtûsîfôlla (Lam. ill. t. 161. f. 4. Poir. dict. 5. p. 67.) glabrous; leaves obovate, cuneated, very blunt, tapering into the very short petioles; stipulas twin on both sides, some-

what concrete at the base, ending in linear points; corymb trifid, pedunculate, much shorter than the leaves, with the branches bearing crowded sessile flowers at the apex. ½ S. Native of Madagascar, where it is called *Maron-Pouton.* Leaves 4-5 long and 2 broad. Berries ovate, striated.

**Blatt-leaved Psychotria.** Shrub.

140 P. angusîtûloa (shrub, nearly simple; leaves oval-lanceolate, entire, acuminate; flowers panicled, terminal. ½ S. Native of Sierra Leone, on the banks of rivulets. Flowers pale red.

**Narrow-leaved Psychotria.** Shrub.

* Species natives of Asia.

141 P. sêprenîs (Lin. mant. p. 204.) plant suffrutescent, much branched, twisted, glabrous; branchlets rather compressed, but at length becoming terete; leaves ovate, acute at both ends, coriaceous; stipulas ovate, obtuse, undivided, brown, deciduous; corymb pedunculate, trichotomous, terminal, having the peduncles and branchlets 2-edged; berries ovate. ½ G. Native of China and the East Indies.

**Serpentine-branched Psychotria.** Shrub 2 to 6 feet.

142 P. Roxb. (D. C. prod. 4. p. 519.) branchlets oppositely, complanate, downy, but becoming smooth at length; leaves elliptic, acuminate at both ends, membranous, shining above, downy on the nerves beneath, which are parallel; stipulas oval, about equal in length to the petioles, recurved at the apex, acutely bifid; panicles terminal, on short pedicels; pedicels downy, compressed, umbellate; lobes of calyx ciliate. ½ S. Native of the Moluccas. P. Asiatica, Lin. spec. ? exclusive of the synonyms. Roxb. fl. ind. 2. p. 160. Leaves 8-10 inches long. Flowers very small, greenish. Bracteas small, lanceolate. Throat of corolla villous; anthers inclosed. Berries oval, 10-nerved (conforming to that in the figures of Gaertn. fruct. t. 1. t. 25. and Browne. jam. t. 17. f. 2), deep red.

**Roxburgh’s Psychotria.** Shrub.

143 P. sâmărâkêra (Wall. in Roxb. fl. ind. 2. p. 161.) glabrous; branchlets compressed; leaves ovate-elliptic, acuminate, coriaceous, with parallel veins; stipulas ovate, about equal in length to the petioles, recurved at the apex, and acutely bifid; corymb pedunculate, compact, villous; teeth of calyx subulate; berries globose, smooth. ½ S. Native of the East Indies, on the hills near Silhet. Leaves 8-12 inches long, shining above. Flowers very small, crowded. Corolla densely bearded at the throat. Berries pale red, without ribs.

**Round-fruited Psychotria.** Shrub.

144 P. trûncâta (Wall. in Roxb. fl. ind. 2. p. 162.) glabrous; branchlets compressed; leaves ovate-elliptic, acuminate, coriaceous, with parallel veins; stipulas ovate, about equal in length to the petioles, recurved at the apex, and acutely bifid; corymb pedunculate, compact, villous; teeth of calyx subulate; berries globose, smooth. ½ S. Native of the East Indies. Leaves 6-8 inches long and ½ broad. Petioles submarginate. Backs of stipulas depressed. Flowers rather large, by threes, intermediate ones sessile.

**Truncate-calyxced Psychotria.** Shrub.

145 P. conûnâta (Wall. in Roxb. fl. ind. 2. p. 165.) glabrous; branchlets compressed; leaves lanceolate, acuminate, tapering much at the base, almost sessile, coriaceous; stipulas ovate, acutely cuspidate, longer than the petioles, rather recurved at the apex; corymb terminal, ovate, on long peduncles, with the first ramifications umbellate, the rest trichotomous; bracteas connate at the base, ciliate, slightly lobed; flowers by threes, sessile; throat of corolla bearded. ½ S. Native of the East Indies. Leaves sessile in the axils of the nerves beneath. Pedicules rather compressed. Berries ovate, almost black, angular when dried.
Conuate-bracted Psychotria. Shrub. 146 P. stipulacea (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acuminated, coriaceous, nerved, tapering at the base, almost sessile, smooth; stipulas broad, triangular, expanded into foliaceous lamina at the apex; petals terminal, trichotomous, shorter than the leaves; pedicels compressed; flowers by threes, sessile; lobes of calyx obtuse. $\pi$. S. Native of Pulo-Penang. Leaves 7-10 inches long, somewhat glandular in the axis of the veins beneath. On the inside of the base of the stipulas there is a tuft of hairs, which remains some time after the stipulas have fallen. Corolla with a very short tube, and a bearded throat. Stamens exserted.

Large-stipuled Psychotria. Shrub. 147 P. Reevesii (Wall. in Roxb. fl. ind. 2. p. 164.) glabrous; leaves oblong-lanceolate, acute at both ends, smooth, glaucous, coriaceous; stipulas broad-ovate, adpressed, with a rounded apex; panicles terminal, oval, small, with deccussate branches; limb of calyx truncate; corolla short, with a densely bearded throat. $\pi$. G. Native of Chittagong, from which place it was sent to the botanical garden at Calcutta by Mr. Reeves. Branches beset with copious small whitish dots, having the upper extremities slightly compressed. Leaves 6-7 inches long, a little wrinkled, foveolate in the axis of the veins beneath. Panicles almost sessile. Bracteas deciduous. Flowers small, by threes, pea-green. Stamens concealed among the hairs in the throat of the corolla.

Reeves's Psychotria. Shrub. 148 P. aurantacea (Wall. in Roxb. fl. ind. 2. p. 163.) glabrous; branches flattened; leaves lanceolate, acuminate, smooth, on short petioles; stipulas ovate, acuminate, deciduous; panicles terminal, pedunculate, erect, with whorled branches; flowers by threes, shortly obovate; limb of calyx truncate; corolla with a long tube, and a villous throat. $\pi$. S. Native of Pulo-Penang, Java, and Nusa-Kambanga. Blum. bijdr. p. 962. Leaves 5-7 inches long, dotted beneath. Stamens ending in a long subulate acumen each. Peduncles compressed. Stamens exserted. Berries obovate, as large as a cherry stone, orange-coloured, ex Wall, but ovate, and 10-ribbed according to specimens from Java.

Orange-coloured-fruited Psychotria. Shrub. 149 P. denticulata (Wall. in Roxb. fl. ind. 2. p. 520.) stem ascending, with a creeping base, compressed at the apex; leaves ovate, ascending, short-acuminated, coriaceous, shining; stipulas ovate, subacute, with a toothed apex, downy outside, about equal in length to the petioles; panicles axillary, linear, coriaceous, combined into a sheath-like tube, which is villous at the base. Panicles cymose, downy. Throat of corolla slightly hairy. Teeth of calyx subulate. Berries globular, purple, size of currants.

Denticulate-stipled Psychotria. Shrub creeping. 150 P. adenosphylla (Wall. in Roxb. fl. ind. 2. p. 168.) glabrous; leaves lanceolate, acuminate, shining, with parallel nerves, which are glandular in the axis; stipulas ovate, blunt, connate at the base, deciduous; racemes terminal, cyllindrical, a little branched at the base; pedicels compressed; bracteas aristately acuminate. $\pi$. S. Native of the East Indies, in Silhet. The uppermost branches dichotomous, and a little compressed. Leaves 3-4 inches long, pallid beneath. Peduncles flattened. Flowers greenish, in heaps, almost sessile. Corolla with a short tube, a villous throat, and acute segments.

Glandular-leaved Psychotria. Shrub. 151 P.? curviflora (Wall. in Roxb. fl. ind. 2. p. 167.) glabrous; branchlets terete; leaves lanceolate-oblong, long-acuminated, tapering much to the base, on long petioles, membranous, shining above, and pubescent on the nerves beneath, and glandular in the axis; stipulas ovate, obtuse, connate at the base, sometimes furnished with 1-2 teeth at the apex, with a series of adpressed hairs within the insertion, deciduous; racemes small, terminal, oval, compact, on short peduncles, much shorter than the leaves; corolla long, slender, tubular, with an incurved border. $\pi$. S. Native of Pulo-Penang. Petioles long. Racemes smooth, consisting of opposite approximate more or less compound fascicules of long sessile flowers. Corollas nearly an inch long, with lanceolate acute lobes, and a naked throat. Anthers exerted. Filaments inserted near the middle of the corolline tube. Perhaps a species of Chasalia or Palicourea.

Curved-flowered Psychotria. Shrub. 152 P. ophioxyloides (Wall. in Roxb. fl. ind. 2. p. 168.) smooth, climbing, dichotomous; leaves lanceolate, on short petioles, acuminate; stipulas ovate, drawn out at the apex into an acumen, which is often bifid; corolla small, terminal; corollas long, slender, tubular, with incurved lobes. $\pi$. S. Native of Silhet, in the East Indies. Leaves smooth, acute at the base, about 5 inches long. Perhaps a species of Chasalia or Palicourea.

Snake-wood-like Psychotria. Shrub cl. 153 P. polyneura (D. C. prod. 4. p. 520.) glabrous; branchlets and peduncles compressed; leaves elliptic-ovate, short-acuminated, coriaceous, with usually 20 pairs of opposite lateral nerves; stipulas ovate, drawn out into a long sessile acumen, deciduous; corolla terminal, pedunculate, one half shorter than the leaves; limb of the calyx with 5 short teeth; corolla short, with a smoothish throat. $\pi$. S. Native of Nicobar Islands. It agrees with P. aurantacea in the stipulas, but differs from that plant in the short corollas, &c.; and from P. nervosa in the teeth of the calyx being acute, not obtuse, nor membranous.

Many-nerved-leaved Psychotria. Shrub. 154 P. wallichiana (Spreng. cur. post. p. 79.) leaves oval, acuminate, serrulate, nervet, glabrous; teeth of the calyx roundish, membranous; panicles terminal, glomerate. $\pi$. S. Native of Nipaul, Wallich. P. nervosa, D. Don, prod. fl. nep. p. 137. but not of Swartz.

Wallich's Psychotria. Shrub. 155 P. vaginale (D. C. prod. 4. p. 520.) glabrous; leaves ovate-oblong, cuspulate at the apex, attenuated at the base; stipules oval, where it was collected by Wall. It agrees with P. vaginale in the stipulas, but differs from that plant in the short corollas, &c.; and from P. nervosa in the teeth of the calyx being acute, not obtuse, nor membranous.

Sheathed-stipled Psychotria. Shrub. 156 P. malaya (Jack, in nail. misc. 1. no. 1. p. 3.) leaves broad-lanceolate; stipulas undivided; panicles terminal, coriaceous, combined into a sheath-like tube, which is bifid at the apex, having the lobes bidentate at the apex, in front of the leaves; panicles terminal, pedunculate, downy, with the rachis compressed, and the branchlets opposite; limb of the calyx broadly campanulate, truncate. $\pi$. S. Native of Ceylon. Ophioloxylon arboreum, Koen. in herb. Royen. Bracteas short, acuminate, spreading. Fruit unknown. Perhaps a species of Chiocoea.

Malay Psychotria. Shrub. 157 P. roxburghii (Blum. bijdr. p. 958.) stem herbaceous, creeping at the base; leaves ovate-oblong, attenuated, smooth above, reticulated beneath, and rather tomentose; stipulas ovate, bifid; cymes compound, pedunculate, axillary, rarely terminal; flowers secund; pyrene 1-ribbed. $\pi$. Z. S. Native of Java, on the mountains, in humid places. Berries globose, ribbed. Perhaps belonging to the first section of the genus.
Twisted-stemmed Psychotria. Pl. creeping.

158 P. divegens (Blum. bijdr. p. 959.) leaves oblong-lanceolate, acuminate at both ends, coriaceous, glabrous above, palloid beneath, and downy on the veins; stipulas bifid, ciliate, hardly shorter than the petioles; coryzms terminal, trichotomous; corollas funnel-shaped; drupes oval, dry, ribbed. H. S. Native of Java, on the higher mountains, in woods. P. divaricata, Blum. cat. hort. bull. p. 53, but not of Swartz.

Diverging Psychotria. Shrub.

159 P. echioides (Blum. bijdr. p. 959.) leaves lanceolate-oblong, acuminate, rather membranous, glabrous; stipulas broad-ovate, short, bidentate, adpressed; coryzms terminal, trichotomous; flowers densely crowded, sessile; calyxes obsoletely 5-toothed, and are, as well as the peduncles, colored; tube of the corolla elongated; drupes globose. H. S. Native of the West of Java, frequent in humid, shady places. Peduncles thickened at length. Pyrene 1-ribbed on the back, and fenestrate inside. Nearly allied to P. corymbosa and P. spheroxarpa.—There is a variety of this with oblong-lanceolate leaves.

Livid Psychotria. Shrub.

160 P. gandarussa-leaved Psychotria. (Blum. bijdr. p. 960.) leaves on short petioles, linear-lanceolate, acuminate at both ends, membranous, glabrous; stipulas ovate, acute, bidentate; cymes terminal and axillary, dense, trifid. H. S. Native of the Island of Java, in the province of Bantam, among bushes. Leaves 5 inches long, and 0-7 lines broad.

Gandarussa-leaved Psychotria. Shrub.

161 P. montana (Blum. bijdr. p. 960.) leaves oblong, acuminate at both ends, membranous, glabrous; stipulas intra-axillary, membranous, clasping the petioles; flowers terminal, umbellately corymbose; limb of the calyx urceolate, obsoletely 5-toothed; corolla with a short sub-cylindrical tube; drupes elliptic-globose; pyrene wrinkled, with one furrow on the back. H. S. Native of Java, on the mountains.

Mountain Psychotria. Shrub.

162 P. rostrata (Blum. bijdr. p. 961.) leaves on short petioles, oblong-lanceolate, much acuminate, membranous, glabrous; stipulas short, rather connate; coryzms pedunculate, dichotomous, or trichotomous; calyxes obsoletely 5-toothed; corolla with a short cylinclindrical tube; drupes nearly globose; pyrene smooth, obsoletely 1-ribbed. H. S. Native of Java, in shady places, on Mount Salak. Allied to P. montana and P. tetraandra.

Beaked Psychotria. Shrub.

163 P. tetraandra (Blum. bijdr. p. 961.) leaves on short petioles, oblong, acuminate at both ends, membranous, glabrous, reticulated beneath; stipulas short, acute; coryzms pedunculate, terminal; flowers tetradromous; drupes nearly globose, ribbed in the dry state. H. S. Native of Java, in woods on Mounts Salak and Seribu, &c. Sides of the leaves mucous.

Tetradromous-flowered Psychotria. Shrub.

164 P. rhinoceros (Reinw. in Blum. bijdr. p. 961.) leaves cuneate-oblong, acute, coriaceous, glabrous above, tomentose beneath; coryzms terminal, tomentose; stipulas bifid, or trifid; flowers capitulate; tube of the corolla sub-campanulate; drupes ovate-globose, furrowed in the dried state. H. S. Native of Java and Nusa-Kambanga, in humid parts of woods.

Rhinoceros Psychotria. Shrub.

165 P. robus (Blum. bijdr. p. 962.) leaves obovate, or cuneate-oblong, acuminate, coriaceous, glabrous; stipulas intra-axillary, acuminate, connate at the base, and clasping the petioles; panicles terminal, with whorled branches; limb of the calyx urceolate, obsoletely 5-toothed; tube of the corolla short, cylindrical. H. S. Native of Java, on the mountains. P. latifolia, Blum. cat. hort. bull. p. 54, but not of Wild.

Robust Psychotria. Shrub.

166 P. viridiflora (Reinw. in Blum. bijdr. p. 963.) leaves oblong-lanceolate, acuminate at both ends, membranous, glabrous; stipulas ovate, obtuse, with membranous margins, ciliated at the base; coryzms terminal, divaricately trichotomous; calyxes downy; tube of the corolla short, cylindrical; drupes nearly globose, somewhat 10-ribbed in the dry state. H. S. Native of Java, in humid places among bushes. Allied to P. stipulacea, Wall.

Green-flowered Psychotria. Shrub.

167 P. sylvestra (Blum. bijdr. p. 963.) leaves on long petioles, oblong-lanceolate, acuminate, glabrous; stipulas ovate, blumish, membranous at the top, clasping the petioles; coryzms terminal, trichotomous, glabrous; tube of the corolla short, cylindrical; drupes elliptic-globose, ribbed when dry. H. S. Native of Java, in mountain woods. Allied to P. viridiflora.

Wood Psychotria. Shrub.

168 P. expansa (Blum. bijdr. p. 963.) leaves elliptic-oblong, acuminate at both ends, membranous, connate at the base; cymes pedunculate, terminal, 3-5-parted; flowers sub-umbellate; calyx obsoletely 5-toothed; tube of the corolla short, cylindrical. H. S. Native of Java, at the foot of Mount Salak. Leaves rather large.

Expanded Psychotria. Shrub.

169 P. laxiflora (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, elliptic-oblong, attenuated at both ends, membranous, glabrous; stipulas connate; coryzms tripartite, loose; tube of the corolla somewhat campanulate; drupes nearly globose, furrowed when dry. H. S. Native of Java, in mountain woods.

Lax-flowered Psychotria. Shrub.

170 P. sarmentera (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, lanceolate-oblong, acuminate at both ends, finely veined, coriaceous, glabrous; stipulas connate; coryzms terminal, divaricate, trichotomous; tube of the corolla funnel-shaped; drupes elliptic-globose, furrowed when dry. H. S. Native of the west of Java, in woods on the higher mountains. Allied to P. paraestica, Swartz.

Sarmentera Psychotria. Shrub.

171 P. leucocarpa (Blum. bijdr. p. 964.) stem radicant and climbing; leaves on short petioles, lanceolate-oblong, acuminate at both ends, coriaceous, glabrous, terminal ones verticillately approximate; stipulas connate; coryzms terminal, trifid; flowers capitulate; drupes globose; pyrene smooth on the back. H. S. Native of Java, in woods on the mountains of Seribu. Allied to P. sarmentera.

White-fruited Psychotria. Shrub.

172 P. paciiflora (Barbl. in herb. Hanke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves narrow-oblong, acute, tapering much at the base, rather coriaceous, glabrescent; stipulas lanceolate, elongated, deciduous; coryzms terminal, trid to the base, having the branches bearing from 1 to 3 flowers; calyx truncate; fruit obovate. H. S. Native of the Island of Luzon. Colour of the leaves and habit almost of P. albula.

Few-flowered Psychotria. Shrub.

173 P. ixoroidea (Barbl. in herb. Hanke, ex D. C. prod. 4. p. 522.) glabrous; branchlets compressed; leaves oblong, tapering much at the base, short-acuminate at the apex, glabescent, hardly veined beneath; stipulas triangularly ovate, acute, deciduous; coryzms terminal, downy, pedunculate, trifid, with compact many-flowered branches; limb of the calyx with 5 short acute teeth; fruit globose. H. S. Native of the Island of Luzon.

Ixonoid Psychotria. Shrub.

174 P. mariana (Barbl. in herb. Hanke, ex D. C. prod. 4. p. 522.) glabrous; branches and peduncles compressed; leaves oval-oblong or obovate, blumish, attenuated at the base, rather coriaceous; stipulas caducous; cymes pedunculate, terminal,
shorter than the leaves, twice trifid; flowers sessile in the forks, and on the tops of the branchlets of the cyme; limb of the calyx campanulate, truncate, or bluntly toothed, and at length cleft irregularly. — S. Native of Marianne Island. Corolla short, campanulate, but obovate in the bud state. Fruit unknown.

Marianne Psychotria. Shrub.

175 P. membranifolia (Bartl. in herb. Hanke, ex D. C. prod. 4. p. 522.) glabrous; leaves ovate-oblong and oval, short-acuminate, membranous, veiny beneath; stipulas membranous, acutely bidentate, erose; panicles terminal, contracted, corymbose, almost sessile, much shorter than the leaves; anthers exerted. — S. Native of the Islands of Luzon and Sozogon, in the Philippine Archipelago. The leaves in the specimens from the Island of Luzon are more oblong and more acuminated at both ends than those from Sozogon.

Membrane-leaved Psychotria. Shrub.

176 P. lineariae (Bartl. in herb. Hanke, ex D. C. prod. 4. p. 522.) branches terete, and are, as well as the panicles, petioles, and leaves, especially on the nervation on the under surfaces, beset with rusty hairs; leaves long-linear, glabrous above; stipulas membranous, ovate, acuminate, caducous; flowers crowded in terminal fascicles, on short pedicels; calyx rather truncate; corolla villous; fruit obovate. — S. Native of the Island of Manilla, near Sozogon.

Linear-leaved Psychotria. Shrub.

177 P. Manilleensis (Bartl. in herb. Hanke, ex D. C. prod. 4. p. 522.) glabrous; branchlets rather compressed; leaves elliptic-oblong, acuminate, attenuated at the base, rather coriaceous, of a different colour beneath; stipulas ovate, acute, combined into a short ring at the base, deciduous; coryumbs triplicate, hardly pedunculate, with elongated branches, which are twice trifid at the apex; fruit ovate-oblong. — S. Native of the Island of Manilla, near Sozogon.

Manilla Psychotria. Shrub.

* * * * * * * * * * * Species natives of Australia.

178 P. colliana (Labill. sert. caled. p. 47. t. 47.) glabrous; branches nearly terete; leaves lanceolate-oblong, attenuated at both ends; stipulas ovate, caducous; coryumbs terminal, on short peduncles, shorter than the leaves, trichotomous; peduncles compressed; style bifid beyond the middle; berries roundish.

— S. Native of New Caledonia.

Hill Psychotria. Shrub.

179 P. loniceroides (Sieb. nov. holl. exsic. no. 263.) every part of the plant is clothed with rusty hairs; leaves elliptic or oblong, acute at both ends; stipulas lanceolate, acuminate, deciduous; panicles terminal, a little shorter than the leaves, with opposite distant branches, which are trifid, or twice trifid at the apex, with a sessile flower in each fork; bractees ovate, acute; berries ovate, crowned by the 5-toothed calyx.

— S. Native of New Holland. It is very like P. hirsuta of Swartz, with which it is joined by Sprengel, in his curr. post., but is still very distinct.

Honeysuckle-like Psychotria. Shrub.

180 P. speciosa (Forst. prod. no. 89.) arboreous; leaves oblong-lanceolate; involucrem terminal, usually 3-flowered. — S. Native of Otaheite. Cephalis speciosa, Spreng. syst. 1. p. 749. Showy Psychotria.

181 P. Daphnoides (Cunningh. in bot. mag. 3228.) shrub dichotomous, glabrous; branches very leafy at ends; leaves ob-ovate; stipulas nearly orbicular, bidentate, small; coryumbs terminal, few-flowered; mouth of corolla villous. — G. Native of New Holland. Flowers pure white.

Cult. All the species of Psychotria are of the most easy culture and propagation. They grow best in a mixture of loam, peat and sand; and cuttings will strike root readily, if planted in sand, with a hand-glass over them. Some of them bear handsome foliage, but the flowers of all are insignificant.

CLXXII. ANTONIA. CLXXII. PALICOUREA.

CLXXII. ANTONIA (named in compliment to the Archduke Antony of Austria, a promoter of botany.) Pohl, pl. bras. 2. p. 13. t. 109.

Gen. syst. Pentandra, Monogynia. Calyx with an oblong-cylindrical tube, which is covered by scales, and a 5-parted limb. Corolla funnelformed, with a bearded throat, and a 5-parted limb; segments lanceolate, acute, at length reflexed. Stamens 5, exerted, bearded at the base. Style long, filiform, thickened towards the apex; stigma bifid, obtuse. Berries oblong, 2-celled.—Shrub middle-sized. Leaves decussately opposite. Stipulas interpetiolar. Cymes terminal, many-flowered. Flowers by threes, white.

1 A. ovaeta (Pohl, l. c. 2. p. 14. t. 109.) leaves ovate-elliptic, quite glabrous, as well as the branches. — S. Native of Brazil, among bushes in dry places, about Joze de Tocantins, in the province of Goiyaz.

Ovate-leaved Antonia. Shrub 5 feet.

Cult. For culture and propagation see Psychotria above.

Gen. syst. Pentandra, Monogynia. All as in Psychotria, but differing in the corolla being tubular, nearly cylindrical, curved or gibous on one side at the base, shortly 5-cleft at the apex, and bearded beneath the middle inside. Teeth of the calyx and lobes of the corolla sometimes rather unequal.—Glabrous shrubs, all natives of America. Leaves opposite, rarely verticillate, usually large. Stipulas connected in various ways. Panicles terminal, sometimes elongated, sometimes thyroid, and sometimes cymose, sessile, but usually pedunculate. Corollas yellow or white. Anthers exerted or inclosed, either inserted in the bottom, middle, or upper part of the tube of the corolla. Flowers variable, rarely with a 3-celled ovary and 2-lobeal stigma.

§ 1. Flowers corymbose or cymose.

1 P. Sellowiiana (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves elliptic, acute at both ends, with undulate margins, on long petioles; stipulas bantly bidentate, with a large blunt recess; panicles cymose, fastigate, with angularly compressed branches; corollas glabrous; stamens inclosed; fruit roundish-ovate. — S. Native of Brazil, about Rio Janeiro, where it was collected by Sello. P. fastigiata, Cham. et Schlcht. in Linnaea, 4. p. 16, but not of Kunt.

Sello’s Palicourea. Shrub 6 to 8 feet.

2 P. fastigiata (H. et Kunt, nov. gen. amer. 3. p. 368, but not of St. Hilt.) glabrous; branchlets rather tetragonal; leaves elliptic, or ovate-oblong, acuminate, acute at the base, membranous; stipulas bidentate; coryumbs pedunculate; flowers on long pedicels, somewhat fastigate, glabrous; fruit ovate, nearly globose. — S. Native on the banks of the Orinoco, near Atures. Psychotria fastigiata, Spreng. syst. 1. p. 742. exclusive of the synonyme of Wild.

Fastigiata-flowered Palicourea. Shrub 6 to 8 feet.

3 P. tabernellioida (D. C. prod. 4. p. 525.) glabrous; branches terete; leaves large, soft, lanceolate, acuminate, petiolate; stipulas unknown; panicles almost cymose, short; segments of the calyx subulate; tube of the corolla slender, with
laceolate lobes. ß. S. Native of St. Domingo. Psychotria tabanafia, Poir. dict. 5. p. 704. Flowers cream-coloured, hardly half an inch long.

Tent-leaved Palicourea. Shrub 4 to 6 feet.

4 P. hebeBATHa (D. C. L. c.) glabrous; branches terete; leaves elliptic-oblong, acuminate, acute at the base; stipulas very short, somewhat bidentate; corollas pedunculate, terminal, rarely axillary, trichotomous, bracteate; corollas downy on the outside, curved; anthers a little exserted. ß. S. Native of French Guiana, where it was collected by Patria. Branches and peduncles yellow. Berries nearly globose, dillyanos, ribbed.

Yellow Palicourea. Shrub 5 to 6 feet.

10 P. punicA (D. C. prod. 4. p. 526.) glabrous; branchlets nearly terete, rufescent; leaves oblong-lanceolate, acute, shining on both surfaces; stipulas twin on both sides; subulate, connected by a short ligula; panicles corymbose, pedunculate, of a scarlet colour; corollas urceolate; berries roundish, didymous. ß. S. Native of Peru, in forests on the Andes. Psychotria punicA, Ruiz et Pav. fl. per. 2. p. 62. t. 42. f. a. Leaves 9 inches long, undulated. Bracteas subulate. Flowers glomerate. Corolla of a purplish scarlet colour, with a short tube, and ovate acute segments.

Scarlet-corymbed Palicourea. Shrub 6 feet.

11 P. crocA (Rom. et Schultes. syst. 5. p. 193.) glabrous; leaves ovate or oval-lanceolate, acuminate, stiltis; stipulas connected by a short ligula, twin on both sides, linear, acuminate, one half shorter than the petioles; panicles corymbose, terminal; corollas obconically tubular; anthers exserted from the tube, but shorter than the limb; berries rather didymous. ß. S. Native of Porto-Rico, Trinidad, Cuba, Guadaloupe, &c. Psychotria crocA, Swartz, fl. ind. occ. p. 429. Sieb. fl. trin. no. 28. Meyer, essq. 1. p. 105.?—Browne, jam. t. 13. f. 1. Leaves with prominent veins. Panicles and peduncles saffron coloured.

12 P. pedunculaA (D. C. prod. 4. p. 526.) glabrous; leaves elliptic-oblong, acuminate at both ends, and somewhat cuneate at the apex, stiltis; stipulas oval, deciduous; panicles corymbose, on long peduncles, with opposite branches; corolla funnel-shaped, glabrous, with revolute lobes; fruit ovate-globose. ß. S. Native of French Guiana, where it was collected by Patria. Psychotria pedunculA, Rich, act. soc. hist. nat. par. 1792. p. 107.?—Palicourea Cayennensis, Desv. in Ham. prod. fl. ind. occ. p. 29.?

Long-peduncled Palicourea. Shrub 4 to 6 feet.

13 P. chionaBATHa (D. C. L. c.) glabrous; leaves ovate, ending in a short point at the apex, hardly acute at the base, stiltis; stipulas oval, at length deciduous; panicles corymbose, pedunculate, shorter than the leaves, with opposite branches; corolla funnel-shaped, glabrous on the outside; anthers exserted; fruit obovate, pears-shaped, ribbed. ß. S. Native of Brazil, about Bahia, where it was gathered by Salzmann, G. Don, &c. Corollas snow-white, tubular, with linear-lanceolate lobes, and a villous throat. Stigma bifid. Lobes compressed.

Snow-flowered Palicourea. Shrub 4 to 6 feet.

14 P. umbellA (D. C. L. c.) glabrous; branches trigonal or tetragonal; leaves elliptic-oblong, acuminate, attenuated at the base, stiff, curved, on short pedicles; stipulas connected, sheathing, short, coriaceous, with 2 short teeth on both sides; corollas pedunculate, sub-umbellate, composed of 5-7 branches, which rise almost from the same point, and are corilymbose at the base; calyx acutely 5-toothed. ß. S. Native of French Guiana, where it was collected by Patria. On the same branch there is often opposite leaves, or 3-4 in a whorl. Stigma 3-cleft in many of the flowers.

Umbellate-corymbed Palicourea. Shrub 4 to 6 feet.
§ 2. Flowers panicled.

* Leaves disposed in whorls.

15 P. triphylla (D. C. prod. 4. p. 526.) glabrous; leaves 3 in a whorl, elliptic-oblong, acuminate at both ends, hardly petiolate; stipules twin on both sides, linear-subulate, hardly joined at the base, longer than the petioles; racemes terminal, pedunculate, downy, somewhat paniculate, longer than the leaves. ʃ. S. Native of French Guiana, where it was collected by Patris. Leaves 4-5 inches long, and 1½ broad. Raceme, along with the peduncle, 6 inches long. Fruit rather compressed, coarsely ribbed. Corolla unknown, hence the genus is doubtful.

Three-leaved Palicourea. Shrub.

16 P. verticillata (D. C. l. c.) branches tetragonal, glabrous; leaves 4 in a whorl, lanceolate-oblong, quite glabrous, on short petioles; stipula bifid; panicles pedunculate, downy; racemes of the panicule triquetrous, and the branches are angularly compressed; corollas glabrous; fruit orbicularly ovate. ʃ. S. Native of the south of Brazil, in woods. P. longifolia, St. Hil. pl. rem. bras. p. 232. t. 22. f. ʃ. Corollas yellow. Stamens inclosed.

Whorled-leaved Palicourea. Shrub 4 to 6 feet.

17 P. quadrifolia (Rudge, pl. guian. p. 27. t. 42.) stem tetragonal; leaves 4 in a whorl, oblong-lanceolate, acuminate; stipulae infrafoliaceous, sheathing; corymb many-flowered; peduncle a little shorter than the leaves. ʃ. S. Native of French Guiana.

Four-leaved Palicourea. Shrub.

18 P. tetraphylla (Cham. et Schlech. in Linnaea. 4. p. 17.) branches bluntly tetragonal, smooth; leaves 4 in a whorl, ovate, or lanceolate-oblong, attenuated at both ends, stiffish, on short petioles, glabrous above, and downy beneath; stipula bifid, with the lobes lanceolate, acute, and ciliated; peduncle terminal, pyramidal, large, pedunculate, downy; corollas glabrous on the outside. ʃ. S. Native of tropical Brazil.

Tetraphyllus Palicourea. Shrub 4 to 6 feet.

* * Leaves opposite, more or less petiolate.

Long-racemed Palicourea. Shrub 10 to 12 feet.

20 P. macrocarpa (B. et Kuntz, nov. gen. amer. 3. p. 569.) branches terete, glabrous; leaves obovate-oblong, short-acuminate, cuneate at the base, rather coriaceous, glabrous above, and hairy on the veins beneath; stipula bifid, glabrous; panicles pedunculate, spreading; corollas glabrous; fruit nearly globose. ʃ. S. Native of New Granada, in hot places. Physotria anacardifolia, Willd. in Rom. et Schultes, syst. 5. p. 190. Distinct from P. maccabotrys, with which it is joined by Sprengel.

Long-fruited Palicourea. Shrub 6 to 7 feet.

21 P. amethystina (D. C. proc. 4. p. 527.) branches somewhat tetragonal, rather hairy; leaves oblong-lanceolate, acuminate, glabrous above and villous on the nerves and veins beneath; stipulas connected together almost to the middle into a sheath, and drawn out into 2 subulate teeth on each side; panicles hairy, a little longer than the leaves; bracteoles subulate; fruit oval. ʃ. S. Native of Peru, in forests on the Andes at Pillao and Huanus-Huass. Psychotria amethystina. Ruiz et Pav. fl. per. 2. p. 57. t. 203. f. b. Glands 7 in the axis of each stipula. Corollas tubular, blue. Berries ovate, blue.

Blue-barred Palicourea. Shrub 10 to 12 feet.

22 P. longibracteata (D. C. prod. 4. p. 527.) branches slightly tetragonal, smoothish; leaves oblong, acuminate, on short petioles, clothed with villous down on both surfaces; stipulas connate at the base a little way, twin on both sides, linear, acuminate; panicles longer than the leaves, hairy; bracteoles elongated, rather foliaceous; berries roundish, compressed. ʃ. S. Native of Panama. P. amethystina ʃ. longibracteata, Bartl. in herb. Hänke. Very like P. amethystina, but differs in the petioles being 1-2 lines long, not 11-12; and in the stipulas not being glandular at the base, and connected only a very short way. Berries globose, blue. Corollas blue?

Long-bracteate Palicourea. Shrub 6 to 8 feet.

23 P. obovata (D. C. l. c.) branches bluntly tetragonal; leaves obovate, acuminate, large, veiny, downy on the nerves and veins beneath; stipulas connected, ovate, with 2 short blunt lobes on each side; panicles thyrsoid, downy, bractiaceous, longer than the leaves; calyx ciliated; corolla tubular; berries globose. ʃ. S. Native of Peru, on the Andes in forests at Chincha and Pillao. Psychotria obovata, Ruiz et Pav. fl. per. 2. p. 58. t. 204. f. a. Leaves a foot long. Stipulas glandular at the base. Corollas purple, villous inside. Berries purplish, almost globular.

Obovate-leaved Palicourea. Shrub 8 to 10 feet.

24 P. siris (D. C. l. c.) branches bluntly tetragonal; leaves lanceolate, acute at both ends, very soft and probably velvety above, and glabrous beneath; stipulas connate at the base, ovate, emarginate, with very blunt teeth; panicles divaricate, hardly longer than the leaves; corollas funnel-shaped. ʃ. S. Native of Peru, in forests on the Andes at Pillao and Chacahuasi. Psychotria mitis, Ruiz et Pav. fl. per. 2. p. 60. t. 208. f. b. Leaves 4-10 inches long. Peduncles tetragonal. Flowers sessile. Bracteas subulate. Corolla yellow, with a hairy throat. Authors linear, shorter than the corolla.

Mild-leaved Palicourea. Shrub.

Loose-flowered Palicourea. Shrub 8 to 10 feet.

26 P. hyacinthiflora (Rom. et Schultes, syst. 5. p. 194.) glabrous; branches bluntly tetragonal; leaves large, obovate, acuminate; stipulas bifid, with the lobes ovate, obtuse; panicles length of leaves; peduncles bractiaceous; bracteas small, ovate; corolla funnel-shaped, with long revolute lobes. ʃ. S. Native of Peru, on the Andes in forests. Psychotria hyacinthiflora, Ruiz et Pav. fl. per. 2. p. 62. t. 213. f. a. Psych. hyacinthifolius, Pers. ench. 1. p. 208. Panicles purple. Corolla violaceous. Stamens inclosed in the middle of the tube. Berries roundish, ovate, of a bluish violet colour.

Hyacinth-flowered Palicourea. Shrub 10 to 12 feet.

27 P. coriifolia (Rom. et Schultes, syst. 5. p. 194.) glabrous;
leaves lanceolate, acuminate, spreadingly deflexed; stipulas ovate, undivided, one-half shorter than the petals; branches of panicle opposite, lower and ultimate ones rising from the axis; flowers crowded at the tops of the branches of the panicle; corolla funnel-shaped, with revolute lobes; berries turbinate.

*Blue-berried Palicourea.* Shrub 9 to 10 feet.

28. P. sulphurea (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves obovate-cuneated, terminating in a short blunt point, coriaceous, nerved, shining above; stipulas bluntly 2-lobed, somewhat connected at the base; panicle loose, rather longer than the leaves; corolla funnel-shaped; fruit roundish.

29. S. Native of Peru, on the Andes in forests. Psyçhòtrîa sulphurea, Ruiz et Pav. fl. per. 2. p. 58. t. 203. f. a. Leaves yellowish, 6 inches long. Bracteae subulate. Corolla sulphur-coloured, having the tube villous inside beneath the throat. The shrub is very villous, and affords a yellow dye, which is used by the natives in the places of its natural growth.

**Sulphur-coloured-flowered Palicourea.** Shrub 10 to 12 feet.

30. P. sulphurea (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branchlets rather tetragonal, villous; leaves oblong, acuminate, narrowed at the base, rather coriaceous, downy or hairy above, and clothed with golden yellow hairy tomentum beneath, and particularly so on the nerves; stipulas villous, combined, bidentate: teeth subulate; petals sessile: corollas hairy.

*Yellow-flowered Palicourea.* Shrub 8 to 10 feet.

32. P. sulphurea (D. C. prod. 4. p. 528.) glabrous; branchlets bluntly tetragonal; leaves lanceolate, acute; stipulas twin on both sides, short, tooth-formed, connected by a ligula; petals thyrsoid, bracteate, longer than the leaves; berries ovate.

33. S. Native of Peru, on the Andes in forests at Cuchero. Psyçhòtrîa thyrsiforme, Ruiz et Pav. fl. per. 2. p. 57. t. 204. f. b. Leaves 5 inches long. Stipulas tridentate, the middle tooth ovate ciliated, and the lateral ones subulate. Calyces yellowish.

34. Corollas yellow, villous inside. Berries ovate, dark purple.

*Thrysae-flowered Palicourea.* Shrub 10 to 12 feet.

35. P. alpinna (D. C. prod. 4. p. 528.) branchlets tetragonal; leaves obovate-lanceolate, membranous, reticulated, a little ciliated; petals downy; stipulas twin on both sides, linear, rather ciliated, connected by a short ligula; petals terminal, erect, usually shorter than the leaves; corollas terete, elongated, diaphanous; anthers inclosed in the throat.

36. S. Native of Jamaica, on the Blue Mountains. Psyçchòtrîa alpina, Swartz, prod. p. 44. fl. ind. occ. p. 401. The leaves and branches are said to be glabrous. Peduncles rufescent. Corolla rather ventricose at the base, yellow, red, purple, and white. Berries nearly globose.

*Alpine Palicourea.* Shrub.

37. P. eriandra (D. C. prod. 4. p. 528.) branchlets terete; leaves elliptic, acute at the base, acuminate at the apex, glabrous above, hairy on the petals and nerves beneath; stipulas twin on both sides, subulate, joined by a membrane; petals terminal; calyx acutely 5-toothed, glabrous; corolla tubular, very hairy outside.

38. S. Native of St. Domingo. Psyçchòtrîa alpina, Poir. dict. 5. p. 702. exclusive of the synonyme of Desf.

*Wolly-flowered Palicourea.* Shrub 8 to 10 feet.

39. P. speciosa (H. B. et Kunth, nov. gen. amer. 3. p. 368.) branches glabrous, terete; leaves oblong, acuminated, acute at the base, membranous, roughish, shining; stipulas glabrous; peduncles pedunculate, with angular branches, which are as well the corollas downy. 39. S. Native of New Granada, near Santa Ana. Form of stipulas and fruit unknown. According to Sprengel, this is the same as Psyçhòtrîa hirugata, Willd. but not of Kuntz.

*Shonly Palicourea.* Shrub 6 to 8 feet.

40. P. elliptica (H. B. et Kunth, nov. gen. amer. 3. p. 369.) branchlets tetragonal, smoothish; leaves roundish-elliptic, acute, rounded at the base, coriaceous, stiff, glabrous above, and hairy or downy beneath; peduncles on short peduncles, with short dichotomous smoothish branches; corollas glabrous.

41. S. Native on the banks of the Oriñon. Psyçchòtrîa circinata, Willd. in Rom. et Schultes, syst. 5. p. 190. ex Spreng. syst. 1. p. 744. 7 Distinct from Psyçhòtrîa elliptica of Kert. and Willd.

*Elliptic-leaved Palicourea.* Shrub.

42. P. longifolia (D. C. prod. 4. p. 528.) branches terete, smooth; leaves ovate-lanceolate, acuminated, large, coriaceous, rather downy beneath, on short pedicles; peduncles one-half shorter than the leaves, with alternate horizontal branches; corolla with a very long tube, which is attenuated at the base, and short, straightish lobes.

43. S. Native of Cayenne. Psyçchòtrîa longifolia, Poir. dict. 5. p. 104, but not of Willd. Nerves of leaves and branches of peduncle yellowish. Stipulas unknown. In the specimen of the plant preserved in the royal museum at Paris, the leaves appear to be quite glabrous on both surfaces. Leaves 6-8 inches long.

*Long-flowered Palicourea.* Shrub.

44. P. Domingensis (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves ovate-lanceolate, acute, shining, petiolate; panicles terminal, usually twin; flowers sessile, cylindrical, incurved; berries shining.

*St. Domingo Palicourea.* Shrub 5 to 6 feet.

46. P. tilmifolia (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves ovate-oblong, acute, reticulated veined beneath, rather coriaceous, shining; stipulas bifid, obuse; panicles stiff, with angular thickened branches; corollas salver-shaped; stamens inclosed.

47. S. Native of South America. Psyçchòtrîa tilmifolia, Willd. in Rom. et Schultes. syst. 5. p. 190. Colladonia tilmifolia, Spreng. syst. 1. p. 716. and 757. Berries 3-celled, 3-seeded, probably from the same cause as those of Palicourea apiciform.

*Laurestine-leaved Palicourea.* Shrub.

48. P. crocoïdes (Desf. in Ham. prod. fl. ind. occ. p. 29.) leaves broad-ovate, acuminated, attenuated at the base, shining, quite glabrous; panicles on long peduncles.

49. S. Native of the Antilles. Branches safron-coloured, as in P. croceâ, to which it is very nearly allied, but differs in the flowers being smaller and fewer, and in the nerves of the leaves being common, not parallel. The stipulas, flowers, and fruit remain unchanged.

*Crocoïde Palicourea.* Shrub 4 to 6 feet.

50. P. coccinea (D. C. prod. 4. p. 529.) glabrous; leaves elliptic-oblong, acuminated at both ends, rather membranous; stipulas twin on both sides, setaceous, connected by a short ligula; panicles elongated, contracted; corolla with a short cylindrical tube, and an erect limb; anthers inclosed; berries roundish.

51. S. Native of St. Domingo and Porto-Rico. Psyçchòtrîa coccinea, Poir. pl. exsic. Very nearly allied to P. croceâ, and is probably often confused with it, but differs in the corollas and fruit being smaller, in the branches of the peduncle being erect and spreading, and usually alternate, in the stipulas being shorter and thinner, &c.

*Scarlet Palicourea.* Shrub 4 to 6 feet.

46. P. longifolia (H. B. et Kunth, nov. gen. amer. 3. p. 369.) 4 H
glabrous; branches terete; leaves lanceolate-oblong, acuminate, acute at the base, membranous, shining; stipulas caducous; panicles sessile; corollas smooth; S. Native of New Granada, near Santa Anna. This is a very distinct plant from Psychotria longiflora, Willd., with which it has been confounded by Sprengel in his syst. 1. p. 744.

Long-leaved Psychotria. Shrub.

41 P. angustifolia (H. B. et Kunth, nov. gen. amer. 3. p. 367.) branchlets hairy; leaves oblong-lanceolate, acuminate, acute at the base, membranous, stiff, discoloured, glabrous, rather hairy on the nerves and veins; stipulas glabrous, bidentate; teeth subulate; panicles pedunculate, hairy; corollas hairy; fruit nearly globose, didymous. S. Native of South America, on the banks of the Orinoco and Rio Negro. Psychotria scutrophylla, Sprung. syst. 1. p. 744.

Narrow-leaved Palicourea. Shrub.

42 P. klot i a n e f o l i a (Cham. et Schlecht. in Linnaea. 4. p. 18.). branchlets, panicles, stipulas, and under surfaces of leaves clothed with minute down; leaves ovoid-lanceolate, acuminate, short at both ends, membranous, glabrous above; stipulas truncate, drawn out into 2 lanceolate-linear teeth each; panicles elongated, contracted; corollas tubular, downy on the outside while young. S. Native of equinoctial Brazil. Segments of the corolla rather unequal, pilose at the apex. There are also 5 fascicles of hairs in the tube of the corolla. Berries nearly orbicular, flattened.

Tobacco-leaved Palicourea. Shrub 6 to 8 feet.

43 P. c a l o p h y l l a (D. C. prod. 4. p. 529.) glabrous; branches terete; leaves oblong, acute at the base, acuminate at the apex, on short petioles; stipulas combined at the base, twin on both sides, lanceolate, acuminate; panicles erect, shorter than the leaves, with very short few-flowered downy branchlets; corollas clothed with powdery tomentum. S. Native of French Guiana, where it was collected by Patris. Leaves 6-8 inches long, and 2 or 2½ broad. Newly allied to P. nicotianaefolia, but differs in the leaves being glabrous beneath, in the different form of the stipulas. The lobes of the stipulas appear as if they were verticillate, 2 being axillary, and the other 2 between the petioles.

Beautiful-leaved Palicourea. Shrub 5 to 6 feet.

44 P. petola r is (H. B. et Kunth, nov. gen. amer. 3. p. 376.) glabrous; leaves elliptic-oblong, acuminate, cuneated at the base, membranous, on long petioles: stipulas connate, acutely biset at the apex; panicles erect, clothed with very minute down; calyx glabrous, with acutish lobes. S. Native of New Andalusia, on Mount Tumiriquiri. Psychotria petolaris, Sprung. syst. 1. p. 745. Corolla unknown. Leaves 6-7 inches long. Petioles 1 or 1½ inch long. Panicles 3-4 inches long. Said to be nearly allied to P. guianensis.

Petiolar Palicourea. Tree 60 feet.

Guiana Palicourea. Shrub 7 to 8 feet.

46 P. henkeana (D. C. prod. 4. p. 539.) branchlets bluntly tetragonal; leaves petiolate, elliptic, acute at the base, and very blunt at the apex, or hardly cuspidate, glabrous, velvety beneath on the middle nerve and veins; stipulas triangular, acute; panicles terminal, pedunculate, much branched, equal in length to the leaves, with opposite or alternate spreading branches; corollas glabrous. S. Native of Peru, on the mountains about the Guanoco, where it was collected by Hanke. Cinchona Henkeana, Bartl. in herb. Hanke. Corollas purpulish, 4 lines long. Fruit unknown. Hanke's Palicourea. Shrub 6 to 8 feet.

47 P. barbarentia (D. C. prod. 4. p. 530.) branchlets terete, glabrous; leaves oval, acute at the base, cuspidate at the apex, stiffish, glabrous, with the nerves rather prominent beneath, and bearded on both sides; stipulas intraflacées, adpressed, very blunt, somewhat 2-lobed; panicles pedunculate, rather longer than the leaves, large, much branched, having the rachis angular, and the branchlets somewhat verticillate, spreading, and many-flowered; corollas clothed with powdery tomentum. S. Native of Porto-Rico, and probably of St. Domingo. Psychotria macropiliya and Psych. lutea, Sprung, in herb. Balb. A very beautiful species, nearly allied to P. guianensis, but very distinct. The nerves of the leaves become naked at length.

Beaded-leaved Palicourea. Shrub 6 to 7 feet.

48 P. costata (H. B. et Kunth, nov. gen. amer. 3. p. 366.) branchlets villous; leaves oblong, acuminate, acute at the base, membranous, glabrous, discoloured beneath, and hairy on the nerves and veins; stipulas hairy, bidentate, with the segments linear, and about equal in length to the petioles; panicles pedunculate, hairy; corollas hairy on the outside, and bearded inside. S. Native of South America, on the banks of the Orinoco and Rio Negro. Said to be nearly allied to Psychotria reticulata. Perhaps the same as Psychotria aristata, Willd. in Ramm. et Schultes, syst. vol. 5. to which it is referred by Sprengel.

Ribbed-leaved Palicourea. Shrub.

49 P. sionica (Mart. reis. ex Linnaea. 5. p. 39.) glabrous; leaves membranous, oblong, acuminate, rounded at the base on short petioles; panicles divericate; pedicels usually trifid; corollas velvety. S. Native of Brazil. The rest unknown, as in the following species.

Poisonous Palicourea. Shrub.

50 P. sions (Mart. l. c.) glabrous; leaves coriaceous, oblong, attenuated at both ends, acuminated or retuse; racemes subcorusciform, disposed into a large pyramidal panicle. S. Native of Brazil. Corollas velvety.

Sounding Palicourea. Shrub.

51 P. diuretica (Mart. l. c.) leaves with thickened revolute margins, velvety beneath the ribs and veins; racemes disposed into a subcorusciform panicle; flowers clothed with fine velvety down. S. Native of Brazil.

Diuretic Palicourea. Shrub.

52 P. officinalis (Mart. l. c.) shrub clothed with harsh yellow down in every part; leaves narrow-elliptic, on short petioles, acute or rounded at the apex, with a mucronate, tapering a little at the base; corollas disposed into a coarctate panicle.

S. Native of Brazil. Official Palicourea. Shrub.

53 P. aue'ata (Mart. l. c. p. 40.) leaves 4 in a whorl, membranous, stiffish, oblong or obovate, on long petioles, bluntish, glabrous, of a golden yellow colour beneath; racemes disposed in a coarctate panicle; corollas clothed with fine velvety down. S. Native of Brazil. Eared Palicourea. Shrub.

54 P. stre'vens (Mart. l. c.) bark corky; leaves coriaceous, stiff, glabrous on both surfaces, almost sessile, broad-ovate, obtuse at both ends, with thickened revolute margins, yellowish beneath; corollas disposed into a pyramidal panicle; corollas clothed with fine velvety down. S. Native of Brazil. Perhaps the same as P. rigidus?

Rattling Palicourea. Shrub.
*** Leaves opposite, sessile.

55 P. rigid a (H. B. et Kunth, nov. gen. amer. 3. p. 370.) glabrous; branches bluntly tetragonal; leaves elliptic, acute, rounded at the base, almost sessile, coriaceous, shining: stipulas twin on both sides, connected by a short ligula, almost linear, acute; pedicels on long peduncules, spreading; corollas clothed with very fine down; stamens exerted. \( \varphi \). Native of New Andalusia, on arid mountains, tropical Brazil, and at Caraquetas. Chaus. et Schlecht. in Linnaea. 4. p. 15. Psychotria rigida, Willd. in Rem. et Schultes, syst. 5. p. 192. Psych. byrsophylla and Psych. rigida, Spreng. syst. 1. p. 747. and 745. and perhaps P. strépens, Mart. Flowers yellow, varying from peta
termous to hexamereous.

CLXXIV. CHASALIA (in honour of D. Chasal, once governor of the Mauritius, a great lover of natural history). Comm. insc. Juss. mem. mus. 6. p. 379. A. Rich. mem. soc. hist. nat. pat. 5. p. 166. t. 16. f. 1. D. C. prod. 4. p. 531.—Psychotria, Coffea, and Nonatèla species, Sieb. Lin. syst. Peniculdris. Monogynia. Calyx with an ovate tube, and 4 lanceolate rather tubular limb, with an entire or 5-toothed border; lobes or teeth joined together at length. Corolla with an elongated terete equal tube, and 5 short acutish erect or spreading lobes, which are usually callous at the apex, and valvate in secession. Anthers 5, inserted in the middle or top of the tube of the corolla, inclosed or sometimes a little exerted. Stigmas 2, linear. Berries ovate, crowned by the limb of the calyx, containing 2 pyrene, hardly ribbed even in the dry state; pyrene coriaceous-chartaceous or horny, oblong, marked by a furrow inside, convex on the outside, and furnished by a longitudinal crest in the middle, which is extended beyond the base, l-seeded. Seed erect, with the transverse section arched, lunate, and compressed. Embryo at the base of a horny albumen.—Glabrous shrubs, all natives of the Mauritius. Leaves opposite or 3 in a whorl. Stipulas ovate, undivided or combined into a 4-cleft sheath. Flowers tubular, crowded and sessile on the tops of the branches, or disposed in terminal panicked corymbs. This genus differs from \( \psi \) \( \psi \) Corollae in the corolla being elongated, and from Palicourea in the corolla not being gibbous at the base, and from both in the urceolate or campanulate calyx. The habit is that of \( \varphi \) \( \varphi \) Gaertnèra, but the characters are very different.

* Flowers sessile, and crowded on the tops of the branches. Leaves opposite. —Chasalia, Juss.

1 C. capitata (D. C. prod. 4. p. 531.) leaves opposite, oval, or obovate, terminating in a very short point; stipulas ovate, acuminate, permanent, longer than the pedicels; flowers disposed in spicate heads at the tops of the branches, fascicled, sessile. \( \varphi \). Native of the Mauritius. Psychotria capitata, Sieb. fl. maur. no. 56. Corolla tubular, 8-10 lines long, with acute hardly open lobes. Leaves 2 inches long, and 12-15 lines broad. Stipulas 8-9 lines long. Fruit unknown. Perhaps the same as Chasalia Commersonii described by Jussieu.

Capitate-flowered Chasalia. Shrub.

** Flowers disposed in terminal panicked corymbs. Leaves opposite.

2 C. psycllorhoides (D. C. prod. 4. p. 531.) leaves opposite, obovate-oblong, bluntish, coriaceous, cuneated at the base, on very short pedicels; stipulas ovate, obtuse, about equal in length to the petioles; panicles corymbose, pedunculate: racis and branches compressed, opposite. \( \varphi \). Native of the Mauritius. Psychotria? Sieb. fl. maur. 2. no. 57. Internodes half an inch long. Leaves 2 1/2 to 3 inches long, and 15 lines broad. Corolla in the unexpanded state 7 lines long. Calyx bluntly 5-toothed.

Psychotria-like Chasalia. Shrub.

3 C. coffeoides (D. C. l. c.) leaves opposite, oblong, bluntish, cuneated at the base; stipulas ovate, acute, a little longer than the pedicels; panicles terminal, pedunculate, somewhat corymbose, with the rachis and peduncles compressed, and the branches opposite. \( \varphi \). Native of the Mauritius. Coffea capitata, Sieb. fl. maur. exsic. no. 385. Leaves 3 1/2 to 4 inches long, and 12-15 lines broad. Stipulas 5 lines long. Calyx with 5 acute short teeth. Corolla in the unexpanded state 3 lines long.

Coffee-like Chasalia. Shrub.

4 C. Fontanesii (D. C. l. c.) leaves opposite, obovate-oblong, bluntish, attenuated at the base; stipulas oval, obtuse, deciduous, shorter than the pedicels; panicles terminal, pedunculate, rather corymbose, with the rachis and branches compressed. \( \varphi \). Native of the Mauritius, and probably of the island of Bourbon. Coffea cymosa, Willd. in Rœm. et Schlüchtes, syst. 5. p. 201. Very nearly allied to C. coffeoides, but the stipulas are different. Petioles 4-6 lines long. Fruit ovate, crowned by the calyx. Flowers unknown.

De Fontanesii Chasalia. Shrub.

5 C. capitata (D. C. prod. 4. p. 539.) leaves opposite, obv

ative, acute, cuneated at the base; stipulas combined in the middle into a 4-cleft sheath, equal in length to the pedicels or longer than them: lobes acuminate, 2 of which are within the leaves, and 2 between the leaves; corollas terminal, trichotomous, with elongated branches, which bear a head of the flowers each at their tops. \( \varphi \). Native of the Mauritius. Psychotria, Sieb. fl. maur. 2. no. 271. Leaves 6 inches long. Corolla 6-7 lines long. Limb of calyx short, 5-toothed.

Large-stipuled Chasalia. Shrub.

6 C. divaricata (D. C. l. c.) leaves opposite, obovate-oblong, acute, cuneated a long way at the base, and petiolo
tate; stipulas ovate, obtuse, membranous, deciduous, 2 or 3 times shorter than the leaves; panicles corymbose, one-half shorter than the leaves; lobes of corolla short, acute, straight. \( \varphi \). Native of the Mauritius. Coffea divaricata, Tansch. ex Sieb. fl. maur. 2. p. 271. in herb. Dunant. Mussa'nda lanceolata, Poir. dict. 4. p. 392. and hence the Chasalia Bourboni, Comm.? Leaves 5-6 lines long, and 15 lines broad. Petioles about an inch long. Calyx urceolate, bluntly and shortly 5-toothed. Corolla 6 lines long.

Divaricata Chasalia. Shrub.

** Flowers disposed in terminal panicked corymbs. Leaves 3 in a whorl.

7 C. Bory'na (D. C. prod. 4. p. 532.) leaves 3 in a whorl, elliptic, acute at both ends, on long pedicels; stipulas deciduous; panicles trichotomous, a little shorter than the leaves; lobes of corolla short, ovate, spreading; anthers exerted a little from the throat; calyx subtruncate. \( \varphi \). Native of the Mauritius and the Island of Bourbon, where it was collected by Bory de St. Vincent. Sieb. fl. maur. 2. no. 253. Petioles 12-16 lines long. Leaves 4 inches long and 2 broad, with the nerves often white. Corolla 6 lines long.

Bory de St. Vincent's Chasalia. Shrub.

8 C. grandifolia (D. C. l. c.) leaves 3 in a whorl, elliptic, acuminate at both ends, rather membranous, on long pedicels; stipulas ovate, acuminate, rather longer than the pedicels; panicles thyrsoid, terminal, on short peduncles. \( \varphi \). Native of the Mauritius. Psychotria grandifolia, Sieb. fl. maur. 2. no. 55, but not of Rœm. et Schlüchtes. Branches bluntly triangular. Petioles 7-10 lines long. Leaves 5 inches long and 1 1/2 broad.

4 ii 2
Limbs of calyx short, hardly 5-toothed. Corolla 10-12 lines long. Anthers at the throat.

Great-leaved Chasalia. Shrub.

9 C. clusiaefolia (D. C. I. c.) leaves 3 in a whorl, obovate-oblong, obtuse, coriaceous, attenuated at the base; stipulas twin on both sides, ovate, obtuse, adpressed, shorter than the petioles; peduncles rising by three to the tops of the branches, angularly compressed, and densely coriaceous at the apex; bracteas numerous, short. ONSE. Native of the Mauritians. non-tella? clusiaefolia, Reich. in Sieb. fl. maur. no. 89. Branchlets angular. Leaves 2-3 inches long and 1 or 1/3 broad. Petioles 6 lines long. Bracteas one at the base of each pedicel, and 2 on each. Corolla 5 lines long in the unexpanded state.

Var. S. leaves opposite. ONSE. Growing along with the species.

Clusia-leaved Chasalia. Shrub.

Cult. For culture and propagation see Psychotria. p. 599.

CLXXV. Jackia, CLXXVI. Cephalis.

Sect. I. Tapogomea (Tapogomo is the Guiana name of the first species). D. C. prod. 4. p. 533. Heads of flowers involucrated by 2 large spreading connate coloured bracteae.

1 C. tomentosa (Willd. spcc. 1. p. 977.) branches, petioles, peduncles, leaves, and involucral hairy; stipulas aminatimated, villous; heads of flowers on long peduncles; leaves of involucrum sessile, ovate-obovate, 2-3 inches wide at the base. p. 8. Native of Guiana, Trinidad, and probably of Mexico (if C. cyanocarpa, Moc. et Sesse, fl. mex. icon. ined. be the same,) in open spaces of woods, and about waysides. Tapogomea tomentosa, Aubl. guian. 1. p. 160. t. 61. Cephalis tomentosa, Vahl, ecol. 1. p. 19. Callicoea tomentosa, Gmel. syst. 1. p. 371. Peduncles axillary and terminal. Bracteas or involucrum scarlet, or of a vermilion-colour, large, sometimes long-acuminated, and sometimes only cuspidate. Branches obscurely tetragonal. Berries striated, ex Aubl., but blue and smooth according to the fig. in fl. mex. There are therefore 2 species probably confused. In Trinidad we have seen this shrub growing in great abundance, and where it makes a very elegant appearance from its scarlet bracteae; the flowers, as far as we can remember, are brownish, and the berries bluish.

Tall Cephalis. Cilt. 1795. Shrubs 12 to 15 feet.

4 C. rubellaris (Cham. et Schlecht. in Linnaea. 4. p. 134.) every part of the plant is clothed with short hairs; leaves broad-lanceolate, acute, attenuated at both ends, on short petiolo, membranous; stipulas triangular, bifid at the apex; heads of flowers terminal, almost sessile, solitary or by threes; floral leaves connate and dilated; bracteas reticulately nerved, lanceo-

Subtribe II. Cepheletae (the plants contained in this subtrice agree with the genus (Cephalis in the flowers being disposed in involucrated heads). D. C. prod. 4. p. 532.—Cepheletae, Cham. et Schlecht. in Linnaea. 4. p. 133. Flowers disposed in fasciculate heads; the heads involucrated by bracteae.

LIN. SYST. Pentandria, Monogynia. Calyx with an obovate tube, and a very short 5-toothed limb. Corolla funnel-shaped, with 5 small blanituous lobes. Anthers inclosed. Stigma bifid, usually exerted. Berries obovate, oblong, 2-celled, 4-seeded, crowned by the vestiges of the calyx.—Shrubs and herbs, natives of America. Leaves ovate, acute, petiolate. Stipulas twin on both sides, free or combined, and sometimes bidentate or bipartite. Heads of flowers terminal or axillary, sessile or pedunculate, involucrated by 2-8 bracteae, which are disposed in a cruciately opposite manner; there are also bracteoles or paleae among the flowers.—Perhaps the species with dry berries, and those with fleshy berries, ought to be separated into distinct genera. Perhaps Evae is properly joined with this genus, notwithstanding its tetrandrous flowers. Probably Carapaecia might be joined with this genus, but for its exerted stamens.
large, longer than the calyx. \( \varphi \). S. Native of equinoctial Brazil.

*Ruellia-leaved Cephalis.* Shrub 4 to 5 feet.

** sect II. Calligecæa** (from καλλιεργος, kallitatos, the most beautiful, and καλλις, kallos, a berry; the berries are blue or pulpy). D. C. prod. 1. p. 533. Heads of flowers involucrated by distinct ovate or oblong erecely adpressed bracteas.

* Shrubs. Heads of flowers pedunculate.

5 C. justi
ceticfollia (Rudge, pl. guian. 1. p. 28. t. 43.) glabrous; branches dependent, knotted; leaves oval-lanceolate; stipulas truncate, bidentate; heads on long peduncles, involucrated by broad-lanceolate bracteas; calyx nearly entire. \( \varphi \). S. Native of Guiana, on the banks of rivers. Peduncles downy. Bracteas fulvous. Corolla with a bearded throat. Flowers sessile on a disk formed by the bases of the bracteas.

* Justicea-leaved Cephalis.* Shrub 6 to 8 feet.

6 C. stipulaceæ (Blum. biijdr. p. 1005.) stem suffruticosse, nearly simple; leaves cuneate-oblong, acuminate, glabrous; stipulas semi-ascending; heads on very short peduncles, axillary, and terminal, involucrated by roundish bracteas. \( \varphi \). S. Native of Java, on the mountains. Stipulas large, membranous. Margin of calyx truncate, entire. Berries dry, 3-celled, compressed, the commissure drawn out into a prominent angle on both sides.

* Stipulaceæ Cephalis.* Shrub 1 to 2 feet.

7 C. ligulæris (Rich. miss. ex D. C. prod. 4. p. 533.) glabrous; leaves petiolate, oval, acute; stipulas broad, emarginate; peduncles compressed, solitary, involucrated by 9-10 ligulate bracteas; calyx hardly 5-toothed. \( \varphi \). S. Native of French Guiana. Scardëra ligulæris, Rudge, pl. guian. 1. p. 29. t. 815. Tratt. tab. t. 84. According to Richard, the ovary is 2-celled, and the cells 1-seeded, and therefore it is a true species of *Cephalis*.

* Ligular-bracteate Cephalis.* Shrub.

8 C. salicifolii (H. B. et Kunth, nov. gen. amer. 3. p. 376.) glabrous; leaves almost sessile, lanceolate, acuminate, shining; stipulas subulate, combined at the base; heads of flowers pedunculate, terminal, involucrated by 4 ovate-cordate leaves or bracteas. \( \varphi \). S. Native of New Andalusia, in arid places on Mount Cocollar. Involution green. Branches compressed while young.

* Willow-leaved Cephalis.* Tree 20 feet.

* Glabrous Cephalis.* Shrub 2 to 3 feet.

10 C. bracteocædæa (D. C. prod. 4. p. 534.) branches terete, clothed with velvet down while young, but glabrous in the adult state; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined a little way at the base; heads of flowers pedunculate, terminal, downy, involucrated by 4-6 acute bracteas, which are cordate at the base. \( \varphi \). S. Native of French Guiana, where it was collected by Patris; and of Brazil, in the province of Bahia by Salzmann.

\( \varphi \) a; bracteas acuminate, purplish.—Native of Guiana.

\( \varphi \) b; bracteas pale, less acuminate. Native of Brazil, at Bahia. Corollas flesh-coloured.

\( \varphi \) c; bracteas pale, hardly acuminate, rather ovate at the base.—Native of Guiana.

* Heart-bracteate Cephalis.* Shrub 2 to 3 feet.

11 C. ambi
guæ (D. C. prod. 4. p. 534.) branches terete, downy, compressed while young; leaves elliptic-oblong, tapering to both ends, downy on the veins beneath; stipulas twin on both sides, subulate, joined together a little way at the base; heads pedunculate, terminal, smoothish, involucrated by 4-6 bracteas, which are hardly cordate at the base, and very blunt at the apex. \( \varphi \). S. Native of Brazil, near Bahia, in shady valleys, where it was collected by Salzmann. Involucrum violaceum.

* Ambiguous Cephalis.* Shrub 2 to 3 feet.

12 C. cromæa (Meyer, essq. p. 107.) glabrous; branches rather tetragonal; leaves ovate, short-acuminate at both ends; stipulas linear, twin; heads terminal, globose, on short peduncles, involucrated by 8 oblong-linear bracteas, and without any palea among the flowers. \( \varphi \). S. Native of Dutch Guiana, at Essequibo. Corolla suffrason-coloured, villous outside. Leaves of involucrum villous, yellowish.

* Saffron-coloured-flowered Cephalis.* Shrub.

13 C. Humboldtiana (Cham. et Schlecht. in Linneae. 14. p. 363.) glabrous; leaves elliptic-lanceolate, tapering to both ends, on short petioles, firm and shining; stipulas tooth-formed on both sides at the base of the petioles; heads terminal, pedunculate, nearly globose, loose; bracteas membranous, nerved; outer ones roundish-ovate; inner ones more acute. \( \varphi \). S. Native of South America, at Javiana, and other places.

* Humboldts Cephalis.* Shrub.

14 C. dichotoma (Rudge, pl. guian. 1. p. 29. t. 44.) glabrous; branches dichotomous; leaves on short petioles, ovate-lanceolate; stipulas bidentate; heads terminal, on short peduncles, involucrated by nearly orbicular bracteas. \( \varphi \). S. Native of French Guiana, and of Brazil, near the river Iheos, if C. dichotoma, Nees et Mart. nov. act. bon. 12. p. 17. be the same. Bracteas fulvous. Calyx obvolutely 5-cleft. Fruit furrowed, as in the genus *Psychotria*.

* Dichotomen Cephalis.* Shrub 6 to 8 feet.

15 C. Swardze (D. C. prod. 4. p. 534.) glabrous; branches rather tetragonal; leaves ovate-lanceolate, acuminate, nerved, petiolate; stipulas broad, combined, acuminate, at length ciliated; heads terminal, globose, pedunculate, involucrated by 5 ovate concave bracteas; palea among the flowers obtuse. \( \varphi \). S. Native of the West India Islands, and of St. Lucia, &c. C. violacea, Swartz, prod. p. 45. fl. ind. occ. 439. exclusive of the syncymes. Peduncles an inch long, quadrangular. Corollas bluish. Berries blue. Bracteas violaceous. It differs from the true *C. violacea* in the heads of the flowers being pedunculated, in the stipulae being ciliated, and in the palea among the flowers being obtuse.

* Swartzs Cephalis.* Shrub 4 to 6 feet?

16 C. Marahamhænis (Leaves broad-oblong, acuminate, membranous, glabrous; heads of flowers terminal and axillary. \( \varphi \). S. Native of Maraham, on the banks of rivulets. Shrub branched. Flowers violaceous.

* Maraham Cephalis.* Shrub 4 feet.

17 C. ferrugineæ (Climbing, villous; leaves oblong-lanceolate, acuminate, rusty beneath, petiolate; peduncle axillary, elongated, villous; heads involucrated by many leaves. \( \varphi \). S. Native of Sierra Leone, on the banks of rivulets.

* Rusty Cephalis.* Shrub cl.

18 C. pedunculata (Salis. par. Lond. 2. t. 99.) stem terete, swelled below the joints; leaves oblong-lanceolate, glabrous, tapering to both ends; stipulas twin on both sides, combined almost to the top, keeled; heads of flowers pedunculate, terminal, or in the forks of the branches; outer bracteas repandly toothed; calyx bearded; segments of calyx horned on the back. \( \varphi \). S. Native of Sierra Leone. Flowers white.

* Pendunculate Cephalis.* Fl. Feb. Ch.? Shrub 2 feet.
19. C. coria'ce.a; leaves oblong, coriaceous, dark green; heads on long peduncles, involucrated by many leaves. h. S. Native of Sierra Leone, on the edges of woods.

Coriaceae-leaved Cephalis. Shrub 2 to 3 feet.

** Shrubs. Heads of flowers sessile.

20. C. violacea (Willd. spec. 1. p. 977. exclusive of the synonyme of Swartz) glabrous; branches nearly terete; leaves oval, acuminate, on short pediels; stipulas broad, somewhat concave, obtuse, rather scariosus at the apex; heads of flowers terminal, globose, sessile, declinate, involucrated by 5 ovate-shaped bracteas; paleae among the flowers acute. h. S. Native of French Guiana, in woods, in humid places. Tapogómea violacea, Aubl. guian. 1. p. 137. t. 60. Leaves 3-5 inches long, Bracteas and corollas violaceus. Berries blue, angular.

Violaceae-flowered Cephalis. Shrub.

21. C. nud'a (Cham. et Schlecht. in Linneus. 4. p. 135.) glabrous; leaves elliptic-lanceolate, sub-acuminate, membranous, on short pediels; stipulas small, thin, on both sides acute; heads terminal, sessile, few-flowered, involucrated by pellucid, membranous bracteas. *S. Native of Brazil, near Rio Janeiro.

Naked Cephalis. Shrub 4 to 6 feet.

22. C. musc'osa (Swartz, prod. p. 46. fl. ind. occ. p. 442.) glabrous; leaves ovate-oblong, attenuated at both ends, on short pediels; stipulas sheathing, bidentate on both sides; heads terminal, almost sessile, involucrated by numerous oblong bracteas; paleae among the flowers toothed. *S. Native of Martini'que, in mountain woods, and by river sides. The same plant has been found in French Guiana, Trinidad, about the Havannah, in Cuba, &c. Morinda musc'osa, Jacq. am. 65. t. 35. Tapogómea musc'osa, Poir. dict. 7. p. 587. Leaves 3-4 inches long. Stipulas rusty. Corollas white. The branches are always covered with moss.

Mossy Cephalis. Tree 15 feet.

23. C. axillari's (Swartz, prod. p. 45. fl. ind. occ. p. 441.) glabrous; leaves petiolate, oblong, acuminate at both ends; stipulas ovate, combined, membranous, obtuse; heads axillary, sessile, glabrous, involucrated by 4-6 bracteas; paleae among the flowers ovate, obtuse. *S. Native of the West Indies, as of St. Christopher, Guadaloupe, &c. Tapogómea axillaris, Poir. dict. 7. p. 585.

24. C. oblong'a (D. C. prod. 4. p. 553.) glabrous; branches dichotomous, terete; leaves oblong, tapering to both ends, on short pediels; stipulas acuminate at length, truncate, ciliated; heads terminal, sessile, involucrated by 4 oblong bracteas. *S. Native of French Guiana. Branches purplish. Leaves painted with white above, as in C. purpure'a, 2-3 inches long, and an inch broad. Berries almost dry, striated, much smaller than peas.

Oblong-leaved Cephalis. Shrub.

25. C. prun'folia (H. B. et Kuntz, nov. gen. amcr. 3. p. 377.) bracteas terete, downy; leaves oblong, acute, mucronate, glabrous, shining; stipulas bidentate; teeth furrowed; heads terminal, sessile, involucrated by 4 spatulate ciliolate bracteas. *S. Native of South America, in shady places on the banks of the Orinoco, near the estuary of Maypures. Involucrum green. Corollas blue. There is a variety of this species with tetratomic flowers, hence the genus *Eca has been joined with Cephalis.

Plum-leaved Cephalis. Shrub.

26. C. fe'grans (Hook. et Arn. in Beech. voy. pt. bot. p. 64. t. 13.) flowers tetramorous; branchlets compressed; leaves broad-oval, obverse, coriaceous, glabrous, reticulately veined, on short pediels; stipulas ovate, acuminate; pedicles bibracteate at the base; bracteas heart-shaped; flowers by threes, sessile. *G. Native of Elizabeth Island, one of the Society Islands. It seems to approach C. speciosa, Sprengel, from Ota'hiti.

Corollas red.

Fregorgi Cephalis. Tree 20 feet.

Eeva Cephalis. Shrub.

** * Herbaceous plants.

28. C. purp'e'rea (Willd. spec. 1. p. 978.) stems creeping, ascending, hispid from rufescent hairs at the tops; leaves oblong, acuminate, hispid on the nerves beneath, and ciliated on the edges; stipulas twin, hispid; heads terminal, almost sessile, involucrated by 2 oblong bracteas, which are, as well as the paleae among the flowers, ciliated. *S. Native of French Guiana, in woods, and of Maranham. Tapogómea purpurea, Aubl. guian. 1. p. 162. t. 63. f. 3. Callicocca purpure, Gmel. syst. 1. p. 371. Leaves painted with a white line above. Corollas and berries purple.

Purple-flowered Cephalis. Fl. April, June. Pl. creeping.

White-flowered Cephalis. Fl. creeping.

Although the root of ipecacuanha has been long employed as a valuable article of the Materia Medica, yet the botanical characters of the plant which produced it remained unknown till Professor Brotero, of Colombia, determined the genus to which it ought to be referred, with the assistance of observations made in Brazil, on living plants; by Bernardo Gomez, a resident medical botanist. The plant is a native of moist woods near Permambuco, Bahia, Rio Janeiro, and other provinces of Brazil. It is called Ipecacuanha by the natives of some parts of Brazil;
Posla do Matte by those of the southern provinces; and Cipo by others, which is the name often given to it by the Portuguese settlers. The root is simple, or a little branched, and furnished with a few short radicles, irregularly bent, externally brown, wrinkled from rings.

It appears that a native of Brazil, whose name was Michael Tristan, was the first who brought ipecacuanha into use. He speaks of it as a remedy for dysentery. Piso afterwards describes it, and speaks of two sorts (hist. nat. bras. p. 101.), the white and brown, which he says were given for fluxes, and as vomits. But we are indebted to Helvetius for bringing it into general use, under the patronage of Louis XIV., from whom he received a thousand pounds, to reveal the secret medicine with which he so successfully treated dysentery. Besides the brown ipecacuanha, there is another sort, brought from Brazil, which varies in appearance from the former; and some have supposed that these differences are owing to accidental circumstances, such as the place of growth, the kind of soil, &c.; but, on the authority of M. Gomez, the common brown ipecacuanha of the shops, is yielded to Cepheila ipecacuanha, while the white is the root of Richard'sia scabra and R. rosea, which is exported largely to Portugal. Besides these, the name of ipecacuanha, which, in the language of South America, means vomiting root, is given to various species of Cynanchum, Asclepias, Euphorbia, Datura, and Rauvolfia; and with regard to their comparative power, De Candolle says that vomiting is produced by 22 grains of Cynanchum; by 24 of Psychotria emetica; by from 60 to 72 of Viola calceolaria; and by from 1 to 3 drachms of C. ipecacuanha. Linnaeus, in a paper published in the third volume of "Amicitiae Academicae," gave ipecacuanha, as a trivial name, to a species of Euphorbia, a native of Virginia and Carolina, the root of which is there used as an emetic. But this was soon discovered not to be real ipecacuanha. In his second "Mantissa" he gave the trivial name to a species of VIOLA, a native of Brazil, the root of which he supposed to be the white ipecacuanha of the shops. De Candolle, in a paper published in the "Bulletin des Sciences par la Société Philomathique," and republished entire in the "Neuveau Dictionnaire d'Histoire Naturelle," says there are three species of Viola which produce the white ipecacuanha; the V. calceolaria, a native of Guiana and the Antilles; the V. ipecacuanha, and the V. parviflora, both natives of Brazil. The roots of these, and especially the last, are sometimes mingled in common with the true, or brown, ipecacuanha; but they are a fraudulent adulteration, and do not possess its active properties. They may be distinguished by their colour, but most certainly by the size of the woody part, which in these is always considerably thicker than the bark; whereas in the true ipecacuanha it is much less, and, as described by Brotero, is only a fibre.

The black or striated Ipecacuanha (Psychotria emetica) is exported from Carthagena to Caliz, and is also said to be the Peruvian grey ipecacuanha. The root is black within and without, fusiform, articulated, striated, and not annulated. The white ipecacuanha is described by Gomez to be the root of Richard'sia scabra; it is of a dirty white, and turns brown by drying; it is simple, or a little branched, often 5 or 6 lines thick, 3 inches long and upwards, variously twisted, and tapering at its extremities, with transverse annular ruggosities, larger than those of the brown ipecacuanha. The common brown ipecacuanha is exported from Rio Janeiro to Portugal. Its colour varies from different degrees of grey and brown; but it is characterized by being contorted, wrinkled, and unequal in thickness; having a thick brittle bark, deeply fissured transversely, covering a central, very small white wood, so as to give the idea of a number of rings strung upon a thread.

Qualities and chemical properties.—Powdered ipecacuanha has a sickly odour, and a bitterish acid taste; and on those who pulverize it, sometimes excites such powerful effects as to produce nausea, faintings, and spitting of blood. It has been subjected to various chemical investigations, and Dr. Irvine ascertained that it contains a gum resin. MM. Pelliot and Magendie, while pursuing their investigation on ipecacuanha, discovered that the power of the various kinds of ipecacuanha depended on a peculiar principle, to which the name emetine has been given; and they think that it might upon all occasions be substituted with advantage, being much more active than ipecacuanha itself, without possessing its disagreeable taste and smell. The latter quality resides in a greasy substance, quite distinct from its emetine virtue; for M. Caventou swallowed it with impunity to the extent of 6 grains.—All vegetable astringents, as infusion of galls and vegetable acids, weaken or destroy the power of ipecacuanha; and Dr. Irvine found that half a drachm, administered in 2 ounces of vinegar, had little effect.

Medical properties and uses.—The utility of ipecacuanha is generally known, and properly appreciated. As an emetic, it operates in doses of from 5 to 30 grains, surely and efficiently, without depressing the system at large, like many other emetics, or injuring the mucous membrane of the stomach; it is therefore to be preferred as a mere evacuant of that organ, and can be given in the fullest doses with perfect safety, and without exciting much nausea. Its power as an emetic has been rather undervalued in one particular view; for if opium be taken, recourse is generally had to violent remedies, which, by simple contact with the stomach, when in a torpid condition, cannot fail to produce injurious results. Ipecacuanha is sometimes employed in a full dose after the accession of a paroxysm of intermittent fever; and, by destroying the link which held the chain of diseased sympathies together, it has often succeeded in cutting short the disease. Paroxysms of spasmodic asthma also often yield to the same treatment; and in the more chronic form of that disease, small doses advantageously produce both expectoration and perspiration. In chronic dysentery and diarrhoea, it is a most useful medicine in small doses. Given in doses of half a grain, it promotes secretion in the lining membrane of the bowels, whereby a healthy condition is eventually re-established, and is, therefore, frequently prescribed in cases of dyspepsia, attended by a foul tongue. Small nauseating doses are advantageously given to subdue uterine and pulmonary haemorrhages; and combined with opium, the effects of both appear to be modified; so that under the name of Dover's powders, doses of from 5 to 10 grains form one of the most powerful and useful sedatives that can be employed for acute or chronic rheumatism, and for eruptive diseases that are disposed to recede. Nauseating doses of ipecacuanha are also useful for hooping-cough, epilepsy and aneurism. Two kinds of emetine are obtained from ipecacuanha—the coloured emetine and pure emetine; the latter is white and powdery, not acted on by the air, whereas coloured emetine is deliquescent. The cases in which emetine may be given, are the same as those in which ipecacuanha is indicated. Pure emetine is much more powerful than the coloured. Two grains are sufficient to kill a large dog. The official preparations are Pulvis ipecacuanhæ, Compositum et Vinum ipecacuanhæ. Pectoral lozenges of emetine are useful in chronic pulmonary catarrhs, hooping-cough, obstructive diarrhoeas, &c.

Ipecacuanha Cephalis. Pl. 2/3 to 1 foot.

31 C. rubra (Hoffm. ex Willd. Mus. in Rave. et Schultes, syst. 5. p. 214.) stem dichotomous, knched; leaves ovate, acuminate, petiolate, glabrous above, and downy beneath; stipulas sheathing, lindentate; heads terminal, on short peduncles, involucrated by 6 unequal bractes. 2. H. S. Native of Brazil. Roots creeping. Veins of leaves purple. Stems flexuous, tumid at the joints.
Red-veined-leaved Cephalis. Pl. 1 foot. 32 C. colora'ta (Hoffm. ex Willd. mas. in Räum. et Schultes, syst. 5. p. 213.) stems herbaceous, simple, glabrous; leaves oblong, tapering at both ends, roughish beneath; stipulas furnished with 2 bristles on each side; heads terminal, on short peduncles. 2. S. Native of Brazil. Stems thickened at the joints.

Coloured Cephalis. Pl. 1 foot. 33 C. fure'scens (Hoffm. l. c.) stem simple, herbaceous, downy; leaves elliptic, acute at both ends, downy at the veins; heads pedunculate, terminal, involucrated by many leaves. 2. S. Native of Brazil, at Bahia.

Downy Cephalis. Pl. 1/2 to 1 foot. 34 C. Hoffmianse'giana (Räum. et Schultes, syst. 5. p. 214.) stem herbaceous, branched; branches dichotomous or trichotomous; leaves oblong, narrowed at both ends, acuminate; heads terminal, surrounded by a 4-leaved involucrem. 2. S. Native of Brazil. C. dichotoma, Willd. rel. but not of Rugde. Nearly allied to C. rubra, but the stems are much taller. Hoffmannsegg's Cephalis. Pl. 2 feet.

† Species not sufficiently known.

35 C. germiff'lora (Willd. rel. and Schultes, syst. 5. p. 213.) leaves obovate, tapering at both ends, glabrous; heads globose, twin, on long peduncles, involucrated. 2. S. Native country unknown.

Bulb-flowered Cephalis. Shrub. 36 C.? biden'ta (Hanb. ex Willd. rel. in Räum. et Schultes, syst. 5. p. 214.) leaves oblong, acuminate, glabrous; heads globose, terminal; involucrem 2-leaved, bidentate. 2. S. Native of Sierra Leone.

Bidentate-involucrated Cephalis. Pl.? Cult. See Psychótria, p. 599, for the culture and propagation of the shrubby species; and Geophila, p. 609, for those of the herbaceous kinds.

CLXXVII. CARAPICHEA (Carapichea is the Caribbean name of the first species). Aubl. guian. 1. p. 167. t. 68. D. C. prod. 4. p. 536. Cepha'lis species, Willd. Juss. Eutróphiæ, Neck. elem. Lin. syst. Pentándria, Monógy'nia. All as in Cephæ'lis, except in the anthers and stigmata, which are a little exerted. Berries dry, bipartite, angularly furrowed, crowned by the small limb of the calyx; nuts or pyræm 1-seeded, smooth on the outside, not striated, as in Cephæ'lis.—Glabrous shrubs, with rather nodose branches. Leaves petiolate, oval, acuminate. Stipulas twin on both sides, combined at the base, and therefore bidentate. Heads of the flowers rising from the axils of the upper leaves, on short peduncles, deflexed, girdled by 4 acute bracteas. Corollas white. According to Willdenow, Jussieu, and Richard, this genus should only form a section of Cepha'lis.

2 C. Patrisis (D. C. prod. 4. p. 536.) stipulas combined, bidentate at the apex; bracteas of the heads of the flowers nearly equal, ovate, acute. 2. S. Native of French Guiana, where it was collected by Patris. Stems terete, dichotomous. Leaves ovate-lanceolate, acute at the base, and acuminate at the apex. Heads on very short peduncles, hardly larger than peas. Corolla white, hairy on the inner part of the limb. Anthers linear, exserted.

Patris's Carapichea. Shrub 5 to 6 feet. Cult. See Psychotria, p. 599, for culture and propagation.

CLXXVIII. SUTERIA (named after John Rudeph Suter, a professor at Bern in Switzerland; author of Flora Helvetica, &c.). D. C. prod. 4. p. 556.—Cephalis species of Lindl.

Lin. syst. Pentándria, Monógy'nia. Calyx with an ovate tube, and a tubular angular limb, which is 5 times longer than the ovaryum, having an unequally 5-toothed border. Corolla salver-shaped, with a terete tube, a naked throat, and 5 ovolobobolobes. Anthers sessile, inclosed. Stigma bilamellate. Fruit 2-celled, 2-seeded.—A glabrous shining shrub, with terete branches. Leaves almost sessile, oblong-lanceolate. Stipulas ovate, deciduous. Heads of flowers axillary, almost sessile, usually 6-flowered, surrounded by ovate-follicaceous bracteas. Paleæ among the flowers linear. Corollas white, almost like those of jasmine, sweet-scented.—This genus differs from Cephæ'lis in the form of the calyx.

1 S. calyce'na (D. C. prod. 4. p. 536.) 2. S. Native of Brazil. Cephalis calycina, Lindl. coll. t. 21.

CLXXIX. GEO'PHILA (from γη, ge, the earth, and φιλεια, philēia, to love; the species creep on the surface of the earth, and the stems never rise beyond it). D. Don, prod. fl. nec. p. 136, and of Berg. D. C. prod. 4. p. 537.—Psychotria species, Lin.—Cepha'lis species, Kuntz. Lin. syst. Pentándria, Monógy'nia. Calyx with an obovate tube, and a 5-parted limb; segments linear, spreadingly recurved. Corolla tubular, with a pilose throat, and 5 oval somewhat recurved lobes. Anthers 5, inclosed. Stigma bifid. Berry ovoid, angularly ribbed, crowned by the calyx, 2-celled, 2-seeded.—Perennial depressed creeping herbs. Leaves petiolate, cordate, similar to those of some species of Viola. Stipulas solitary on both sides, undivided. Pedunces rising from the axis of the ultimate leaves, terminal, solitary, bearing many flowers at the apex. Flowers almost sessile, umbellate, involucrated by bracteas, which are shorter than the flowers.

1 G. keni'roëmis (Cham. et Schlcht. in Linnæa. 4. p. 137.) petioles hairy above; leaves reniform, obtuse, with the lobes at the base approximate; bracteas linear; peduncles 4-6-flowered, shorter than the leaves. 2. S. Native of South America, in shady places; as of Jamaica, Porto-Rico, Cubas, about the Ori'noco, Brazil, Guiana, Society Islands, &c. Psychotria herbacea, Lin. spec. p. 245. Jacq. amer. t. 46. Tuss. ant. t. 8. Psychot'rophum herbaceum, Browne, jan. p. 161. Cephalis reniformis, H. B. et Kunth, nov. gen. amer. 3. p. 377. Flowers white. Berries red. There are varieties of this with downy or glabrous stems and leaves. Leaves always glabrous beneath.

2 G. vi'la'ce'a (D. C. prod. 4. p. 537.) petioles hairy above; leaves cordate-reniform, obtuse, glabrous, with the lobes approximate at the base; umbels few-flowered, almost sessile between the ultimate pair of leaves; bracteas linear-lanceolate. 2. S. Native of Cayenne and Guiana, in woods (Aubl.); and of the Isthmus of Panama (Hænke). Psychotria violacea, Aubl. guian.
Violaceous-flowered Geophila. Pl. creeping.

5 G. diversifolia (D. C. pro. p. 557.) petals and peduncles clothed with short hairs or down; leaves reniformly cordate, rounded or acute, glabrous on both surfaces, paler beneath, with the lobes at the base approximate; heads 2 or few-flowered; bracteas linear-lanceolate, downy. \( \text{fl.} \) S. Native of Java, on the mountains; and probably of Malabar and Sihle, &c., if the Karinta-Tali, Rhed. mal. 10. 1. 21. be the same. Psychotria herbaecae, Roxb. fl. ind. 2. p. 161. and therefore G. reniformis, D. Don, pro. fl. nep. p. 136. Cephalis diversifolia, Blum. bijdr. p. 1004. Flowers white? Berries red?

Diverse-leaved Geophila. Pl. creeping.

4 G. violacea (D. C. l. c.) petals hairy above; leaves roundish-cordate, acute, glabrous on both surfaces, with the lobes at the base divericate; peduncles about equal in length to the petals; bracteas lanceolate; umbellules 6-9-flowered. \( \text{fl.} \) S. Native of New Granada, on the banks of the river Magalacena, in humid places. Cephalis violacea, H. B. et Kunth, nov. gent. vol. ii. p. 379. Psychotria kederzeka, Willd. in Roem. et Schultes, syst. 5. p. 191. Corolla white, glabrous, 4 times longer than the calyx.

Violet-leaved Geophila. Pl. creeping.

5 G. macroroda (D. Don, pro. fl. nep. p. 136.) petals roughish; leaves cordate, acute, glabrous; peduncles length of leaves; bracteas linear-lanceolate; umbellules 3-6-flowered. \( \text{fl.} \) S. Native of Peru, in groves, along the tract of Pillao to Izwuna. Psychotria macroroda, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. b. Psychotria cordifolia, Dietr. gebrn. f. l. 1. 618. Berries dark purple. Seeds smooth.

Long-peduncled Geophila. Pl. creeping.

6 G. gracilis (D. Don, l. c.) petals striated, beset with retrograde hairs at top; leaves cordate, acute, rather pilose above; peduncles length of petals; bracteas subulate; umbells 6-9-flowered. \( \text{fl.} \) S. Native of Peru, in forests at Pillao and Pueblo-Nuevo. Psychotria gracilis, Ruiz et Pav. fl. per. 2. p. 63. t. 211. f. c. Corollas pale-violaceous, glabrous inside. Berries ovate, blackish. Seeds trisulate.

Scler Geophila. Pl. creeping.

Cult. A mixture of vegetable mould and sand, or peat and sand, is the best soil for the species of Geophila; and they are easily increased by detachment of their creeping stems.

Linn. syst. Tetra-Heptandra, Monogynia. Calyx with an obovate-globose tube, and a very short entire or 4-toothed limb, rarely 5-6-toothed. Corolla with a short nearly terete tube, and 4-6 oblong spreading lobes. Stamens 4-6; anthers sessile within the throat. Stigma bluntly bifid. Berries globose, crowned by the nearly closed calyx, smooth, 2-celled, 2-seeded.

—Glabrous shrubs, natives of South America. Leaves on short petioles, oval or ovate, acuminate at the apex. Stipulas broad at the base, and subulate at the apex. Flowers sessile, crowded into heads in the axils of the leaves or tops of the branches. Heads propped by 4 small bilaterally opposite bracteas. This genus differs from Psychotria in the capitate inflorescence, in the sessile bracteas, and in the number of the floral parts being usually quaternary.

1 P. coccysea (Aulb. l. c.) stipulas undivided; leaves oval, acute at the base; heads of flowers sessile; flowers tetramorous; throat of corolla naked. \( \text{fl.} \) S. Native of French Guiana, in the woods of Orope. Lam. ill. no. 1464. t. 65. Cephalis sessiliflora, Willd. spec. 1. p. 979. Flowers red.

Scarlet Patabee. Shrub 4 to 5 feet.

2 P. \( \text{fl.} \) tenuiflora (D. C. pro. p. 558.) leaves oblong, acute at both ends, membranous; stipulas 4, lanceolate-linear, connate at the base; heads of flowers some sessile, and others pedunculate; corolla with a naked throat, linear lobes, and a slender tube; limb of calyx truncate. \( \text{fl.} \) S. Native of French Guiana, where it was collected by Patris. Leaves 5-6 inches long and 1/2 broad. Bracteas small. Fruit unknown.

Slighted-flowered Patabee. Shrub 4 to 5 feet.

3 P. \( \text{fl.} \) alta (H. B. et Kunth, nov. gen. amer. 3. p. 375.) leaves ovate, rounded at the base; stipulas bifid at the apex; cymes pedunculate; flowers pentameros and hexameros; throat of corolla villous. \( \text{fl.} \) S. Native of South America, on the banks of the Orinoco, near Mayapures, and San Fernando. Cephalis cynosura, Spreng. syst. 1. p. 749. Psychotria Mayapurusis, Willd. rel. in Roem. et Schultes, syst. 5. p. 190. ? ex Spreng. Calyx violaceous. Corollas white.

White-flowered Patabee. Shrub.

Cult. See Psychotria, p. 599. for culture and propagation.

CLXXXI. SALZMANNIA (named after M. Salzmann, a collector of plants in Mauritania, and afterwards in Brazil). D. C. prod. 4. p. 617.

Linn. syst. Tetrandria, Monogynia. Calyx with an oval cup, and a very bluntly 4-toothed or sinuated permanent limb. Corolla with a short tube, and 4 oblong lobes. Abalabra tetragonal. Stamens with very short filaments, and very long anthers. Style 1, undivided, or the lobes are combined. Berry dry, crowned by the limb of the calyx, 1-celled in the adult state by abortion, compressed, oval, 1-seeded. Seed compressed.—A glabrous Brazilian shrub. Branches at first tetragonal, but terete in the adult state. Stamipus truncate, very short. Leaves opposite, ovate, on short pedicels, shining above, and as if they were varnished. Peduncles axillary, opposite, very short, bearing dense heads composed of 10-12 flowers, girded by 2-4 ovate foliaceous bracteas. Flowers sessile within the bracteas, white. This genus appears to come nearest to Cephalis, from which it differs in the very long anthers, in the compressed fruit, and in habit.

1 S. nitida (D. C. prod. 4. p. 617.) \( \text{fl.} \) S. Native of Brazil, about Bahia on arid hills. Corolla a line and a half long. Leaves 1 1/2 inches long and 1 broad, obtuse.

Shining-leaved Salzmania. Shrub 5 to 6 feet.

Cult. See Psychotria, p. 599. for culture and propagation.

Tribe X.

Spermacoceae (this tribe contains plants agreeing with the genus Spermacoce in particular characters). Clam. et Schlecht. in Linnaea, 3. p. 309. A. Rich. mem. soc. hist. nat. Paris. 5. p. 147. D. C. prod. 4. p. 538. Stigma bilamellate (f. 109. b.). Fruit dry or hardly fleshy, usually of 2, rarely of 3-4 1-seeded mericarps or nuts, which are sometimes combined, and sometimes separating from each other, indehiscent or dehiscent in various ways. Albumen between fleshy and horny.

—Shrubs or herbs. Leaves opposite. Stipulas membranous at the base, and usually of many bristles at the apex.

Subtribe 1. Cephalanthinae (this subtribe only contains the genus Cephalanthus). D. C. prod. 4. p. 538. Flowers and fruit crowded and sessile, upon globose receptacles. Fruit divisible into 2 parts.

Sect. II. Naucleoides (from Nauclea and idea, like; the species resemble species of the genus Nauclea). D. C. prodr. 4. p. 539. Glands in the recesses between the lobes of the calyx and corolla.—Indian species.

4 C. naucleoides (D. C. prodr. 4. p. 539.) leaves opposite or 3-4 in a whorl, ovate-lanceolate, acuminate, on short petioles, villous beneath, and on the branchlets; stipulas inlastraceous, acuminate; heads terminal, subverticilicate. ‡ S. Native of the East Indies, in Silhet. Nauclea tetrándra, Roxb. fl. ind. 2. p. 125. Peduncles terminal, from 3 to 4 in whorled panicles. Flowers yellow, intermixed with filiform clavate scales. Capsules turbinate, 2-celled, 2-seeded; the cells 2-valved. According to Cham. et Schlecht. in Linnæa. 4. p. 147. This species is more nearly allied to Cephalanthus than to Nauclea, from the tetraneous flowers, and single seeded cells of the fruit.

Nauclea-like Button-wood. Tree 10 to 20 feet.

† Asiatic species not sufficiently known, and probably ought to be excluded from the genus altogether.

5 C.? Plučiler (Lam. diœt. 1. p. 679.) leaves opposite, approximate, ovate, bluntly acuminate, smooth on very short petioles; peduncles axillary, leafy, a little shorter than the leaves. ‡ S. Native of the East Indies. Fruit and number of the parts of the flowers unknown. Leaves hardly 2 inches long. Heads of flowers hardly the size of peas. Pile-bearing Button-wood. Shrub.

6 C.? Plučilfiorus (Wild. fl. in Rœm. et Schultes, syst. 5. p. 521.) leaves elliptic, tapering to both ends, bluntish; heads of flowers terminal and axillary, numerous. ‡ S. Native of Asia. The rest unknown. Pileflowered Button-wood. Shrub.

7 C.? orientalis (Rœm. et Schultes, syst. 3. p. 105. but not of Lin.) arboreous; leaves opposite or 3 in a whorl, ovate, acuminate, reflexed, glabrous; peduncles terminal; divided; fruit bacca. ‡ S. Native of China. C. orientalis, Lour. coch. p. 67. but not of Lin. Acbróyron orientale, Spreng. syst. 1. p. 386. A large tree. Flowers white, tetramerous, and tetrurous. Berries 1-seeded, red, edible. Perhaps a species of Morinda. According to Sprengel, this with the following species will constitute a distinct genus, which he has called Acbróyron.

Eastern Button-wood. Tree large.

8 C.? Angustifiorus (Lour. coch. p. 67.) arboreous; leaves opposite, lanceolate-linear; heads of flowers terminal; lobes of calyx subulate, beset with glandular hairs; fruit bacca. ‡ G. Native of Cochinchina. Acbróyron angustifiorum, Spreng. syst. 1. p. 386. Receptacle of flowers villous. Flowers pale, tetramerous and tetrurous. Berries roundish, crowned, 2-celled, 1-seeded, aggregate into a globose head. Perhaps a species of Morinda, or perhaps will form a distinct genus along with the preceding species.

Narrow-leaved Button-wood. Tree.

† † The two following species should be removed from the order altogether.

9 C.? procumbens (Lour. coch. p. 67.) stem procumbent; leaves alternate, ovate-lanceolate, tomentose; racemes terminal, interrupted; flowers 5-cleft, dioecious. ‡ G. Native of Cochinchina. Stilbe procumbens, Spreng. syst. 1. p. 418. Flowers violaceous. The female flowers on a naked global receptacle. Flowers numerous, on long peduncles, forming a ball or head. Stigma simple. This plant ought evidently to be excluded from the order, but it is hardly a species of Stilbe.

Procumbent Button-wood. Shrub procumbent.

Willow-leaved Button-wood. Shrub 10 feet.

Sect. I. Platanocéphalus (from πλατανος, platans, the plane-tree, and χεφαλη, kephale, a head; the heads of flowers resemble those of the plane-tree). D. C. prodr. 4. p. 538.—Platanocéphalus, Vaill. act. acad. par. 1722. Glands none in the calyx or corolla.—American species.

1 C.? occidentalis (Lin. spec. 138.) leaves opposite or 3 in a whorl, ovate or oval, acuminate; peduncles much longer than the heads, usually by threes at the tops of the branches. ‡ S. Native of North America, from Canada to Florida, in marshy places. Duham. arb. 1. t. 54. Schkuhr, handb. t. 21, and t. 5. b. fruit. Lois. herb. amat. t. 272.—Plank. aln. 336. t. 77. f. 4. C. oppositifolius, Meench. meth. p. 487. Petioles reddish next the branches. Heads of flowers globular, size of a marble. Flowers whitish-yellow. There are varieties of this species having the branchlets and young leaves either glabrous or downy.

Var. β. brachipodus (D. C. prodr. 4. p. 539.) leaves elliptic-oblong, 3 in a whorl, on short pedicels. ‡ G. Native of the North of Mexico, near Rio de la Trinie and Bejar, where it was collected by Berlandier. Petioles 3–4 lines long. There are varieties of this either with glabrous or downy branches.

2 C. Sakaund (Cham. et Schlecht. in Linnæa. 2. p. 610. and 4. p. 147.) leaves opposite or 3 in a whorl, oblong, acuminate, on very short petioles; peduncles hardly longer than the heads, 3-5-together at the tops of the branches. ‡ S. Native of the south of Brazil, where it is called Sarandi by the natives, and where it was collected by Sello; common on the coasts of La Plata and Caracass; and of Peru, ex Henke. Budden glabra, Spreng. syst. 1. p. 431. ex Cham. et Schlecht. in Linnæa. Glabrous. Leaves lanceolate or ovate-lanceolate, red beneath while young, and hairy in the axils of the secondary veins. Heads of flowers verticillate in the axils of the upper leaves, and umbellate at the tops of the branches, much smaller than those of the first species, Sarandi. Button-wood. Shrub 10 to 15 feet.

3 C. Salicifolius (Humb. et Bonpl. pl. equin. 2. p. 63. t. 98.) leaves opposite or 3 in a whorl, linear-lanceolate, on very short petioles; heads of flowers on long peduncles, terminal, solitary. ‡ S. Native of Mexico, near Acapulco. Stipulas linear-subsulate, permanent, twin on both sides. Heads of flowers white.

Willow-leaved Button-wood. Shrub 10 feet.
Cult. See *Spermacoce* for culture and propagation.

**CLXXXV. BORRERIA** (named after William Borrer, F.L.S. &c. one of our first British botanists). Meyer, exs. p. 79. Cham. et Schlecht. in Liñanea. 3. p. 310. Spreng. neue entd. 2. p. 144; but not of Aeh.—Bigelowia, Spreng. syst. 1. p. 394, but not of his neue entd. nor of others.—Chlorophytm and *Spermacoce*, Polh, in litt.—*Spermacoce* species. Lin. Lam. Spreng. A. Rich.—Gruñhamiá, Neck. elem. no. 323.? Linn. syst. *Tetrandria, Monogynia.* Calyx with an ovate tube, and a permanent limb, which is parted into 2-4 teeth. Corolla salver-shaped or funnel-shaped, 4-lobed. Stamina 4, exserted or inclosed. Stigma bifid or univided. Capsule crowned by the limb of the calyx, 2-celled, opening from the apex at the dissepiment when mature, but without any free dissepiment; coccce or nuts 1-seeded, opening by a longitudinal chink inside. Seeds ovate-oblong, marked in front by a longitudinal furrow.—*Herbs or subshrubbs, nearly all natives of the hotter parts of America.* Stems and branches usually tetragonal. Leaves opposite, or the young ones are disposed in fasicles in the axils of the old ones, and therefore appearing verticillate. Stipulas joined with the petioles, more or less sheathing, fringed by many bristles. Flowers disposed in verticillate heads in the axils of the leaves, or on the tops of the branches, rarely cymose or corymbose, small, white, rather blue.

§ 1. Flowers disposed in axillary and terminal verticillate heads: the terminal heads are girded by floral leaves, which are longer than them.

* Teeth of calyx only 2.

1 B. *Globularioides* (Cham. et Schlecht. in Liñanea. 3. p. 312.) plant shrubby, erect, glabrous; branches somewhat tetragonal; leaves narrow-lanceolate, acuminate, with scabrous margins, paler beneath; bristles of stipulas longer than the sheath; heads of flowers globose, terminal or lateral; calyx bidentate; genitals exserted. ♂. ♀. Native of equinoivial Brazil. *Spermacoce* fruticos, Polh, in litt. Heads of flowers a little larger than peas. Flowers 3 times the size of those of *B. verticillata*, white. Capsule glabrous; nuts opening but slowly.

**Globularia-leaved Borreria.** Shrub 1 to 1 ½ foot.

♂. ♀. Native of Brazil, in dry places at Rio Janeiro.

**Whorled-flowered Borreria.** Fl. June, July. Clt. 1732. Sh. 2 to 3 feet.

3 B. *Konautilana* (Cham. et Schlecht. in Liñanea. 3. p. 311.) plant suffruticose, glabrous; branchlets tetragonal; leaves oblong-linear, bluntish, mucronate, opposite, but appearing verticillate from clusters of young ones in their axils; bristles of stipulas shorter than the sheath; whorls of flowers globose, terminal, and axillary; capsule downy, crowned by the bidentate calyx. ♂. ♀. Native of Senegal and Gambia; and probably

---

**CLXXXIV. OCTODON.** Liñanea. 3. p. 310. Spreng. neue entd. 2. p. 144.
RUBIACEÆ. CLXXXV. Borreria.

Kohaut's Borreria. Fl. Ju. Aug. Ct. 1732. Shrub 1 to 2 ft. B. stricëta (Meyer, essq. p. 83. t. 1. f. 1-3. fr.) stems herbaceous, suffruticose, rather compressed, tetragonal; branchlets dichotomous; leaves lanceolate, acutely mucronate, glabrous, with serrulate margins; stipulas hairy, ciliate, with bristles at the apex; heads or whorls of flowers terminal and axillary; capsule scabrous from dots, glabrous, obtuse, crowned by the 2 subulate teeth of the calyx. S. S. Native of Porto-Rico, where it was collected by Ledru and Wydler. Flowers white. Nearly allied to B. verticillata, but differs in the capsule being twice longer. Lower leaves almost lanceolate-linear, rather scabrous on the margins at the top; upper ones usually with revolute margins.

Straight Borreria. Shrub 1/2 to 1 foot. B. dichotómia (Cham. et Schlecht. in Linnaea. 3. p. 348.) stem suffruticose, rather compressed, tetragonal; branchlets dichotomous; leaves lanceolate, acutely mucronate, glabrous, with serrulate margins; stipulas hairy, ciliate, with bristles at the apex; heads or whorls of flowers terminal and axillary; capsule scabrous from dots, glabrous, crowned by the 2 ovate-lanceolate teeth of the calyx. S. S. Native of Peru, near Ayavaca, (Diodia glabra, Willd. herb.), and on Mount Tanqueragua (Knöxia dichotóma, Willd. herb.). Spermacéè dichotóma, H. B. et Kunth, nov. gen. amer. 3. p. 348. Flowers white.

Dichotomous-branched Borreria. Shrub 1 to 2 feet. B. podoce'phala (D. C. prod. 4. p. 542.) stem branched, tetragonal, glabrous, rather downy at the nodi; leaves linear, glabrous, opposite, or falsely verticillate, almost veinless, with revolute margins; bristles of stipulas 5-7, longer than the sheath, which is downy; heads of flowers globose, and if as they were pedunculate, in consequence of the lateral branches being naked, except the 4 floral leaves surrounding each head; capsule oblong, glabrous, crowned by the 2 subulate calyceal teeth. S. S. Native of Mexico or of Cuba. This species differs from all the others in the heads of flowers being on long tetragonal peduncles, which are 1-2 inches long, naked and glabrous, sometimes rising from the forks of the branches, then solitary, and sometimes from the axils of the leaves, then opposite.

Stalked-headed Borreria. Pl. 1 foot. B. dístáns (Cham. et Schlecht. in Linnaea. 3. p. 340.) stems herbaceous, erect, tetragonal, having the angles becset with retrograde prickles; leaves lanceolate, glabrous, with serrulate scabrous margins; stipulas hairy, ciliate with bristles; whorles of flowers capitately remote; capsule oblong, villous at the top, crowned by the 2 subulate teeth of the calyx. S. S. Native of Mexico. Spermacéè distáns, H. B. et Kunth, nov. gen. amer. p. 344. Spermacéè spiculátá, Willd. herb. Spermacéè acúlátá, Schlecht. in Schultes, syst. 3. p. 531. Flowers white. Very nearly allied to B. verticillata. Corolla funnel-shaped, a little longer than the calyx.

Distant-whorled Borreria. Pl. 1 foot. B. densíflora (D. C. prod. 4. p. 542.) stem erect, tetragonal, glabrous; leaves linear, with revolute margins, 1-nerved, glabrous; bristles of stipulas 7-9, longer than the sheath; whorles of flowers dense, sessile, 2-3 axillary, and the terminal one globose, and larger than the axillary ones; floral leaves 1-6, reflexed; capsule linear-oblong, villous at the apex, crowned by the 3 subulate calyceal teeth. S. S. Native of Jamaica. Spermacéè longifólia, L'Hérit. herb. but not of Aubl. Superior leaves 2 inches long, and 1-2 lines broad. Corollas small, glabrous.

Dense-flowered Borreria. Shrub 1 to 2 feet. B. spínösa (Cham. et Schlecht. in Linnaea. 3. p. 340.) stem erect, herbaceous, simple, glabrous, somewhat tetragonal, with the angles a little mucrinated; leaves lanceolate-linear, acuminate, attenuated at the base, glabrous, with roughish margins: the mid-rib drawn out into a pricklike-formed tubercle at the apex; stipulas membranous, bristly; whorles of flowers capitately axillary ones 2-3, and the terminal one surrounded by a 8-leaved involucreum; capsule oblong, downy at the apex, crowned by the 2 subulate teeth of the calyx. S. S. Native of Jamaica, in filds; and of Martinique and Mexico. Spermacéè spinósa, Lin. spec. 148. exclusive of the syn. of Jacq. Swartz, obs. p. 45. Flowers white.

Spiny-leaved Borreria. Pl. 1 ft. B. neesi'ana (D. C. prod. 4. p. 542.) glabrous, erect; stems herbaceous, tetragonal; leaves lanceolate, acute, scabrous on the mid-rib and margins; bristles of the stipulas 5, ciliated; whorles of flowers white, one of them terminal; calyceal teeth 2, scutaceous; throat of the corolla closed with hairs. S. S. Native of Brazil. Spermacéè linifólia, Nees. herb. bol. p. 49. but not of Vahl. Spermacéè neesi'ana, Schultes, mant. 3. p. 289. Flowers white. The same as B. Bogotá'ensis, according to Sprengel, but doubtful according to Cham. et Schlecht. in Linnaea. 3. p. 311.

Nees's Borreria. Pl. 1 foot. B. repens (D. C. prod. 4. p. 542.) stems herbaceous, creeping, dichotomous, low, tetragonal, with the angles winged and pilose, and the sides striated; leaves oblong, acute, attenuated at the base, glabrous; bristles of stipulas shorter than the sheath, which is villous; heads of flowers roundish, sessile in the forks, and at the tops of the branches, and nearly in the axils of all the leaves; capsule ovate, rather villous, crowned by the 2 acute teeth of the calyx. S. S. Native of the Mauritius. Bigelowia parvifóra, Sieb. fl. marr. exsic. no. 144. but not of Spreng. Flowers white.

Creeping Borreria. Pl. creeping. B. mínima (D. C. prod. 4. p. 542.) plant glabrous, herbaceous, small, sparingly branched; stems tetragonal; leaves oblong-linear, acuminate at both ends; bristles of the stipulas rather shorter than the sheath; heads of flowers terminal, involucrated by 4 leaves; calyceal teeth 2, subulate. S. S. Native of Brazil, where it was collected by Pohl. Herb a finger high, erect, or ascending. Corolla and mature fruit unknown.

Least Borreria. Pl. 1/2 foot.

** Teeth of the calyx 4.**

B. radí'ya (D. C. prod. 4. p. 542.) stem herbaceous, erect, branched, terete, hispid from spreading hairs; leaves oblong-linear, acuminate, glabrous, glaucous, smooth, margined by a vein, 1-nerved; bristles of the stipulas longer than the sheath, which is villous; heads of flowers terminal, depressed, girded by 12-16 radiant floral leaves; capsule oblong, downy at the apex, crowned by the 4 short, linear-subulate teeth of the calyx. S. S. Native of Senegal, in sandy places, at Gala and Walo. Spermacéè radí'ya, Siebl. pl. sen. exsic. no. 8. Flowers white. A very distinct species, agreeing in habit with B. spinósa. Keel or mid-rib of the leaves smooth, and much exserted.

Ray-involved Borreria. Pl. 1 foot. B. aspe'élula (D. C. prod. 4. p. 543.) stem herbaceous, erect, glabrous, rather tetragonal; leaves oblong-linear, acute, glabrous, having the keel rather prickly from small stiff teeth; bristles of the stipulas longer than the sheath, which is membranous; heads of flowers many; verticillate; calyceal teeth 4, 1 or 2 of which are often deciduous, shorter than the ovary, which is rather pilose. S. S. Native of Brazil, about Bahia, in dry pastures, where it was collected by Salzmann.

Rugish Borreria. Pl. 1 foot.

B. subúla'ta (D. C. prod. 4. p. 543.) plant herbaceous,
glabrous, erect, sparingly branched; stem tetragonal; leaves linear-subulate, with rather scabrous margins; bristles of the stipulas the length of the sheath; heads of flowers terminal, girded each by an erect 8-leaved involucrem; corolla tubular, glabrous; anthers exerted; teeth of the calyx 4, lanceolate, unequal, 2 of which are one half smaller than the other. C. S. Native of Mexico. Spermacéco subulátá, Pav. ined. Flowers white.

Subulate-leaved Borreria. Pl. 1 foot.

16 B. crávilíma (D. C. prod. 4. p. 543.) plant glabrous, herbaceous, slender, sparingly branched; branches rather tetragonal; leaves linear-subulate; stipulas lanceolate, undivided, or furnished with 5 bristles; heads of flowers terminal, on long peduncles, girded by 2-leaved involucre. C. S. Native of Brazil, where it was collected by Pohl. Flowers and fruit hardly known. Habit very much like that of B. subulátá.

Very slender Borreria. Pl. ½ to 1 foot.

17 B. pusílla (D. C. prod. 4. p. 543.) stem herbaceous, slender, simple or branched, tetragonal, hispid under the nodi, the rest glabrous; leaves linear-lanceolate, acute, glabrous, pale beneath; bristles of the stipulas exceeding the whorles; heads of flowers small, 2-3 of them axillary, and one terminal; involucra 4-6-leaved; capsule ovate, hairy, crowned by the 3-4 linear-subulate teeth of the calyx. C. S. Native of Nipaul, in the valley. Spermacéco pusílla, Wall. fl. ind. 1. p. 379. Bigelowia pusílla, Spreng. syst. 1. p. 405. Spermacéco tríandrá, Ham. ex D. Don, prod. fl. nep. p. 134. Flowers white. Very like B. ténera and B. pámíta, but differs from them in the calyceye teeth being usually 3.

Small Borreria. Pl. ½ to ½ foot.

18 B. ténera (D. C. l. c.) stem herbaceous, erect, branched, tetragonal, slender, hardly scabrous; leaves linear, acute, glabrous; bristles of stipulas shorter than the sheath, which is glabrous; whorles of flowers dense, 3 of them axillary, and 1 terminal, the latter larger, sessile, and involucred by 4-6 leaves; capsule ovate, smooth, crowned by the 3-4 linear-subulate calyceye teeth. C. S. Native of Brazil. Spermacéco ténera, Pohl, in litt. Flowers white. Very nearly allied to B. pámíta, but differs in its smoothness, and in the axils of the leaves being nearly all floriferous, and in the leaves being almost always 3 times shorter.

Tender Borreria. Pl. ½ foot.

19 B. fúmíla (D. C. l. c.) stem herbaceous, slender, tetragonal, beset with retrograde plí; leaves linear, acuminate, with revolute margins, scabrous above, and glabrous beneath, 1-nerved; bristles of the stipulas longer than the sheath, which is scabrous; heads of flowers terminating the stem and axillary branches, rarely axillary; involucra 6-8-leaved; capsule ovate, downy at the apex, crowned by the glabrous, subulate teeth. C. H. Native of Brazil, where it was collected by Pohl. Herb with a slender root, and a stem 6 inches high. Superior leaves 15 lines long, and a line broad.

Dwarf Borreria. Pl. ½ foot.

20 B. téntémus (D. C. l. c.) stem slender, tetragonal, erect, sparingly branched, downy, especially on the angles; leaves lanceolate-linear, acute, downy on both surfaces, scabrous; bristles of the stipulas stiff, a little longer than the sheath, which is villous; whorles of flowers capitate, 1-2 of them axillary, and 1 terminal; involucra 2-leaved; calyceye teeth 4, glabrous, unequal; anthers inclosed. C. F. Native of Brazil, where it was collected by Pohl. Spermacéco téntémus, Pohl, in litt. Herb 6-7 inches high, indurated at the base. Fruit unknown, but from habit it is judged to be a species of Borréria.

Slender-stemmed Borreria. Pl. ½ foot.

21 B. cépuláris (D. C. l. c.) stem herbaceous, erect, simple, rather angular, downy, and rather scabrous; leaves oval-oblong, acuminated, petiolate, glabrous; upper stipulas broad-concave, cup-shaped, furnished with 9-10 bristles on each side, which are shorter than the sheath; heads of flowers 2, 1 axillary, and 1 terminal and larger; capsule oval, downy at the apex, crowned by the 4 oblong teeth of the calyx. C. F. Native of Brazil, where it was collected by Pohl. Spermacéco pisílla, Pohl. in litt. but not of Wall. Herb 5-6 inches high. Flowers densely crowded in the cups formed by the stipulas, white.

Capsular-stipulated Borreria. Pl. ½ foot.

22 B. ocyoides (D. C. prod. 4. p. 544.) stem herbaceous, branched, tetragonal, with the angles hairy and winged; leaves oval, tapering into the stem and axillary branches; bristles of the stipulas few, rather shorter than the sheath; whorles of flowers axillary, sessile, dense; capsule small, ovate, crowned by the 2-4 small teeth of the calyx. C. H. Native of the East Indies. Spermacéco ocyoides, Burm. fl. ind. 34. t. 13. f. 1. but the angles of the stems are said to be glabrous.

Basil-like Borreria. Pl. ½ foot.

23 B. ramíspadás (D. C. prod. 4. p. 544.) smoothish; stem herbaceous, dichotomous, tetragonal; leaves oval-oblong, acute at both ends; bristles of the stipulas membranous, pale, longer than the sheath; whorles of flowers capitate in nearly all the axils, and on the tops of the branches, equal in size, sessile, girded by 2-4 leaves; capsule small-ovate, smooth, crowned by the 4 short subulate calyceye teeth. C. F. Native of the West Indies, as of Porto Rico, Guadaloupe, and Sperm. áspéra from Hispaniola, Spreng. syst. 1. p. 401. ex herb. Balh. Perhaps Spermacéco lévis, Linn. is identical with this plant. This species, with many others, is very intricate, but is nearly allied to B. ramíspadás. It differs from B. áspéra. It is another allied to B. ramíspadás. It differs from B. áspéra. It is the much less scabrous stem, in the shorter leaves, and in the smaller whorles of flowers. Flowers white. Bigelowia áspéra, Sieb. is a distinct plant from this. Bristles of the stipulas pilose.

Small-flowered Borreria. Pl. 1 to 2 feet.

25 B. f. álátá (D. C. prod. 4. p. 544.) stems herbaceous, diffuse, radicant, branched, glabrous, tetragonal, with winged angles; leaves smooth, not acuminate; bristles of the stipulas longer than the sheath; heads of flowers terminal, girded by 4 leaves; style bibracteolate. C. F. Native of French Guiana, at the river Aroura. Spermacéco álátá, Aubl. ann. 1. p. 60. t. 22. f. 7. Flowers white. Fruit divisible into 2, 1-seeded, dehiscent nuts. It is nearly allied to B. bartlingiana, but the structure of the fruit and flowers is different. Superior leaves sessile, rather cordate at the base. Stamens didymous, 2 of which are shorter than the corolla. Corollas rather large, blue.

Winged-stemmed Borreria. Pl. creeping.

26 B. bartlingiána (D. C. prod. 4. p. 544.) stem herbaceous, diffuse, radicant, tetragonal, with winged ploce angles,
and the sides between the wings are lined with parallel veins; leaves oval, acutish, beset with bristle-like hairs on both surfaces; whorles of flowers sessile, glomerate, axillary ones numerous, and one terminal, girded by 4 leaves; capsule nearly globose, pilaose, crowned by the 4 lanceolate teeth of the calyx. F. Native of Mexico. Bigelovia alata, Bartl. in herb. Hanke, but differs from B. alata in the wings of the stem being hispid, in the leaves being hispid and much less acute, in the axillary whorles, &c.

Bartling’s Boreria. Pl. creeping.

27 B. Tampica (D. C. L. c.) plant glabrous, diffuse, branched, herbaceous; branches tetragonal, with smooth angles; leaves oblong-linear, acute, 1-nerved, scabrous on the mid-rib, but not on the margins; whorls of flowers capitulate from nearly all the axils, and from the tops of the stems, sessile, involucrated by 4-8 leaves; capsules small, ovate, glabrous, crowned by the 4 short subulate teeth of the calyx. Y. G. Native of Mexico, at Tampico de Tamaulipas, where it was collected by Berlandier. Very nearly allied to B. parejiflorus, but the nuts of the fruit are dissimilar, one of them bearing 3 of the calycine teeth, and the other 1.

Tampico Boreria. Pl. 1 foot.

28 B. Borreria (D. C. L. c.) glabrous; stem diffusely, dichotomous, rather tetragonal; leaves linear, with revolute margins; stipules setiform; whorles of flowers capitate, axillary, and terminal, globose, rather compound; floral leaves 4-5, reflexed; capsule oval, smoothish, crowned by the 4 short, subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacéæa diffusæ, Pohl, in litt. but not of Kunth. Corollas small, smooth, white. ? Capsule small, membranous, whitish.

Diffuse Boreria. Pl. diffuse.

29 B. Nettosifolia (D. C. L. c.) stem slender, tetragonal, rather hairy; leaves oblong-linear, almost sessile, acute, scabrous above and on the margins, but downy beneath; bristles of the stipulae downy, a little longer than the sheath, which is villous; whorls of flowers capitulate, terminal ones on long peduncles, a very few axillary; lobes of the calyx 4, narrow, acute, unequal, glabrous.—Native of Brazil, where it was collected by Pohl, in litt. but not of Ruiz et Pav.

30 B. discolor (Bartl. in herb. Hænke, under Bigelovia, ex D. C. L. c. 1. p. 545.) stem herbaceous, branched, quite glabrous, tetragonal, having the wings angled a little; leaves oval-oblong, or oblong-lanceolate, acute, scabrous above, and clothed with yellowish down beneath; bristles of the stipulae many, longer than the leaves; whorls of flowers axillary, and terminal, small, girded by 2 leaves; capsule nearly globose, rather downy, crowned by the 4 lanceolate teeth of the calyx.—Native of the Island of Manilla, near Sorzogon, where it was collected by Hænke.

Discoloured-leaved Boreria. Pl. 1 to 2 feet.

31 B. ? Cornifolia (D. C. L. c. 4. p. 545.) stem herbaceous, erect, tetragonal, tomentose; leaves petiolate, oblong, acute, with scabrous margins, and having the veins downy beneath; stipulae villous, of many bristles; whorls of flowers dense, 1 axillary, and 1 terminal, the latter girded by 4 leaves; calyx villous, with 4 equal teeth; anthers exerted. G. F. Native of Brazil. Spermacéæa cornifolia, Fisch. in Nees. hor. berl. p. 50. Link. Enum. herb. berl. 1. p. 152. Cham. et Schlecht. Linnaea. 3. p. 313.

Allied to B. brechystemonides, but the fruit is unknown.

32 B. ? Wydecriana (D. C. L. c.) stem herbaceous, ascending, elongated, rather tetragonal, with the angles rather hairy; leaves elliptic-oblong, attenuated at both ends, glabrous above, and downy on the nerves beneath; bristles of the stipula 5, shorter than the sheath; whorls of flowers 2-3, axillary, distant, almost immersed in the stipular sheaths, and terminal, pedunculate, larger than the axillary ones; involucrum of 4 spreading leaves.—Native of Porto Rico, where it was collected by Wydler. Flowers while young densely crowded, intermixed with a number of bristles. Very like the following and preceding.

Wydler’s Boreria. Pl. ascending.

33 B. brachystemonides (Cham. et Schlecht. in Linnaea. 3. p. 314.) stems suffruticose at the base, erect, tetragonal, scabrous from retrograde hairs; leaves elliptic-lanceolate, acute, scabrous on both surfaces, and on the margins when young, but glabrous above in the adult state; bristles of the stipulae longer than the sheath, which is villous; heads of flowers terminal, girded by 4 leaves; capsule oblong-conical, villous upwards, crowned by the 2 acute teeth of the calyx, and 1-2 accessory ones. G. S. Native of the south of Brazil. Flowers white?

Brachystemon-like Boreria. Shrub 1 to 2 feet.

34 B. capitella (Cham. et Schlecht. in Linnaea. 3. p. 319.) stems fistular; leaves petiolate, ovate, lined, acuminated, rather pilaose on both surfaces; bristles 2 to the stipulae 4-7; whorles of flowers axillary and terminal; capsules oblong, elliptic, hairy at the top, crowned by the teeth of the calyx, which are 3 times shorter than it.—Native of New Granada, near Santa Fe de Bogota. Spermacéæa capitellata, Willd. in Róm. et Schultes, syst. 3. p. 530. H. B. et Kunth, nov. gen. amer. 3. p. 349. but not of Sprengel. Flowers white. ? Said to be allied to B. scabiosoides. Involucrum clothed with pili.

Small-headed Boreria. Pl. 1 foot.

35 B. scabiosoides (Cham. et Schlecht. in Linnaea. 3. p. 318.) stems fistular, terete, glabrous; leaves lanceolate, acute, on short petioles, with a few oblique veins, and scabrous margins; teeth of the stipulae 3-5, ending in a bristle each, shorter than sheath; heads of the flowers terminal, hemispherical, involucrated by 2-6 leaves; capsule glabrous, oblong, crowned by the 2-4 hairy teeth of the calyx.—Native of equinoctial Brazil. The part of the involucrum girding the flowers is pilose both inside and outside.

Scabious-like Boreria. Pl. 3/4 foot.

36 B. capitella (D. C. L. c. 4. p. 545.) stems shrubby at the base, prostrate; branches ascending, rather tetragonal, villous; leaves lanceolate, with scabrous margins, smoothish on both surfaces; bristles of the stipulae longer than the sheath; heads of flowers 2-3, one axillary, and the other terminal and larger, involucrated by 4 leaves; corolla glabrous, tubular; anthers exerted; capsule glabrous, turbinate, crowned by the 4 lanceolate teeth of the calyx. G. S. Native of Peru, on the declivities of the mountains. Spermacéæa capitata, Ruiz et Pav. fl. per. 1. p. 61. t. 91. f. b. Branches purplish. Leaves sessile. Flowers white; anthers reddish.

Capitale-flowered Boreria. Shrub 1 foot.

37 B. Aturensis (Cham. et Schlecht. in Linnaea. 3. p. 345.) plant shrubby, erect; branchlets tetragonal, roughish; leaves narrow-linear, glabrous, with serrulate margins; stipulae hairy, ciliated with bristles; heads of flowers terminal, rarely lateral; capsule hairy, oblong, crowned by the 4 linear-subulate, ciliated teeth of the calyx. G. S. Native on the banks of the Orinoco, near Atures. Spermacéæa Aturensis, H. B. et Kunth, nov. gen. amer. 3. p. 345. Flowers white. Allied to B. verticillata. Corolla tunnel-shaped, a little longer than the calyx.

Atures Boreria. Shrub 1 to 2 feet.

38 B. erys goofy (Cham. et Schlecht. in Linnaea. 3. p. 316) glabrous; stems herbaceous, erect, tetragonal, almost simple; leaves linear, acute, with revolute margins; bristles of the stipulae 5, longer than the sheath; whorls of flowers nearly globose, terminal and axillary; capsule downy, elliptic, crowned...
by the nearly equal teeth of the calyx, and with a small accessory tooth between each of these.  

2. S. Native of the south of Brazil and Buenos Ayres. Heads small. Leaves an inch long, and a line broad. Seed oblong, granular.

*Eryngio-like* Borreria. Pl. 1 foot.

39 B. *saturefolia* (Cham. et Schlecht. in Linnae. 3. p. 313.) stem shrubby, erect, smooth; branchlets tetragonal; leaves linear-lanceolate, acute, glabrous, with somewhat revolute edges; bristles of the stipulas rather downy, longer than the sheath; whorls of flowers semi-globose, axillary, and terminal, the latter the largest; capsule glabrous, crowned by the 4 elongated calycine teeth, which are furnished with short pili in the recesses. *S.* Native of equinoctial Brazil. Said to be allied to *B. saturefolia*, but the flowers are smaller, the involucral leaves are larger, and the stature is smaller, &c.

*Savory-leaved* Borreria. Shrub 1 foot.

40 B. *suaveolens* (Meyer, ess. p. 81. t. 1.) glabrous; stem shrubby, erect, much branched; branchlets slightly tetragonal; leaves linear, pungent, opposite, and falsely verticillate; bristles of the stipulas stiff, rather shorter than the sheath; whorls of flowers globose, a few axillary, and a larger terminal one, which is involucreted by 8 leaves; corolla glabrous, with acuminate lobes; capsule ovate, glabrous, crowned by the 4 teeth of the calyx, and 4 small accessory teeth in the recesses among the others. *S.* Native of Dutch Guiana, in shady places, at Arrowsichkreek. Bigelowia suaveolens, *Spreng.* syst. 1. p. 494, exclusive of the variety from Porto Rico, and probably that from Brazil. Corolla funnel-shaped, ex Meyer involucres exerted.

*Sweet-scented* Borreria. Shrub 1 to 2 feet.

41 *sideritis* (Cham. et Schlecht. in Linnae. 3. p. 201.) plant scabrous from hairs; stem tetragonal, having the angles a little winged; leaves ovate-oblong, sessile, marked by 4 nerves on both sides; bristles of the stipulas shorter than the sheath, which is pilose; whorls of flowers axillary, at length globose; lobes of the corolla bearded below; capsule pilose, ovate, crowned by the 4 teeth of the calyx. *S.* Native of equinoctial Brazil. Plant probably procumbent.

*Sideritis-like* Borreria. Pl. procumbent.

42 B. *scaenens* (D. C. prod. 4. p. 546.) stem shrubby at the base, ascending, weak, rather scantily branched; branches tetragonal, striated, rather scabrous along the edges; leaves ovate, glabrous, tapering into the petioles a little; bristles of the stipulas few, shorter than the sheath; heads of flowers small, terminal, girded by 4 leaves; capsule oval, glabrous, crowned by the 4 teeth of the calyx. *S.* Native of Guadaloupe, where it was collected by Bertero. Diâdia sarmentosâs, from Guadaloupe, *Spreng.* syst. 7. p. 405. Spermacécœa scænêns, *Gmel.* syst. 235.—Sloam. jam. hist. 1. t. 28. f. 4. A. It differs from *Diâdia sarmentosâs*, in the leaves being glabrous and more ovate, in the heads being terminal, and in the fruit being dehiscent.

*Climbing* Borreria. Shrub cl.

43 B. *affinis* (D. C. prod. 4. p. 546.) stems herbaceous, tetragonal, having the angles scabrous from pili; leaves oblong-lanceolate, having the edges tapering to the base, scabrous from scattered pili above, and more so along the veins beneath; bristles of the stipulas yellow, 7-9, longer than the sheath; whorls of flowers sessile, axillary, and terminal, the latter involucreted by 2-4 leaves; capsule oval, glabrous, crowned by the 4 subulate teeth of the calyx, and 4 smaller subulate accessory ones in the recesses between the others.—Native of Brazil, where it was collected by Pohl. Spermacécœa affinis, Pohl, in litt.

*Allied* Borreria. Pl. 1 foot.

44 B. *microphylla* (D. C. prod. 4. p. 436.) glabrous; stems herbaceous, ascending, tetragonal; leaves lanceolate-linear, acute; bristles of the stipulas 7-9, longer than the sheath; whorls 10-12-flowered in nearly all the axils, and at the tops of the stem and branches, all equal in size, the latter girded by 4-6 leaves; capsule oval, downy, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacécœa microphylla, Pohl, in litt. Leaves 7-8 inches long, and 1½ to 2 broad.

*Small-leaved* Borreria. Pl. ascending.

45 B. *rubro-stipulata* (D. C. l. c.) stem herbaceous, straight, almost simple, tetragonal, having the angles beset with retrograde villi; leaves oblong-linear, acute at both ends, opposite, or falsely verticillate; bristles of the stipulas 7-9, stiffish, coloured, glabrous, longer than the sheath, which is downy; whorls of flowers capitata, 3-4 axillary, and one terminal, the latter the largest, and girded by 4 leaves; teeth of the calyx 4; anthers exerted. *S.* Native of Brazil, where it was collected by Pohl. Spermacécœa rubro-stipulata, and Sperm. fasciculata, Pohl, in litt. Spermacécœa Brasilíciensis, *Spreng.* syst. 1. p. 402. Fruit unknown.

*Red-stipuled* Borreria. Pl. ½ to 1 foot.

46 B. *elongata* (D. C. prod. 4. p. 547.) stem herbaceous, branched; branches elongated, hairy, terete; leaves oblong-lanceolate, acuminate, downy on both surfaces; bristles of the stipulas longer than the sheath, which is villous; whorls of flowers capitata, 1-2 axillary, and a nearly globose terminal one, which is involucreted by 5-6 leaves; teeth of the calyx 4, acute, short.—Native of Brazil, where it was collected by Pohl. Spermacécœa verticillata, Pohl, in litt. Branches a foot high. Leaves usually in fascicles in the axis. Fruit unknown, and therefore the plant is referred to *Borreria* from habit only.

*Elongated*-branched Borreria. Pl. 1 to 2 feet.

47 B. *ferruginea* (D. C. prod. 4. p. 547.) stem herbaceous, lard, erect, branched; branches tetragonal, hairy; leaves oblong, acute, obliquely 3-4-nerved, scabrous above, and pale beneath and scabrous on the nerves from hairs; bristles of the stipulas the length of the sheath; whorls of flowers globose, terminal, and axillary; capsule downy, crowned by the 4 subulate teeth of the calyx. *S.* Native of Brazil, in elevated pastures in the provinces of Minas Geraes and St. Paul. Spermacécœa ferruginea, *St. Hil.* pl. usuul. bras. no. 15. t. 13. Spermacécœa globosa, Pohl, in litt. The hairs on the branches and nerves of the leaves are rust coloured. Corollas rose-coloured, violaceous, or white, with the lobes pilose at the apex. Heads of flowers one half larger than those of *B. verticillata*, which it very like. The plant is called *Poaiga* and *Poaiga do praya* at Cape Frio. The roots are of a brown colour, and are used as *Ipecacuanha*.

*Rusty* Borreria. Pl. 1 to 2 feet.

48 B. *spineca* (D. C. l. c.) stem suffruticos at the base? branched, terete, glabrous; leaves oblong-linear, acute, scabrous above, pale and villous beneath; bristles of the stipulas longer than the sheath, which is villous; heads of flowers globose, terminal, and axillary; capsule oblong, glabrous, crowned by the 4 subulate ciliated teeth of the calyx.—Native of Cayenne. Very like *B. ferruginea*, but differs from it in the branches being smoothish, in the leaves being less nervèd, in the involucral leaves being larger and reflexed, and in the capsules being twice the length.

*Spherical*-headed Borreria. Shrub 1 to 2 feet.

49 B. *luteascens* (D. C. prod. 4. p. 547.) stem terete, simple, clothed with dense soft hairs, but with retrograde down at the apex; leaves sessile, lanceolate, acuminate, villous on both surfaces, furnished with 4 oblique nerves on each side; bristles of the stipulas stiffish, rufous, much longer than the sheath, which is almost obsolete; whorls of flowers dense, sessile,
1-2 axillary, and a terminal globose one, which is involucreted by reflexed bracteas; capsule oblong, villous at the apex, crowned by the 4 subulate, glabrous teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacoeae nutescens, Pohl, in litt. Allied to B. fessignea. *Luescent Boreria.* Pl. 1 foot.

50. B. *Haekeana* (D. C. I. c.) stem erect, sub-herbaceous, straight, branched, tetragonal, with the angles hairy at the apex; leaves linear, acute, rather scabrous, with rather revolute edges; bristles of the stipulas longer than the sheath; heads of flowers globose, terminal, girdled by 4-leaved reflexed involucra; capsule obovate, roughish, crowned by the 4 lanceolate teeth of the calyx.—Native of Mexico and Peru. Bige- lowia pyrshoideae, Bartl. in Herb. Haeke. Spermacoeae tenior, Pav. ined. but not of Lin. It differs from *B. pellissooides* in the involucretion being reflexed, in the heads being one half larger, in the limb of the calyx being divided into 4 lobes to the base, not to the middle.

*Haeke's Boreria.* Pl. 1 foot.

51. B. *strictissima* (D. C. I. c.) stem and branches straight, tetragonal, clothed with powdery down under the nodi; leaves linear, acute, glabrous, almost veinless, opposite, and in axillary fascicles; bristles of the stipulas 5-7, stiff; longer than the sheath; whorls of flowers capitata, sessile, 1-2 of which are axillary, and a larger terminal globose one, which is girdled by 2-4 leaves; capsule oblong, glabrous, crowned by the 4 short subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacoeae strictissima, Pohl, in litt. Allied to B. *suaveolens,* but differs from that species in the calyx being without accessory teeth. *Corolla unknown.*

*Very straight Boreria.* Pl. 1 to 2 feet.

52. B. *Tenuella* (Cham. et Schlecht. in Linnaea. 3. p. 317.) stem suffruticos at the base, erect, nearly terete, clothed with retrograde adpressed villi; leaves oblong-linear, acuminated, clothed with small down above, and scabrous on the nerves and margins, having a few oblique nerves on both sides; bristles of the stipulas longer than the sheath, which is downy; heads of flowers globose, terminal, surrounded by 4 reflexed leaves; capsules oblong, hairy at top, crowned by the hairy 4-toothed calyx. *S. S.* Native of equinocial Brazil.

*Var. β, augustifolia* (D. C. prod. 4. p. 547.) plant weak; leaves narrow-linear; seeds large of peas; floral leaves spreading.

*Var. γ, lavandulifolia* (D. C. prod. 4. p. 548.) stem at first clothed with fine velvety down, but at length becoming glabrous; leaves linear, with rather revolute margins; bristles of the stipulas very long; heads of the flowers hemispherical, depressed, involucrated by 4 spreading leaves. *S. S.* Native of Brazil, where it was collected by Pohl. Spermacoeae lavandulifolia, Pohl, in litt. *Weak Boreria.* Shrub ½ to 1 foot.

53. *Linoides* (D. C. prod. 4. p. 438.) quite glabrous; stem suffruticos at the base, erect; branches tetragonal; leaves linear, acutish, with revolute edges; stipulas ending in 1-3 stiff, setaceous points; axillary heads few, or wanting, and 1 terminal and sub-globose, the latter involucrated by 2-4 reflexed floral leaves; corolla glabrous; capsule oval, glabrous, crowned by the 4 short teeth of the calyx. *S. S.* Native of Brazil, where it was collected by Pohl. Spermacoeae Linoides, Pohl, in litt. Anthers exserted.

*Flax-like Boreria.* Shrub 1 foot.

54. B.? *Puellioidea* (H. et Kunth, nov. gen. amer. 3. p. 346. t. 278. under *Spermacoeae*) stem suffruticos, erect, tetra- gonal, branched, scabrous from retrograde bristles; leaves linear-lanceolate, hairy on both surfaces, with serrately scabrous edges; bristles of stipulas longer than the sheath; heads of flowers terminal, involucrated by 6-8 radiant floral leaves; calyx funnel-shaped, 4-cleft to the middle. *S. S.* Native of Mexico, near Ario. Fruit unknown, but from habit it is evidently a species of *Borriaea.* Very nearly allied to *B. strictissima* and *B. Haenkeana.* It differs from all the rest of the species in the calyx being divided to the middle.

*Flavouri-Borrea.* Shrub 1 to 2 feet.

55. B. *Flavescens* (D. C. prod. 4. p. 548.) plant diffuse, quite glabrous, suffruticos at the base; branches tetragonal; leaves oblong, acute, attenuated at the base; bristles of stipulas 3-5, longer than the sheath; axillary whorls of flowers few, and one terminal and larger than the axillary ones, the latter involucrated by 2-4 floral leaves; capsule oval, crowned by the lanceolate teeth of the calyx. *S. S.* Native of Brazil, where it was collected by Pohl. Spermacoeae flavescens, Pohl, in litt. The whole herb is yellowish. The nuxs of the immature fruit appear almost indeliscent; it is, therefore, perhaps a species of *Diosia,* with the habit of *Borriaea.*

*Yellowish Borrea.* Shrub diffuse.

56. B. *Scabra* (D. C. I. c.) stem erect, tetragonal, scabrous on the angles; leaves lanceolate, acute, with 4 oblique nerves on both sides, scabrous above, and pilose on the nerves beneath; bristles of stipulas 5, stiffish, longer than the sheath; whorles of flowers capitata, sessile, terminal, and axillary, approximate; corolla glabrous; capsule oblong, glabrous, crowned by the 4 subulate teeth of the calyx.—Native of Brazil, where it was collected by Pohl. Spermacoeae scabra, Pohl, in litt. Corollas one half smaller than in *B. asclepiadea.*

*Scabrosa Borerea.* Pl. 1 to 2 feet.

57. B. *Asclepiadea* (Cham. et Schlecht. in Linnaea. 3. p. 520. under *Bigelowia*) plant smoothish, suffruticos at the base; stems erect, tetragonal, glabrous, but downy at the apex, having the angles winged; leaves lanceolate, acute, glabrous, obliquely 4-nerved on both sides; bristles of stipulas 3, longer than the sheath, the middle one the longest; whorles of flowers loosely capitata, terminal, and axillary; lobes of corolla lanceolate, bearded a little; capsule elliptic, crowned by the 4 elongated, acuminate teeth of the calyx. *S. S.* Native of the south of Brazil. *Stipulas 2, revolute.*

*Var. β, glabriflora* (D. C. prod. 4. p. 548.) stems and corollas glabrous; stipulas furnished with one bristle each. *S. S.* Native of equinocial Brazil.

*Asclepias-like Borrea.* Shrub 1 to 2 feet.

58. B. *Perrottei* (D. C. I. c.) stem herbaceous, tetragonal, with rather rough angles; leaves oblong-lanceolate, acuminate at both ends, scabrous above, and downy beneath, obliquely 4-nerved; bristles of stipulas 9, hispid, longer than the sheath; flowers axillary, vertical, sessile; capsule oblong, compressed, crowned by the 4 lanceolate acute convivertic teeth of the calyx.

—Native of French Guiana, where it was collected by Perrottet. Perhaps *Sperma* áspera, Aubl. guian. 1. p. 59. t. 22. f. 6. not of Vahl, but in the present plant the branches are nearly glabrous.

*Perrottei Borrea.* Pl. 1 foot.

59. B. *Nervosa* (Pohl, in litt. under *Chlorophýnum,* ex D. C. prod. 4. p. 548.) the whole plant clothed with scabrous pubescence; stems erect, tetragonal, striated; leaves lanceolate, or oval-lanceolate, acute, obliquely 4-nerved on both sides; stipulas cleft into 3-5 linear, acute ligule; whorles of flowers axillary and terminal, sessile; lobes of calyx 3-4, longer than the ovarium, lanceolate, acuminate, scabrous, a little toothed at
the apex. 2. S. Native of Brazil, where it was collected by Pohl. Perhaps the same as Spermacoce Poiya, var. pubescens, St. Hil. &c.

Nerved-leaved Boreria. Pl. 1 foot.

60. B. frate'ssis (Pohl. in litt. under Chlorophytum, ex D. C. prodr. 4. p. 548.) quite glabrous; stem tetragonal, erect, almost simple, with the angles a little winged; leaves sessile, obtlong-oblong, acute, with 6-7 prominent veins on each side; stipulas triangular, 3-4-toothed at the apex: teeth acute, middle one the largest; heads of flowers axillary and terminal: lower ones on short peduncles, the rest sessile; lobes of calyx 4, lanceolate-linear; lobes of corolla smooth: stamina exerted. 2. S. Native of Brazil, where it was collected by Pohl. Corolla very like that of B. Poiya when dry. Perhaps the same as Spermacoce gentianoides, St. Hil. pl. us. bras. no. 12. in a note.

Meadow Boreria. Pl. 1 foot.

61. B. Poiya (D. C. prodr. 4. p. 549.) quite glabrous; stem herbaceous, simple, tetragonal; leaves sessile, obtong-eliptic, acute, obliquely 6-nerved on both sides of the mid-rib; stipulas cleft into many long bristles; whorles of flowers capitate, sessile, few axillary, and a larger terminal one; lobes of calyx 4, lanceolate-linear, acute, longer than the ovary; corolla smooth; anthers exerted. 2. S. Native of Brazil, in elevated pastures, in the mine provinces frequent. Spermacoce Poiya, var. a. St. Hil. fig. 12. t. 12. Corolla blue, with the lobes rather hairy above. The roots are white, and are substituted with success in place of Ipecacuanha. The leaves are at first sweet, but afterwards acid, and a decoction of them is used in the cure of cholic.

Poya Boreria. Pl. ½ to 1 foot.

62. B. platyphylla (D. C. prodr. 4. p. 549.) the whole plant is scabrous from stiff hairs; stem herbaceous, erect, simple, tetragonal, having the angles a little winged; leaves lanceolate, acute, attenuated at the base, obliquely 4-5-nerved on both sides; stipulas ending in 5-7 very long scabrous bristles; whorles of flowers sessile, capitulate, many axillary, and one terminal, which is hardly larger than the rest: lobes of calyx 4, lanceolate-linear, subulate, scabrous, longer than the ovary. 2. S. Native of Brazil, where it was collected by Pohl. Spermacoce latifolia, Pohl, in litt. but not of Aubl. Bristles of stipulas 6 lines long. Very nearly allied to B. Poiya, but differs in being hispid. Corolla unknown.

Broad-leaved Boreria. Pl. ½ to 1 foot.

63. B. gymnocephala (D. C. prodr. 4. p. 549.) stem branched, tetragonal, striated, furrowed, and glabrous between the angles: and the angles are winged a little, and rough from being serrulate; leaves ovate, acute, attenuated at the base, glabrous, obliquely nerved; bristles of stipulas 7-9, longer than the sheath; whorles of flowers nearly globose, many axillary, and one terminal, which is naked from the abortion of the floral leaves; teeth of calyx 2-3, conically subulate.—Native of Brazil. This plant is probably generally distinct from Boreria. Stem tetragonal and smooth between the heads. Corollas small. Anthers inclosed.

Naked-headed Boreria. Pl. 1 foot.?

64. B. cyrmosa (Cham. et Schlecht. in Linnae. 3. p. 323.) shrubby, glabrous; branches flexuous, tetragonal; leaves elliptic-lanceolate, acuminate, coriaceous, on short petioles; stipulas interpetiolar, connate, drawn out on both sides into 2 linear segments, the middle segment the longest; heads of flowers 3 at the top of each stem, and the lateral ones pedunculated and almost leafless; capsule smooth, crowded by the 4 lanceolate-linear teeth of the calyx. 2. S. Native of Brazil, in the province of Rio Janeiro. Spermacoce cyrmosa, Spreng. syst. 1. p. 405. Leaves 3 inches long, and one broad. Corollas hairy outside. Inflorescence rather panicked.

Cynose-headed Boreria. Shrub 2 to 3 feet.

§ 2. Flowers solitary, or in axillary fascicles.

65. B. virgata (Cham. et Schlecht. in Linnae. 3. p. 324.) branches fistular, tetragonal, with downy angles; leaves lanceolate, tapering to both ends, glabrous on the margins, and scabrous at the nerves beneath; upper stipulas undivided, the rest downy, and furnished with 5-9 bristles; flowers glomerate in every other axil; capsules downy, elliptic, crowned by the irregularly 2-6-toothed calyx. 2. S. Native of Brazil, about Rio Janeiro. Twiner Boreria. Pl. 11 foot.

66. B. saponerifolia (Cham. et Schlecht. in Linnae. 3. p. 325.) glabrous; stem prostrate, tetragonal, fistular, branched: leaves sessile, acuminate, with scabrous margins; lower ones obovate, upper ones lanceolate: bristles of stipulas 1-3, hairy, the middle one the largest; flowers solitary in every axil; capsules glabrous, oblong-elliptic, crowned by the 2 primary and the 2 accessory teeth of the calyx.—Native of Brazil.

Soap-nort-leaved Boreria. Pl. prostrate.

67. B. A'rida (D. C. prodr. 4. p. 549.) stems simple, erectish, tetragonal, downy, glabrous at the apex; leaves linear, acute, scabrous on the nerve beneath at the apex, with revolute serrately scabrous edges; bristles of stipulas 5, pilifer, longer than the sheath: floral leaves 3, having bristles axial, sessile; capsule oblong-oblong, rather downy, crowned by the 2 subulate teeth of the calyx.—Native of Porto Rico, in arid places by the sea side, where it was collected by Bertero. Bigelovia suaveolens, from Porto Rico, Spreng. syst. 1. p. 416. but is very distinct from the true B. suaveolens.

Arid Boreria. Pl. 1 foot.

§ 3. Flowers disposed in cymes, or corymb-cymes. Floral leaves small. Corollas campanulately funnel-shaped. Seeds marked by a crest inside, probably in all. Perhaps a proper genus.

68. B. ericoides (Cham. et Schlecht. in Linnae. 3. p. 326.) shrubby, erect, glabrous; branchlets tetragonal; leaves linear, blntish, 1-nerved, opposite, or in whorled fascicles: bristles of stipulas 3-5, shorter than the sheath; cymes terminal, 3-4-forked; floral leaves small; capsule cylindrically turbinate, crowned by the 4 elliptic teeth of the calyx. 2. S. Native of equinoctial Brazil. Corolla short, funnel-shaped, glabrous outside, and villous in the throat. Habit of a heath.

Heath-like Boreria. Shrub ½ to 1 foot.

69. B. Anthospermoides (D. C. prodr. 4. p. 550.) glabrous; branches twiggy, tetragonal; leaves linear, acute, nervless; bristles of stipulas many, stiff, longer than the sheath; coryms small, terminal, crowded; lobes of calyx 4, narrow, acute. 2. S. Native of South America, near Santa Fe de Bogota. Habit of B. stipulata, with the inflorescence of B. ericoides. Mature fruit unknown.

Anthospermoid-like Boreria. Pl. 1 foot.

70. B. Eupatoriumoides (Cham. et Schlecht. in Linnae. 3. p. 327.) shrubby, downy; branches bluntly tetragonal; leaves ovate-oblong, acute, lined; bristles of stipulas equal in length to the sheath; cymes terminal, compact, trichotomous; floral leaves small; capsule oblong, downy, crowned by the 4 ovate teeth of the calyx. 2. S. Native of Equinoctial Brazil. Corolla campanulately funnel-shaped, glabrous outside.

Eupatorium-like Boreria. Shrub 1 foot.

71. B. Centranthoides (Cham. et Schlecht. in Linnae. 3. p. 328.) plant herbaceous, smoothish; stem ascending, fistular, bluntly tetragonal; leaves elliptic-lanceolate, attenuated at both ends, rather scabrous; bristles of stipulas 5-7, slightly longer than the sheath; cymes terminal, fastigate, pedunculate; floral leaves small; capsule hairy, obconically cylindrical, crowned by 4 K.
the 4 ovate teeth of the calyx. 2. S. Native of the south of Brazil.

*T. β. angustifolia* (Cham. et Schlecht. l. c.) the whole plant is catkin from hairs; leaves oblong-lanceolate, much more narrow than those of the species. 2. S. Native of the south of Brazil.

*Centranthus-like Borreria.* Pl. 1 to 2 feet.

72 B. *Pohlia'na* (D. C. prod. 4. p. 550.) branches hairy, compressed; leaves lanceolate, acuminate, lined, downy above, and rather hairy on the nerves beneath; bristles of stipules length of sheath, which is villous; corymb tricholomous, terminal, crowded; tube of calyx calyx from hairs; lobes of calyx 4, lanceolate; corolla hairy inside.—Native of Brazil, where it was collected by Pohl. Hydrophyllæus pusillum, Pohl, in litt. Fruit unknown, but the plant has a habit very different from Hydrophyllæus, and appears to be nearly allied to *B. eupatioroides* and *B. centranthoides*.

Pohl's Borreria. Pl. 1 foot.

73 B. *angustiphilia* (Cham. et Schlecht. in Linnaea. 3. p. 356.) plant herbaceous, erect, glabrous; stem tetragonal; leaves lanceolate-linear, with revolute edges, having 2-3 veins on each side of the mid-rib; bristles of stipules twice the length of the sheath, which is downy; cymes tricholomous, capsule obovate-oblong, glabrous, crowned by the 4 lanceolate teeth of the calyx. 2. S. Native of Equinoctial Brazil. Corolla short, glabrous outside.

Narrow-leaved Borreria. Shrub 1 foot.

74 B. *corymbosa* (Batr. in herb. Henke, under Bigelovia, ex D. C. prod. 4. p. 550.) glabrous; stem suffruticoso, tereke, erect; leaves lanceolate, acuminate, lined with veins, which are smooth, as well as the margins; bristles of stipules longer than the sheath; coryms terminal, tricholomous; capsule obovate-oblong, glabrous, crowned by the 4 lanceolate teeth of the calyx. 2. S. Native of Peru, on the mountains. Spermacoæe corymbosa, Ruiz et Pav. fl. per. 1. p. 60. t. 91. f. 5. but not of Lin. Spermacoæe! Ehrh. Pers. ench. 1. p. 134. Hedychiét Spermacoæe, Donn. herb. The leaves of the figure in fl. per. are one half broader than those of the specimens collected by Pavon and Henke.

Corymbose-flowered Borreria. Shrub 1 to 2 feet.

75 B. *verbénoïdes* (Cham. et Schlecht. in Linnaea. 4. p. 550.) plant herbaceous, erect, smoothish; stem tetragonal at bottom; leaves narrow-lanceolate, very acute, scabrous on the margins above; bristles of stipules longer than the sheath; cymes terminal, tricholomous, with a lateral flower; floral leaves small; capsule oblong-cylindrical, glabrous, crowned by the 4 lanceolate teeth of the calyx. 2. S. Native of the south of Brazil. Herb very variable in habit, sometimes glabrous, and sometimes downy. Leaves linear, or lanceolate; lower ones usually ovate, petiolate. Corolla short, tubular, clothed with pruinose down outside.

Terete-like Borreria. Pl. 4 feet.

76 B. *Valerianoides* (Cham. et Schlecht. in Linnaea. 3. p. 335.) plant herbaceous, erect; stem tetragonal, fistular, glabrous at the base, but scabrous from retrograde bristles at the apex; leaves lanceolate, acute; lower ones somewhat spatulate, with the nerves all scabrous from hairs; bristles of stipulas longer than the sheath, which is rather scabrous; cymes terminal, large, tricholomous; floral leaves small; capsule nearly cylindrical, roughed, crowned by the 4 narrow-linear teeth of the calyx. 2. S. Native of Equinoctial Brazil. Corolla glabrous; lobes acute, bearded with stiff hairs at the apex.

Valerian-like Borreria. Pl. 3 to 4 feet.

77 B. *Là'xa* (Cham. et Schlecht. l. c. p. 337.) plant herbaceous, erect; stem fistular, tetragonal, with opposite, spreading branches; leaves lanceolate, attenuated at both the ends, loose, membranous, with scabrous edges; bristles of stipulas glabrous, length of the sheath, which is downy; cymes terminal, somewhat tricholomous; floral leaves small; capsule elliptic, rather truncate, crowned by the 4 narrow, acute teeth of the calyx.

2. S. Native of the south of Brazil.

Loose-leaved Borreria. Pl. 2 feet.

78 B. *Equisetoides* (Cham. et Schlecht. l. c. p. 338.) glabrous; root woody; stems herbaceous, erect, contracted at the nod; blumly tetragonal? leaves narrow-linear, straight, almost filiform, with revolute, scabrous edges; stipulas fuscose, ciliated with bristles; cymes terminal and axillary, crowded. 2. S. Native of the south of Brazil. Habit of the plant elegant; but the fruit being unknown, it is very doubtful whether it belongs to the present genus.

Horse-tail-like Borreria. Pl. 3 feet.

§ 4. *Flora umbellata; umbels cymose or capitata.*

79 B. *umbellata* (Spreng. neu. entd. 2. p. 144.) stem herbaceous, branched, somewhat tetragonal, shining; leaves lanceolate, tapering to both ends, glabrous; stipulas setose, connate at the base; umbels pedunculate, semi-globe, axillary, and terminal; capsule obconical, downy, crowned by the 4 acute teeth of the calyx. 2. S. Native of Brazil, within the tropic. Cham. et Schlecht. in Linnaea. 3. p. 338. Bigelovia umbellata, Spreng. syst. 1. p. 405. Corolla small, white. Herb clothed with very fine down while young.

Umbellate-flowered Borreria. Pl.

80 B. *alaroides* (Cham. et Schlecht. in Linnaea. 3. p. 339.) glabrous; stem herbaceous, erect, fistular, tetragonal, branched at the top; leaves lanceolate, acuminate, on short petioles, rather coriaceous; bristles of stipulas few, shorter than the sheath; cymes umbellate, terminal, downy, with tetragonal branchlets; calyx glabrous, acutely 4-toothed; anthers exerted.—Native of Equinoctial Brazil. Allied to *B. umbellata*, but is twice the size in all its parts. Fruit unknown, therefore the genus is doubtful.

Aralia-like Borreria. Pl. 2 feet.

† Species not sufficiently known.

81 B. *abscédens* (Cham. et Schlecht. in Linnaea. 3. p. 340.) glabrous; stems ascending; leaves linear-lanceolate, acute; stipulas toothed; teeth bristy.—Native of Madagascar. Spermacoæe abscédens, Willd. in Roem. et Schultes, syst. 3. p. 523.

Ascending Borreria. Pl. ascending.

82 B. *vagina'ta* (Cham. et Schlecht. l. c. p. 340.) stem suffruticoso, and is as well as the branches, tereke and glabrous; leaves lanceolate; stipulas cunate; lower ones sheathed; fruit hispid.—Native of St. Domingo. Spermacoæe vagina'ta, Willd. in Roem. et Schultes, syst. 3. p. 531. Bigelovia vagina'ta, Spreng. syst. 1. p. 405.

Sheathed Borreria. Shrub 1 foot?

83 B. *linifölla* (D. C. prod. 4. p. 551.) stem herbaceous, tetragonal, rather villous on the angles; leaves linear-lanceolate, acule, on short petioles, villous, with scabrous margins; bristles of stipulas rather shorter than the flowers: whorles of flowers axillary and terminal; the latter globose, and girded by 4 leaves: anthers exerted; calyxes clothed with cinius villous.

Flax-leaved Borreria. Pl. 1 foot.

Cult. The species of Borrëria are of most easy culture. A light soil suits them best; and cuttings of the perennial and shrubby kinds strike root readily in the same kind of soil, in heat. The annual kinds require the treatment of other tender annuals.
CLXXXVI. SPERMACOCE (from σπέρμα, σπέρνει, a seed, and ακολω, akole, a point; in allusion to the capsule being crowned by the calycine points). Meyer, fl. esaq. p. 79. Cham. et Schlecht. in Linnaea. 3. p. 355. D. C. prod. 4. p. 559.—

LIN. SYST. TETRAPLIA, Monogynia. Calyx with an ovate or turbine tube, and a 2-4-lobed limb (f. 108. a. b.), and sometimes accessory teeth in the recesses of the primary lobes. Corolla salver-shape, or funnel-shaped, 4-lobed (f. 108. c.). Stigma bital or undivided. Capsule crowned by the limb of the calyx (f. 108. f.), which is often obliterated, 2-owed; nuts 1-seeded, divided into 2 parts from the apex: the one part closed by the adran dissepiment, and the other open. Seed oval-oblong, marked inside by a longitudinal narrow.—Herbs or subshrubs. Branches or stems usually tetragonal. Leaves opposite. Stipulas combined with the petiole, sheathing, fringed by numerous bristles. Flowers axillary, sessile, crowded, verticillate, or semi-verticillate, white, red, or blue.—The fruit of this genus is drawn with great character in Gärtn. fruct. 1. t. 23.—

The fruit of a great number of the plants still preserved in this genus being unknown, many of them will yet be expelled, when proper specimens can be procured.

* Species natives of America.

1 S. TENn'or (Lin. spec. p. 147.) stems herbaceous, branch- ed; branches tetragonal, with the angles smooth or scabrous; leaves lanceolate, on very short petioles, rather scabrous above and on the margins; bristles of stipulas hardly longer than the sheath; flowers disposed in sessile axillary fascicles, semi-verticillate; stamens inclosed; capsule ovate, usually hairy, crowned by the 4 short, acute calycine teeth. O. F. Native of the West Indies Islands, as of Jamaica, Martinico, Porto-Rico, Cuba, St. Domingo, &c, as well as of Peru, Panama, Carolina, very frequent. S. lanceolata and S. dichotoma, Willd. in herb. S. parviflora, Salisb. prod. p. 60.—Dill. clth. p. 370. t. 359. Lam. ill. t. 62. f. 1. There are varieties of this species (ex Swartz, obs. p. 43), with smooth, pubescent, and straight or ascending stems; narrow and broader leaves; scabrous or solitary flowers; smooth or hispid fruit, having one of the parts or nuts bearing 3 of the calycine teeth, and the other bearing only one. The varieties are so numerous, and run so gradually into each other, as hardly to be distinguished, many specimens of which are to be found in herbaria, under various names, from their different habits; as P. ossisergens, Spreng. syst. 1. p. 402, a native of Porto-Rico, but not of the fl. per.; and Sperna longifolia, Bartl. in herb. Hänke, &c. Some specimens are suffruticose at the base, and others are herbaceous. Perhaps the whole form a congeries of species, of which some may be ultimately distinguished from each other. The flowers in most of the varieties are of a white or pink colour, and one is said to have yellow flowers.

2 S. PORTORIE'nes (Balb. in herb. Bert. ex D. C. prod. 4. p. 532.) stems herbaceous, glabrous, tetragonal; leaves elliptic-oblong, acuminate at both ends, on very short petioles, glabrous; stipulas rather downy, having the bristles longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, rather downy, somewhat truncate at the apex.—Native of Porto-Rico, where it was collected by Bertero. Perhaps sufficiently distinct from S. teniitour.

* Porto-Rico Button-weed. Pl. 1 to 2 feet.

3 S. LONGIFOLIA (Aspl. guian. 1. p. 59. t. 21.) stem herbaceous, glabrous, dichotomous, and are, as well as the branches, acutely tetragonal; leaves oval-oblong, tapering to both ends, on short petioles, scabrous above between the nerves and on the margins, and pilose on the nerves beneath; stipulas downy, bearing each 5-7 bristles, and short hairs between these bristles; whorles axillary, few-flowered; fruit ovate, downy, crowned by the 4 short teeth of the calyx. y. S. Native of French Guiana. S. fruticosa, Poir. Flowers white. Stems reddish.

* Long-leafed Button-weed. Shrub. 4 S. CEREA'lea (Pohl. in litt. ex D. C. prod. 4. p. 552.) stem herbaceous, almost tetragonal, downy; leaves elliptic-oblong, acute, petiole, glabrous, downy on the nerves beneath; stipulas downy, bearing 3-7 bristles, which are a little longer than the sheath; flowers axillary, sessile, crowded, semi-verticillate; fruit oval, downy, truncate at the apex.—Native of Brazil, where it was collected by Pohl. Flowers blue. Very nearly allied to S. teniitour, but is very distinct.

* Blue-flowered Button-weed. Pl. 1 to 2 feet?

5 S. RIPA'BIA (Cham. et Schlecht. in Linnaea. 3. p. 355.) quite glabrous; stems long, fistulat, tetragonal, sulfrutescent at the base; leaves lanceolate, acute, with scabrous margins; bristles of stipulas 3, longer than the sheath; flowers terminal in the upper axis, disposed in whorled heads; stamens almost inclosed; capsule ovate, glabrous; teeth of calyx 6-7, acute, at length obliterated. y. S. Native of Brazil, on the banks of the Rio Negro.

6 S. HEVERCA'pa (D. C. prod. 4. p. 553.) stem herbaceous, tetragonal, nearly naked, downy; the rest of the plant smoothish; leaves ovate, acute, tapering to the base, glabrous above, but downy on the nerves beneath while young; bristles of stipulas many, rather shorter than the sheath, which is downy: heads of flowers verticillate, 1-2 axillary, and one terminal; the latter girded by 4 very unequal leaves: fruit downy, truncate at the apex.—Native of South America, about Caraccas, where it is collected by Vargas. Both the nuts of the fruit being dehiscent, it is therefore rather an ambiguous species.

7 S. VARI'US (D. C. prod. 4. p. 553.) leaves lanceolate, and are, as well as the stems, glabrous.—Native of St. Domingo, where it was collected by Bertero.

* Downing-fruited Button-weed. Pl. 1 foot?

8 S. DIFFUS'As (H. B. et Kunth, nov. gen. amer. 3. p. 343.) stems suffruticose, procumbent, terete, hairy; leaves lanceolate, scabrous from retrograde hairs on both surfaces, with the margins serrately scabrous; stipules hairy, ciliated with bristles; whorles of flowers axillary, sessile, and one larger terminal; the latter girded by 4 leaves: capsule smoothish, globose, crowded by the 4 teeth of the calyx, 2 of which are linear-subulate, and longer than the other 2. y. S. Native of South America, in the province of Vario, at the river Atures. Flowers white. Said to be allied to S. teniitour, and therefore it is probably a true species of Spermacoce.

Diffuse Button-weed. Shrub procumbent.

9 S. SUFFRUT'EScens (Jacq. schoenbr. t. 332.) stem suffruticos at the base, rather diffuse, branched, tetragonal, glabrous; leaves ovate-lanceolate, acuminate, lined, with scabrous margins; stipules furnished with bristles: whorles of flowers dense, sessile, axillary, and terminal; the latter girded by 4 leaves: lobes of corolla large, villous at the apex; genitils exserted; stigma capitate; fruit turbinate, hispid, crowded by the 4-cleft calyx. y. S. Native country unknown. S. sulfruticosa, Spreng. syst. 1.
400. S. tragantha, hort. berol. Leaves pilose above? Flowers pale red.

9 S. *linearis* (H. B. et Kunth, nov. gen. amer. 3. p. 543.) stem suffrutescent, obsolete tetragonal, clothed with hairy down; leaves linear, scarbose above and on the margins, hairy beneath; stipulas hairy, ciliated with bristles; whorles many-flowered, sessile, axillary; corollas glabrous; stigma rather capitate, exserted; capsule oblong, hispid at top; teeth of calyx 4, ovate-lanceolate. S. Native on the banks of the Orinoco. Corollas white. Bigelovia linearis, Spreng. syst. 1. p. 405.

Linear-leaved Button-weed. Shrubs 1 foot.**

** Species natives of Africa.

10 S. *palmetorum* (D. C. pro. 4. p. 553.) plant herbaceous, ascending, branched; stem tetragonal, hairy; branchlets compressed; leaves oval-lanceolate, scarbose above and lined, hairy beneath and nervled; stipulas villous, with the bristles shorter than the sheath; flowers 3-6 together on both sides, sessile, axillary, verticillate; fruit rather hairy, obovate; teeth of calyx 4, short, subulate, at length deciduous.—Native everywhere where about the Gambia, at the roots of palm-trees, in humid places, where it was collected by Leprieur and Perrottet. Al- lied to *S. tenax.* Perhaps Diódia scabra, Schum. pl. guin. p. 76.

*Pilose* Button-weed. Pl. 1 foot.

11 S. *fideosa* (D. C. pro. 4. p. 553.) stem herbaceous, tetragonal, with blunt, pilose angles; leaves ovate, acute, scarbose on both surfaces; bristles of stipulas distant, longer than the sheaths; whorles sessile, many-flowered; fruit ovate, crowned by the reflexed, acute lobes of the calyx.—Native of Guine. Diódia pilosa, Schum. pl. guin. p. 76.

Pilose *Button-weed.* Pl. 1 foot.

12 S. *phillocéthala* (D. C. l. c.) plant erect, glabrous, sparingly branched; stems tetragonal; leaves linear, 1-nerved; floral ones dilated at the base; bristles of stipulas 5-7 on each side, longer than the sheath; heads of flowers axillary, verticillate, very few, and a large terminal one, the latter surrounded by long, squarrose leaves; fruit solitary in the axils of the floral leaves, crowded from the floral leaves being clustered; seeds large, shining. O. S. Native of the west coast of Africa, at Kouma and Walo, where it was collected by Perrottet and Leprieur. Seeds 2 lines long, almost like those of *Psyllium.*

Leaf-headed *Button-weed.* Pl. 1 foot.

13 S. *stachydea* (D. C. pro. 4. p. 554.) plant erect, nearly simple, villous; stem tetragonal; branchlets compressed; leaves linear, acute, floral ones dilated at the base; bristles of stipulas 5-7, longer than the sheath, which is velvety; heads of flowers verticillate, numerous, surrounded by 6-8 aggregate, squarrose leaves; flowers solitary in the axils of the leaves, and aggregate only from the leaves being crowned; lobes of calyx linear-subulate, nearly the length of the fruit; seeds large, shining. O. S. Native of the west coast of Africa, among stones, at Bakel, where it was collected by Leprieur. Plant about a foot high. Leaves 3 inches long, and nearly 4 lines broad. Bristles of stipulas blackish. Seed 2 or 2½ lines long, larger than any other of the genus.

Stachys-like *Button-weed.* Pl. 1 foot.

14 S. *gallochlaena* (D. C. pro. 4. p. 554.) erect, branched; stem tetragonal, hairy; leaves lanceolate-linear, rather scarbose on both surfaces; bristles of stipulas longer than the sheath, which is velvety; flowers axillary, few, sub-verticillate; fruit large, velvety, longer than the subulate, calycine lobes. O. S. Native of Senegambia, at Dagaio, in sandy places. Allied to *S. Ruellia.* But very distinct. Herb about a foot high. Leaves 15-16 lines long, and 3 broad, pale beneath. Stipulas yellowish. Fruit larger than in any other species of the genus, almost like that of a species of *Diodia,* but is membranous and dehiscent. Seeds large.

*Galeopsis-like* Button-weed. Pl. 1 foot.

15 S. *ruellie* (D. C. l. c.) erect, branched; stem tetragonal, hispid; leaves lanceolate-linear, acuminated, clothed with rough down on both surfaces; heads many, verticillate, axillary; bristles of stipulas many, 3 times longer than the sheath, which is downy; valves of fruit at length opening widely at the apex; lobes of calyx subulate, rather longer than the fruit. O. S. Native of Equinoctial Africa, in sandy places at Bakel, where it was collected by Leprieur. Stem a foot high. Leaves 3 inches long, and 3-6 lines broad. Mature fruit nearly as in the genus *Ruellia.* Seed a line and a half long.

*Ruellia-like* Button-weed. Pl. 1 foot.

16 S. *cheilocéthala* (D. C. l. c.) stem erect, simple, terete at the base and glabrous, and tetragonal at the apex, with the angles scarbose; leaves linear-elongated, acuminated, glabrous; bristles of stipulas 5-7, subulate, longer than the sheath, which is villous; heads verticillate, surrounded by many leaves, and the many bristles of the stipula; fruit pale, membranous, downy at the apex; lobes of calyx subulate, shorter than the fruit. O. S. Native of Equinoctial Africa, in Gala, among rocks at Bakel, where it was collected by Leprieur. Plant ½ foot high. Leaves 3 inches long, and 3 lines broad. Bristles of stipulas rufous. Capsules whitish. Seeds a line long.

Bristly-headed *Button-weed.* Pl. ½ foot.

** Species natives of the Mauritius and Madagascar.

17 S. *flagelliformis* (Poir. dict. 7. p. 314.) stem herbaceous, terete, glabrous, simple, erectec; leaves glabrous, oblong-lanceolate, acute, revolute on the margins at the base, and therefore petiole-formed; stipulas broad-cupshaped, having the bristles rather shorter than the sheath; flowers axillary, few, sessile, verticillate; capsule ovate, subulate, crowned by the 3 slender acute teeth of the calyx. O. S. Native of the Mauritius and Bourbon. S. flagellaris, Wild. in Rom. et Schultes, syst. 3. p. 532; ex Cham. et Schlecht. in Linn. 3. p. 357. Hedyotis verticillata, Lam. ill. no. 1423, exclusive of the synonyms of *Desf.*

Whip-formed *Button-weed.* Pl. 1 foot.

18 S. *muriculata* (D. C. pro. 4. p. 554.) glabrous; stem herbaceous, tetragonal, having the angles just under the nodi rough from small tubercles; leaves elliptic-lanceolate, acuminated at both ends, scarbose above; bristles of stipulas longer than the sheath, which is very short; flowers disposed in sessile, glomerate whorles in the axils of the leaves; fruit ovate, downy, crowned by the 2-4 very short, acute, calycine teeth, but is at length nearly naked.—Native of the Mauritius and Bourbon. Allied to *S. tenax;* but the angles of the stem are not downy, but scarrous from tubercles.

Muriculated-stemmed *Button-weed.* Pl. 1 to ½ foot.

19 S. *serrylíphióphora* (Wild. in Rom. et Schultes, syst. 3. p. 532.) plant diffuse, scarrous; leaves elliptic, with revolute margins; whorles few-flowered.—Native of Madagascar. A true species of Spemmacoeae ex Cham. et Schlecht. in Linn. 3. p. 357; but the rest is unknown. Wild-tygna-leaveded *Button-weed.* Pl.

** Species natives of India.

20 S. *stricta* (Lin. fil. suppl. p. 120.) stem herbaceous, straight, erect, scarrous at the angles; leaves linear-lanceolate, lined, scarrous; stipulas ciliately fringed; whorls of flowers axillary, remote, globose; fruit obovate-globose, rather membranous at the base, and hispid at the apex, crowned by the 4

**Straight Button-weed.** Fl. June, July. Cl. 1820. Pl. 11/2 to 1 foot.

21 S. BURMANNI (D. C. prod. 4. p. 555.) stem tetragonal, branched, slender, rather pimose on the angles; leaves oblong-linear, acuminate at both ends, scabrous above, and on the margins; bristles of stipulas glabrous, about the length of the sheath, which is villose; flowers axillary, sessile, few, somewhat verticillate, almost inclosed in the stipular sheaths; fruit ovate, rather hairy, crowned by the 4 acute teeth of the calyx. Native of the East Indies. S. corynomus, Burm. fl. ind. p. 34, but not of Lin. Allied to \textit{S. flagelliformis}. Flowers white.

**Burmans Button-weed.** Pl.

22 S. \textit{Scapebrima} (Blum. bijdr. p. 946.) stem herbaceous, branched, climbing; branches quadrangular, having the angles beset with retrograde down; leaves oval-lanceolate, rough above, and on the veins beneath; stipulas pubescent, furnished with bristles, which are a little longer than the sheath; stamens exserted; fruit glabrous, crowned by the 4 lobes of the calyx. Native of Java, in humid places about Buitenzorg. Habit of \textit{S. tenor}.

**Very-sea-bourn Button-weed.** Pl. climbing.

23 S. \textit{hispid/a} (Lin. mant. p. 558.) plant herbaceous, erect, hoary; stem tetragonal, hispid; leaves ovate, a little mucronate, hispid on both surfaces, and on the margins; bristles of stipular length or longer than the sheath; flowers 1-3-together, axillary, sessile, opposite or somewhat verticillate; stamens length of corolla; capsule elliptoid, hairy, crowned by the 4 teeth of the calyx. Native of the East Indies. Murr. comm. gett. 3. t. 57. Cham. et Schlecht. in Linneja. 3. p. 355. S. rigidus, Salsib. prod. p. 60. Burm. zeyl. t. 20. f. 5. Corollas turbinate, violaceous. Stamens purplish.

24 S. \textit{Scaera} (Willd. spec. 1. p. 572.) stem herbaceous, diffuse, turete, or slightly tetragonal, scabrous from pili; leaves ovate, obtuse or acute, undulated, scabrous on both surfaces, and on the margins; bristles of stipulas rather longer than the sheath, which is downy; flowers few, axillary, verticillate; stamens exserted; capsule ovate, rather hairy, crowned by the 4 lanceolate teeth of the calyx. Native of Coromandel, ex Roxb.; of Malabar, ex Rheed. mal. t. 76.; and of the Island of Timor. Roxb. fl. ind. 1. p. 377. S. hirta, Rotch. in nov. act. nat. cur. berl. 1803. p. 95. Flowers small, purple.

**Rough Button-weed.** Pl. June, July. Clt. 1818. Pl. diffuse. 25 S. \textit{Articulaa} (Lin. fl. suppl. p. 119. exclusive of the synonyms.) plant herbaceous, diffuse; stems tetragonal, pilose above at the angles; leaves elliptic-lanceolate, hardly acutely clothed with rough pubescence on both surfaces, and on the margins; bristles of stipulas longer than the sheath, which is downy; flowers 2-4, axillary, sessile; capsule oval, downy, crowned by the 4 teeth of the calyx. Native in sandy places on the shores of Coromandel. Roxb. fl. ind. 1. p. 378. Allied to \textit{S. hispida}. Stem reddish. Flowers white. Branches succulent.

**Jointed-branched Button-weed.** Pl. procumbent. 26 S. \textit{Bruxonii} (Wall. cat. no. 822.) stems herbaceous, erect, tetragonal, glabrous; leaves lanceolate, acute, sessile, glabrous, with serrulate scabrous edges; stipulas bifid and trident, or multident; heads of flowers terminal, rarely axillary: the former involucrated by 2 long leaves, and sometimes also 2 small ones. Native of Kamaon. Flowers white. Perhaps a species of \textit{Barbarea}.

**Brownie's Button-weed.** Pl. 1 to 2 feet.

27 S. \textit{Loxocalvis} (R. Br. in Wall. cat. no. 826.) plant scabrous; stem elongated, tetragonal, with scabrous angles; leaves oblong and obovate-oblong, opposite, and falsely verticillate, scabrous; bristles of stipulas longer than the sheath; flowers axillary, few, verticillate. Native of the Burmese Empire, at Prome; and of Singapore.

**Long-stemmed Button-weed.** Pl. 2 to 3 feet, diffus. 28 S. \textit{Avana} (R. Br. in Wall. cat. no. 828.) stems tetragonal, scabrous on the angles; leaves elliptic or obovate-elliptic, acute, attenuated at the base, rather scabrous, serrulate on the margins; bristles of stipulas longer than the sheath; flowers axillary, sessile, somewhat verticillate. Native of the Burmese Empire, at Ava. Very nearly allied to the preceding. 

**Avana Button-weed.** Pl. 1 to 2 feet. 29 S. \textit{Teixera} (R. Br. in Wall. cat. no. 833.) plant glabrous, diffuse; leaves lanceolate, tapering to both ends, petiolate, smooth; flowers axillary, verticillate; bristles of stipulas longer than the sheath. Native of the East Indies. O. cymoides, Heyne, but not of Burm.

**Plant Button-weed.** Pl. diffuse. 30 S. \textit{Compressa} (Wall. cat. no. 6187.) plant diffuse, densely clothed in every part with woolly scabrous hairs; leaves ovate or oblong, acute; stipulas bristly; heads of flowers axillary and terminal, verticillate; fruit compressed, crowned by the teeth of the calyx. Native of Sibhet, in the East Indies. Compressed-fruited Button-weed. Pl. procumbent.

† Species not sufficiently known.

* Species natives of Asia.

31 S. \textit{Flexuosus} (Lour. coch. p. 79.) stem shrubby, flexuous, nearly terete, procumbent; leaves ovate-lanceolate, obliquely-nerved, thick; stipulas bristly; heads of flowers globose; capsule of 2 2-horned nuts. Native of Cochlin-china, in hedges and among bushes. Corollas white, with revolute segments.

**This Button-weed.** Shrub procumbent. 32 S. ? \textit{Hedyotisdea} (D. C. prod. 4. p. 555.) stem tetragonal, glabrous; leaves lanceolate; stipulas rhomboid; thyrse bracteate; bracteae subulate; corolla tomentose inside; anthers linear; stigma capitata; capsule ovate, crowned by the 4-toothed calyx; cells 1-seeded. Native of the East Indies. Hedyotis fruticosa, Retz, obs. 2. p. 8. and probably also of Lin. If the cells of the fruit are truly 1-seeded, it is a true \textit{Spermacocce}. All the synonyms cited by authors for this plant are very doubtful.

**Hedyotis-like Button-weed.** Pl. 33 S. \textit{Procumbens} (Lin. syst. veg. p. 124.) stems herbaceous, procumbent, angular; leaves linear; corollas lateral, opposite, pedunculate, surrounded by many-leaved involucra; stamens exserted. Native of the East Indies. S. corynomus, Lin. spec. p. 149. but not of others. Stamens longer than the corolla.

**Procumbent Button-weed.** Pl. procumbent. 34 S. ? \textit{Semiresta} (Roxb. fl. ind. 1. p. 377.) stems tetragonal, ascending, bent in various ways, with rather hispid angles; branches brachiata, alternately smaller; leaves ovate, acuminate, on short petioles, scabrous; stipulas of many bristles; whorls of flowers small, compact; genicula inclosed; capsule turbinate, pilose. Flowers small, white. Native of Sunnata. S. Roxburghiana, Wall. cat. no. 6186. Fruit not sufficiently known. Half-creep Button-weed. Pl. 1/2 foot. 35 S. ? \textit{Costata} (Roxb. fl. ind. 1. p. 376.) plant diffuse, very villous; leaves broad-lanceolate or oblong, nervet; stipulas...
usually furnished with 3 bristles; flowers axillary, disposed in small proliferous crowded umbels; stamens protruding beyond the corolline tube. *S*. Native of the Moluccas. Perhaps the same as *S. cristata*, Willd. in Röem. et Schultes, syst. 3. p. 530. * Flowers pale, pink.

**Rubiaceae.**

**Rosed-leaved Button-weed.** Pl. diffus. 39 *S.* *R.* (Roxb. fl. ind. 1. p. 375.) stem erect, simple, nearly terete, smooth; leaves petiolate, lanceolate, smooth; flowers axillary or terminal, sessile, crowded.—Native of the Island of Honimoa. Plant hardly half a foot high.

**Dwray Button-weed.** Pl. $\frac{1}{2}$ foot. 40 *S.* *l.* (Lex.) (Roxb. fl. ind. 1. p. 375. but not of Blume,) plant erect, branched, pilose; leaves on short petioles, lanceolate-linear, acuminate, lined; stipulas triangular, furnished with bristles; peduncles axillary, trichotomous; flowers capitate; stamens exserted.—Native of the Moluccas. The rest unknown.

**Lined-leaved Button-weed.** Pl. 1 foot. 41 *S.* *l.* (Lex.) (Spreng. syst. 1. p. 401.) stem erect, and as well as the leaves rough; stipulas toothed; stamens exserted; fruit glabrous.—Native of the Philippines. The rest unknown.

**Smooth Button-weed.** Pl. Fl. May, July. Ch. 1820. Pl. 1 foot. 42 *S.* *l.* (Lex.) (Röem. et Schultes, syst. 3. p. 530.) flowers terminal, capitulate; leaves linear, verticillate.—Native of St. Domingo, where it was collected by Martin. Sloane, hist. 1. p. 94. f. 2. Said to be nearly allied to *S. teniouri*. Flowers numerous.

**Steellate-leaved Button-weed.** Pl. 1 foot? 43 *S.* *l.* (Lex.) (Spreng. syst. 3. p. 275.) glabrous; stems diffusely, ascending, quadrangular; leaves ovate, mucronate; bristles of stipulas few, naked, short; flowers in capitulate whorls; teeth of calyx villous.—Native of St. Domingo, where it was collected by Martin. Poir. dict. 7. p. 512. Whorles of flowers the size of a pea.

**Rotate Button-weed.** Pl. diffuse. 44 *S.* *l.* (Lex.) (Lam. ill. 1. no. 1436.) stems straight, rather tetragonal, and downy; leaves linear-lanceolate, very rough, crenose beneath, shorter than the internodes; whorles of flowers dense, distant; capsules obtuse, villous.—Native of St. Domingo, where it was collected by Martin. Poir. dict. 7. p. 512. Leaves more than an inch long.

**Remote-whorled Button-weed.** Pl. 1 foot? 45 *S.* *l.* (Lex.) (Spreng. syst. 3. p. 530.) branchlets and under sides of leaves downy; bristles of stipulas longer than the whorles of flowers; stamens inclosed.—Native of the West Indies. S. decidua, Bosc. The rest unknown.

**Basil-leaved Button-weed.** Pl. 1 foot. 46 *S.* *l.* (Lex.) (D. C. prod. 4. p. 556.) glabrous; stem herm-locuneus, tetragonal; leaves ovate-oblong, attenuated at both ends, lined; stipulas connate, ciliate with bristles; whorles of flowers globose; corollas villous inside; stamens exserted.—Native of Cuba and Hispaniola. S. capitellata, Spreng. neuf. entd. 3. p. 46. exclusive of the synonyms. Fruit unknown.

**Obscure Button-weed.** Pl. 1 foot? 47 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 48 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 49 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 50 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 51 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 52 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 53 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.

**Oldenlandia-like Button-weed.** Pl. creeping. 54 *S.* *l.* (Lex.) (D. C. prod. 4. p. 557.) plant glabrous; stem herbaceous, much branched, creeping, filiform; branches opposite; leaves ovate, on very short petioles, shining; peduncles 1-flowered, solitary; fruit hispid.—Native of Chili, in humid places and about springs. Oldenlandia uniflora, Ruiz et Pav. fl. per. 1. p. 57. but not of Linn. Perhaps a true species of *Spermacoce* from the cells of fruit being 1-seeded.
urceolate, sinutately-quadrifid. ț. S. Native near Santa Fe de Bogota. Corolla, genitals, and fruit unknown.

**Trailing Button-weed.** Shrub procumbent. 53 S. ș. **ERIOCLADA** (D. C. prod. 4. p. 557) plant suffruticose, ascending; branches rather angular, clothed with hairy tomentum; leaves oblong, acuminate, very scabrous on both surfaces, almost villosus, with serrately scabrous edges, and sometimes mucronate at the apex; bristles of stipulas glabrous, length of sheath, which is villous; heads of flowers terminal, girded by 4 leaves; teeth of calyx 4, equal; stamens exerted. ț. S. Native of Peru. S. scaberrima, Bartl. in herb. Hance, but not of Blume. Fruit unknown, and therefore the genus is doubtful.

The habit is that of **Borreria**.

Var. ț. **LINEARIFOLIA** (D. C. prod. 4. p. 557) leaves linear, distinctly mucronate. ț. S. Native of Peru.

**Woolly-branched Button-weed.** Shrub ascending.

**** Species natives of Guinea.

54 S. ș. **SEXANGULARIS** (Amb. guian. 1. p. 61. t. 22. f. 8.) plant glabrous, prostrate; stem flexuous, prostrate, hexagonal; leaves ovate, acute, petiolate; heads of flowers terminal; anthers in the throat.—Native of Guiana, on the banks of rivers. S. hexagona, Wildt. spec. 1. p. 569. Flowers small, blue. Perhaps a species of **Borreria** nearly allied to B. alata.

55 S. ș. **PROSTRA'TA** (Amb. guian. 1. p. 58. t. 20. f. 3.) glabrous; stem herbaceous, prostrate, oppositely branched, tetragonal; leaves almost sessile, elliptic, acute, smooth; flowers verticillate.—Native of Guiana, on the banks of rivers. Flowers small. Leaves pale green.

Prostrate Button-weed. Pl. prostrate.

56 S. ș. **Radi'cans** (Amb. guian. 1. p. 58. t. 20. f. 4.) glabrous; stem herbaceous, alternately branched, prostrate, radical; leaves almost sessile, lanceolate, acute; flowers verticillate. ț. S. Native of Guiana, on the banks of the river Orapu. The rest unknown.

57 S. ș. **CERULE'SCENS** (Amb. guian. 1. p. 57. t. 19. f. 2) stem simple, straight, tetragonal; leaves ovate, acute, rather hairy, smooth; bristles of stipulas about equal in length to the flowers; flowers verticillate; stamens exerted.—Native of Guiana and Cayenne, on the edges of fields. Vahl. ecolg. 1. p. 9. Corollas blue. Fruit unknown.

Bluish-flowered Button-weed. Pl. 1 to 2 feet.

58 S. **LATIFOLIA** (Amb. guian. 1. p. 56. t. 19. f. 1.) glabrous; stem, erect, herbaceous, tetragonal; leaves ovate, acuminate, petiolate; rough; bristles of stipulas hispid, a little longer than the sheath; flowers axillary, verticillate; limb of calyx 4-toothed, rather villous, as well as the capsules, which are ovate.—Native of Guiana and Cayenne by way sides. Lam. ill. t. 62. f. 2. Probably a species of **Borreria** or Mitracarpum. Flowers white.

**Broad-leaved Button-weed.** Fl. July. CIt. 1803. Pl. 2 to 3 feet.

**** Species natives of Mexico.

59 S. **POLYCEPHALA** (Bartl. in herb. Hance, ex D. C. prod. 4. p. 558.) stem herbaceous, erect, branched, quadrangular, villous; leaves ovate-lanceolate, acuminate, pilose on both surfaces, lined with veins beneath; bristles of stipulas longer than the sheath, hairy; heads of flowers terminal, nearly globose, girded by 4-leaved involucra; teeth of calyx subulate, nearly equal; stamens exerted.—Native of Mexico. Perhaps a species of **Borreria**.

Many-headed Button-weed. Pl. 2 to 3 feet.

60 S. ș. **ECHINODERES** (H. B. et Kunth, nov. gen. amer. 3. p. 344.) stem herbaceous, tetragonal, erect, hispid; leaves lanceolate, acuminate, petiolate, hispid on both surfaces; stipulas hispid, ciliate by bristles; whorls of flowers nearly globose, axillary and terminal. ț. S. Native of Mexico, near Campeche. There is a variety of this with glabrous stems, and narrower less hispid leaves.

**Buglos-like Button-weed.** Pl.

61 S. ș. **INVERSIFOLIA** (H. B. et Kunth, nov. gen. amer. 3. p. 341.) plant herbaceous, erect, with tetragonal branches, which are scabrous from retrograde bristles; leaves linear, with remotely scabrously serrated margins: the lower ones minute and oblong-elliptic; stipulas smoothish, fringed by bristles; heads of flowers terminal; calyx 2-4-toothed; capsules hispid. ț. F. Native of Mexico. Knösia simplex, Willd. in Rom. et Schultes. sst. 3. p. 532. Perhaps a species of **Borreria**. Flowers white.

Diverse-leaved Button-weed. Pl.

62 S. ș. **RECLINATA** (Nees, hor. berl. p. 50.) plant glabrous, ascending, herbaceous; leaves lanceolate, acute, smooth, veinless; stipulas downy, furnished with 5 bristles each; heads terminal, dense, hemispherical, supported by 2 leaves; calyx and fruit glabrous. ț. S. Native of Mexico. Fruit unknown.

**Reclinata Button-weed.** Pl. ascending.

**** Species natives of North America.

63 S. ș. **LASS'ANTHA** (Rafin. fl. lud. p. 76.) stem weak; branches diffuse; leaves sessile, oblong, acute, nerved; nerves scabrous; flowers verticillate; corolla woolly inside.—Native of Louisiana.

Woolly-flowered Button-weed. Pl. diffuse.

65 S. ș. **INVOLUCRATA** (Pursh, fl. amer. sept. 1. p. 105.) plant very hispid, herbaceous, erect; stem alternately branched; leaves ovate-lanceolate, acuminate, hairy on both surfaces; stipulas of many bristles; heads terminal, involuong; tube of corolla very long; stamens exerted.—Native of Carolina. Flowers white. Leaves rather broad. According to Sprengel this is a variety of Cracea rubra. Fruit unknown.

Involuturate-flowered Button-weed. Pl. 1 foot.

Cult. See **Borreria**, p. 618. for culture and propagation.

**CLXXXVII. Hexaspe'culum** (from ἕξ, hex, six, and σπεῖρα, σεπαλον, an alternation of σπεῖρα, a sepal; in reference to the limb of the calyx being 6-parted, indicating its being composed of six sepals). Bartl. in herb. Hance, ex D. C. prod. 4. p. 561.

**Lin. syst.** Tetra'ándrum, Monogy'nia. Calyx with an oblong obovypyramidal tube, and a 6-parted limb; lobes narrow, nearly equal, acute, permanent. Corolla campanulate funnel-shaped, with an obconcical tube, and 4 lanceolate acute lobes, which are valvate in resurrection. Stamens 4, shorter than the lobes of the corolla. Fruit oblong, dry, ribbed, divisible into 2 parts at the dissepiments: the dissepiment being double, both the parts of the fruit or nuts are closed, and 1-seeded.—A small ascending much branched glabrous shrub, with diffuse flexuous compressed branches. Leaves opposite, long-linear, acute, with the margins hardly scabrous. Stipulas sheathing, furnished with many bristles, which are equal in length to the sheath, intermixed with very short ciliate. Flowers axillary, solitary, sessile, larger than in any other genus belonging to the tribe Spermacoceae.

1 H. ANGUSTIFOLIUM (Bartl. l. c.) ț. S. Native of Mexico,
in Real del Monte, where it was collected by Henke. Leaves 1½ to 2 inches long, and a line broad. Corolla 6 lines long. Ovarium 3 lines long.

**Narrow-leaved Hexasepalum.** Shrub 2 to 3 feet. 

**Cult.** See Borrêria, p. 618. for culture and propagation.

---

**CLXXXVII. DIO DIA (from διόδος, a passage; the greater part of the species grow by way sides, hence the name).** Lin. gen. no. 122. Gaertn. fruct. 1. p. 121. t. 25. Meyer, essq. p. 81. Cham. et Schlecht. in Linnaea. 3. p. 341. D. C. prod. 4. p. 561.—Diôdia and Spermacoce species of authors.

**Lin. syst. Tetrándria, Monogyîna.** Calyx with an obovate or ovate tube, which is usually 8-nerved; limb dentately parted; teeth sometimes 2, sometimes 4, equal or unequal, cruciately disposed, rarely more than 4. Corolla funnel-shaped, with a 4-lobed limb. Stamens 4, exerted or inclosed. Style bifid or undivided. Fruit 2-celled, crowned by the calyx, divisible into 2 1-seeded inacelous parts or nuts. Seeds erect in the cells, furrowed in the front.—Herbs or subshrubs, all natives of America except one species. Branches terete or tetragonal. Leaves opposite, or falsely verticillate from axillary fascicles. Flowers small, white, disposed in various ways in the different sections.

---

**SEC. I. EUDÔRIA (from eu, well, and Diodia; this section is considered to contain the true species of the genus).** D. C. prod. 4. p. 561. Capsules crustaceous or somewhat fleshy; having the mericarps or nuts separate, without any dispacement between them.—Flowers axillary, sessile, opposite; or 2 or more on each side verticillate.

1. **D. VIRGINICA** (Lin. spec. 151.) glabrous in every part; stems procumbent, nearly terete; leaves lanceolate; lobes of stipules linear-subulate; corolla rather hairy inside; fruit ovate-oblong, glabrous, crowned by the 2 lanceolate lobes of the calyx. 2. F. Native from Virginia to Carolina, in humid sandy places. Jaqc. icon. rar. 1. t. 29. Lam. ill. t. 63. Pursh, fl. sept. amer. 1. p. 105. Stems reddish, smooth. Flowers white.

**Tetragonal-stemmed Diodia.** Pl. procumbent.

**Hairy Diodia.** Pl. procumbent.

4. **D. MELLEX** (Swartz, fl. ind. occ. 1. p. 226.) stems herbaceous, erectish, smooth, simple; leaves oblong-lanceolate, glabrous; lobes of stipules linear-oblong; fruit ovate-oblong; limb of calyx benticate; teeth linear. 2. ? F. Native of Jamaica, on the higher mountains. Leaves ciliate on the margins while young. Flowers sessile, solitary, axillary, white.

**Simple-stemmed Diodia.** Pl. 1 to 1½ foot.

5. **D. VERTİCILLÂTA** (Vahl, symb. 2. p. 28.) glabrous; stem herbaceous, simple, erect, smooth; leaves lanceolate, attenuated at both ends, with scabrous margins; stipules ciliate; flowers verticillate; fruit linear, crowned by the 2 calcyce teeth.—Native of the Island of Santa Cruz. The leaves are said to be in whorles within the stipules, hence they are probably in axillary fascicles. Flowers white, in axillary and terminal whorles: the latter the largest. It is probably a species of Borrêria from the terminal whorl of flowers being larger than the axillary ones.

**Whorled-flowered Diodia.** Fl. June, July. Ct. 1821. Pl. 1 foot

6. **D. VILLÔSA** (Moc. et Sesse, fl. mex. icon. ined. ex D. C. prod. 4. p. 562.) stem herbaceous, deciduate, tetragonal, villous; leaves lanceolate, acuminate, scabrous above and on the margins, hairy beneath, and obliquely nerved; bristles of stipulas scabrous, longer than the sheath; whorles axillary, sessile, 10-12-flowered; fruit ovate, easily separated into 2 parts, crowned by the 2 teeth of the calyx.—Native of New Spain. Spermacoce declinata, Pavon, ined. Habit of Spermacoce teniòris, but the fruit is composed of 2 indehiscent nuts, each crowned by one calyce tooth.

**Villosa Diodia.** Pl. declinate.

* Calyx 4-toothed.

7. **D. TÉRES** (Walt. car. p. 87.) stem terete, velvety, procumbent; leaves linear-lanceolate, clothed with velvety down; lobes of stipulas setaceous, longer than the fruit; corolla bearded inside; fruit ovate, downy, crowned by the 4 lanceolate calyce lobes. 0. H. Spermacoce dioídia, Michx. fl. amer. bor. 1. p. 82. Torr. fl. u. st. 1. p. 170. Leaves with scabrous edges and keel. Flowers white, solitary, sessile.

**Tere-stemmed Diodia.** Pl. procumbent.

8. **D. HYSSÔPODÔRIA** (Cham. et Schlecht. in Linnaea. 3. p. 342.) plant suffruticosæ, branched; branches nearly terete, hairy; leaves linear, acute, glabrous, glaucescens; bristles of stipulas equal in length to the fruit; whorles usually 6-flowered; fruit obvolutely turbinate, downy. 8. S. Native on the banks of the Orinóco, near San Borja in hot places. Spermacoce hyssopîdôria, H. B. & Kuntth. nov. gen. amer. 3. p. 342. Wild. in Rom. et Schultes, syst. 3. p. 532. Said to be allied to D. teëræ. Flowers white.

**Hyssop-leaved Diodia.** Shrub.

9. **D. PRÔSTRÂTA** (Swartz, fl. ind. occ. 1. p. 228.) stems suffruticosæ, subdivided; branches prostrate, tetragonal, filiform, rather hairy at the apex; leaves linear, rather hairy, with revolute edges; lobes of stipulas setaceous, intermixed with pili, which rise from the sheath; fruit ovate, downy, crowned by the 4 short lobes of the calyx. 8. S. Native of Jamaica. D. protonáta, Swartz, in herb. L'Her. D. próstrata, Spreng. exclsive of the species from Hispaniola.

**Vacc. β, longiçéta** (D. C. prod. 4. p. 562.) bristles of stipulas longer than the sheath; branches hispid. 8. S. Native of Mexico. D. próstrata, Bartl. in herb. Hænke, ex D. C. l. e. 

10. **D. DOMINGÈSSIS** (D. C. prod. 4. p. 563.) glabrous; branches and stems procumbent, tetragonal, filiform; leaves linear, with revolute margins; bristles of stipulas stiff.—Native of St. Domingo, where it was collected by Bertero. Diodia prostrata, ex Hispaniola, Spreng. syst. 1. p. 406. Flowers and fruit unknown, and therefore the genus to which it belongs is doubtful. Nearly allied to D. próstrata.

**St. Domingo Diodia.** Shrub procumbent.

11. **D. SCÂNDENS** (Swartz, fl. ind. 1. p. 230.) stems suffruticosæ, climbing; branches very long, tetragonal, smoothish; leaves ovate-lanceolate, scabrous, at length rather muricate above; bristles of stipulas stiffish; fruit ovate-oblong, crowned by the 4 lanceolate calyce teeth. 8. S. Native of St. Domingo.

**Diam.** Leaves muricate above, almost as in boraginaceous plants. Flowers white, sessile, 4-6-together, axillary.

**Climbing Diodia.** Shrub el. 8 to 10 feet.
12 D. sarmentosa (Swartz, fl. ind. occ. 1. p. 231.) stem climbing, suffruticulose, tetragonal, villous, particularly on the leaves; leaves ovate-oblong, acute, scabrous from murice, rosely nerved in the adult state; bristles of stipulas stiffish; fruit oval, rather tetragonal, crowned by the 4 lanceolate teeth of the calyx. ≠ S. Native of Jamaica, Porto-Rico, St. Thomas, &c. Spermacoce radaula, Spreng. neut. entd. 2. p. 144. Schultes, mant. 3. p. 207. but not of Willd.—Diodia sarmentonosa = Guadalupa, Spreng. syst. 1. p. 405. is a species of Borrieda. Flowers solitary, axillary, white. Corolla with a tetragonal tube.

13 D. latiloba (D. C. prod. 4. p. 563.) stems suffruticos, flexuous, sparingly branched, tetragonal, glabrous, hardly pilose at top; leaves linear, cuspitate, glabrous on both surfaces, with serrately scabrous margins, ciliated at the base; bristles of stipulas equal in length to the fruit; flowers axillary, sessile, opposite; corolla glabrous; fruit ovobrate-globose, crowned by the 4 lanceolate, acuminate, unequal calyceal teeth. ≠ S. Native of St. Domingo. Spermacoce barbata, Spreng. in herb. Balb. but not of Lam. D. scändens, Vahl, herb. ex Puer. Very nearly allied to D. scándens, and probably only a variety of it. Corolla 5 lines long, oblong, white.

Broad-flowered Diodia. Shrub cl.

14 D. grandiflora (D. C. prod. 4. p. 563.) stems twiggly, flexuous, sparingly branched, tetragonal, glabrous, hardly pilose at top; leaves linear, cuspitate, glabrous on both surfaces, with serrately scabrous margins, ciliated at the base; bristles of stipulas equal in length to the fruit; flowers axillary, sessile, opposite; corolla glabrous; fruit ovobrate-globose, rather hairy, crowned by the 4 lanceolate, acuminate, unequal calyceal teeth. ≠ S. Native of St. Domingo, where it was collected by Bertero. Spermacoce grandiflora, Spreng. neutr. entd. 3. p. 45. syst. 1. p. 400. Flowers white. Nuts of fruit truly indehiscent. Allied to D. scándens and D. latiloba.

Great-flowered Diodia. Shrub.

15 D. conésta (D. C. prod. 4. p. 563.) stem ascending; branches hairy, almost tetragonal; leaves ovate, acuminate, terminated by a long hair each, sessile, with serrately scabrous edges, hairy beneath; bristles of stipulas numerous, stiff longer than the sheath. ≠ S. Native of Brazil, where it was collected by Schott. Spermacoce conferta, Schott. ex Pohl, in litt. Fruit not seen, but from its analogy with D. polysticha it has been placed in this genus.

Crowded-flowered Diodia. Shrub 3 to 4 feet.

16 D. setígera (D. C. prod. 4. p. 563.) stem ascending, suffruticulose at the base, somewhat tetragonal, hairy; leaves sessile, ovate-lanceolate, subacutate at the base, and terminating in a bristle at the apex, ciliated on the nerve and margins: the ciliate largest towards the base; bristles of stipulas longer than the sheath, which is smoothish; fruit nearly globose, ribbed, glabrous, crowned by the 4 teeth of the calyx. ≠ S. Native of Brazil, about Bahia, in arid places, where it was collected by Salzmann. Corolla blue, with acuminate lobes.

Bristle-bearing Diodia. Shrub ascending.

17 D. ? barba'ta (D. C. l. c.) plant procumbent, scabrous; branches tetragonal, downy; leaves lanceolate, villous; bristles of stipulas long; flowers few, axillary.—Native of St. Domingo. Spermacoce barbata, Lam. ill. no. 1457. Poir. dict. 7. p. 514. Allied to D. longiflóra and D. longisétá, but the fruit is unknown. The flowers are said to be small. Leaves hardly an inch long; superior ones disposed in fascicles.

Bearded Diodia. Pl. procumbent.

18 D. folisétá (D. C. l. c.) branches or stems simple, twiggly, rather tetragonal, hispid from long spreading stiff hairs; leaves lanceolate, acute, hispid from long spreading pilly bristles; bristles of stipulas numerous, long, stiffish; fruit 2-3-together, axillary, roundish, crowned by the 4 small teeth of the calyx. ≠ S. Native of Porto-Rico.

Many-bristled Diodia. Shrub.

19 D. marítima (Schum. pl. guin. p. 75.) stems prostrate, tetragonal, with furrowed sides, and scabrous angles; leaves ovate or oblong, having the margins scabrous from serrulations, rather downy or hairy on both surfaces; bristles of stipulas stiffish; fruit oval-oblong, crowned by the 4 lanceolate teeth of the calyx. ≠ S. Native of Guinea, along the coast in the sand. Flowers white.

Var. β, commutáta (D. C. prod. 4. p. 564.) leaves glabrous on both surfaces. ≠ S. Native of Porto-Rico, in the sand by the sea side, where it was collected by Bertero and Wydler. Spermacoce commutáta, Schultes, mant. 3. p. 208. There are varieties of this plant with either elongated or tufted branches, and having the axils of the leaves naked, or bearing fascicles of leaves or branches, and with the leaves flat, or nervously furrowed.

20 D. nigéa (Cham. et Schlecht. in Linn. aa. 8. p. 341.) stem suffruticulose, creeping, quadrangular, hairy; leaves lanceolate, piliferous at the apex, stiff, with serrulated margins, hairy beneath; stipulas hairy, ciliated at the apex; fruit ovate-globose, crowned by the 4 linear-subulate teeth of the calyx. ≠ S. Native of the Spanish Main, near Caracas; of St. Domingo; Brazil, in the province of Para, and of the Society Islands. Spermacoce rigida, H. B. et Kunth, nov. gen. amer. 3. p. 342. Sperm. apiculata and Sperm. rigida, Willd. in Schultes, syst. 3. p. 551. Sperm. setosa, Willd. herb. but not of Schultes. Flowers white.

Stiff Diodia. Shrub creeping.

21 D. articuláta (D. C. prod. 4. p. 564.) glabrous; stem shrubby, terete, nodose; leaves linear, acute at both ends, with rather revolute edges, also smooth on the margin and mid-rib; bristles of stipulas stiff, shorter than the sheath; whorles 6-8-flowered; fruit ovobrate-oblong, crowned by the 4 calyceal teeth. ≠ S. Native of Brazil, where it was collected by Pohl. Spermacoce articulata, Pohl, in litt. Leaves in axillary fascicles, hence they appear in whorles, very like those of Hippuris.

Jointed-stemmed Diodia. Shrub.

22 D. kosmarinisólla (Pohl, in litt. ex D. C. prod. 4. p. 564.) stem herbaceous, erect, simple, terete, hairy; leaves linear, ending in a long hair each, with rather revolute edges, glabrous, but scabrous from serrulations on the margins and nerve below; bristles of stipulas very long; fruit oval, crowned by the 4 calyceal teeth. ≠ F. Native of Brazil, where it was collected by Pohl. This is a very distinct species, having the ciliate of the stipulas half an inch long, about half the length of the leaves.

Rosemary-leaved Diodia. Pl. 3 to 1 foot.

23 D. arenósa (D. C. prod. 4. p. 564.) stem decumbent, branched, tetragonal, rather scabrous above; leaves lanceolate-linear, sessile, acuminate, with revolute edges, rather scabrous on both surfaces; bristles or ciliate of stipulas longer than the sheath; whorles 8-10-flowered; fruit ovobrate-globose, scabrous from down, crowned by the 4 calyceal teeth. ≠ L. S. Native of Brazil. Spermacoce arenósa, Pohl, in litt. Nuts of fruit indehiscent. If Spermacoce ciliáris, Pay. in herb. Moric. be the same it is also a native of New Spain.

Sand Diodia. Pl. decumbent.

24 D. multíflóra (D. C. prod. 4. p. 564.) stem and branches long and twiggly, compressedly tetragonal, hairy; leaves lanceolate, sessile, acute, lined, beset with stiff villi on both surf.
faces; bristles of stipulas longer than the sheath, reflexed under the heads of flowers; whorles 15-20-flowered, nearly in all the axils; fruit obovate, rather downy, crowned by the 4 calyceal teeth.—Native of Brazil. Fruit easily separated into 2 parts; the parts or nuts closed.

Many-flowered Diodia. Pl. 25 D. muriculata (D. C. prod. 4. p. 504.) stem ascending; branches tetragonal, hairy; leaves sessile, ovate, cuspitate, reflexed below the whorles of flowers, beset with stigmas above, and villi on the nerves beneath; bristles of stipulas longer than the sheath; fruit nearly globose, downy, crowned by the 4 calyceal teeth. 4. S. Native of Brazil, about Bahia, in dry places. Allied to D. multiflora.

Multiclavulose Diodia. Pl. ascending.

26 D. micolor (D. C. l. c.) stem suffruticosum, downy, rather ascending, tetragonal; leaves lanceolate, acuminate at both ends, glabrous, rough, canescent beneath; bristles of stipulas 7-11, ciliate; fruit hairy, brittle, crowned by the 4-5 hispid teeth of the calyx. 4. S. Native of Surinam. Spermacoce discolor, E. Meyer, nov. act. bonn. 12. p. 178. Flowers white. Allied to D. radula, but distinct, ex Cham. et Schlecht. in LINN. 3. p. 342.

Discolored-leaved Diodia. Shrub 1 to 1½ foot.

27 D. radicans (Cham. et Schlecht. in LINN. 3. p. 550.) stem radicant, oppositely branched, tetragonal, glabrous; leaves lanceolate, acute, obliquely nerved, smoothish, pale beneath; fruit ovate, sessile, crowned by the 4 lanceolate lobes of the calyx. 4. S. Native of St. Domingo, where it was collected by Poiteau. Spermacoce radicans, Wildl. herb. but not of Annul. Flowers large, axillary, solitary, white?

Rooting Diodia. Shrub creeping.

*** Calyx 5-10-toothed.

29 D. radula (Cham. et Schlecht. in LINN. 3. p. 342.) stem herbaceous, weak, tetragonal, smoothish; leaves ovate-lanceolate, acute, lined, scabrous above, and downy on the nerves beneath; stipulae downy, ciliate; whorles 6-10-flowered; calyx unequally 5-10-toothed, ciliate; fruit didymous. 4. S. Native of Brazil, in the provinces of Para and Rio Janeiro. Spermacoce radula, Wildl. in Rom. et Schultes, syst. 3. p. 531. This probably belongs to a different genus from the calyx.

Rasp-leaved Diodia. Pl. 3 feet.

Sect. II. Dasyphyllea (from ὀδυς, dasy, thick, and κέφαλη, kepale, a head; the flowers are disposed in dense thick heads). D. C. prod. 4. p. 565. Capsules membranous, having the mericarps or nuts probably subdehiscent inside at length. Flowers disposed in heads.—This is probably a section of the genus Borreria, or a proper genus.

30 D. Falustris (Cham. et Schlecht. in LINN. 3. p. 347.) stem herbaceous, glabrous, erect, simple, tetragonal, with winged scabrous angles; leaves elliptic, rather cuneate, obtuse, but apiculate; bristles of stipulas 7-9, long; heads of flowers axillary, rather pedunculate; limb of calyx 4-toothed. 4. S. Native of Brazil. Flowers white.

Marsh Diodia. Pl. 1 to 2 feet.

31 D. dasycphyllea (Cham. et Schlecht. l. c. p. 348.) plant glabrous, herbaceous, ascending, rather woolly at the base; branches tetragonal; leaves lanceolate, on short petioles, rather glaucous, with scabrous margins; bristles of stipulas 5-7, hardly longer than the sheath; heads terminal, globose, girded by 4 leaves; calyx hairy, bidentate. 4. S. Native of the south of Brazil. Flowers white.

Thick-leaved Diodia. Pl. ½ to 1 foot.

32 D. alata (Nees et Mart. nov. bonn. 12. p. 11.) stem erect, glabrous, dichotomous at the base, tetragonal; angles membranous, spinulose; leaves ovate, cuspitate, glabrous, with scabrous edges; bristles of stipulas 7-8, long; whorles of flowers terminal, naked, globose; fruit obovate, crowned by the 2 oblong-lanceolate teeth of the calyx. 4. S. Native of Brazil, about the river Ilheos. Probably a species of Borreria.

Winged-stemmed Diodia. Pl. 1½ foot.

33 D. Bogotaensis (Cham. et Schlecht. in LINN. 3. p. 347.) plant suffruticosum; branches quadrangular, scabrous; leaves oblong-lanceolate, glabrous, serrulatated on the margins, and on the middle nerve beneath; heads of flowers terminal, rarely nearly axillary; fruit glabrous, obovate, crowned by the 4 scabrous teeth of the calyx. 4. S. Native of the town of Santa Fe de Bogota. Spermacoce Bogotensis, H. B. et Kuntz, nov. gen. amer. 3. p. 347. Wildl. in Rom. et Schultes, syst. 3. p. 530. Corolla white, having the throat, and upper part of the tube bearded.

Bogota Diodia. Shrub procumbent.

34 D. indecora (D. C. prod. 4. p. 565.) plant decumbent or ascending, much branched, glabrous; stem tetragonal, scabrous along the angles; leaves oblong-linear, acuminate; fruit glabrous, oppositely, or falsely verticillate; bristles of stipulas longer than the sheath; heads of flowers terminal, girded by 4 leaves; fruit oval-oblong, glabrous, crowned by the 4 teeth of the calyx. —Native of Mexico, at the Cordillera de Cuchilaguna, where it was collected by Berlandier. Perhaps the immature fruit is indehiscent. Perhaps a species of Borreria.

Indecomus Diodia. Pl. decumbent.

Cult. For culture and propagation see Borreria, p. 618.

CLXXXIX. TRIDODON (from τρίς, treis, three, and ὀкос, okovos, odous odontos, a tooth; the axis remains after the nuts of the fruit have fallen, and is tridentate at top). D. C. prod. 4. p. 566.—Diódia species, Cham. et Schlecht. in LINN. 3. p. 343.

L. SYST. Tetrandria, Monogyния. Calyx with a turbinate tube, and a 2-4-toothed limb, and sometimes with accessory teeth. Corolla short, funnel-shaped, 4-cleft. Stigma bident. Capsule clavatiform, 2-celled, crowned by the calyx, containing 2 indescibent 1-seeded nuts; having the axis, along with the lateral nerves, remaining after the nuts have fallen, and therefore the axis appears tridentate.—Much branched glabrous shrubs, natives of Brazil, with acutely tetragonal branches. Leaves opposite and falsely verticillate, oblong or linear; floral ones small. Flowers axillary or terminal at the tops of the branches, small, disposed in spikes or fascicles. It differs from Diodia in the axis of fruit being permanent and tridentate; and in habit.

1 T. Anthospermoides (Cham. et Schlecht. in LINN. 3. p. 343. under Diodia) shrubby, much branched, glabrous, downy at top while young; branches acutely tetragonal; leaves sessile, linear, acute, opposite, or falsely verticillate; bristles of stipulas longer than the sheath; flowers usually by threes in the axils of the upper leaves, and appear almost spicule from the upper leaves being nearly abortive; calyx hairy, with many teeth. 4. S. Native of Equinoctial Brazil. Anthospermum-like Triodon. Shrub.
2 T. glomeratus (D. C. prod. 4. p. 566.) shrubby, much branched, glabrous; branchlets acutely tetragonal; leaves oblong-linear, opposite, and falsely verticillate; bristles of stipulas short; flowers disposed in fascicles at the tops of the branches; teeth of calyx 4, on the top of the fruit, 2 large, and 2 nearly obliterated. \( \uparrow \) S. Native of Brazil. Dióedia Brasiliana, Spreng. syst. 1. p. 406. Rūbia glomerata, Pohl, in ltt. Nearly allied to T. polymorpha, var. a., but differs in the bristles of the stipulas being one-half shorter, in the branchlets being glabrous, and in the flowers being in terminal fascicles.

Glomerate-flowered Triodon. Shrub.

3 T. polyphora (Cham. et Schlecht. in Linnaea. 3. p. 344. under Dióidea) shrubby, much branched, glabrous; branchlets tetragonal; leaves petiolate, oblong-linear, opposite, and falsely verticillate; bristles of stipulas rather longer than the sheath; flowers axillary and terminal, few; calyx bidentate, and sometimes with 2 accessory teeth. \( \uparrow \) S. Native of Brazil. Fruit as in T. anthospermoideae, to which it is very nearly allied.

Var. a., microphyllae (Cham. et Schlecht. 1. c.) tops of plant downy; leaves smaller and finer; calyx hairy, 4-toothed. \( \uparrow \) S. Native of Brazil, in the province of Rio Janeiro, in dry, exposed places.

Var. \( \beta \), intermedius (Cham. et Schlecht. 1. c.) smoothish; leaves flat, softish; calyx glabrous, 4-toothed. \( \uparrow \) S. Native of the south of Brazil.

Var. \( \gamma \), macrophylæ (Cham. et Schlecht. 1. c.) glabrous; internodes elongated 2 leaves flat, thinner and larger; calyx glabrous, bidentate. \( \uparrow \) S. Native of the south of Brazil.

Polyphorinus Triodon. Shrub \( \frac{1}{2} \) foot.

Cult. The species of Triodon will grow in any good, light soil; and cuttings of them will strike root readily in the same kind of soil, under a hand-glass in heat.

Lin. syst. Tetrándria, Monogynía. Calyx with a didymous, ovate tube, and with the limb contracted at the base, and profusely cleft at the apex, but not parted; lobes 4, linear-subulate, elongated, hairy, and 4 small accessory ones between these. Corolla salver-shaped, with a long tube, which is obconical at the apex; a naked throat, and a 4-lobed limb. Stamens exerted. Style longer than the stamens, bifid at the apex. Fruit composed of 2 indehiscent, 1-seeded nuts, which at length separate from the axis, which is permanent, flat, membranous, and retaining the calyx at its apex.—Herbs which are sometimes suffruticoses at the base, erect or ascending. Leaves opposite, ovate-lanceolate. Stipulas sheathing, ciliated with bristles. Flowers red, disposed in capitae, terminal umbels, which are girded by involucra.

1 C. calceophylla (D. C. prod. 4. p. 567.) stem terete, herbaceous, villous; leaves oblong-lanceolate, acuminate, with rather oblique nerves, of which 2 rise near the base on both sides; bristles of stipulas 7-9, hispid. \( \bigcirc \) H. Native of Mexico. Spermáceae capitata, Morc. et Sesse. fl. mex. icon. ined. but not of fl. per. Spermáceae hirta, Pav. ined. but not of Lin. Stamens longer than the lobes of the corolla. Corolla 4 lines long, red.

Beautiful-headed Crusea. Pl. 2 feet.

2 C. rubra (Cham. et Schlecht. in Linnaea. 5. p. 165.) stem tetragonal, herbaceous, hispid; branches opposite; leaves ovate, acuminate, hairy, with the nerves oblique on both sides of the mid-rib; bristles of stipulas 7-9, hispid. \( \bigcirc \) H. Native of Vera Cruz and Cuba. Crucianella hispida, Mill. dict. no. 4. Spermáceae rubra, Jacq. Hort. schoenbr. 3. p. 3. t. 256. Spermáceae longiflora, H. et Kunt. nov. gen. amer. 3. p. 271. Spermáceae striósa, Sims, bot. mag. t. 1558. but not of Thunb. Spermáceae rubra and S. striósa, Poir. Schultes. Flowers red or purple.

3 C. cocinea (D. C. prod. 4. p. 567.) stem tetragonal, suffruticos at the base, glabrous; leaves ovate-lanceolate, acuminate, petiolate, glabrous, with 3 nerves on both sides of the mid-rib; bristles of stipulas 3, glabrous, the middle one the longest. \( \uparrow \) S. Native of New Spain. Spermáceae coccinea, Pavon, in herb. Duant. Corollas scarlet, larger than in any other plant belonging to the tribe Spermáceae; it is even an inch long. Alabastra and lobes of the corolla beset with bristles on the outside; the rest of the corolla glabrous. Style exerted beyond the tube of the corolla. Fruit unknown; but the plant agrees in habitat with the other species of the genus.

Scarlet-flowered Crusea. Pl. 1 to 2 feet.

4 C. rachyphylla (Cham. et Schlecht. in Linnaea. 5. p. 165.) stem nearly terete, fustular, clothed with rather retrograde hairs; leaves broad-ovate, on short petioles, of a different colour beneath, beset with scattered hairs above, and along the nerves beneath; heads of flowers terminal, involucrated by leaves; lobes of calyx triangular.—Native of Mexico, on Serra Colorado, where it was collected by Schiede and Deppe. Nearly allied to C. rubra, but differ in the characters indicated above, and in the fruit being much smaller, and nearly terete, not globose. Flowers red, smaller and shorter than in C. rubra.

Short-leaved Crusea. Pl. 2 feet.

Cult. The annual species should be treated as other tender annuals, by being raised in a frame, and afterwards planted out in the open ground in May. The shrubby species should be treated in the manner recommended for Triodon above.

Lin. syst. Tri- Hexandria, Monogyínia. Calyx with a subglbose tube, and a 6-7-parted limb; teeth or lobes unequal, without any accessory ones. Corolla funnel-shaped, with an obconical tube, and a spreading, 3-6-lobed limb; lobes valvate in aestivation. Stamens equal in number to the lobes of the corolla; filaments exerted. Style 3-4-cleft at the apex. Stigmas rather capitate. Capsule containing 3-4 indehiscent, membranous, 1-seeded nuts, crowned by the permanent calyx, which at length becomes circumcised at the base, and falls off, leaving the nuts naked. Seeds peltate.Albumen between fleshy and horny, rather thick, and composed of a distinct biform, decumbent herbs, natives of America. Roots almost simple, rather woody, with thick bark, which is wrinkled transversely; those of many of the species are used in various parts of the world as substitutes for Ipecacuanha. Leaves opposite, ovate. Stipulas of many bristles. Flowers capitate at the tops of the branches, each head involucrated by the 4 uppermost leaves.

§ 1. Calyx 6-7-lobéd.

R. scabra (St. Hili. pl. us. bras. 8. t. 8. Mart. spec. med. bras. p. 10. t. 9. f. 13. root.) stems hairy; leaves ovate, or ovate-lanceolate, rather oblong, acutish, with seersucker margins; bristles of stipulas shorter than the sheath; heads many-flowered; lobes of calyx triangular, ciliated; segments of 4 to 2.
corolla pilose at the apex. \[S.\] Native of Brazil, at Rio Janeiro, in sandy, cultivated fields, and by way sides; also of New Granada, in dry, sandy places near Ibague, and at Vera-Cruz; as well as of Peru, about Lima and Cercado, &c., Sweet, fl. gard. t. 91. Richardsia scabra, Lin. spec. 470. Richardsia pilosa, Ruiz et Pav. fl. per. 3. p. 50. \[R.\] scabra and \[R.\] pilosa, Pers. cich. t. 3. p. 392. \[R.\] pilosa, H. B. et Kunth, nov. gen. amer. 3. p. 330. t. 279. Spermacoce hexandria, A. Rich. hist. nat. spec. p. 13 and 31. R. Brasilienchrist, Gom. mem. ipec. p. 31. t. 2. Virey, journ. pharm. 1829, p. 297, with a figure. Hayn. arzn. 8. t. 21. Spermacoce hirsuta, Röhm. et Schultes, syst. t. p. 85. Corolla white, twice the length of the calyx. The roots are horizontal and white, and are used as a substitute for Ipecacuanha, in the province of Rio Janeiro, where it grows in great plenty, under the name of Paoya do Canapo. It is the Ipecacuanha amâlce on blane, Merat. dict. med. 26. p. 13, and therefore the white Ipecacuanha of the shops.

2 \[R.\] kôseâ (St. Hil. pl. us. bras, no. 7. t. 7.) stems hispid, very hairy at the tops; leaves ovate-lanceolate, mucronately acute, with scabrous margins; bristles of stipulae longer than the sheath; heads few-flowered; lobes of calyx 6, linear, rather hispid; corolla ventricose, having the segments pilose on the outside. \[S.\] Native of Brazil, in dry, sandy places. R. enôtica, Mart. spec. nat. med. bras. p. 11. t. 9. f. 19. Cham. et Schlecht. in Linneana. 3. p. 351. R. rôscea and R. enôtica, Schultes, syst. t. p. 87. Corolla rose-coloured, 3 times longer than the lobes of the calyx. Roots black, twisted, and are used as a substitute for Ipecacuanha in the neighbourhood of Joao del Rey, in Brazil, where it is cultivated in great quantities for that purpose, under the name of Paoya do Canapo, and are, along with the roots of \[R.\] scabra, imported into Europe.

Rose-flowered Richardsonia. Pl. procumbent.

3 \[R.\] grandiflôra (Cham. et Schlecht, in Linneana. 3. p. 551.) plant ascending; stems hispid from bristles; leaves lanceolate, acute, scabrous from bristles; bristles of stipulae rather longer than the sheath; heads few-flowered; segments of the calyx lanceolate, acuminate; corolla glabrous. \[S.\] Native of the south of Brazil. Roots like that of \[R.\] rôscea. Corolla white, tipped with red. Stamens 6.

Great-flowered Richardsonia. Pl. decumbent.

4 \[R.\] laterâalis (D. C. prod. 4. p. 568.) erect, stem hispid from spreading hairs; leaves oblong-lanceolate, muriculated above, and pilose beneath; bristles of stipulae longer than the sheath; heads of flowers small, 3 times shorter than the bracteas, which are ovate-lanceolate, and hispid beneath at the base; lobes of calyx 6, subulate, longer than the tube. \[S.\] Native of Brazil, where it was collected by Pohl. Spermacoce latérâlis, Pohl, in litt. Very nearly allied to \[R.\] divêrgens, but the fruit is unknown, and is therefore a doubtful species of the genus.

Lateral Richardsonia. Pl. 1 to 2 feet.

5 \[R.\] divêrgens (D. C. prod. 4. p. 568.) plant erect, hispid from bristles in every part; leaves linear-lanceolate, acuminate; bristles of stipulae longer than the sheath; heads small, 3 times shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly muricate nuts. \[S.\] Native of Brazil, Pohl; and near Bahia, in cultivated places, Salzmann. Spermacoce divêrgens, Pohl, in litt. Corolla white.

Diverging Richardsonia. Pl. 1 to 2 feet.

6 \[R.\] spârâsa (D. C. prod. 4. p. 568.) the whole plant hispid from bristles; branches trichotomous; leaves linear-lanceolate, acuminate; bristles of stipulae equal in length to the sheath: heads either from the forks of the branches or from their tops; the latter one-half shorter than the bracteas, which are lanceolate; limb of calyx very hispid, 6-cleft; fruit of 4 tubercularly muricate nuts. \[S.\] Native of Brazil, Pohl; at Bahia, in dry pastures, Salzmann. Spermacoce spârâsa, Pohl, in litt. Flowers white.

Scattered Richardsonia. Pl. 1 to 2 feet.

§ 2. Calyx 4-lobed, very rarely 5-5-lobed.

7 \[R.\] stella'rm (Cham. et Schlecht. in Linneana. 3. p. 552.) plant decumbent, twisted; stem hairy; leaves lanceolate, acuminate, hairy; bristles of stipulae 5, much longer than the sheath; heads hemispherical; segments of the calyx 4, oblong; corolla glabrous, about equal in length to the calyceous teeth. \[S.\] Native of Brazil, in the province of Cisplatine. Flowers 3-4-parted, white.

Starry Richardsonia. Pl. decumbent.

8 \[R.\] humistrâta (Cham. et Schlecht. l. c. 3. p. 534.) plant trailing, flexuous; stems clothed with canescent hairs; leaves ovate-lanceolate, acute, clothed also with canescent hairs; bristles of stipulae 3-6, equal in length to the sheath; heads hemispherical; segments of calyx 4, ovate; corolla glabrous, rather longer than the lobes of the calyx. \[S.\] Native of Brazil, in the province of Monte Video. Flowers small, tetraermous and pentamous.

Trailing Richardsonia. Pl. trailing.

9 \[R.\] arcingendens (D. C. prod. 4. p. 549.) stems ascending, villous; leaves oblong, attenuated at both ends, scabrous from pubescence on both surfaces; heads terminal, on long peduncles; leaves of involucrum ovate, hardly exceeding the flowers; calycine segments 5, acute; corolla tubular, downy outside at the tops of the lobes, the rest glabrous. \[S.\] Native of Mexico. Spermacoce arcingendens, Pav. in herb. Moric. Richardsoni villösa, Moc. et Sesse, fl. mex. icon. ined., in which the corolla is more coloured.

Ascending Richardsonia. Pl. ascending.

10 \[R.\] Henke'a (D. C. prod. 4. p. 569.) stems trailing, tufted, twisted, creeping, suffruticose, hairy; leaves oblong, villous; bristles of stipulae shorter than the sheath; heads of flowers flatish; lobes of calyx 4, ovate, acutish; corolla subrotate. \[S.\] Native of Mexico, where it was collected by Hauke. Schiedea Mexicana, Bartl. in herb. Hauke. Hauke's Richardsonia. Pl. trailing.

Cult. The species of this genus will thrive in any light soil; and cuttings of them strike root readily in the same kind of soil, under a hand-glass, in a little heat.

Lin. syst. Tetrándria, Monogyna. Calyx with an ovate, rather ribbed tube, and 4 small unequal teeth, which are permanent, and extremely convinent on the fruit. Corolla salver-shaped, with a terete tube, a usually bearded throat, and a 4-lobed limb. Anthers at the throat. Stamina 2-lobed. Fruit 2-celled, usually separated from the base to the apex at the dissectum into 2 indehiscent, 1-seeded nuts, which are sometimes, however, combined at the base, and separating slowly, having the axis filiform, and remaining as in unbelliferous plants. Seeds ovate, triquetrous, erect. Albumen fleshly. Embryo eery.—Herbs or sub-shrubs, natives of the East Indies. Stems terete or tetragonal. Leaves opposite, and falsely verticillate from axillary fascicles. Stipulas undivided, or of few bristles, joined with the base of the petioles. Cymes as in the plants belonging
to the order Valerianaceae, terminal, sessile, or pedunculate, having their branches becoming elongated and spike-formed, after flowering.

1 K. "Zeylanica" (Linn. spec. p. 151.) stem erect, glabrous, nearly terete; leaves lanceolate, almost sessile, glabrous; branches of cyme 1-3, very long, spicate, erect; tube of corolla much longer than the calyce teeth; throat of corolla bearded; stigma exserted. — Native of Ceylon. Burm. fl. ind. 34. t. 13. f. 2. Lam. ill. t. 59. f. 1. Corolla 6 lines long. Fruit easily separated into 2 parts from the base.

Sumatra Knoxia. Fl. July, Aug. Clt. 1818. Sh. 2 to 3 ft. 3 K. te'zes (D. C. l. c.) stem suffruticoso, erect, branched, terete, villous; leaves lanceolate, villous; corymb terminal, compound, with opposite branches, which at length become spike-formed; tube of corolla terete, straight, with the throat very villous, and hiding the anthers; style twice the length of the corolla. ½. S. Native of the East Indies, in woods at Koorg. Spermacoea teres, Roxb. fl. ind. 1. p. 373. K. umbellata, Banks, herb. ex Roxb.

4 K. eXee'ta (D. C. l. c.) stem suffruticoso, stiff, villous in the younger parts; leaves lanceolate, petiolate, remote; corymbs terminal, compound; stamens exserted; style bifid, exserted; fruit ovate, hardly separable into 2 parts. ½. S. Native of the East Indies, on the Circars, and of Nipaul. Spermacoe exserta, Roxb. fl. ind. 1. p. 374. This is only, perhaps, a var. of K. teres, according to Roxb.

Exserted-stemmed Knoxia. Shrub 1 foot.

Glabrous Knoxia. Shrub 1 foot.

Heyne's Knoxia. Pl. 1 foot.
Asparagus-like Psyllocarpace. Shrub 1 to 2 feet. 4 P. thyrmoides (Mart. t. c. p. 46.) shrub much branched; branches squarrose, downy; leaves downy, in fascicles; flowers terminal, somewhat spicate; calyces hairy. b. S. Native of Brazil, in the province of Minas Geraes, on Serra de Gran Mogol. Flowers azure blue.

Thymandra-like Psyllocarpus. Shrub 1 to 2 feet. Culti- See Richards, p. 628, for culture and propagation.

Linn. syst. Tetradraria, Monogynia. Calyx with an ovate tube, and a 4-toothed, permanent limb: 2 of the teeth are usually larger than the other 2, which are always small, or nearly obsolete. Corolla salver-shaped, with a terete tube, which is furnished near the base inside with a circular line of hairs, a glabrous throat, and a 4-lobed limb. Anthers exerted, or enclosed. Stigma bifid. Capsule membranous, crowned by the calyx; 4-celled, circumcised round the middle. Seeds solitary in the cells, basilar, partly fixed to the dissemination. —Herbs or sub-shrubs, with the habit of Spermacoce, all natives of America, except one species from Africa. Leaves opposite. Stip- ulas combined with the petioles a little way, and ending in many bristles. Flowers in dense, verticillate, axillary and terminal heads, the latter always involucrated by 4 leaves. Corollas white.

§ 1. Two of the calycine teeth are large, and two small.

* Sufiiffocose and herbaceous parenchymatous plants.

1 M. humboldtianum (Cham. et Schlecht. in Linnaea. 3. p. 358. f. 1.) erect; branches nearly terete, downy when young, but glabrous in the adult state; leaves linear-oblong, or lanceolate, pubescent or hairy on both surfaces; stipulas with 5 stiff bristles on each side, naked in the apex; flowers disposed in dense verticillate heads; heads numerous, distant, terminal and axillary ones alike; the two large teeth of the calyx are subulate, and ciliated. b. S. Native of New Spain, on Silha de Caracas; and of Brazil, in sand by the sea-side, at Rio Janeiro. The specimens from Caracas are more hairy than the Brazil plant, which is trailing. Spermacoce frigida, Wildh. in Roem. et Schultes, 3. p. 531. Knuth, nov. gen. 3. p. 349. Flowers white.

Humboldt's Mitracarpum. Pl. 2 to 3 feet.

2 M. ellowianum (Cham. et Schlecht. in Linnaea. 3. p. 361.) stem diffusse, much branched, clothed more or less with white hairs; leaves oblong or lanceolate, sessile, cuspitate, scabrous on both surfaces; stipulas cleft into many stiff bristles, membranous and villous at the base; heads terminal, dense, inco- lated by 4 leaves, which are 2 or 3 times longer than the head. —Native of Brazil, about Rio Grande do Sul, Monte Video, &c.; in the Pampas of Buenos Ayres and Cordova. Capsule glabrous. The 2 larger teeth of the calyx are scabrous, erect, and subulate, with a very few additional deculations. Flowers white. Leaves varying from 2 to 4 lines broad. Stem usually very villous, but sometimes almost glabrous, as well as the leaves.

Sello's Mitracarpum. Pl. diffusse.

3 M. salzmannianum (D. C. prod. 4. p. 571.) stems diffusse, much branched, hispid from spreading stiffish hairs; leaves ovate-lanceolate, scabrous on both surfaces, setigerous at the apex; stipulas villous, membranous at the base, cleft into many stiffish bristles; flowers disposed in dense, verticillate heads, the ultimate or terminal head round, and involucrated by 2-4 leaves, which are hardly longer than the head. b. S. Native of Brazil, in sand by the sea-side, at Bahia, where it was collected by Salzmann. Very like M. schonienia, but differs in the characters indicated, as well as in the seeds being paler and one-half smaller. Flowers white.

Salzmann's Mitracarpum. Pl. diffusse.

4 M. schizangium (D. C. prod. 4. p. 572.) suffruticose; branches sub-tetragonal, downy; leaves oblong-lanceolate, acu- minated, scabrous on both surfaces, and on the margins; sti- pulas villous and membranous at the base, cleft in many stiff bristles; heads of flowers terminal and axillary, verticillate; the former involucrated by 4 leaves. b. S. Native of Mexico, where it was collected by Henke. Schizangium teres, Bartl. in herb. Henke. Leaves 24-27 lines long, and 4 broad. Teeth of calyx acuminate, scabrous. Flowers white.

Cut-capssule Mitracarpum. Shrub diffusse.

5 M. cuspidatum (D. C. prod. 4. p. 572.) stems ascending, branched, downy; leaves linear, cuspitate by a straight mucro, almost whinless, glabrous; bristles of stipulas 3-5, stiff, longer than the sheath; heads of flowers hemispherical, terminal, 3-4 times shorter than the bracteas; calyx with 2 cuspitate teeth, and 3-4 nearly abortive ones. b. S. Native of Monte Video; and of Chili, at Maldanado, in the Banda Oriental. Stem hardly a hand high, suffruticose at the base. Heads of flowers 4 lines in diameter. Floral leaves 9 lines long, and a line broad. Tube of the corolla almost double the length of the calycine teeth. Flowers white.

Cuspidate-leaved Mitracarpum. Pl. ascending.

6 M. virgatum (Cham. et Schlecht. in Linnaea. 3. p. 363.) stem suffruticose, erect, and are, as well as the branches, terete and glabrous; leaves linear, very narrow, flaccid; stipulas of two colours, ciliated; corollas long, tubular; stamens exerted. b. S. Native of Brazil. Spermacoce virgata, Wild. in Roem. et Schultes, syst. 3. p. 281. and 531. mant. 3. p. 205. Sprengi- syst. 1. p. 401. Flowers white. Leaves 6-8 in a whorl, according to Link, but are probably only in axillary fasciciles.

Trigge Mitracarpum. Shrub 1 foot.

7 M. diffusum (Cham. et Schlecht. in Linnaea. 3. p. 363.) stem suffruticose, procumbent, terete, hairy; leaves lanceolate, bett with retrograde asperities on both surfaces, and serrately ciliated on the margins; flowers capitulate and verticillate; the 2 larger lobes of the calyx exceeding the corolla, which is silvershaped; capsule smoothish. b. S. Native of South America, in woods about the Orinoco and Apare. Flowers white; stamens exerted; seeds oblong.

Diffuse Mitracarpum. Shrub diffusse.

8 M. sagrada (D. C. prod. 4. p. 572.) plant suffruticose, twisted and tufted, clothed with fine down; leaves oblong; heads of flowers axillary and terminal, the latter girded by 4 leaves; lobes of calyx 4, 2 large concave and blunt, and 2 small. b. S. Native of Cuba, near the Havana, where it was collected by Ramon de La Sagra. Flowers white. Seeds brown, hollow in front, and marked by 4 small rays.

Ramon de La Sagra's Mitracarpum. Shrub tufted.

9 M. senegalense (D. C. prod. 4. p. 572.) glabrous; stem erect, suffruticose at the base, rather tetragonal; leaves oblong, acuminated at both ends; stipulas furnished with 2-3 teeth on both sides; flowers disposed in capitulate whorles; calyx with 4 teeth, 2 long and acute, and 2 small. b. ? ? ? F. Native of Senegal, on the banks of the river at Walo, where it was collected by Bache, Perrotet, and Leprieur; and in other parts of Guinea, by Thonnong. Oldenlandia verticillata, Bache, in litt. Stauropspermum verticillatum, Thom. in Schum. pl. guin. pl. 73. Flowers white. Seeds small, nearly globose, pale, umbilicate in
front, and marked by 4 rays. Perhaps the same as M. scabrum, Zuccar. in Rüm. et Schultes, syst. 3. p. 210. which was found about Fort Louis.

Seneval Mitracarpum. Shrub.

** Annual plants.**

10 M. Torreana* (Cham. et Schlecht. in Linnaea, 3. p. 360. t. 3. f. 2.) stem erect, simple, somewhat tetragonal, rather pilose on the angles; leaves elliptic-lanceolate, attenuated at the base, membranous, rather downy on both surfaces; stipulas membranous, with white villous bristles; flowers disposed in capitake whorles, the terminal one usually formed of 2 combined heads, and girded by 4 leaves. O. F. Native of Guajan and Marianne Islands. Flowers white.

Torres' Mitracarpum. Pl. 2 ½ foot.

11 M. villosum (Cham. et Schlecht. in Linnaea, 3. p. 363.) stem erect, sparingly branched, slightly tetragonal, villous; leaves oval-lanceolate, downy; stipulas membranous, cleft into many bristles; heads of flowers axillary, verticillate, and terminal, the latter girded by 4 leaves; anthers inclosed. O. F. Native of Jamaica. Spermacoece hirta, Jacq. icon. r. t. 380. and probably of Linn. Spermacoece villosa, Swartz, obs. p. 45. Corolla white. Anthers yellow. Seeds pale, somewhat tubercular on the back, and marked by a cruciate furrow in front.

12 M. hirtum (D. C. prod. 4. p. 572.) stem erect, branched, scabrous, tetragonal; leaves ovate-lanceolate, clothed with hairy pubescence; stipulas membranous, with many bristles: axillary heads of flowers verticillate; terminal ones girded by 4 leaves; anthers exerted. O. F. Native of Jamaica. Spermacoece hirta, Swartz, obs. p. 45. Very like M. villosa, but differs in being more branched, in the anthers being exerted and blue, and in the seeds being smaller, blacker, and concave in front, not with 4 rays.

13 M. Fishe'ri (Cham. et Schlecht. 3. p. 363.) stem erect, hairy, tetragonal; leaves oblong, attenuated at the base, acute, downy from very short hairs; stipulas ciliated; flowers densely capitate, terminal; teeth of calyx 4, lanceolate, acute, a little shorter than the corolla. O. F. Native of Jamaica. Spermacoece Fischéri, Link. enum. 1. p. 132. Spermacoece adscendens, Fisch. ined. Corollas white. Habit of Spermacoece Aspera, Aubl.

14 M. styl'osum (Cham. et Schlecht. in Linnaea. 3. p. 363.) stem decumbent, terete, glabrous; leaves oblong-lanceolate, attenuated at the base; bristles of stipulas long; flowers disposed in dense whorles; the two large teeth of the calyx are subulate at the apex; style exerted. O. F. Native of Manilla. Spermacoece stylosa, Link. enum. 1. p. 132. Spermacoece crassifolia, Hortul. Capsule membranous, glabrous. Corolla white. Seed orbicular, with a mark like the letter x engraved on the front, somewhat 4-lobed, of a pale, dirty colour.

§ 2. Calyx with 4 nearly equal acute teeth.

15 M. negl'ectum (D. C. prod. 4. p. 573.) plant glabrous, dichotomous; leaves oblong-linear, acute, almost veinless; bristles of stipulas 3, stiff, longer than the sheath; heads of flowers terminal, 6 times shorter than the bracteas; calyx glabrous, with 4, hardly acute teeth, which are a little shorter than the corolla.

—Native of Brazil, where it was collected by Pohl. Spermacoece neglecta, Schott ex Pohl, in litt. Heads of flowers 3 inches in diameter. Floral leaves about an inch long, and 2 lines broad. Neglected Mitracarpum. Pl.?  

† Species not sufficiently known.

16 M. squarro'sum (Cham. et Schlecht. in Linnaea, 3. p. 363.)—Native of Cuba, on rocks about Havana. Spermacoece squarrósa, Poepp. Nearly allied to M. Selloinum, but differs in its smoothness.

Squarrose Mitracarpum. Pl.

Cult. See Borreria, p. 618, for culture and propagation.

CXCIV. CRUCKSHANKSIA (named after Mr. Cruckshanks, the original discoverer of the plant, and a particular friend of both Hooker and Arnott). Hook, et Arn. in bot. misc. 3. p. 361, but not of Hook. in bot. misc. vol. 3. t. 90.

Linn. syst. Pentendria, Monog'ynia. Calyx with a globose subdudious tube, and a 5-toothed limb; teeth usually furnished with an accessory small subulate tooth on each side; one or two of the teeth are usually expanded into large reticulated pedunculate roundish membranous wings. Corolla salver-shaped, with an elongated tube, a 5-cleft spreading limb, and a glabrous throat. Stamens 5, exerted, inserted in the mouth of the corolla. Filaments club-shaped, acute; anthers linear-oblong, fixed by the base. Style filiform, a little longer than the tube of the corolla; stigma bifid, pilose: the divisions linear and acute. Capsule membranous, globose, subdudious, crowned by the more or less widened calycine segments, 5-celled, 4-valved, and furnished with 2-seeded; valves ovate, very concave, boat-shaped, 1-nerved in the middle, separable from the thin membranous white dissolution. Seeds large, obovate, black, tubercled, very deeply furrowed on the outside at the hylum. Albumen horny. Embryo central, very much curved; cotyledons flat; radicle nearly terete, inferior, elongated.—The whole plant is more or less pubescent. Root perennial, dividing into many stems at the neck. Stems herbaceous, terete, ascending, flexuous, branched. Leaves obovate-lanceolate, acute, tapering into the petiole, stipitate; stipulas interspersed, broad-subulate, free, or joined more or less. Bracteas involucrate, simple or tripartite, furnished with small subulate toothed stipulas at the base on both sides. Peduncles terminal and axillary. Flowers disposed into a rather large depressed cyume; having the corolla and calycine wings yellow.

1 C. hy'me'nodon (Hook. et Arn. l. c.)—Native of Chili, about Coquimbo. There are varieties with hoary or less pubescent leaves. This most extraordinary plant has little of the general appearance of any of the Rubiaceae, although in its most striking peculiarities, the dilatation of some of the calycine teeth into disproportionately large orbicular, or somewhat reniform petiolar wings, it has an affinity with Mussa'nda. Its place in the order is, however, near Spermacoece and Mitracarpum.

Mammea-toothed Cruckshanksia. Pl.

Cult. See Richards'onia, p. 628, for culture and propagation.

CXCVI. STAEelia (this genus is dedicated to the illustrious Baron Augustus de Stael Holstein). Cham. et Schlecht. 3. p. 364. t. 3. f. 5. D. C. prod. 4. p. 575.

Linn. syst. Tetrindria, Monog'ynia. Calyx with an ovate tube, and only 2 subulate teeth, with hardly any accessory ones. Corolla funnel-shaped, with a slender tube, and a 4-lobed acute limb. Stamens 4, exerted. Stigma 2-lobed. Capsule membranous, 2-celled, 2-valved, with an entire permanent dissepiment; valves concave, crowned each by a calycine tooth, cut at the
base by a line from the dissepiment, and therefore falling asunder. 

Seed solitary, fixed to the dissepiment.—Brazilian herbs, with terete stems. Leaves glabrous, linear, opposite, and in axillary fascicles. Stipulas membranous, narrow, of many bristles, or acutely 5-lobed. Axillary heads of flowers verticillate, and the terminal ones globose. Allied to Mirraecrium.

1 S. TRITOMIDES (Cham. l.c.) stem much branched, ascending, puberulous; stipulas acutely 3-lobed; whorles of flowers few. 2. S. Native of the south of Brazil. Leaves 5 lines long, and hardly a line broad. Corolla purple. Heads of flowers size of small peas.

**Thyme-like** Stelia. Pl. ¼ to ½ foot.

2 S. galoideis (D. C. prod. 4. p. 573.) stems glabrous, sparingly branched, twiggy, elongated; stipulas of many bristles; whorles of flowers few.—Native of Brazil, where it was collected by Pohl. Spermacoeae galooides, ex Pohl, in litt. Leaves an inch long, and half a line broad. Whorles of flowers distant at the top of the stem.

**Galium-like** Stelia. Pl. ½ foot.

3 S. reflexa (D. C. l.c.) stems smoothish, much branched; branches twiggy; leaves linear, with rather revolute margins; stipulas tridentate; whorles in nearly all the axis; floral leaves reflexed.—Native of Brazil, where it was collected by Pohl. Spermacoeae reflexa, Pohl, in litt. Whorles 20-30 on each branch. Leaves 4 lines long.

**Reflexed-leaved** Stelia. Pl. ½ to 1 foot.

Cult. See Richardsonia, p. 628. for culture and propagation.

**CXCVII. TESSIEREA** (named after M. Tessier, who has written on the diseases of wheat, and the effects of light upon plants, &c.). D. C. prod. 4. p. 574.

**Lin. syst. Tetrandria, Monogynia.** Calyx with an ovate tube, and a 4-lobed limb; lobes nearly equal, without any accessory ones. Corolla funnel-shaped, with a glabrous throat, and a 4-lobed limb. Stamens hardly exerted. Stigma 2-lobed. Capsule 2-celled, 2-valved, with an entire oval deciduous dissepiment; valves concave, crowned by the teeth of the calyx, falling asunder from being cut vertically along the dissepiment. Seeds solitary in the cells, fixed to the middle dissepiment.—American herbs, clothed in every part, except the corollas, with tomentum or wool. Leaves opposite, sessile, lined by the nerves. Stipulas cleft into many bristles. Flowers axillary, sessile, few, verticillate, bracteate.—This genus is nearly allied to *Stelia* from the structure of the fruit, but to *Borreria* or *Diodia* from habit.

1 T. LANIEREA (D. C. prod. 4. p. 574.) plant clothed with long white wool; stem or branches twiggy, terete.—Native of Brazil, where it was collected by Pohl. Diodia or Spermacoe laniera, Pohl, in litt.

**Wool-bearing** Tessiera. Pl.

2 T. LITHOSPERMOIDES (D. C. prod. 4. p. 574.) plant suffruticose, erectish, branched; grey in every part from crowded short velvety down; fruit at length glabrous. ½. ½. S. Native of Mexico, where it was collected by Haene. Spermacoeae lithospermoides, Bartl. in herb. Haene.

**Lithospernum-like** Tessiera. Pl. 1 foot.

Cult. For culture and propagation, see Richardsonia, p. 628.

**CXCVIII. GAILLONIA** (evidently named after some person of the name of Gaillon, of whom we know nothing). A. Rich. mem. soc. hist. nat. par. 5. p. 153. t. 15. f. 54. D. C. prod. 4. p. 574.

**Lin. syst. Pent-Hepactria, Monogynia.** Calyx with an ovate tube, and a 5-7-lobed permanent limb; teeth unequal. Corolla funnel-shaped, with a terete tube, and a 5-7-lobed limb; lobes oblong. Stamens 5-7, exserted from the throat, but shorter than the corolline lobes. Style filiform, thickened at the apex; stigma 2-lobed. Fruit egg-shaped, almost naked at the apex, containing 2 separable, 1-seeded, indehiscent nuts.—Hard, oppositely-branched herbs, velvety from fine down in every part, as also on the corollas. Leaves linear, ending in a callosous mucrone, opposite, bearing twin stipulas on both sides, which are sometimes short and truly stipula-formed, and sometimes long and foliaceous, and in the latter case appearing like those of Galium. Flowers some in the forks of the branches, sessile, solitary, and naked, and others sessile at the tops of the branches, between the 2 superior leaves.—Habit of *Aspérala*, with a velvety aspect. This genus ought probably to be placed among Rubiaceae, sect. Stellate.

1 G. OLIVEIRII (Rich. l.c.) stem multiple, brachiate, and as if it was articulated; branches opposite; leaves distinct at the base, linear-subulate, spineasect at the apex; stipulas leaf-formed, distinct from the leaves. ½. ½. F. Native of Persia, between Tcheran and Isphan, where it was collected by Olivier and Bruguier.

**Olivier’s Gaillonia.** Pl. ½ foot.

2 G. BORRELLII (A. Rich. l.c.) stem multiple; leaves linear-lanceolate. ½. 2. ½. S. Native along with the preceding, and probably only a broad-leaved variety of it.

**Bruguieres’ Gaillonia.** Pl. ½ foot.

3 G. SZOWITZII (D. C. prod. 4. p. 574.) stem branched at top; branches erect; leaves subulate; upper ones connate at the base, and adhering to the stipulas, and therefore appearing trifurcate and tripinose at the apex. ½. F. Native of Persia, in very arid, stony places near Nekhiteheven, where it was collected by Szowitz.—A very distinct species.

**Szowitz’s Gaillonia.** Pl. ½ foot.

Cult. The species of *Gaillonia* should be grown in pots, half filled with pot-swards, in a mixture of sand and peat, and placed among other alpine plants. They may be increased either by cuttings or seeds.

**Lin. syst. Pentandria, Monogynia.** Calyx with an ovoid tube, and a small 5-parted limb. Corolla funnel-shaped, 5-cleft, with a short tube, and a villous throat. Stamens 4, inserted in the throat, exserted; authors rather coriaceous. Stigma bipartite. Capsule oblong-cuneated, rather tetragonal, crowned by the limb of the calyx, 2-celled, separable into 2, 1-seeded, indehiscent, lignosus-coriaceous, trigonal nuts, which are fixed internally to the linear axis beneath its apex. Seeds solitary in the cells, pendulous. Radicle superior. Alumen fleshy.—Shrubs or trees natives of South America. Leaves opposite, petiolate, acuminate. Stipulas interpetiolar, solitary on both sides. Panicles sub-corymbose, terminal. Flowers white, hardly larger than those of *Aspérala*.

1 M. AUMINATA (Humb. et Bonpl. pl. equin. t. 29.) unarmed; leaves ovate-elliptic, short-acuminate, downy on both surfaces. ½. S. Native in the town of Guyaquil, by way sides, where it is called *Céiba-blanca* by the natives. H. B. et Kunth, nov. gen. amer. 3. p. 350. Flowers white.

**Auminated-leaved** Machaonia. Tree 25 feet.

2 M. BRASILIENSIS (Cham. et Schlecht. in Linnea. 4. p. 2.) unarmed; leaves oblong-lanceolate, acuminate, having the veins downy beneath. ½. S. Native at the mouth of the Amazon, about Gran-Para. Cinebora Brasilensis, Hoffmannseg. ex Willd. miss. in Humb. berl. med. p. 119. Roem. et Schultes,
Native Thymelae'a, S. andthers hence E. S. Native of Brazil. Flowers white. 

Pterostigma Machaonia. Shrub cl.?

SUTURE III. PUTOIRIE (the plants contained in this tribe agree with the genus Potoria in having fleshy, indivisible fruit). D. C. prod. 4. p. 575. Fruit rather fleshy, not separable into parts.

LIN. SIST. Tetra-Pentandria, Monogyna. Calyx with an obovate tube, and a 5, rarely 4-cleft limb; lobes short, and sometimes with a few accessory teeth between them. Corolla funnel-shaped, with the tube hairy inside, and a 5, rarely 4-parted limb; lobes induplicate in aestivation: hence they are somewhat trifid at the apex. Stamens 5, rarely 4. Anthers exserted, linear. Style inclosed; stigma bifid. Berry nearly globose, 2-celled, 2-seeded, crowned by the limb of the calyx, ex Rich. - A small shrub, glabrous in every part except the young branches, which are whitish. Leaves small, almost sessile, opposite, and generally in axillary fascicles, having an ungrateful scent when bruised. Stipules combined with the petioles, and ciliately fringed on the margins. Flowers terminal, in fascicles, almost sessile, white. - The fruit is described by Blume and Jussieu as many-seeded.

Cult. This little shrub grows well in a mixture of loam, peat, and sand; and cuttings root readily in sand, with a hand-glass over them.

LIN. SIST. Tetra-Hexandria, Monogyna. Calyx with an ovate tube, and a 4-6-parted limb; lobes oblong-linear, acute, erect, permanent. Corolla salver-shaped, with a terete, somewhat tetragonal tube, a naked throat, and 4-6 lanceolate, revolute lobes, ex Rich; but circumnately convolute according to others. Stamens with the filaments free from the upper part of the tube, longer than the corolla; anthers acute, erect. Style longer than the stamens; stigma emarginate. Berry roundish, crowned by the calyx, biseriate, 2-celled, containing two 1-seeded pyriform, or nuts. Seeds peltate, ex Rich, fixed by a longitudinal chink in the middle. Albumen cartilaginous. Embryo erect, with foliaceous cotyledons. - A decumbent shrub, native of America. Leaves opposite, almost sessile, lanceolate or elliptic. Flowers axillary, pale yellow, sessile.

1 E. littorta lis (Swartz, l. c.). ę. S. Native of Jamaica, Porto Rico, Guadaloupe, and others of the West India Islands, on the sea shore, Vahl. symb. 2. p. 28. - Knóxia, Browne, jan. 140. no. 1. Thymeza, Sloane, hist. jam. 2. p. 93. t. 109. f. 1-2. Berries yellow. In fl. mex. the flowers are painted white, and the berries reddish; it is, therefore, perhaps a distinct species. Stipulas surrounding the branch ciliated.

Sea-shore Ernodea. Shrub decumbent.

Cult. See Richardsiana, p. 628. For culture and propagation.

1 C. taimida (Hamilt. l. c.). ę. F. Native of Nipaul. Trifid-bracted Cuncea. Pi. 1½ foot.

Cult. For culture and propagation, see Richardsiana, p. 628.

LIN. SIST. Tetra-andria, Monogyna. Calyx with an ovate, angular tube, and a 4-parted, permanent limb (f. 109. a.); teeth acute, erect. Corolla campanulately funnel-shaped, 4-cleft (f. 109. a.). Anthers 4, sessile in the throat, exserted, linear-oblong (f. 109. f.). Stigma roundly 2-lobed (f. 109. b). Berry dry, corky, angular, lanceolate, crowned by the calyx, 2-celled (f. 109. c). Seeds solitary in the cells, oblong, bisulate inside, with hard albumen, and a straight embryo. - Glabrous, creeping herbs. Stems terete. Leaves opposite, ovate-oblong, fleshy, jointed with the stipulas into a cupular toothed sheath at the base. Flowers axillary sessile, usually by twos, pale lilac. -This genus is very nearly allied to Diáé, but differs in the fruit not being divisible into 2 parts, and in the stipulas not being cut into many bristles.

1 H. maríta (Lin. fil. suppl. p. 126.). ę. S. Native of Malabar and Coromandel, in the sand by the sea side, Roxb. 4 M

Sea-side Hydrophilax. Pl. creeping.

† A species not sufficiently known.

2 H. Madagascarensis (Willd. herb. ex Rœm. et Schultes, sys. 3. p. 527.) leaves lanceolate, acute, sessile, closely imbricated, sheathed; flowers terminal.—Native of Madagascar, where it was collected by Commerson.

Madagascar Hydrophilax. Pl. creeping.

Cult. This plant should be grown in a pot filled with small gravel, and watered from time to time with salted water. It will be easily increased by separating the stems, or by seeds.

LIN. SYST. Tetrandria, Monogynia. Calyx with an ovate tube, and a short tubular truncate nearly entire limb. Corolla funnel-shaped, having the tube hairy inside, and the limb with 5 lanceolate spreading segments. Stamens 4, exerted; filaments short; anthers incumbent inwardly. Stigma bifid, with approximate lobes. Drape bacatte, crowned, 8-furnished, containing 2 bony oblong 1-seeded pyrenae or nuts, which are flat inside, and furrowed on the back. Albumen fleshy. Embryo central, erect, with oblong cotyledons, and a somewhat incurved radicle. —A shrub native of the Moluccas. Leaves opposite, veinless. Flowers subcoriaceous, axillary.

1 S. hydrophilax (Gaertn. and Blum. l. c.). Γ. S. Native of the Moluccas, by the sea side. Hydrophilax, Banks, herb.

Hydrophilax-like Scyphiphora. Shrub.

Cult. For culture and propagation see Hydrophilax above.

LIN. SYST. Pent-Heptandria, Monogynia. Calyx with an ovate-globose tube, and a small simutaneously toothed limb. Corolla campanulatefunnel-shaped, 5-cleft, rarely 6-cleft. Anthers inserted between the lobes of the corolla, sessile at the throat, linear. Stigma thickish, slightly 2-lobed, or undivided. Fruit almost baccate, arcuate at the apex, and crowned by the small infulose calyx, 2-5-celled. Endcarpal membranous. Seeds solitary in the cells, erect, with thin albumen. Embryo with a tereate radicle, and flat cotyledons.—A small, glabrous, much-branched shrub, with the branches terete, slender, and pendulous. Leaves linear-silifórm, opposite. Stipulas combined, with the petioles short, bluntly toothed, membranous. Flowers solitary or by threes in the axils of the upper leaves, and on the tops of the branches, white, or short peduncles.

Cult. See Serissa, p. 633, for culture and propagation.

2 P. ? Sibbe (D. C. prod. 4. p. 577.) stem hermaphrodite, sparingly branched, rather radicate at the base; branches hispid from villi; leaves ovate, acute, villous; stipulas twin on both sides, subulate. Γ. F. Native of the East Indies, on the Negilgery mountains, in humid places, where it was collected by Lessenault, who has called it Aspérula from habit, in his herbarium. Style exerted, divided at the apex into 2 thickish, hispid, short stigmas. The flowers are much like those of the first species, but the fruit being unknown, the genus to which it properly belongs is still doubtful.

Indian Putoria. Pl. ½ to 1 foot.

Cult. A mixture of chalk, sand, and peat will be the best soil for the species of Putòria; and they may be readily increased by cuttings or seeds.

Tribe XI.

ANTHOSPERMEE (the plants contained in this tribe agree with the genus Anthosperma in particular characters). Cham. et Schlecht. in Linnea. 3. p. 389. A. Rich. mem. soc. hist. nat. Par. 5. p. 136. D. C. prod. 4. p. 578. Flowers dioecious, or hermaphrodite. Corolla rotate (f. 110. b). Styles separate to the base, ending in an elongated, hispid, or plumose stigma each (f. 110. c). Fruit constantly of 2 indehiscent, 1-seeded mericarps or nuts (f. 110. g, f), which are easily separated at maturity. Albumen fleshy. —Small shrubs or herbs. Leaves opposite or verticillate. Stipulas small, 1-3-toothed, adnate to both sides of the petioles.

LIN. SYST. Tetra-Heptandria, Digynia. Calyx with an ovate tube, and a 5-lobed short limb (f. 110. a.). Corolla cam-
panulately turbinate, with a short broad tube, a naked throat, and 4-7 acute lobes (f. 110. b. e). Stamens 4-7 (f. 110. k.). Style almost divided to the base into 2 parts; the divisions filiform, very long, pilose (f. 110. c.), and exserted. Berry nearly ovate, pulpy, containing 2-3 indehiscent, bony nuts (f. 110. f.). Seeds flat on one side, and convex on the other: one in each nut. Albumen hard, fleshy. Embryo with an inferior radicle, and foliaceous cotyledons.—Glabrous shrubs, natives of Australia. Leaves opposite, oval-oblong. Stamens interpetiolar, solitary on both sides, permanent. Flowers axillary and terminal, solitary or few together on the same peduncle, bifracteolate at the base, sometimes male by abortion. Fruit of Coffea. Stigma of Anthospermum.

1 C. DISTELLI (Labiil. nov. holl. 1. p. 70. t. 95.) leaves oblong, cuspidate; peduncles simple; flowers 3-5 together, axillary or terminal, hermaphrodite; anthers inclosed; styles very long, hairy. G. Native at Cape Van Dieman. (F. 110.)

Hairy Caprosma. Shi. 8 feet.
2 C. PENALDINNIA (Forst. prod. no. 118.) peduncles simple; flowers solitary; anthers exserted. G. Native of New Zealand. Leaves oblong obtuse. Very feathery.

Very-feathery Caprosma. Shrub.
3 C. LUCIDA (Forst. prod. no. 118.) leaves ovate, acuminate at both ends; peduncles axillary, compound; flowers sub-capitate; anthers exserted. G. Native of New Zealand. C. lucida, Gertrn. fil. carp. 3. p. 17. t. 182. is probably distinct from Forster's plant, and even appears to belong to a different genus, as the fruit is said to be a unilocular, 8-seeded berry.

Shining-leaved Caprosma. Shrub.
4 C. CUSPIDIFOLIA (D. C. prod. 4. p. 578.) leaves oval, attenuated at the base, and ending in a spine-forming point at the apex; flowers axillary, few, fasciculate, almost sessile. G. Native of Australia, at the Strait of Entrecasteaux. The flowers are probably dioecious, as in a specimen we examined they were all female. Limb of calyx nearly entire. Lobes of corolla 4-7, linear, striated by 3 parallel nerves. Anthers 1-3 at the top of the tube. Style solitary: very hairy, elongated. Berry ovate, 2-celled, crowned by the calyx. Stipules triangular, acuminate.

Cusp-leaved Caprosma. Shrub.

Cult. For culture and propagation, see Phyllis.

Lin. syst. Pentantria, Digynia. Calyx with an obovate, compressed tube, and an obsolete limb. Corolla with a short tube, and a 5-lobed spreading limb. Stamens 5. Anthers sessile at the throat. Style almost wanting. Stigma 2. Capsule obovate, compressed, narrow at the apex, divisible into two 1-seeded parts, or nuts, ex Gertrn. which hang from the central filiform axis, as in the genus Knöxia, or as in umbelliferous plants, ex Rich; but according to others there is no central axis. Seeds erect, conforming to the mericarps. Albumen fleshy. Embryo erect, dorsal, with a filiform radicle, and cordate foliaceous cotyledons.

—Glabrous shrubs, with tereate branches. Leaves opposite, or 3-4 in a whorl, acuminate. Stipulas membranous, adnate to the petioles, and cleft into many filiform bristles. Panicles terminal, compound. Flowers small, greenish white, but changing to brownish as they fade. According to Cruse, ex Linn. 6. p. 20. the fruit is shining, and the nuts are fixed by the base, not hanging from a central filiform axis.

1 P. nobla (Linn. spec. p. 333.). G. Native of the Canary Islands.—Dill. eth. p. 405. t. 299. f. 386. Panicles many-flowered. Leaves large.

Noble Bastard Hare's-ear. Fl. June, July. Cult. 1869. Shrub 2 to 3 feet.

Cult. A mixture of loam, peat, and sand is a good soil for this shrub; and cuttings root freely, if planted in a pot of sand, with a hand-glass over them.

Lin. syst. Tetrandria, Digynia. Flowers hermaphrodite. Calyx with an obovate tube, and a very minute, nearly equal limb. Corolla subrotate, 4-parted, almost cleft to the base. Stamens 4, inserted in the bottom of the corolla. Anthers oblong. Styles 2, very short, each ending in a long hairy stigma. Fruit obovate, rather didymous, somewhat compressed from the back, and elegant and gyroscopically warty on the back, composed of two 1-seeded, indehiscent mericarps, joined by a concave commissure, but at length separating from each other.—A glabrous herb, with the habit of Circce'a. Stem rather angular from 2 elevated lines which run from the stipulas, branched. Leaves opposite, 1 to 3 inches long, obovate-lanceolate, acuminate, tapering into the petioles, paler beneath, with sori-lately-scabrous margins. Stipulas trifurcate. Peduncles terminal and axillary, the whole forming a large terminal, trichotomous panicle, which is nearly a foot in diameter. Flowers small. Fruit dark brown.

Enchantress's Nightshade-like Galopina. Pl. 2 feet.

Cult. See Phyllis above for culture and propagation.

Lin. syst. Tetra-Pentandria, Digynia, or Diazia Tetra-Pentandria. Flowers dioecious or hermaphrodite. Calyx with an obovate tube, and a 4-5-toothed deciduous limb (f. 110. a.). Corolla funnel-shaped, with a short tube, and a 4-5-parted limb (f. 110. b.); lobes linear or ovate-lanceolate, revolute, valvate in restitution. Stamens 4-5, inserted in the base of the tube of the corolla (f. 110. c.). Anthers oblong, sub-tetragonal, exserted. Styles 2, very short, connate? ending each in a long 

FIG. 110.
hairy stigma (f. 110. f. g). Fruit composed of 2 easily-sepa-
rated, induscent, 1-seeded mericarps, which are a little com-
pressed at the raphe, and joined together by a flatfused
suture. Albumen sub-cartilaginous. Embryo dorsal, erect.—
Small shrubs or herbs, natives of the Cape of Good Hope.
Stems branched. Leaves linear or lanceolate, small, opposite or
verticillate. Stipulas adhering to the petioles at the base, drawn
out into a tooth in the middle. Flowers axillary, sessile, verti-
cillate or opposite, rarely panicled, small, furnished each with
2–3 bracteas at the base, usually dioecious. The male flowers
are always smaller than the female ones.

* Flowers dioecious, sessile in the axils of the leaves.

1 A. BERGIAINUM (Cruse, rub. cap. p. 8.) leaves linear-lanceo-
late, 3 in a whorl, imbricated, and connately pediolate, ciliated;
flowers pentandrous, disposed in a verticillate spike; G. 
Native of the Cape of Good Hope. Stem branched, terete or
obsoletely angular, glabrous at the base, but clothed with long
white hairs above. Leaves pale green, having the margins and
keel ciliated with long white hairs, half an inch long. Whorles
3-flowered. 

Bergia's Amber-tree. Shrub 1 foot.

2 A. AETHIOPICUM (Lin. spec. 1511.) leaves linear-lanceolate,
3 in a whorl, glabrous; stipulas simple, short, acute; flowers
tetrandrous, disposed in verticillate spikes; G. 
Native of the Cape of Good Hope, Cruse, rub. cap. p. 10.
Gerrn. fruct. 3. p. 195. Lin. hort. clff. t. 27.—Pluk. alm. t.
183. f. 1.—Ambrària Heisteri, Walth. hort. t. 9. Stem much
branched, downy above. Leaves shining above, and whitish
beneath, 2–3 lines long. Male flowers brownish, and the female
ones green.

Ethiopian Amber-tree. Fl. June, July. Ch. 1692. Shrub
2 to 3 feet.

3 A. SPATULATUM (Spreng. gen. contd. 3. p. 45. syst. 1. p.
399.) leaves opposite, linear-spulate, bluishish; flowers axil-
ary, sub-verticillate; mericarps oblong, warted; branches
twiggy, crenely spreading, downy. G. 
Native of the Cape of Good Hope, Cruse, rub. cap. p. 9, and p. 13.
A. Aethiopicum, var. b, oppositifolium, Schlecht. and Cruse, in Linnaea.
6. p. 10. It differs from A. Aethiopicum in the opposite,
linear-spulate leaves, and in the more loose habit. A. Aethiopicum,
var. c, Ecklonianum, Schlecht. and Cruse, in Linnaea, 6. p. 10.

Spatulate-leaved Anthospermum. Shrub 2 feet.

4 A. CILORE (Lin. spec. 1521.) leaves opposite, lanceolate,
acute, ciliated; stipulas short, short; flowers axillary, tetrar-
androus; mericarps oblong, glabrous, shining, destitute of the
calyx limb. G. 
Native of the Cape of Good Hope, Gerrn. fil. carp. 3. p. 195. Cruse, rub.
344. f. 5. Stem usually decumbent, much branched; branches
angular, downy. Leaves glabrous, and green above, but white
beneath, connate at the base. Lobes of the corolla hairy out-
side. Anthers white.—The A. galoideis, Rechb, differs from this
in the leaves being rusty beneath.

Ciliated-leaved Amber-tree. Shrub decumbent.

5 A. LANCEOLATUM (Thum. prod. 32. fl. cap. p. 157.) leaves
opposite, lanceolate, acute, glabrous, spreading; stipulas pro-
foundly bifid; flowers axillary, sub-verticillate, tetrandrous, and
often pentandrous; mericarps ovate-oblong, glabrous. G. 
Native of the Cape of Good Hope, Cruse, rub. cap. p. 12. A.
herbacem, Lin. fil. suppl. p. 440. Stem procumbent, glabrous,
brownish purple. Branches sub-tetragonal, purplish, downy at the
apex. Leaves an inch long, connate at the base, paler
beneath, and whitish. Habitat of Galiwm.

Lanceolate-leaved Amber-tree. Shrub procumbent.

6 A. uritum (Cruse, rub. cap. p. 11.) leaves opposite, lanceo-
late, acute, ciliated while young, hairy at the base; stipulas sim-
ple, subulate, hairy; flowers axillary, pentandrous; mericarps
unknown. G. 
Native of the Cape of Good Hope, on
p. 5. p. 580. Stem purplish brown, branched, beset with white
hairs about the axis of the leaves. Branches purple, hairy.
Leaves oval long, connate at the base. Stipulas hairy, of a
shining green colour above, but whitish beneath.

Hairy Amber-tree. Shrub 1 foot.

7 A. saccatum (Thum. prod. 32. fl. cap. p. 158.) leaves
opposite, linear, somewhat trigonal, acuminate, having the mar-
gins and keel scabrous; stipulas simple, very short; flowers
axillary, pentandrous. G. 
Native of the Cape of Good
Hope, on the mountains. Stem decumbent at the base, branched
a little. Branches aggregate, twiggy, crenulous at the base, and
rather scabrous at the apex, leafy. Leaves ½ to 1 inch long, connate
at the base.

Scabrous Amber-tree. Shrub ½ decumbent.

* * * Flowers dioecious, panicled.

8 A. PANCULATUM (Cruse, rub. cap. p. 9, and p. 15. t. 1.
f. 2.) leaves opposite, linear-subspatulate; stipulas short, sim-
ple; flowers panicled, tetradrous; mericarps glabrous, with 3
ribs. G. 
Native of the Cape of Good Hope. Stem
fuscescent, branched from the base; branches downy. Leaves
glabrous, blunting, pale on the lower surface, hardly ½
inch long. Panicle terminal, narrow, elongated. Fruit crowned by
the calyceal teeth.

Panicled-flowered Amber-tree. Shrub 1 to ½ foot.

* * * Flowers hermaphroditic.

9 A. LICHTENSTIINI (Cruse, rub. cap. p. 15.) leaves opposite,
linear, keeled, glabrous, ciliated; stipulas simple, ciliated;
flowers axillary, verticillate; mericarps hairy. G. 
Native of
the Cape of Good Hope. Spermacoce ericoides, Lich. in
Reem. et Schultes, syst. 3. p. 281. Stem branched, glabrous
at bottom, and downy at top. Branches naked at the base.
Leaves connate at the base, mucronate. Flowers tetrandrous.

Lichtenstein's Amber-tree. Shrub 1 to 2 feet.

10 A. Spermacoce (Rechb. in Spreng. syst. 4. p. 338.) leaves
opposite, oblong-lanceolate, with scabrous margins; stip-
ulas entire; flowers axillary, solitary, pedicellate, pentandrous;
calyx 5-toothed. G. 
Native of the Cape of Good Hope.
Stem herbaceous, flexuous, rather angular, branched, glabrous,
downy at the apex. Leaves connate at the base. Stipulas
pliote, cleft into bristles.

Spermaceae-like Amber-tree. Fl. 1 foot.

Cult. See Phyllis, p. 635. for culture and propagation.

CCXI. AMBRARIA (a name formerly applied to the genus
Anthospermum by Heister, and is probably derived from Cape
Ambra, in Madagascar). Cruse, rub. cap. p. 16. t. 1. f. 34.
hist. nat. Par. 5. p. 139. t. 12. f. 2.

Lin. syst. Dioxia, Tétrandra. Flowers dioecious, of the
same structure as those of Anthospermum, but differs from that
genus in the capsule being 5-celled, the intermediate cell vacant,
and the lateral ones 1-seeded. The rest as in Anthospermum.

1 A. nitra (Cruse, rub. cap. p. 17. t. 1 f. 2.) leaves 3 in a
whorl, connately pediolate; fruit tomentously hairy. G. 
Native of the Cape of Good Hope. Shrub much branched from
the base, hairy at the top. Leaves linear, subtriquetrous, glab-
rous, connate at the base, with the margins and keel ciliated,
at length imbricated and deciduous. Stipulas hardly prominent, ciliate. Flowers axillary, verticillate. According to Cham. et Schlecht. Clitófora cinerea, Lin. is a synonyme of this.

**Uairy Ambraria.** Shrubs $\frac{1}{2}$ to $\frac{3}{4}$ foot.

2 A. *Ciaera* (Cruse, rub. cap. p. t. 1. f. 3.) leaves 3 in a whorl, connately perfoliate; fruit obovately subglobose, glabrous.  bj. G. Native of the Cape of Good Hope. Nénax acerosa, Gaertn. fruct. t. 32. f. 7. Young branches reddish. Leaves linear, subtriquetrous, glabrous, seriatly ciliated on the margin and keel, 3-6 lines long, and $\frac{1}{2}$ to 1 broad. Flowers axillary, subverticillate.

**Glabrous Ambraria.** Shrubs $\frac{1}{2}$ to $\frac{3}{4}$ foot. Cult. See *Phyllis*, p. 635. for culture and propagation.

**Tribe XI.**

**STELLATE** (from *stellatus*, starry; the leaves and stipulas form whorls, resembling the rays of a star). Ray, syn. p. 229. Cham. et Schlecht. in Linnaea. 3. p. 220. D. C. prod. 4. p. 580. — Aperineae, Link, (1809). — Galée, Kunth, nov. gen. amer. (1818) p. 335. — Asparacérea, A. Rich. mem. soc. hist. nat. Par. (1830) p. 126. Flowers hermaphrodite, rarely of different sexes. Corolla rotate or funnel-shaped; lobes valvate in anthesis. Styles 2, almost distinct from the base, or more or less combined in one. Stigmas capitulate. Fruit constantly of 2 indehiscent 1-seeded mericarps. Seeds hardly distinct from the pericarp and calyx. Albumen horny. — Usually herbs, rarely small shrubs. Leaves opposite, bearing each a bud in the axils, furnished with 1-2 or 3 leaf-formed stipulas between the leaves on both sides, which are destitute of buds, and form whorles along with them. Roots usually red, furnishing a red dye, as the madder. — The leaves are only to be distinguished from the stipulas in having buds in their axils.

**Lin. syst. Tetradria, Monogynia.** Calyx with an ovate tube, and a 4-6-toothed permanent limb. Corolla funnel-shaped, with a terete tube, and a 4-lobed limb. Stannias 4. Style 1, 2-lobed at the apex; stigmas capitellate. Fruit dry, crowned by the calyx, divisible into two mericarps; mericarps 1-seeded, indehiscent, flat on one side, and convex on the other. — An annual herb native of Europe. Leaves opposite, with 1-2 stipulas on each side, obovate, acute, scabrous, forming whorls. Flowers small, red, capitulate, almost sessile, girded or involutated by the uppermost whorl of leaves.

1 S. *Arve'ssis* (Lin. spec. p. 119.)  bj. H. Native of Europe and Tauria, very common in fields in sandy soil; plentiful in many parts of Britain in fallow fields and among corn. Fl. dan. t. 439. Cart. lond. 5. t. 13. Smith, engl. bot. t. 891. Schkuhr, handb. t. 22. — Barcel. icon. t. 541. Root with many reddish brown fibres. The whole plant rough and hairy. Leaves rough along the edges and keel, 4-6 in a whorl.

**Corn Field-madder.** Fl. April, Sept. Britain. Pl. $\frac{3}{4}$ to $\frac{3}{2}$ ft.

N. B. *Sherardia fruticosa* (Lin. spec. 149.) stem shrubby; leaves 4 in a whorl, equal; flowers axillary.  bj. G. Native of the island of Ascension. Stipulas very short, subulate, interfoliaceous. Corolla white. Fruit unknown. This plant appears to be intermediate between *Didia* and *Spermacoce*.

Cult. The seeds only require to be sow in the open ground in a dry situation.

**Lin. syst. Tetradria, Monogynia.** Calyx with an ovate didymous tube, and a very short 4-toothed deciduous or obsolete limb. Corolla funnel-shaped, rarely campanulate, 4-cleft, rarely 3-cleft. Styles 2, joined together at the base, and nearly to the apex. Fruit didymous, not crowned by the calyx, dry, or hardly fleshy; mericarps easily separated, indehiscent, 1-seeded.—Herbs, rarely small shrubs. Stems and branches usually tetragonal. Leaves opposite, with 1-2-3 stipulas on each side; they are therefore called 4 to 8 in a whorl, but between the uppermost leaves there are no stipulas. Flowers terminal and axillary, in fascicles.

1 A. *Arve'ssis* (Lin. spec. p. 149.) plant erect, smoothish; leaves 6-10 in a whorl, lanceolate-linear, a little ciliated; lower ones obovate; floral ones ciliated with long hairs; corybens ciliated, terminal, many flowered; flowers sessile; fruit glabrous.  bj. H. Native of Europe and Caucasia, in fields and arid stony places. A. corcula, Dod. pempt. p. 585. Lob. icon. t. 801. f. 2. A. ciliata, Moench. meth. p. 484. A. doubt, Wild. herb. ex Spreng. Roots yellow. Under surface of leaves whitish from adpressed hairs. This differs from all the other species of *Asperula* in the flowers being blue. It differs from Sherardia in the capsule not being crowned by the calyx, in the blunter leaves, and in the floral leaves being ciliated. Anthers yellow.

**Cornfield Woodroof.** Fl. July. Cit. 1596. Pl. $\frac{3}{4}$ to 1 foot.

2 A. *Ciliata* (D. C. prod. 4. p. 582.) stems ascending, angular, glabrous; leaves 6-9 in a whorl, lanceolate-linear, acute, and are as well the bracteas, serrated by stiff cilia; flowers almost sessile, disposed in a terminal subumbellate corymb, pedunculose; style exerted.—Native of Persia, where it was collected by Gneelin. Corollas glabrous, 5-6 lines long. Stamens 5.

**Ciliated Woodroof.** Pl. ascending.

3 A. *Trichodes* (Gay, in litt. 1821) ex D. C. prod. 4. p. 582.) stems erect, simple at the base, branched at the apex, glabrous; leaves glabrous, subultimately filiform, equal in length to the internodes; cauline ones 10-16 in a whorl, and the rameal ones 2-6 in a whorl; pedicels solitary, almost axillary; corollas small, downy outside, trifid; fruit obturate, clothed with very short down.  bj. H. Native of the north of Persia. Stem very smooth, white, 7-10 inches high. Leaves an inch long, scabrous. Corolla greenish-white, with a slender terete tube, and oblong awnless lobes. Stamens 3.

**Hairly Woodroof.** Pl. $\frac{3}{4}$ to 1 foot.

4 A. *Taurina* (Lin. spec. 150.) plant smoothish, erect; leaves 4 in a whorl, ovate-lanceolate, 3-nerved, with finely ciliated margins; corybens pedunculate, axillary, fasciculate umbellate, involutated; bracteas ciliated; fruit glabrous, and rather scabrous.  bj. H. Native of Dauphiny, Piedmont, Switzerland, Carniola, Iberia, &c. on hills in shady places. A. triërìvà, Lam. fil. fr. 3. p. 376. Gálium Tauricum, Scop. carn. no. 148. Lob. icon. t. 800. f. 1.—Moris, hist. sect. 9. t. 21. f. 1.—Hall. helv. no. 752. Leaves broad. Corollas white, elongated. Anthers violaceous, exserted.

**Bell Woodroof.** Fl. April, July. Cit. 1759. Pl. 1 foot.

5 A. *Léviota* (Lin. mant. p. 58.) plant glabrous, ascending; leaves 4 in a whorl, elliptic, nervs, with finely scabrous margins; cymes corybecute, pedunculate, axillary or nearly terminal; corolla with a short tube; fruit glabrous, scabrous from elevated
RUBIACEÆ. CCXIII. ASPERULA.

6 A. hexaphylla (All. ped. no. 48. t. 77. f. 3.) plant ascending, glabrous; leaves 6 in a whorl, linear, spreading, acute, with revolute scabrous margins; cymes terminal; flowers aggregate, umbellate; bracteas glabrous, acute, shorter than the flowers.  2. H. Native of Piedmont, on the lower Alps about Tende and Saorgio. A. Allioni, Baumi. enum. trans. 1. p. 89. Corolla purple outside, but white within.

Var.  β, rigida (D. C. prod. 4. p. 582.) leaves stiffer and blunter than those of the species, and the floral ones are obovate.  2. H. Native of Sicily, in the fissures of calcareous rocks by the sea side. A. hexaphylla, Guss. profl. fl. sic. 1. p. 166. There are glabrous and downy variations of this plant.

Six-leafed Woodroof. Pl. ½ foot.

7 A. graecifilis (Meyer, verz. pfl. p. 52.) plant perennial, smooth, glabrous; stems filiform, much branched, diffuse; leaves 4 in a whorl, equal, elliptic, blunter, with rather scabrous margins; upper ones opposite; umbels terminal, few-flowered; corolla 4-5-cleft, almost glabrous; with obuse segments; style seminifl.; mericarps smooth, glabrous.  2. H. Native of Caucasus, in alpine places at the river Maka.

Slender Woodroof. Pl. diffuse.

8 A. uncata (Lamond, bul. phil. no. 41. p. 131. t. 9. f. 1. 2-3.) plant tufted, erectish; leaves 6 in a whorl, linear, acute, hairy, longer than the internodes; flowers aggregate umbel late, terminal, sessile, exceeding the bracteas; fruit glabrous.  2. H. Native of the central Pyrenees, on the higher ranges on dry banks. A. nov. spec. St. Amans, trav. pyr. 194. Corollas white, purplish outside. In cultivation the plant becomes smooth, and is then referable to  A. hexaphylla.

9 A. tintoria (Lin. spec. 150.) plant erectish, glabrous; leaves linear; lower ones 6 in a whorl; middle ones 4, and the uppermost few opposite; floral leaves ovate; flowers usually triandrous.  2. H. Native of Europe, on hills in arid stony places. A. rubiβa L., Lam. fl. fr. 3. p. 375. Gálium tintorium, Scop. carn. no. 149.—Tabern. icon. t. 733. f. 2. Roots large, creeping, reddish, and are used in Gothland instead of madder for dyeing red. Plant procumbent, unless supported. Stem 1-2 feet long, purplish. Flowers usually by threes. Corollas white, reddish on the outside. Very like  A. cynanchica.

10 A. cynanchica (Lin. spec. p. 151.) plant glabrous, erectish; leaves 4 in a whorl, linear; lower ones small, oblong, upper ones opposite; floral ones lanceolate-linear, acuminate; awned; flowers terminal, quadrifid; fruit granulat.  2. H. Native of Europe, in dry gravelly places; abundant in many parts of England on chalky downs. Smith, engl. bot. t. 33. Berg. phyt. t. 81. Rubia cynanchica, J. Bauh. hist. 3. p. 723. with a figure. Asp. rubiβa, Lam. fl. fr. 3. p. 375. A. tinctoria var. β, Lam. dict. 1. p. 298. Gálium cynanchicum, Scop. carn. no. 147. Herb variable in habit. Stems prostrate, dichotomously branched. The flowers grow on erect branches, forming a fastigate corymb, white or blush-coloured, elegantly marked with red lines, and sometimes they are pure white. Dalechamp seems to be the chief authority for the reputation this plant formerly acquired in the cure of quinsies. He says it should be applied externally, as well as taken internally, but it is now entirely out of use.

11 A. supina (Bieb. fl. tur. 1. p. 101.) glabrous; stem much branched at the base, procumbent; leaves 4 in a whorl, linear, acute; lower ones imbricately crowded; peduncles 3-flowered, axillary and terminal, rather panicked; corolla with a terete tube, and 4 oblong lobes; fruit glabrous.  2. H. Native of Tauria and Caucasus, in the fissures of calcareous rocks, and in gravelly places. A. cynanchica  β, Meyer, verz. pf. p. 406. Very nearly allied to A. cynanchica, but the flowers are white, not as in it, blush-coloured. Internodes of the stem short.

12 A. longiflora (Waldis. et Kl. pfl. rar. hung. 2. t. 150.) stems numerous from the same neck, erectish, glabrous; leaves 4 in a whorl, linear; lower ones small, obovate; upper ones opposite; fascicles of flowers terminal, pedunculate; bracteas small, subulate; tube of corolla elongated; fruit glabrous, smooth.  2. H. Native of Croatia, Carniola, and Carinthia, in mountainous places, and on rocks. A. suavolens, Schrad. in litt. 1815. Corolla white, yellowish inside, and reddish outside. Stems weak.

13 A. brevifolia (Vent. hort. cels. p. 65. t. 63.) plant glabrous, decumbent; leaves 4 in a whorl, very short, distant: uppermost ones opposite; flowers axillary, solitary on short pedicels, and in terminal fascicles; corolla 4-cleft; style bipartite to the base.  2. H. Native of Caramania, near Cylindre on mountains. Stem much branched. Corollas at first yellowish-green, but at length becoming purplish.

14 A. lu£tea (Smith, fl. grac. t. 120.) stems erect; leaves 4 in a whorl, linear, glabrous, mucronate; flowers in fascicles, downy, awned.  2. H. Native of Mount Parnassus. Rubéola Crética saxatilis frutescens flore luteo, Tourn. cor. p. 5. Flowers yellow. Fascicles of flowers spicate.

Yellow-flowered Woodroof. Pl. 1 foot.

15 A. aristata (Lin. suppl. fl. 120.) plant erect, glabrous; leaves 4 in a whorl, linear, acute: upper ones opposite: the floral ones like the rest, but smaller; flowers in terminal fascicles; lobes of corolla bluntly awned.  2. H. Native of the south of Europe, Sicily, &c. Flowers usually by threes, pale yellow.

16 A. montana (Willd. enum. p. 151.) glabrous; stem flaccid; leaves linear; lower ones 6 in a whorl; middle ones 4, upper ones opposite; floral leaves linear; flowers in fascicles; corollas 4-cleft, scabrous externally.  2. H. Native of Hun-

Mountain Woodroof. Fl. June, July. Cl. 1801. Pl. ½ to ¾ foot.

17 A. virs'E'ta (Desf. fl. atl. 1 p. 127.) plant erect or ascending; leaves 6 in a whorl, linear, acute, with revolute margins: lower ones and tops of stems glabrous; flowers in fascicled umbels, rising from the tops of the stem or branches; bracteas hardly exceeding the ovaries; fruit glabrous. 2. H. Native of Algiers and Algarves, on chalky and sandy hills. Rubia Lusitánica, t. c. Tourn. inst. p. 130. A. répens, Brot. phyt. lus. pl. 10. 10. A. Algérica, Pers. ench. 1 p. 124. Rubia répens, &c. Grisel. vir. no. 1244. Stem hairy at bottom. Leaves glaucous. Flowers subcapitate, red. In cultivation this plant becomes smooth.

Hairy Woodroof. Fl. May, June. Cl. 1819. Pl. 1 to 2 ft.

18 A. Tomentó'sa (Ten. prod. xii. fl. neap. t. 9.) plant ascending or diffuse, clothed with velvety tomentum; leaves 4 in a whorl, linear, with revolute margins: lower ones obovate; flowers terminal or axillary, 8-10 in a fascicle; bracteas rather shorter than the flowers. 2. H. Native of Goats' Island, near Naples, in arid places. Herb branched from the base. Stem tetragonal. Stipular leaves the longest. Tube of corolla longish. Corolla red. A crassifolia, Lin. mant. p. 37. does not seem to differ from the present plant. Perhaps A. scabra, Link, enum. 1 p. 134. is also the same.

Făr. 5. Demiglabra (D. C. prodr. 4 p. 58.) lower part of herb velvety; upper part and flowers glabrous. 2. H. Native along with the species, and probably of Sicily at Càfalu. A. commutátà, Presl, fl. sic. prod. p. 62.? Rœm. et Schultes, syst. 3 p. 267.?

19 A. inc'ana (Smith, fl. græc. t. 119.) stems villous at the base, and smoothish at top; leaves 6 in a whorl, linear, hairy, flowers downy, in terminal fascicles. 2. H. Native of Candia, on the Sphecceotn mountains. Flowers pale red.

Hoary Woodroof. Pl. ½ to ¾ foot.

20 A. Arcadí'esnis (Sims, bot. mag. t. 2146.) plant hoary, decumbent; leaves 6 in a whorl, oblong-ovate, acute, with revolute edges; flowers terminal and axillary, aggregate, sessile; style bifid at top. 2. F. Native of Arcadia, on Mount Tyria. A small hoary plant, with rose-coloured flowers. Gália Grec'm of Hort.

Arcadian Woodroof. Fl. May, Cl. 1819. Pl. 2 to 3 inches.

21 A. De'blis (Led. hort. dorp. suppl. 1824, p. 2.) plant hispid from pili; leaves 6 in a whorl: upper 4 in a whorl, linear-lanceolate, scabrous above, and keen smooth; umbels lateral, pedunculate, 3-flowered; corolla funnel-shaped; fruit granular. 2. H. Native of Tauria, near Bachtachsaraf.

Weak Woodroof. Pl. ½ foot.

22 A. Nísida (Smith, fl. græc. t. 121.) glabrous; stems diffusely tufted, as well as the leaves; leaves 4 in a whorl, shining, glaucescient; lower ones oval, the rest linear, acute, awned, revolute; fascicles terminal, 3-4-flowered, length of leaves; lobes of corolla awned; tube terete, wide; fruit glabrous, rather rugged. 2. H. Native of Sicily, on rocky and gravelly mountains, and on Mount Olympus, in Bithynia. Guss. prod. fl. sic. 1 p. 168. Flowers purplish. Very like A. hexaphyllum.

Nítid Woodroof. Pl. tufted, ½ foot.

23 A. scabr'a (Presl. del. prag. p. 124. but not of Link.) stem scabrous, diffuse, kneed; leaves 4 in a whorl: lower ones oblong downy: upper ones glabrous, linear, unequal, opposite, small, awned; flowers in fascicled; corollas scabrous, with the

lobes mucronate; style biparite to the base. 2. H. Native of Sicily, on dry mountains; of Spain, in arid places; and of Portugal, on the banks of the Tagus and Douro. Guss. prod. fl. sic. 1 p. 167. A. digyna, Dufour, ann. gen. sc. phys. 7 p. 295. A. macrorhiza, Link. fl. port. 2 p. 41. t. 84. Stamens exactly quadrangular. Flowers purplish white. Habit of A. longifólia, but differs from it in the lower leaves and flowers being downy.

Scabrous Woodroof. Pl. 1 to 2 feet.

24 A. Alpína (Bieb. fl. taur. suppl. p. 103.) the whole plant, as well as the corollas and ovaries are downy; stems procumbent, much branched, tetragonal; leaves 4 in a whorl, linear, acute: upper ones nearly equal, spreading; cymes terminal, crowded, 5-7-flowered; lobes of corolla 4. 2. H. Native of Eastern Caucasus, on the Alps. A. cynáchica, var. yr. Stev. in mem. soc. mosc. 3 p. 253. Meyer, verz. pl. p. 406. Flowers white, or tinged with red. Leaves shorter and broader than in A. cynáchica, and the lower ones blunter.

25 A. cretác'ea (Willd. in Rœm. et Schultes, syst. 3 p. 529.) stems tufted, prostrate; leaves 6 in a whorl, lanceolate: the whorles so close as to be imbricated; flowers terminal, aggregate. 2. H. Native of Siberia, in chalky places.

Cretaceous Woodroof. Pl. prostrate.

26 A. tauri'atrás (Smith, fl. græc. t. 129.) stem downy; leaves linear, 4 in a whorl, scabrous on the margins and stem (almost hoary, according to D'Urv.) floral ones opposite: flowers quadrifid, pilose; fruit hispid. 2. H. Native on the shores of the Euxine Sea, on hills. Flowers pale red. Fascicles of flowers disposed in terminal panicles.

Sea-shore Woodroof. Pl. procumbent.

27 A. negléc'ta (Guss. fl. rar. 69. t. 13. f. 1.) stems numerous, hairy, ascending; leaves 4 in a whorl, hairy, acute, longer than the internodes: lower ones obtuse; flowers in terminal fascicles; mericarps globose, hispid. 2. H. Native of Abruzzo and Sardinia, in alpine places. Corolla white inside, and reddish outside, and downy. Bracteas ovate. Said to be allied to A. littoralis.

Neglected Woodroof. Pl. decumbent.

28 A. six'ens (Guss. fl. rar. 70. t. 13. f. 2.) plant smooth; stems tufted, decumbent; leaves 4 in a whorl, awned, longer than the internodes, shining, quite glabrous; lower ones the broadest; flowers in terminal fascicles; lobes of corolla awned; mericarps tuckercularly mucricated. 2. H. Native of Abruzzo, in arid, alpine situations. Flowers white inside, and purplish outside. Very like A. negléc'ta, and probably only a variety of it.

Shining Woodroof. Pl. decumbent.

29 A. ni'sida (Sibth. et Smith, fl. græc. t. 121.) stems diffusely, downy; leaves linear, 4 in a whorl, superior ones opposite; flowers scattered; fruit glabrous. 2. H. Native of Candia, on hills and in fields, Rœm. et Schultes, syst. 3 p. 270. exclusive of the syn. of Lois. Leaves rather scabrous. Flowers pale red, disposed in terminal and lateral few-flowered fascicles.

Staff Woodroof. Pl. ½ to 1 foot.

30 A. suber'es (Smith, fl. græc. t. 123.) stems tufted, ascending; root corky; leaves 4 in a whorl, linear, rather hoary; lobes of the corolla awnless. 2. H. Native of Greece, on high rocks. Stems downy. Flowers rose-coloured, disposed in subsipicate fascicles.

Corky-rooted Woodroof. Pl. ½ to ¾ foot.

31 A. longifóli'ea (Smith, fl. græc. t. 118.) stems smooth;
leaves 8 in a whorl, linear-lanceolate, deflexed, with rather scabrous margins; panicles capillary, many-flowered; fruit smooth.  
H. Native of Turkey, about Constantinople. Flowers white, campanulately funnel-shaped. Habit of a species of Gálium. 

32 A. odoráta (Dod. fl. p. 355.) plant glabrous, erect, or ascending; stems simple; leaves 8 in a whorl, lanceolate, smooth, with serrately scabrous edges; corymb terminal, pedunculate; fruit hispid.  
H. Native of Europe, Siberia, and Caucasus, in shady places and woods, plentiful in Britain. Cbl. fl. t. 502. Lam. ill. t. 61. Mill. fig. t. 55. Smith, eng. bot. t. 755. Blackw. t. 267. Gálium odoráatum, Scop. carn. no. 158. Root creeping a little below the surface of the soil. Stems tetragonal. Corymb usually trifid, each division bearing about 4 flowers. Flowers snowy white. The plant is without scent when fresh, but when dried diffuses an odour like that of vernal grass. It is said to give a grateful flavour to wine; and when kept among clothes, not only to impart an agreeable perfume to them, but to preserve them from insects. Turner calls the plant Wood-rose, or Wood-rowel. 

Gerard, Woodrose, Woodrowell, and Woodroof; and Parkinson, Woodroof. In modern times it is called Woodroof, or Woodruff; These names are derived from the place of its natural growth, in woods, and from the whorls, ruffs, or rows of leaves. 

Sweet-scented or common Woodroof. Fl. May, June, Britain. Pl. ½ to 1 foot. 

33 A. apárine (Bieb. fl. taur. p. 102. and suppl. 105. Bess. fl. gall. 1. p. 114.) branches diffuse, straggling, with scabrous angles; leaves 6-8 in a whorl, oblong or lanceolate, scabrous, having the keel and margins beset with small retrograde prickles; peduncles axillary, branched, disposed in a loose fasciculate panicle; corolla short, tubular; fruit granular.  

Herb scabrous all over. 

34 A. paniculáta (Bunge in Ledeb. fl. alt. ill. t. 301. fl. alt. 1. p. 140.) stems tetragonal, glabrous; lower leaves 4 in a whorl: the rest 6, oblong-lanceolate, acuminate, with scabrous margins; flowers terminal and axillary, panicled; panicle diffuse; corolla campanulate; fruit smooth.  
H. Native of Siberia, in grassy parts of mountains at the rivers Tscharysch and Sentelek, and in sandy places at the river Katunja. Leaves rather glaucous beneath. Corollas white, with obtuse segments. 

Panicled-flowered Woodroof. Pl. 1 foot. 

35 A. subélvétina (D. C. prod. 4. p. 585.) stems many, branched, erect, velvety from small down; leaves 3-8 in a whorl, broad-linear, obtuse, rather velvety; flowers verticillate, and capitate at the tops of the branches; floral leaves small; corollas campanulate; fruit glabrous.  
H. Native of Persia, on Mount Elwend, where it was collected by Olivier and Bruniquere. Old stems permanent, white, and glabrous. Leaves 6 lines long, and a line broad. 

Rather-velvety Woodroof. Pl. ½ to 1 foot. 

36 A. galáloïdes (Bieb. fl. taur. 1. p. 101. and suppl. p. 104.) plant glabrous; stems terete, ascending; leaves 6-8 in a whorl, linear, glaucous; peduncles dichasious, terminal, racemose; corolla campanulate; fruit glabrous, smooth.  
H. Native of Middle and South Europe, even to Tauria and Caucasus, in stony places. Gálium glaucócium, and probably Gálium monánum, var. Lin. spec. 156. Asp. gláucia, Bess. Gálium Hal-léri, Sut. fl. helv. 1. p. 88. Gálium campanulatum, Vill. dauph. 2. p. 326. Gálium grandiflorum, Clairv. man. p. 41. Flowers white. Plant glaucous.—This is a very variable plant, and is intermediate between Gálium and Aspérula. Stems either terete or blunted sub-tetragonal, erectish or diffuse, smooth or scabrous at the base. Leaves with revolute or flat margins, obtuse or mucronulate.—See Jacq. fl. austr. t. 84. Vill. dauph. in. M. Bocc. Gálium 'Tyráica, (D. C. prod. 4. p. 585.) stems erect, hispid at the base; lower leaves rather hispid.  

37 A. humpífísa (Bieb. fl. taur. suppl. p. 105.) stems prostrate, much branched, hispid, tetragonal; leaves 6 in a whorl, linear, spreadingly reflexed, with scabrous edges: lowermost ones 8 in a whorl; pedicels axillary, usually by threes, 1-flowered; corolla sub-campanulate, with a short tube; fruit glabrous.  

† Species not sufficiently known. 

38 A. tournefortí (Sieb. ex Spreng. syst. 1. p. 395.) stems suffrutescous; leaves obovate-oblong, quite glabrous, glaucous; whorles of flowers approximate; flowers sub-fasiculate, hispid. 
H. Native of Candia. 

Tournefort’s Woodroof. Pl. suffrutescous. 

39 A. umbelláta (Willm. herb. ex D. C. prod. 4. p. 586.) 
H. Native of Hungary. This is the same as A. hexáphíthía, ex Spreng. syst. but according to Stevens, obs. miss. it differs in the flowers being shorter. 

Umbellate-flowered Woodroof. Pl. 

40 A. involúcráta (Bergr. et Wahl. in 1825. vol. 21. p. 971.) leaves 4 in a whorl, obovate, elongated, obtuse, glabrous; stems decumbent; peduncles lateral and terminal; flowers umbellate; leaves of involucrum obtuse, glabrous.  
H. Native of the Levant, among bushes on the sides of hills. Leaves like those of Gálium palustré. 

Involucrated Woodroof. Pl. decumbent. 

Cul. Most of the species of Woodroof are very pretty when in flower, and are therefore well adapted for decorating flower-borders or rock-work. They will grow in any common garden-soil, and are easily increased by parting at the root. A. odoráta will thrive under the shade of trees, where hardly any thing else will grow. The seeds of annual species only require to be sown where the plants are intended to remain. 

Lin. syst. Tetra-Pentádria, Monogyinia. Calyx with an ovate tube, and a hardly distinct limb. Corolla tubular, elongated, funnel-shaped, 4-5-lobed; lobes usually drawn out into a setaceous, inflexed appendage each. Stamina 4-5, inclosed; anthers linear. Style 2-lobed at the apex, shorter than the tube of the corolla. Fruit divisible into 2 parts, but not crowned by
the calyx; mericarps semi-ovate or oblong, indehiscent.—Herbs, sometimes suffrutescent at the base, but usually annual. Leaves truly opposite, furnished with from 1 to 3 stipulas on each side. Flowers furnished with 3 bracteas each, the exterior bractea representing a calyce leaf, and the 2 lateral ones opposite, all longer than the ovarium, and appearing like a calyx. Spikes sometimes elongated and continuous, sometimes capitate, and sometimes interrupted from being formed of pedunculate fascicles of flowers.

§ 1. Flowers disposed in continuous spikes.

1 C. latifolia (Lin. spec. 157.) plant erect, with ascending branches; leaves 4 in a whorl, elliptic-lanceolate, acute; lower ones usually ovate, and mucronate, with sebaceous margins; spikes biflorn, tetragonal; flowers quadridiform, solitary, imbricated in 4 rows. \( \text{C. latifolia, } \text{Bieb. fl. t. 1. p. 106.} \)

2 C. angustifolia (Lin. spec. p. 157.) erect; leaves 6 in a whorl, linear, acute, sebaceous on the margins, and on the angles of the stem; spikes linear, imbricated in 4 rows, somewhat interrupted at the base; flowers tetracyclic, twin: one of them biflacteolate. \( \text{C. angustifolia, Bieb. fl. t. 149.} \)

3 C. glauca (A. Rich. in mem. soc. hist. nat. par. 5. p. 131.) plant suffrutescent at the base, erect, glaucescent; leaves 6 in a whorl, linear, with revolute edges; spikes slender, pedunculate, somewhat interrupted at the base; bracteas ciliate; flowers pentanemous. \( \text{C. glauca, Roth, cat. 1. p. 27.} \)

4 C. siliqua (Lam. dict. 2. p. 217.) plant diffuse; leaves 4 in a whorl, or opposite; spikes hardly interrupted at the base; bracteas ciliate, unequal, rather loose; flowers tetracyclic; fruit beaked with blunt tubercolae. \( \text{C. siliqua, Roth, Ust. neu. anm. 4. p. 40. cat. 1. p. 26.} \)

5 C. pætula (Lin. spec. p. 602.) erect; branches spreading; leaves 6 in a whorl, linear, rather sebaceous; flowers 1-2 in the axils of the bracteas, on short pedicels, pentancicous; fruit smoothish.

6 C. suaveolens (Meyer, ver. pl. p. 406.) plant perennial, glabrous; stem herbaceous, erect, branched; leaves linear, mucronate, with prickly, revolute edges, 8 in a whorl, but the upper ones are 6 in a whorl; flowers opposite, disposed in dense spikes; floral leaves and bracteas lanceolate, ciliate, a little shorter than the corollas, which are glabrous, and 5-cleft; stamens inclosed; mericarps glabrous, smooth.\( \text{C. suaveolens, Bieb. fl. t. 106.} \)

§ 2. Flowers capitata.

7 C. EGYPTIACA (Lin. mant. p. 38.) plant diffuse; leaves 4 in a whorl, linear, with revolute edges, glabrous above, and on the margins; lower ones ovate; spikes terminal; bracteas lanceolate, with the keel and margins rather sebaceous. \( \text{C. EGYPTIACA, Bieb. fl. t. 602.} \)

8 C. GILANTICA (Trin. in mem. act. petersb. 1818. p. 493. t. 12.) stems erect, branchless; leaves 4 in a whorl, linear, mucronate, with prickly revolute edges; flowers remotely spicate; bracteas and floral leaves ovate, ciliate, 4 times shorter than the corolla, which is glabrous.

9 C. MARITIMA (Lin. spec. 158.) plant suffrutescent, procumbent, much branched, glabrous, glabrous; leaves 6 in a whorl, lanceolate, stiff, margined, mucronate; flowers axillary, disposed in interrupted spikes, pentanemous. \( \text{C. MARITIMA, Bieb. fl. t. 354.} \)

10 C. CAPitaTA (Lam. dict. 2. p. 217.) plant diffuse, procumbent, branched, callous, glabrous; leaves 6 in a whorl, linear, with revolute edges; spikes capitate, ovate; bracteas membranous, lanceolate, longer than the leaves, trilobed, girding 2 flowers each; corollas 6-parted. \( \text{C. MARITIMA, Bieb. fl. t. 354.} \)
mountains. Laxmannia fasciculata, S. G. Gmel. Said to be nearly allied to C. molluginoides.

Long-styled Crosswort. Pl. procumbent.

12 C. purpurea (Willd. spec. 1. p. 602.) plant erect; leaves 6 in a whorl, linear, downy; heads of flowers pedunculate, axillary, and terminal; corollas pentameras. 5. H. Native of Candia. Rubéola Crética meana floribus purpurascensibus, Tourn. cor. 5. Stem downy. Corollas purplish, downy.

§ 3. Flowers in fascicles; fascicles opposite, on short peduncles: the whole forming an interrupted raceme.

13 C. molluginoides (Bieb. cent. 2. t. 65. ex fl. taur. 1. p. 106. suppl. 110.) erect; leaves 5–12 in a whorl; linear-lanceolate, with revolute, scabrous edges, and a villous keel; fascicles of flowers opposite, disposed in an interrupted spike; bracteas ovate-lanceolate, acuminate, villous, much shorter than the flowers; fruit glabrous, smoothish; corollas pentameras. 5. H. Native of Candida, in subalpine places, Armenia, and Hungary. C. acanuïma, Balh. herb. taur. Aspérula tubiflora, Hortul.—Buxb. cent. 2. t. 30. f. 1. Corollas greenish yellow. Stamens 5. Mericarps nearly globose. Angles of the stem scabrous.

14 C. aspera (Bieb. fl. taur. 1. p. 107.) plant procumbent or ascending; leaves usually 6 in a whorl, linear, bluntish, with revolute edges, and are, as well as the stem, scabrous; fascicles of flowers opposite, pedunculate, disposed in interrupted spikes; bracteas ovate, acute, ciliated, much shorter than the flowers; flowers pentameras; fruit glabrous. 5. H. Native of Iberia and Caucasus, in subalpine places.

Flowers greenish yellow.

Rough Crosswort. Pl. procumbent.

15 C. clavaetá (Bieb. fl. taur. 1. p. 107.) stems ascending, sterile ones hairy, and floriferous ones smooth; leaves 6 in a whorl, linear, with revolute margins, scabrous, rather glabrous; heads of flowers opposite, pedunculate, disposed in an interrupted raceme; bracteas ovate, acute, ciliated, much shorter than the flowers; flowers pentameras. 5. H. Native of Iberia and Caucasus, on stony hills. Rubéola orientalis folis Galli, flore multiplici, Tourn. cor. 5. Flowers greenish yellow.

† Plants referred to the genus which ought to be excluded from it.

16 C.? Ameriana (Mill. dict. no. 5.) stem erect, villous; leaves opposite, linear-lanceolate, hairy; flowers solitary, axillary. 5. S. Native of Vera Cruz. Flowers pale blue. Fruit didymous. Probably a species of Spiraeaæceae.

17 C.? dispida (Mill. dict. no. 4.) stem hispid; leaves opposite, lanceolate, hairy; flowers umbellate, terminal. 5. S. Native of Vera Cruz. Stems quadrangular, rough, prickly. Flowers blue, tetrameras. Fruit didymous.

Hispid Crosswort. Shrub 2 feet.

Cult. The seeds of annual species should be sown in the open ground where the plants are intended to remain. The perennial, herbaceous, and shrubby species being rather tender, should be grown in pots, in a mixture of peat, sand, and a little loam; and they will be easily increased by dividing at the root, or by cuttings.

CCXV. RUBIA (from ruber, red; in allusion to the red colour of the roots), Tourn. inst. 113. t. 38. Lin. gen. no. 127.

Lin. syst. Pentândria, Digesta. Calyx with an ovate-globose tube, and a 4-toothed limb. Corolla 4-5-parted, rotate. Stamens 4, short. Styles 2, short. Fruit didymous, nearly globose, baccate, juice.—Herbs or sub-shrubs. Stems diffuse, much branched, tetragonal. Leaves opposite, usually furnished with 1–2, rarely with 3–4 stipulas on both sides, which are very like the leaves, constituting 4–10-leaved whorles. Flowers small, greenish white, or pale yellow. Berries black, rarely red or white.

§ 1. Exineolocrinita (the flowers of the plants contained in this section are without involucra). D. C. prod. 4. p. 588. Peduncles axillary, dichotomous or trichotomous; bracteas wanting, or very small, and opposite, but never constituting an involucre. Flowers usually pentameras. —Species all natives of the old world.

* Cardifolia (from cor, the heart, and folium, a leaf: the leaves are heart-shaped). D. C. prod. 4. p. 588. Sterns herbaeaceous. Leaves on long petioles, all coriaceae, or only the lower ones.

1 R. cardifolia (Lin. mant. p. 197.) leaves 4 in a whorl, petiolate, oblong, coriace at the base, 3–5-nerved, beset with prickles on the middle nerve, margins, petals, and angles of stems; flowers tetrameras or pentameras. 5. H. Native of Siberia, on the banks of the Salenga, &c.—There are varieties of this plant with glabrous, hairy, narrower and broader leaves, which are disposed 8 in a whorl. (Pall. inn. 3. t. L. f. 1. and gall. t. 92.) Flowers whitish. Berries red or black. Perhaps 2 species are confused under this name.

2 R. java (D. C. prod. 4. p. 588.) leaves 4 in a whorl, petiolate, ovate-lanceolate, not coriace at the base, 5-nerved, scabrous on the middle nerve, petioles, and angles of stems; flowers tetrameras and pentameras. 5. S. Native of Java, on the mountains. R. cordifolia, Blum. bijdr. p. 944. An intermediate plant between R. cordifolia, R. Siberica, and R. Munjista.

Java Madder. Pl. straggling.

3 R. munjista (Roxb. fl. ind. 1. p. 383.) leaves 4 in a whorl, petiolate, ovate-lanceolate, and linear, 5-nerved, and are, as well as the stem, hispid; flowers all pentameras. 5. H. Native of Nipaul and Bengal, on the mountains; and of Japan. R. cordifolia, Thunb. fl. jap. p. 60. R. Munjith, Roxb. ex Flem. cat. in Desv. journalet bot. 1814. pt. 2. p. 207. There does not appear much difference between this and R. cordifolia, Lin. This kind of madder is used by the dyers and calico-printers in the same manner as the common madder.

Munjith or Indian Madder. Pl. straggling.

4 R. alata (Wall. in Roxb. fl. ind. 1. p. 384.) leaves 4 in a whorl, petiolate, ovate-lanceolate, and linear, 3-nerved, acuminate at the apex, scabrous; angles of stem winged, scabrous from recurved denticulations; flowers pentameras, hispid; corymbbs trichotomous, elongated. 5. H. Native of Nipaul. Limb of leaf 3 times the length of the petiole. Very like a species of Galium.

Winged-stemmed Madder. Pl. straggling.

5 R. petiolatus (D. C. prod. 4. p. 588.) leaves 4 in a whorl, petiolate, oblong-lanceolate, acuminate, 1-nerved, having the nerve, margins, petals, and angles of the stem scabrous from prickles. 5. G. Native of the Cape of Good Hope. R. cordifolia, Thunb. fl. cap. p. 151, but not of Lin. Petioles the length of leaves, tetragonal; perhaps the lower leaves are coriace. Flowers not sufficiently known.

Petiolate-leaved Madder. Pl. straggling.
6. *R. angustissima* (Wall. cat. no. 6207.) stems quadrangular, almost winged, serrated from retrograde prickles; leaves 4 in a whorl, long, linear, with scabrous edges, sessile; peduncels dichotomously divided. Ζ. S. Native of the Burmese Empire, on Mount Taung Dong, near Ava. Root like that of *R. Munjista*.

Very-narrow-leaved Madder. Pl. straggling.

7. *R. charadriolía* (Wall. cat. no. 6210.) stems quadrangular, angles beset with retrograde, prickly denticulations; leaves 8-10 in a whorl, linear, sessile, scabrous on the margins and keel; corymbs terminal. Ζ. F. Native of Nipaul.

Chara-leaved Madder. Pl. straggling.

**Suffrutescens.** Stems shrubby. Leaves on short petioles, oblong or lanceolate.

8. *R. fruticosae* (Ait. hort. kew. 1. p. 147.) stem shrubby, smooth; leaves 2-6 in a whorl; the uppermost ones opposite, elliptic, on short petioles, having the margins and keel scabrous from prickles; flowers pentameros; corymb axillary, short, few-flowered. Ζ. G. Native of Teneriffe, among bushes. "Large brown prickles on stems of young plants, but they do not persist in the mature stage." From the Canary Islands. R. fruticosae, Poir. suppl. 2. p. 707. Leaves varying from oval to oblong-lanceolate, with distant retrograde prickles on the margins. Corollas yellowish. Peduncles usually 3-flowered.

Vari. β. galoides (D. C. prod. 4. p. 589.) stem shrubby, terete, smooth; leaves 6 in a whorl, petiolate, ovate-lanceolate, with rough margins; peduncles axillary, 3-4-flowered, much shorter than the leaves. Ζ. G. Native of the Canary Islands. R. galoides, Poir. suppl. 2. p. 705.

9. *R. acalyculata* (Cav. hort. 2. p. 75. t. 193.) stems rather herbaceous, smooth, hexagonal; leaves petiolate, ovate-lanceolate, having the nerve beneath and the margins furnished with retrograde prickles; corymb axillary, trichocephous, birotate; flowers pentameres. Ζ. G. Native of Madras, where it is called *Tasaggo*. Leaves 7-9 in a whorl, but on the branches only 3 in a whorl. Flowers yellowish. Teeth of calyx not perspicuous, as in many other species of the genus. Very nearly allied to *R. fruticosae*.

Ecalyculate-flowered Madder. Shrub 2 feet.

Smooth Madder. Shrub.

**Tinetorius** (from tintorium, for dyeing; the roots of most of the species are used for dyeing). D. C. prod. 4. p. 589.

Stems herbaceous. Leaves sessile, or on short petioles, never cordate.

11. *R. angustifolia* (Lin. mant. p. 39.) plant herbaceous; leaves 4 in a whorl, linear, scabrous above, and also along the margins and nerve; angles of stems prickly; corymb axillary, 3-flowered; lobes of corolla bluntish, apiculated. Ζ. F. Native of Gibraltar, Portugal, and Balearic Islands. Lam. ill. t. 60. f. 2. Leaves evergreen. Flowers pale yellow. Perhaps this and the 6 following are only variations of *R. tintorius*.

12. *R. longifolia* (Poir. suppl. 2. p. 703.) herbaceous; leaves 4-6 in a whorl, linear-lanceolate, elongated, acuminate, almost sessile, smooth above, but with the margins and nerve scabrous from prickles, as well as the angles of the stem; peduncles trichotomous; lobes of corolla acutish, acuminate, not abruptly cuspitate. Ζ. H. Native of Corsica and at Mogador. R. Requien, Duby, bot. gall. 1. p. 247. Flowers yellowish. Berries black.

Long-leaved Madder. Pl. straggling.

13. *R. tintorius* (Lin. spec. p. 158.) herbaceous; leaves 4-6 in a whorl, on short petioles, lanceolate, smooth above, scabrous from prickles on the margins and keel, and along the angles of the stem; peduncles axillary, trichocephous; lobes of corolla gradually acuminated, not cuspitate. Ζ. H. Native of the Levant and south of Europe; and also of Caucasus, on Mount Beschbarmak, and plentiful near Dervent, and in the province of Bukh; but cultivated in many parts for the sake of its roots. Lam. ill. t. 66. f. 1. Heyne, aræ. gw. xi. t. 5. Seihuhr. hambl. t. 28. Mill. fig. t. 1. Woolv. med. bot. t. 68. Smith, fl. gecc. t. 141. Sall. hort. t. 177. Blackw. t. 26. R. perennis, Marr. bot. val. p. 91. ex Gaudin. R. sylvariaes and R. tintorius, Mill. dict. no. 1-2. Roots long, thick, and red. Leaves and stems fading in autumn. Flowers yellow, pentameroS. Berries dark purple.

The root of the dyer's madder is composed of many long, thick, succulent fibres, almost as large as a man's little finger; these are joined at the top in a head, like the roots of asparagus, and strike very deep into the ground, being sometimes more than three feet in length. From the upper part come out many side-roots, which extend just under the surface of the ground to a great distance, whereby it propagates very fast; for these send up a number of shoots, which, if carefully taken off in spring, soon after they are above ground, become so many plants. It is native of the south of Europe, flowers in June, and seeds soon afterwards; but by them it is never propagated. Madder is mentioned by the Greeks as a medical plant; but when it was first used in dyeing is uncertain. It has been cultivated in Holland and Flanders, and other parts of the continent for that purpose, for many years, and has been tried in this country; but unless the importation of the root from the continent were entirely prevented, it will not answer. Its culture has been attempted at different times, when our commerce with the Dutch was interrupted, or when they raised the price of the article exorbitantly high. At present it may be imported not only from Holland, but from France, Italy, and Turkey.

The soils most suited to the cultivation of madder are those of the deep, fertile, sandy loams, which are not retentive of moisture, and which have a considerable portion of vegetable matter in their composition. It may also be grown on the more light descereous soils, that have sufficient depth, and which are in a proper state of fertility.

The preparation of the soil may either consist in trench ploughing, lengthways and across, with pronged stirrings, so as to bring it to a fine tilth; or, what will often be found preferable, by one trenching 2 feet deep by manual labour.

The sets of plants are best obtained from the runners, or surface shoots of the old plants. These being taken up, are to be cut into lengths of from 6 to 12 inches, according to the scarcity or abundance of runners. Sets of one inch will grow, if they have an eye, or bud, and some fibres; but their progress will be slow, for want of maternal nourishment. Sets may also be procured by sowing the seeds in fine light earth, a year before they are wanted, and then transplanting them; or sets an inch long may be planted for one year in a garden, and then removed to the field plantation.

The season of planting is commonly May or June, and the manner is generally in rows, 9 or 10 inches asunder, and 5 or 6 inches apart in the rows. Some plant promiscuously in beds, with intervals between; but this is unnecessary, as it is not the surface, but the descending roots, which are used by the dyer.

The operation of planting is generally done by the dibber, but some plant them by the aid of the plough. By this mode, the
ground is ploughed over with a shallow furrow, and in the course of the operation the seeds are deposited in each furrow, leaving on and pressed against the furrow-slice. This, however, is a bad mode, as there is no opportunity offirming the plants at the roots, and as some of the seeds are apt to be buried, and others not sufficiently covered.

The after culture consists in hoeing and weeding, with stirring by pronged hoes, either of the horse or hand kind. Some earth up, but this is unnecessary, and even injurious, as tearing the surface roots.

The Madder crop is taken at the end of the third autumn after planting, and generally in the month of October. By far the best mode is that of trenching over the ground, which not only clears it effectually, but fits it once for another crop. But where madder has been grown on land prepared by the plough, that implement may be used in removing it. Previously to trenching, the haunch may be removed with an old scythe, and carted to the farmery, to be used as litter to spread in the straw-yards.

Drying the roots is the next process, which, in very fine seasons, may sometimes be effected on the soil, by simply laying the plants on it as are taken up; but in most seasons they require to be dried on a kiln, like that used for malt or hops. They are dried till they become brittle, and then packed up in bags for sale to the dyer.

The produce from the root of this plant is different according to the difference of the soil, but mostly from 10 to 15 or 20 hundred weight, where it is suitable to its cultivation.

In judging of the quality of Madder roots, the best is that which, on being broken in two, has a bright red or purplish appearance, without any yellow cast being exhibited.

The use of the Madder roots is chiefly in dyeing and calico printing. The haunch which accumulates on the surface of the field in the course of 3 years, may be carted to the farm-yard, and fermented along with horse-dung. It has the singular property of dyeing the horns of the animals who eat it of a red colour.

Madder seed in abundance may be collected from the plants in September of the second and third years, but it is never so propagated. Madder is sometimes blighted, but in general it has but few diseases.

Madder is cultivated in Holland only on the very best soils, and with plenty of manure. At the end of May or April, according as the young plants are large enough to be transplanted, the land must be ploughed in beds of 2 feet, and 2½ feet wide; the beds are then harrowed and raked, and the young suckers of the roots or plants are to be put down in rows, at intervals of a foot or a foot and a half, and at 6 or 8 inches distant in the row. During the entire summer the land should be frequently stirred, and kept free from weeds. In the month of November, when the leaves are faded, the plants are covered with 2 inches of earth, by a plough, having the point of the coulter a little raised or rounded, so as not to injure the young plants. In the following spring, when the young roots are 4 or 5 inches long, they are gathered or torn off, and planted in new beds, in the same manner as above stated; and then, in the month of September or October, after the faded leaves have been removed, the old roots are taken up. The madder thus taken up should be deposited under cover, to protect it from the rain, and after 10 or 12 days, placed in an oven moderately heated. When dried sufficiently it is gently beaten with a flail, to get rid of the clay that may adhere to the plants; and by means of a small wind-mill, is ground and sifted, to separate it from any remaining earth or dirt. It is then replaced in the oven for a short time, and when taken out, is spread upon a hair cloth to cool; after which it is ground and cleaned once more. It is then carried to a bruising mill, and reduced to fine powder, and then packed in casks or barrels for the market.

Var. β, Iberica (Fisch. in litt. ex D. C. prod. 4. p. 589.) leaves on longer petioles, downy on the veins and nerves beneath. 2. H. Native of Iberia. The roots of this variety are said to be better for the purposes of dyeing than those of the species.

15 R. lucida (Lin. syst. veg. xii. p. 732.) herbaceous; leaves 4-6 in a whorl, elliptic, shining, with a smooth keel, but scabrous from prickles along the margins and angles of the stem; peduncles axillary, trichotomous, short; lobes of corolla lanceolate, acuminate, inflexed at the points. 2. H. Native of south and middle Europe, in rugged places. Smith, fl. grace. 142. D. C. fl. fr. 4. Leaves perfoliata, D'Urv. cat. p. 17. R. rotundifolia, Poir. suppl. 2. p. 106. Leaves permanent. Flowers dusky yellow, pentan- taneous.

Var. β, angustifolia (Guss. prod. fl. sic. i. p. 183.) stem smoothish; leaves elliptico-oblong or lanceolate. 2. H. Native of Sicily and the south of France.

17 R. sphenes (Hoffins. et Link, fl. port. 2. p. 67-85.) herbaceous; leaves 4-6 in a whorl, obliquely oblong, acute, having the nerve on both surfaces and margins scabrous from prickles, as well as the angles of the stems; peduncles axillary; lobes of corolla prickly. 2. H. Native of Portugal, in hedges about Lisbon. R. sylvestris, Brob. fl. lus. 1. p. 152, but not of Mill. Flowers yellow, pentan- taneous.

18 R. intricata (Hook. et Arn. in bot. misc. 3. p. 362.) glabrous, smoothish; stem diffusus; wholly prickly. Stock entirely branched, intricate, acutely 4-angled; leaves small, oblong-linear, hardly acute, almost nerveless; branches of pedicellate; flowers pedunculate, bracteless; berries globose.—Native of Chili, among hedges of Cacti at San Isidro.

Intricate-branched Rubia. Pl. diffuse.

19 R. Oliveri (A. Rich. in mem. soc. hist. nat. Par. 5. p. 132.) stems suffruticos, rather hexagonal, scabrous from retrograde prickles or bristles; branches powdery, downy; leaves usually 6 in a whorl, ovobovate, mucronate at the apex, with hispid margins; peduncles axillary, usually by threes, tripartite, and 5-flowered at the apex; corolla subcampanulate, 5-parted. 2. H. Native of the island of Scio, where it was collected by Olivier and Bruguier.
Oliveir's Madder. Pl. straggling.
20 R. Thunbergii (D. C. prod. 4, p. 590.) plant glabrous in every part; leaves usually 4 in a whorl.—Native of the Cape of Good Hope. R. hævis, Thumb. fl. cap. 151. but not of Poir. The rest unknown.

Thunberg's Madder. Pl. straggling.

§ 2. Involucrata (the flowers of the plants contained in this section are involucrated by bracteas). D. C. prod. 4, p. 590.
Peduncles axillary, bearing each 4 bracteas in a whorl, which constitute an involucrium to the flowers. Flowers 1–3, rising from each involucrum, sessile, or pedicellate, usually tetramerous.—
Diffuse prostrate plants, all natives of America, which probably should be joined with Gálium according to A. Richard.

* Berries glabrous. Leaves 1-nerved.
21 R. Walterii (D. C. prod. 4, p. 590.) stems tetragonal, smooth on the angles, and pilose on the sides; leaves ovate, membranous, rather pilose on both surfaces while young, but having the keel and margins scabrous in the adult state; bracteas ovate, acute; flowers solitary from the involucrum; fruit glabrous, pedicellate. 2. H. Native of Carolina and Florida, in shady places. R. peregini, Walt. var. p. 86. but not of Lin. R. Brownei, Michx. fl. bor. aner. 1. p. 81. exclusive of the syn. of Browne. R. Techénesis, Ralf. fl. Ind. p. 76. Flowers small, yellow, tetramerous. Fruit blackish.
Walter's Madder. Pl. straggling.

22 R. Guadaloupe (Spicy. syst. 1. p. 397.) stems tetragonal, rough along the angles at the base; leaves oblong, mucronate, attenuated at the base, having the margins and keel prickly; peduncules axillary, shorter than the leaves, 1-flowered; flower sessile among the bracteas, which are oblong; berries sebaceous. 2. S. Native of Guadaloupe, where it was collected by Badier and Bertero.

Guadaloupe Madder. Pl. straggling.

23 R. Indecóra (Cham. et Schlecht. in Linnaea. 3. p. 229.) stems tetragonal, scabrous from pili; leaves oblong, somewhat cuneated, obuse, mucronate, membranous, remotely pilose on the nerves beneath and margins; peduncules axillary, solitary, opposite, 1-flowered; bracteas lanceolate; ovarium pilose; berries egg-shaped, glabrous, sessile within the involucrum. 2. F. Native of the south of Brazil.

Indecorus Madder. Pl. straggling.

24 R. Chile (Mol. chil. 118. ed. gall. p. 390. but not of Willd.) stems smooth, tetragonal while young, but at length becoming terete and erectish; leaves oblong-linear, mucronate, pilose on the nerves and margins; peduncules axillary, opposite, 1-flowered, a little longer than the leaves, hairy at top, as well as the bracteas. 2. F. Native of Chili, near Ranagua and Valparaiso, where it was collected by Bertero, who asserts that it is the Retbmn of the natives. Nearly allied to R. indecora.

Chile Madder. Pl. straggling.

25 R. Ramosissima (Polh. in litt. ex D. C. prod. 4. p. 591.) stems tetragonal, rather hairy along the angles; leaves oblong, obtuse, rather cuneated at the base, 1-nerved, rather pilose beneath and glabrous above, and shining; peduncules axillary, length of leaves, 1-flowered; bracteas oval, glabrous; berry sessile, within the involucrum, glabrous. 2. G. Native of Brazil, where it was collected by Polh. Herb becoming black on drying.

Much-branched Madder. Pl. straggling.

26 R. Valántioideae (Cham. et Schlecht. in Linnaea. 3. p. 231.) stems tetragonal, pilose along the angles; leaves sessile, ovate, acute, membranous, 3-nerved, pilose on the margins and nerves; peduncules axillary, verticillate, shorter than the leaves, 1-flowered; bracteas ovate-oblong; flower sessile within the involucrum. 2. F. Native of Brazil. Stem sebaceous from the bases of the hairs remaining. Corolla pilose. Berries glabrous.

Valantia-like Madder. Pl. straggling.
27 R. nitida (H. B. et Konth, nov. gen. 3. p. 339. t. 280.) stems tetragonal, beset with reflexed hairs along the angles; leaves elliptic, bluish, with revolute edges, glabrous above and shining, and rather hairy beneath; peduncules axillary, 1-flowered, opposite, twice the length of the leaves; flower sessile, within the involucrum; berries glabrous. 2. F. Native at the foot of the burning mount Pichincha, near Quito. Allied to R. Walterii.

Nitid-leaved Madder. Pl. straggling.
28 R. vitis (Cham. et Schlecht. in Linnaea. 3. p. 230.) glabrous; stems tetragonal, sebaceous from retrograde bristles on the angles, and on the nerves and margins of the leaves; leaves oblong, obtuse, hardly attenuated at the base, rather mucronate, membranous; peduncles axillary, verticillate, 3-flowered, length of leaves: the middle flower sessile; bracteas oblong, acute. 2. F. Native of the south of Brazil. Berries glabrose.

Vite Madder. Pl. straggling.

Ciliated-leaved Madder. Pl. procumbent.
30 R. monanthia (D. C. prod. 4. p. 591.) stems procumbent, much branched, tetragonal, smoothish; leaves oval or ovate-oblong, acutish, ciliated with long hairs, hispid above; peduncules axillary, solitary, 1-flowered, bearing each 4 leaves or bracteas just under the flower; flower sessile, within the involucrum; fruit glabrous, smooth. 2. F. Native of Peru, where it was collected by Hænke. Gálium monanthum, Bartl. in herb. Hænke. This species is nearly allied to R. ciliata.

One-flowered Madder. Pl. procumbent.
31 R. ovalis (D. C. l.c.) stems climbing a little, tetragonal, hairy; leaves 4 in a whorl, oblong-oblong, acuminate, equal, at length reflexed; peduncles axillary, 1-flowered, a little shorter than the leaves, bearing 4 oval acute bracteas at top under the flower; fruit glabrous. 2. F. Native of Peru; among rubbish. Gálium ovale, Ruiz et Pav. fl. per. 1. p. 59.
Oval-leaved Madder. Pl. climbing.
32 R. crócea (D. C. l.c.) stems procumbent, branched; bracteas tetragonal; leaves 4 in a whorl, linear, ciliated, rather sebaceous beneath; peduncles axillary, short, 1-flowered, bearing 4 leaves at the apex; fruit glabrous.—Native of Peru, at Tarma and Huanaco, on arid declivities. Gálium cróecum, Ruiz et Pav. fl. per. p. 126. Flowers 3-4-cleft. Fruit of a reddish copper-colour.

Saffron-coloured-fruited Madder. Pl. procumbent.
33 R. levigata (D. C. l.c.) plant quite glabrous; stems tufted, much branched, diffuse; leaves 4 in a whorl, ovate-oblong or ovate-lanceolate; peduncles axillary, 1-flowered, bearing 4 leaves at the apex; flower sessile, within the involucrum; fruit glabrous, smooth. 2. H. Native of Mexico, where it was collected by Hænke. Gálium levigatum, Bartl. mss.

Smooth Madder. Pl. diffuse.
34 R. ? corymbosa (D. C. prod. 4. p. 591.) stems creeping, filiform; branches alternate, erect, corimbosely dichotomous, tetragonal; leaves 4 in a whorl, sessile, approximate, oblong-lanceolate, rather ciliated, glabrous; peduncles 1-flowered, bearing each 4 bracteas; fruit glabrous.—Native of Peru, on the

* * Berries hairy or scabrous. Leaves 1-nerved.

35 R. hyopocárpi (D. C. prod. 4. p. 591.) stems tetragonal, hispid from long villi along the angles; leaves oval-oblong, hairy on both surfaces; peduncules axillary, 1-flowered, hardly shorter than the leaves; bracteas oblong, rather hairy; flower as well as the fruit almost sessile within the involucrum; berries rather hairy.—Native of Jamaica. P. Browne, jam. p. 141. Valentiná hypocárpi, Lin. spec. 1491. Swartz, obs. p. 385. R. Brönné, Spreng. syst. 1. p. 397. Berries blackish.

Under-frutet Madder. Pl. creeping.

36 R. Re'ljus (Cham. et Schlecht. in Linnena. 3. p. 229.) the whole plant is scabrous, and clothed with short piles; stems acutely tetragonal; leaves ovato-elliptic, obtuse, mucronate, rather membranous, with ciliated margins, scabrous from hairs on both surfaces; peduncules axillary, 1-flowered, opposite or verticillate; bracteas broad- Lanceolate; flower sessile; berry sessile, glbose, rather pilose. 2. F. Native of Chili, Brazil, and Caracas. Pocp. pl. exsic. chil. no. 703. Fenn. obs. 3. p. 60. t. 45. R. Chilicensis, Willd. spec. 1. p. 604. but not of Mol. The plant is called Re'ljus in Chili, as well as other species; and the roots are red, and used for dying like the common madder.

Redlim Madder. Pl. straggling.

37 R. Hendek's Rubia. Pl. straggling.

38 R. Hendek's Rubia (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 382.) plant glabrous, scabrous, shining; stems erectish, terete, or slightly quadrangular; leaves in a whorl, linear-oblong, acute, 1-nerved, one-half shorter than the internodes; peduncules opposite or in whorles, equal in length to the leaves, bearing 4 bracteas and 3 flowers at the apex; fruit tubercular, scabrous. 2. F. Native of Chili, about Mendoza.

Hendek's Rubia. Pl. procumbent.

39 R. Fugi'silla (Gill. mss. ex Hook. et Arn. in bot. misc. 3. p. 363.) plant tufted, glabrous, branched, shining; stems smooth, terete, furrowed; leaves in a whorl, oblong-linear, mucronate, with smoothish margins; peduncles equal in length to the leaves, bearing 3 flowers and 3 bracteas at the apex; fruit minutely tubercular when immature. 2. F. Native of Chili, in the province of San Louis. This has quite the appearance of some of the species of Gálium pinpinum.

Small Rubia. Pl. straggling.

40 R. Orinoco'èsis (H. B. et Kunth, nov. gen. amer. 3. p. 299.) stems tetragonal, glabrous, scabrous on the angles; branches pilose; leaves on short petioles, oblong, acute, pilose, one-half shorter than the internodes; peduncules axillary, 1-flowered, solitary; flower almost sessile, within the involucrum; berries pilose. 2. F. Native on the banks of the Orinoco, in hot places, and of the south of Brazil, ex Cham. et Schlecht. in Linnena. 4. p. 228. R. Brönné, Spreng. syst. 1. p. 397. Gálium paciïrôm, Willd. herb. Orinoco Madder. Pl. herb.

41 R. Mucroná (Hook. et Arn. in bot. misc. 3. p. 363.) stems prostrate, glabrous, terete, 4-furrowed, branched; leaves in a whorl, linear-oblong, glabrous, shining, with revolute edges, 3 times shorter than the internodes; common peduncles axillary, longer than the leaves; flowers cymose. 2. F. Native of Chili, about Conception and Tarma; and of Peru, in arid places. Gálium leucocárporum, D. C. prod. 4. p. 612. Gálium Tarménsë, Spreng. syst. p. 27. G. mucronatum. Ruiz et Pav. fl. per. 1. p. 66. G. apiculatum, Rem. et Schultes, syst. 3. p. 222. Fruit milk coloured.

Mucronate Madder. Pl. prostrate.

45 R. Inca'na (H. B. et Kunth, nov. gen. amer. 3. p. 388.) stems tetragonal, hairy from villi; leaves in a whorl, ovate, short-acuminate, mucronate, with revolute margins, which are as well as the middle nerve hispid from pili; peduncles axillary, 1-flowered, length of leaves; flower sessile, within the involu- crum; berries rather pilose. 2. F. Native on the Andes about Quinindiu, near El Moral. Corolla rather hairy outside.

Hoary Madder. Pl. straggling.

45 R. ho'ria (H. B. et Kunth, nov. gen. amer. 3. p. 388.) stems tetragonal, hairy; leaves in a whorl, on short petioles, oblong, acute, mucronate, hairy; peduncles axillary, opposite, 1-flowered, hardly shorter than the leaves; flower sessile, within the involucrum; berries scabrous. 2. F. Native near the town of Quito.

Hairly Madder. Pl. straggling.

* * * Leaves 3-nerved. Berries glabrous.

44 R. sôma (St. Hil. pl. rem. bras. p. 229.) stems tetragonal, beset with retrograde bristles along the angles below, and hairy at top; leaves sessile, elliptic, obtuse, ending in a very short point, 3-nerved, membranous, rather pellucid, scabrous from pili above, and on the nerves beneath; peduncles axillary, solitary, 1-flowered, pilose; bracteas 4, ovate; berries glabrous.—Native of Brazil, in woods in the province of Minas Geraes. Corollas greenish, hardly pilose. Flowers either sessile or pedicellate within the involucrum. Berries white.

Hortful Madder. Pl. straggling.

45 R. Asper'a (Pohl. in litt. ex D. C. prod. 4. p. 592.) stems tetragonal, glabrous, scabrous along the angles from retrograde bristles; leaves sessile, ovate, mucronate, membranous, 3-nerved, rather scabrous along the margins and nerves, especially beneath, glabrous; peduncles axillary, tetragonal, rather longer than the leaves; bracteas ovate, glabrous; berries glabrous, sessile, within the involucrum. 2. F. Native of Brazil, where it was collected by Pohl. Nodi of stems scabrous from short crowded hairs. Bracteas greenish-yellow. Berries blackish.

Rough Madder. Pl. straggling.

46 R. Diffpusa (Pohl. in litt. ex D. C. prod. 4. p. 592.) stems tetragonal, hispid; leaves sessile, ovate, acute, membranous, 3-nerved, hispid along the margins and nerves, especially beneath; peduncles axillary, 1-flowered, longer than the leaves; bracteas 4, ovate, acute, rather hispid; berry glabrous, sessile within the involucrum. 2. F. Native of Brazil, where it was collected by Pohl. Upper leaves smoothish. Peduncles 5-6 lines long. Berries blackish.

Diffuse Madder. Pl. straggling.

§ 3. Galioideae (this section contains plants having the habitat of species of Gálium). D. C. prod. 4. p. 492. American species with tetraëdrous flowers, which are disposed in dichotomous cymes, never girded by any involucre.

47 R. equisetoïdes (Cham. et Schlecht. in Linnena. 3. p. 332.) branches compressedly tetragonal, scabrous from retrograde bristles; leaves small, erectly adpressed, somewhat triangular, acute; cymes divaricate, dichotomous or trichotomous; flowers sessile in the forks; bracteas 4, under the branches; berries glabrous. 2. F. Native of the south of Brazil.

Horse-tail-like Madder. Pl. straggling.

48 R. ephe'droides (Cham. et Schlecht. in Linnena. 3. p. 231.) glabrous; stem nearly terete; branches acutely tetragonal, roughish; leaves narrow-elliptic or linear, acute, smooth; cymes
dichotomous or trichotomous; bracteas conformating to the leaves under the branches; flowers pedicellate; berries glabrous. 2.

F. Native of Brazil. Leaves deciduous, smooth.

Ephedra like Maddier. Pl. straggling.

49 R. SCABRA (H. B. et Kuhn, nov. gen. amer. 3. p. 340.) stems tetragonal, beset with retrograde prickle along the angles; leaves 6 in a whorl, and the upper ones 4 in a whorl, sessile, oblong-lanceolate, acutish, with rather revolute and serrated edges, 3 times shorter than the internodes; peduncules terminal, usually by threes; bracteas 1-3; berries glabrous. 3. H. Native of the Andes about Quindiu, between Carthage and Ibagué. Perhaps a species of Galium nearly allied to G. Cleistostoma.

Seabward Maddier. Pl. straggling.

50 R. DEBILIS (H. B. et Kuhn, nov. gen. amer. 3. p. 341.) stems tetragonal, beset with retrograde prickle along the angles; leaves oblong, acute, mucronate, flat, having the margins and keel beset with retrograde prickle; peduncules 2-3 together, terminal, 1-flowered, naked; berries glabrous. 2. F. Native of Quito, in high places near Chillo and Ichuamba. Perhaps a species of Galium nearly allied to G. citatum. Mature fruit unknown.

Weak Maddier. Pl. trailing.

Cult. The species will grow in any common soil, and are all easily propagated by dividing at the root or by seeds. Those species natives of warm climates require to be placed in the green-house in winter.

SECT. I. Ecgalium. Perennial plants.

§ 1. Leucogáta (from λυκος, leios, smooth, and galium; in reference to the smooth fruit of the species). Perennial plants. Leaves 6 to 10 in a whorl, rarely only 4-5. Flowers disposed in cymose panicles, hermaphrodite, white. Fruit glabrous.

1. G. SYLVATICUM (Lin. spec. p. 155.) stems erect, smooth, terete, much branched; leaves 8 in a whorl, elliptic, obtuse, mucronate, smooth, scabrous beneath, and rather glaucous; floral leaves opposite; peduncules capillary, disposed in a terminal panicle; lobes of corolla obtuse; fruit glabrous. 2. H. Native throughout Europe (Britain and Sicily excepted), in woods. D. C. fl. fr. no. 3356.—Bauh. hist. 3. pt. 2. p. 716. f. 4. Flowers white.

Var. β. pubescens (D. C. fl. fr. vol. 4. p. 248.) stems, branches, and nerves on the under side of leaves downy. 2. H. Native of Moguntia and elsewhere.

2 G. LINIFLÓLUM (Lam. dict. 2. p. 578.) stems erect, terete, smooth; leaves 4-5 in a whorl, lanceolate-linear, acuminate, quite glabrous, membranous, glaucous beneath, with smoothish margins; peduncules capillary, panicked; lobes of corolla acute; fruit glabrous, smooth. 2. H. Native of Dauphiny, Provence, Italy, &c. in shady places as in woods. D. C. fl. fr. t. 4. p. 255. G. atró-virens, Lápey. abr. ex Benth. G. levigáiatum, Vill. dauph. 2. p. 229. Leaves rather rough at the tops from a very few bristles or prickles. Flowers white.

Var. β. serrulatúm (D. C. prod. 4. p. 593.) leaves membranous, serrulated by prickles round the margins. 2. H. Native about Naples, where it was collected by Passy.

Flax-leaved Bed-straw. Pl. June, July. Ch. 1753. Pl. 1 to 2 feet, var. γ. 3 to 4 feet.

3 G. PASCALIA (Forsk. deserp. p. 203.) stems weak, glabrous, smooth; leaves 8-9 in a whorl, linear-lanceolate, with scabrous margins, glabrous, mucronate; peduncles axillary, opposite, twice longer than the leaves, trichotomous at the apex; fruit glabrous, minute. 2. H. Native about Constantinople. G. Hierosolymitánnum is probably not distinct from this, ex Vahl, symb. 2. p. 29, but that plant is joined to G. leveillei by Schrad, and to G. scabrum by Persoon. Flowers white.

4 G. INCENDÉUM (Sibth and Smith, fl. gréc. t. 132.) stems panicled; leaves 8 in a whorl, linear, glabrous, awned, incurved; lobes of corolla obtuse, awnless; fruit glabrous. 2. H. Native of Crete, on the spathaceae mountains. Flowers yellow.—Perhaps the same as G. incendéum, D'Urv. unn. p. 15. which was collected on rocky hills in the island of Samos. Often much pubescent. Peduncules axillary and terminal, trichotomous. Incurvèd Bed-straw. Pl.

5 G. SUBTRIFIDUM (Reinw. ex Blum. bidjr. p. 944.) stems twigg, obversely scabrous; leaves usually 6 in a whorl, short, narrow, linear-spatulate, acute, rather scabrous; peduncles terminal, few-flowered. 2. F. Native of Java, on the mountains. Said to be nearly allied to G. spelátulatum and G. pilúnitum.

Sub trifid Bed-straw. Pl. 1 foot.

Apiculátum-flowered Bed-straw. Pl. 1/4 to 1 foot.

7 G. INCA'NÉUM (Sibth and Smith, fl. gréc. t. 130.) leaves 6 in a whorl, linear, and are as well as the stems hoary; peduncles 3-flowered; lobes of corolla awned; fruit glabrous. 2. H. Native on Mount Parnassus. Flowers white. (F. 111.)

8 G. OBELi'ÁTUM (Vill. dauph. 2. p. 221. t. 8.) stems ascending, tetragonal, villous at the bottom; leaves 8 in a whorl; lower ones obovate, villous; upper ones linear-lanceolate, glabrous; peduncles twice triñed, glabrous; lobes of corolla ending in a setaceous acumen each; fruit glabrous. 2. H. Native of Dauphiny, Piedmont, Eturia, and Austria, in rugged places, and in hedges among the mountains. G. mucronátum, Lam. dict. 2. p. 581. D. C. fl. fr. 4. p. 258. Flowers white. Habit of G. Boccòni, but differs in the lobes of the corolla ending in a setaceous point.
Rubiaceae. CCXVI. Galium.

**Oblique Bed-straw.** Pl. 1 foot, ascending.

13. *G. littoralis* (Guss. fl. sec. prod. 1. p. 172.) stems stiff, tetragonal; branches approximate; leaves nearly in a whorl, oblong-lanceolate, dilated at the apex, mucronate, a little serrate on the margin, spreading or reflexed; branches of panicle trichotomous, erect; corolla downy outside, with ovate-lanceolate, awned lobes. 2. H. Native of Sicily, in sandy, bushy places by the sea. Flowers white. Nearly allied to *G. mollugo* and *G. apiculatum*.

**Var. ß, pubescens** (Guss. l. c.) stems and peduncles downy or villous at top.

**Sea-shore Bed-straw.** Pl. 1 to 2 feet.

12. *G. pumilum* (Lam. dict. 2. p. 580. ill. no. 1368. t. 60. f. 2.) plant tufted; leaves 6-8 in a whorl, linear, smooth, bisulate beneath, very acute, tufted at the base; flowers almost terminal, subumbellate; peduncles longer than the leaves; fruit glabrous. 2. H. Native of the Pyrenees, in rugged places, &c. D. C. fl. fr. no. 3374. Req. diss. mss. G. thyrsoides. All. ped. art. p. 1. Flowers white. Lobes of the corolla obtuse.

**Var. ã, hypnoides** (Vill. dauph. 2. p. 323.) plant tufted, erectish; peduncles 2-3-flowered. 2. H. Native of Dauphiny, frequent on the mountains.

**Var. ã, récentum** (Req. diss. mss.) stems erectish, branched above; peduncles divided, 2-4-flowered. 2. H. Native of Provence, &c., among rocks.

twice the length of the fruit.  

**Hypocaenia Bed-straw.** Pl. 1 foot.

18 G. ERECTUM (Huds. angl. p. 68. Smith, engl. bot. 2067.) stems erect, branched at the top, tetragonal, smooth, equal; leaves 6-8 in a whorl, linear-lanceolate, mucronate, still, having the margins serrulated with prickles; panicles trichotomous, lobes of corolla accuminated; fruit glabrous, smooth.  

**Var. β, luctidum** (D. C. l. c.), lobes of corolla setaeceously acuminated. 

**Var. γ, scabridum** (D. C. prod. 4. p. 596.) lower part of stem and lower leaves clothed with scabrous pubescence.  

**Var. τ, approximatum** (D. C. prod. 4. p. 596.) whorles of leaves closer together.  

2. H. G. luctidum, Hort. par.

**Erect Bed-straw.** Fl. June, July, Britain. Pl. 1 to 2 feet.

19 G. MOLLUGO (Linn. spec. p. 153.) stems flaccid, tetragonal, thickened above the node, glabrous, sparsely branched; leaves 6-8 in a whorl, elliptico-ovate, mucronate, spreading, serrated a little; peduncles much branched, disposed in panicles; lobes of corolla acuminated; fruit glabrous, smooth.  

2. H. Native almost throughout Europe and Caucasus, in hedges; plentiful in Britain. (Ceder. fl. dan. t. 455. Bull. herb. t. 283. Smith, engl. bot. t. 1673. Lob. icon. t. 502. f. 12. G. boreale, Lapeyr. ex Benth.—Petiv. herb. brit. t. 30. f. 4. Flowers white, and sometimes yellowish. Herb very variable in height and breadth of leaves. Leaves hairy on the margins and keel, but never rough to the touch. The plant is called Wild Madder, and Great Bastard Madder. The roots are creeping, and yield a red dye like the true Madder, but of a brighter colour: like that also they dye the bones of animals red that feed on them.

**Var. α, aristatum** (Durb. bot. gall. p. 240.) lobes of corolla mucronate.  

**Var. γ, scabrum** (D. C. fl. fr. no. 3861. β,) lower parts of stems and lower leaves scabrous from hairs.  

**Var. δ, elatum** (D. C. prod. 4. p. 596.) stems taller and more umbil. at the joints.  

2. H. Native of moist places, as bogs. G. elatum, Thuill. fl. par. ed. 2. vol. 1. p. 76.

**Mollugo, or Great-hedge Bed-straw.** Fl. July, Aug. Britain. Pl. 2 to 4 feet.

20 G. FRUTICOSUM (Wildl. spec. 1. p. 585.) stems suffrutescent, glabrous, tetragonal; leaves 4 in a whorl, linear, very blunt, glabrous; flowers densely panicked at the tops of the branches; lobes of corolla acuminated; fruit glabrous.  

**Shrubby Bed-straw.** Fl. June, July. Chit. 1819. Sh. 1 ft.

21 G. MEDITERRANEUM (D. C. prod. 4. p. 596.) stems ascending, tetragonal, smooth; lower leaves 4 in a whorl, obovate, mucronulate: upper leaves 6 in a whorl, linear-lanceolate, mucronate, with rather scabrous margins; peduncles di-trichotomous; lobes of corolla ending in an awn; fruit glabrous.  

2. H. Native of Corsica, on Mount Reston, where it was collected by M. Thomas; and on the mountains of Liguria, by Badaro. G. campéstre, Dub. bot. gall. 1. p. 248. but not of Willd. Flowers white or yellowish. It differs from *G. campéstre* in the stem being smooth, not scabrous on the angles, in the form of the leaves, and in the formed lobes of the corolla.

**Mediterranean Bed-straw.** Pl. ascending.

22 G. MAXIMUM (Moris, elench. sard. 1. p. 55.) plant glabrous; stems smoothish, much branched, erect; leaves 6 in a whorl, oblong-linear, obscure, with scabrous edges; branches 4 in a whorl; peduncles trichotomous; lobes of corolla acutish; fruit glabrous.  

2. H. Native of Sardinia, among bushes, and in wet pastures by the sea side.

**Largest Bed-straw.** Pl. 2 to 3 feet?

23 G. INSEBUM (Gaud. fl. helv. 1. p. 421.) plant glabrous; stems decumbent, much branched; leaves ovate, apiculated, serrated with prickles; cauline ones 6 in a whorl: rachel ones 4 in a whorl; umbels trifid, few-flowered; bracteae oblong, solitary; lobes of corolla drawn out into a thread each; fruit glabrous.  

2. H. Native of Switzerland and Insubria, in rocky, stony places. Flowers very small, white. Allied to *G. Mollugo.*

**Insubrian Bed-straw.** Pl. decumbent.

24 G. PYRENAEUM (Goun. ill. p. 5 t. 1. f. 4.) plant tufted, quite glabrous, greenish-glaucescent, shining; stems striated, smooth; leaves 6 in a whorl, linear, aristate, erect, approximate, rather tumid at the base; pedicels axillary, solitary, 3 times shorter than the leaves, 1-flowered; fruit glabrous.  

**Pyrenean Bed-straw.** Pl. ft. tufted.

25 G. VILLARISI (Req. in Guer. in vauc. ed. 2. p. 250.) stems flaccid, filiform, glabrous, much branched; leaves 4-5 in a whorl, oblong-linear, soft, mucronate, with smoothish margins; peduncles by threes, trifid, subumbellate; lobes of corolla awnless; fruit smooth, glabrous.  

26 G. ULiginosum (Linn. spec. 153.) stems weak, erectish, seaborous along the angles; leaves 6 in a whorl, obovate-lanceolate, serrated on the margins and nerve, with retrograde prickles, mucronate, stiff; peduncles almost terminal, trichotomous; lobes of corolla acute; fruit glabrous, dotted.  

**Var. a, Witheringii** (D. C. prod. 4. p. 597.) leaves lanceolate: lower ones 5-6 in a whorl: upper 4 in a whorl, beset with hooked prickles on the margins; the serratures often tumid towards the apex.  

27 G. helodes (Hoffm. et Link. fl. port. 2. p. 47.) stems weak, diffuse, scabrous; leaves 5-6 in a whorl, lanceolate-linear, maronulate, scabrous above and on the margins; panicles ciliate. 1. H. Native of Portugal, in marshes about Torres Vedras. G. uliginosum, Brot. fl. lus. 1. p. 150. It is very like G. uliginosum, and probably only a variety of it.

28 G. falu'stre (Lin. spec. p. 153.) stems diffuse, tetragonal, rather scabrous; leaves 4-6 in a whorl, ovate, obvate, unequal, glabrous, with scabrous edges; superior ones lanceolate; peduncles nearly terminal, trichotomous; lobes of corolla ovate, awnless; fruit smooth, glabrous. 1. H. Native of Europe and Siberia, on the banks of rivers and ditches, and in moist meadows; frequent in Britain. Ed. fl. dan. t. 423. Smith, Engl. bot. t. 1857. Hook. fl. lond. fasc. 1. t. 26.—Petr. brit. t. 30. f. 5. Roots creeping. Flowers numerous, white. Plant tall when supported by other herbage.

29 G. sulfo'temum (Sibth. et Smith, fl. grece. t. 128.) stems diffuse, much branched, smooth; leaves 4 in a whorl, lanceolate, acute, glabrous; flowers terminal and axillary, by threes; fruit glabrous. 1. H. Native of Canidia, on the mountains. Leaves with roughish margins. Flowers greenish-purple, bracteolate. Bracteas ciliate, ovate, acute.

30 G. sa'turefoulwm (Trev. mag. nat. amic. berl. 1815. vol. 7. p. 146.) stems fuscous, scabrous along the angles; lower leaves 6 in a whorl, rameal ones 4 in a whorl, linear-elliptic, unequal; branches of panicule dichotomous, panicled; fruit glabrous, spherical, emarginate. 2. H. Native of Tauris, among reeds about Astracan; and of Caucasus, in humid places near Lebeker, mixed with G. palustris, Bieb. suppl. 106. G. pal'-stri, Bieb. fl. taur. 1. p. 103. Corolla white.

32 G. tin'torium (Lin. spec. p. 155.) stems decumbent, smooth; leaves 4-6 in a whorl, linear, obtuse, scabrous on the margins and keel; peduncles axillary and terminal, elongated, subcorynose, many-flowered; lobes of corolla 4, obtuse; fruit glabrous, smooth. 2. H. Native of North America, in low marshy places, as in Canada, United States, Newfoundland; Straits of De Foc, on the North-West Coast. Very nearly allied to the preceding, but differs from it in the stems being smooth, in the peduncles being longer, and in the flowers being always 4-parted. It is said that from the roots of this species the Indians prepare the red dye with which they colour the feathers and other ornaments of their dress. Some states of G. palüstre, in our country, when they have more numerous leaves than usual, are scarcely distinguishable from the G. tinctorium.

Dyers' Bed-straw. Pl. decumbent.

33 G. obtu'sum (Torr. fl. bowt. ed. 2. p. 55.) stems smooth; peduncle, tetragonal; leaves 4 in a whorl, oblanceolate, obtuse, roughish on the margins and nerves; peduncles 3-flowered; lobes of corolla acuate; fruit smooth, glabrose. 1. H. Native about Boston, on the banks of rivers and rivulets. Corollas white.

Ibex-leaved Bed-straw. Pl. procumbent.

34 G. sax'a'tile (Michx. fl. bor. amer. 1. p. 178.) stems diffuse, much branched, tetragonal, rough from retrograde prickles along the angles; caudine leaves 6 in a whorl, rameal ones 4, lanceolate, acuminate, prickly on the nerve and margins; floriferous branches divericate, many-flowered; pedicles short; lobes of corolla awnless; fruit glabrous. 1. H. Native of North America, from Canada to Virginia. Pursh. fl. amer. sept. 1. p. 103. Flowers white. Perhaps the same as G. Claytōni or G. trifolium.

Rough Bed-straw. Pl. decumbent.

37 G. asperfo'tium (Wall. in Roxb. fl. ind. 1. p. 381.) stems branched, weak, tetragonal, scabrous from recurved hairs along the angles; leaves 6 in a whorl, oblong-linear, somewhat cutaneous, maronulate, rather scabrous above, but beset with recurved hairs on the nerve beneath and margins; peduncles axillary, many-flowered, disposed in a kind of leafy panicle; fruit glabrous.—Native of Nipau. Req. diss. miss. G. parviflorum, D. Don, prod. fl. nep. 133. Flowers white, but blackish when dried. Lower leaves 8-9 in a whorl. The stem and branches are soft, while the leaves are harsh.

Etna Bed-straw. Pl. tufted.

39 G. G'rut'uc'scens (Cav. icon. 3. p. 3. t. 206. f. 1.) stems suffrutescent at the base, erect; branches tetragonal, glabrous; leaves 6 in a whorl, linear, maronulate, subrevolute; peduncles
usually 2-3-flowered; lobes of corolla acute; fruit glabrous. 

Frutescent Bed-straw. Shrub 1 foot. 

40 G. De'bell (Hoffm. et Link. fl. port. 2. p. 48.) stems weak, tetragonal, branched, rather scabrous; leaves 6 in a whorl, linear, ending in a short mucrone, with roughish margins: the prickles bending forward, not backwards, as in most of the species; panicules erect. 

2. H. Native of Portugal, in humid meadows. Corollas white. Nearly allied to G. pallitare and G. helodes, and probably only a mere variety of one of them.

41 G. Aristatum (Linn. spec. 152. Smith, Engl. fl. 1. p. 294.) stems erect, much branched, spreading, smooth; leaves 6 in a whorl, petiolate, lanceolate, flat, bistris pointée, with minute marginal prickles, which point forward; lobes of corolla acuminate; seeds smooth, kidney-shaped, separated. 

2. H. Native of many parts of Europe; in Scotland, on billy ground, in Angusshire, but not common.—Barcl. Ind. 1. t. 256.—Boce. mus. 1. t. 75. Flowers white, in terminal forked compound panicles. The upper leaves are sometimes 4-5 in a whorl.

42 G. Junceum (Sibth. et Smith, fl. grece. t. 127.) stems erect, smooth; leaves 4 in a whorl, obovate-linear, obtuse, glabrous; flowers crowded, panicked; fruit glabrous. 

Rushy Bed-straw. Pl. 1 to 2 feet.

§ 2. Platygalia (from παρε, platys, broad, and galium; in reference to the leaves of the species being broad). D. C. prod. 4. p. 598. Perennials, herbaceous plants. Leaves broad, 4 in a whorl. Flowers disposed in cymose panicles, hermaphroditic, white, very rarely purple or cream-coloured. Fruit glabrous.

43 Tata'ricum (Trev. mag. am. nat. erl. berl. 1815. p. 146.) stems quadrangular, scabrous from retrograde prickles along the angles; leaves 4 in a whorl, lanceolate, equal, acuminate, 3-nerved, scabrous along the margins above, and on the nerves beneath; peduncles axillary, shorter than the leaves, trichotomous, 2-flowered; fruit glabrous. 

2. H. Native of Tartary, on the Ural mountains, ex Fisch. and frequent about Astrachan, ex Trev. Stem purplish at the base. Corollas white, with obtuse lobes.

Tartarian Bed-straw. Pl. 1 foot.

44 G. Latifolium (Michx. fl. bor. amer. 1. p. 70, but not of D. Don.) stems erect, smooth; leaves 4 in a whorl, ovate-lanceolate, acuminate, 3-nerved, membranous, having the margins and nerves hispid from very minute bristles; peduncles axillary, opposite, or terminal, divaricate, trichotomous, loosely many-flowered; fruit glabrous.

2. H. Native of Carolina, on the mountains. Ell. sketch. 1. p. 194. Flowers dark purple. One of the mericarps of the fruit is abortive, and therefore the fruit is 1-seeded. Leaves 2-3 inches long.

Broad-leaved Bed-straw. Pl. 1 foot.

45 G. Ruboideus (Linn. spec. p. 152.) stems erect, straight, tetragonal, simple, smoothish; leaves 4 in a whorl, lanceolate, 4 or 5 times longer than broad, 3-nerved, often scabrous on the nerves beneath and margins; peduncles axillary, trichotomous, much longer than the leaves, disposed in a terminal panicle; bracteas ovato-oblong; fruit glabrous. 

2. H. Native of Europe, in meadows and woods, especially in the temperate parts; and of Siberia and Caucasus, even to Kamtschatka. G. ruboideus, var. a., Lam. dict. 2. p. 576. Rom. et Schultes, syst. 3. p. 214. Buxb. cent. 2. t. 29. G. diffisum, Schrad. Link, Enum. 1. p. 131. ex Cham. et Schlecht. in Linneæ. 4. p. 220. G. lyssopitofilum, Hoffm. germ. 1. p. 71. Root creeping, red. Flowers pale yellow, or cream-coloured. Very like G. boreale, but larger, with broader leaves. There is a variety of this species with hispid fruit, according to Steven, obs. p. 70.

Var. β. angustifolium; leaves narrower and longer; flowers fewer.

2. H. Native of Kotzebue's Sound; abundant in dry elevated soils, under the shade of solitary pines, in the valley of Columbia, North-west America. The leaves are almost as narrow as those of G. boreale, but the inflorescence and fruit are very different. G. ruboideus, Hook. et Arn. in Beech. voyt. pt. bot. p. 115. and 125. This variety has been received by Dr. Hooker from the United States, under the name of G. Bermoduhamum.

46 G. Articulatum (Lam. dict. 1. p. 260.) stems ascending, nodose at the joints, tetragonal, smooth; leaves ovate-lanceolate, 3 times longer than broad, 3-nerved, with scabrous edges; peduncles trichotomous, disposed in a crowded corymbose panicle; bracteas ovate; fruit glabrous. 

47 Valantoides (Beeb. fl. taur. 1. p. 102.) stems erect, branched at the base, glabrous, smooth along the angles; leaves 4 in a whorl, rhomboid-lanceolate, twice longer than broad, obtuse, 3-nerved, rather scabrous on both surfaces; panicle trichotomous, much branched; fruit glabrous, smooth. 

§ 3. Trichogalium (from τρις τριγώνον, trichus, a hair, and galium; in reference to the fruit being hispid). D. C. prod. 4. p. 599. Perennials, herbaceous plants. Leaves 4-10 in a whorl. Flowers hermaphroditic, usually white, disposed in cymose panicles. Fruit hispid.

48 G. Ca'picum (Stev. obs. pl. ross. p. 70.) whole plant villous; stems obsoletely tetragonal; lower leaves 8 in a whorl, lanceolate-oblong, mucronate, upper ones opposite; floriferous branches panicked, and are, as well as the fruit, villous. 

2. H. Native of the north of Persia, in the province of Ghilan. Flowers white. Stature and leaves of G. syléatica, but the panicle is dense, like that of G. mollugo.

Caspian Bed-straw. Pl. 1 to 2 feet.

49 G. Roundifolium (Linn. spec. p. 156. exclusive of var. β.) stems diffuse, glabrous; leaves 4 in a whorl, roundish-ovate, 3-nerved, ciliated; peduncles axillary and terminal, loose, elongated, naked, trichotomous at the apex; fruit nearly globose, beaked with bristles, which are hooked at the apex. 

Elliptic-leaved Bed-straw. Fl. Ju. July. Clt. 1819. Pl. 1 ft. 51 G. obovatum (H.B. et Kuntz, nov. gen. amer. 3. p. 336. t. 278.) stems almost simple, pilose; leaves 4 in a whorl, on short petioles, obovate, acute, flat, smoothish, ciliated, 4 times shorter than the internodes; flowers terminal, by threes, pedunculate; fruit covered with hooked bristles.—Native of South America, in temperate parts of the kingdom of Quito, about Chiloé and Guancabamba. Corolla of a whitish violaceous colour.

Nearly allied to G. rotundifolium.

Obovate-leaved Bed-straw. Pl. 1½ foot. 52 G. Javaeum (Blum. bidr. p. 943.) branches tetragonal, hairy; leaves 4 in a whorl, roundish obovate, 3-nerved, with the margins and veins downy beneath; cymes pedunculate, trichomatous, leafy.—Native of the East of Java, on the mountains.

Said to be allied to G. elegans.

Java Bed-straw. Pl.

53 G. neesianaum (Req. diss. miss. ex D. C. prod. 4. p. 600.) stems ascending, erectish, branched, tetragonal, beset with soft hairs; leaves 4 in a whorl, roundish-ovate, ending each in a very short cusp, 3-nerved, hairy; peduncles axillary and terminal, longer than the leaves, trichomatous, hairy; fruit nearly globose, beset with hooked bristles. 2. F. Native of Teneriffe, in the Chestnut woods. G. hisitiatum, Nees, in Buch. in hor. berl. p. 115. t. 22. but not of Ruiz et Pavon. G. ovatifolium, Schott, Spis, & Mart. 1. p. 55. ex Link, in Buch. can. p. 131. Flowers white. Said to be nearly allied to G. rotundifolium.

Necci's Bed-straw. Pl. ascending.

54 G. kiegans (Wall. in Roxb. fl. ind. 1. p. 382.) stems diffuse, ascending, tetragonal, hairy; leaves 4 in a whorl, elliptic, obtuse, sessile, 3-nerved, rather hairy above, and villous along the nerves and margins beneath; peduncles axillary and terminal, trichomatous, hardly pilose, disposed in a panicle; fruit roundish, hispid from bristles, which are hooked at the apex. 2. F. Native of Nipaul. G. Punduannum, Wall. cat. no. 6212. Roots creeping. Fruit small. Flowers white. Habit of G. cruciatum.

Var. β. glabrisculum (Req. diss. miss. ex D. C. i.c.) stems and leaves smoothish. 2. H. Native of Nipaul.

Elegant Bed-straw. Pl. diffuse. ½ foot.

55 G. hamiltonii (Spreng. cor. post. p. 39.) stems erect, branched, pilose; leaves 4 in a whorl, oblong, acute, rather pilose on both surfaces; peduncles terminal, trichomatous, loose-flowered; fruit hispid. 2. F. Native of Upper Nipaul, at Mereba. G. latifolium, Ham. in D. Don, prod. fl. nep. 133.

Hamilton's Bed-straw. Pl. ½ foot.

56 G. hirtifolium (Req. diss. miss. ex D. C. prod. 4. p. 600.) stems weak, branched, rather scabrous; leaves 4-6 in a whorl, linear, bluntish, glabrous above, and scabrous from pilii on the keel and margins beneath; peduncles axillary and terminal, biform, disposed in a kind of panicle; pedicels divaricate; corollas bristly outside; fruit roundish, hispid from bristles, which are hooked at the tops. 2. F. Native of Nipaul, at Narahamby. G. ciliatum, D. Don, prod. fl. nep. p. 133, but not of Ruiz et Pav. G. Aparico, Roxb. fl. ind. 1. p. 382. Stems rather hispid. Flowers small, milk-coloured.

Hairy-flowered Bed-straw. Pl. ½ to 1 foot.

57 G. uscinulatum (D. C. prod. 4. p. 600.) stems weak, diffuse, branched, tetragonal, hispid at the base, and glabrous at the apex; leaves 4 in a whorl, oval, acutish, hispid on both surfaces, hardly 3-nerved at the base; peduncles dichotomously corymbose, few-flowered; fruit beset with bristles, which are hooked at the apex, and about equal in length to the diameter of the fruit. 2. F. Native of Mexico, between Tampico and Real del Monte, where it was collected by Berlandier.

Small-leaved Bed-straw. Pl. 1½ foot.

58 G. Chammissonis (Hook. et Arn. in bot. misc. 3. p. 563.) plant quite glabrous, perennial; stems erectish, acutely tetragonal; angles smoothish; leaves deflexed, oblong, acute, with revolute margins; pedicels axillary and terminal, tridif, bifid, or trichomatous; pedicels very much divaricate; fruit roundish, hispid from compressed bristles, which are acute at the apex, but not hooked. 2. F. Native of Chili, about Valparaiso. This approaches somewhat in habit to Asperula galloides.

Chanissao's Bed-straw. Pl. 1 foot.

59 G. Gilliesii (Hook. et Arn. in bot. misc. 3. p. 364.) perennial; stems herbaceous, diffuse, almost simple, acutely 4angled; leaves 4 in a whorl, oval, obliquely 1-nerved, with spiny margins; pedicels axillary and terminal, 3-flowered, equal in length to the leaves; flowers pedicellate; fruit hispid; bristles longer than the fruit, not hooked at the apex.

Var. α; stem and leaves glabrous. 2. F. Native of Chili, in El Valle de Las Caigas, Andes of Mendoza, Cordillera of Chili.

Var. β; stem and leaves hairy. 2. F. Native of Chili, at El Malpaso and Los Palomares, Andes of Mendoza.

Gillies's Bed-straw. Pl. diffuse.

60 G. suffruticosum (Hook. et Arn. in bot. misc. 3. p. 363.) suffruticosum, hairy, crenascents; stems erectish, simple, terete; leaves oblong-linear, mucronate, hairy; the nerves as well as the recurved margins pilose; pedicels alternate, longer than the leaves, divaricately pinnate. 2. F. Native of Chili, in Vina de la Mar, near Valparaiso. The hairs forming the pubescent point downwards.

Suffruticosum Bed-straw. Pl. 1 foot.

61 G. Ericarum (Bartl. in herb. Hanke, ex D. C. prod. 4. p. 600.) plant suffruticosum, glabrous, erect; leaves 4 in a whorl, oblong, 1-nerved; flowers trichomatously pilose; fruit beset with bristles, which are as long as, but not hooked at the apex. 2. F. Native of Cordillera of Chili. This is very distinct from all other species.

62 G. Tricharum (D. C. prod. 4. p. 600.) stems dichotomous, much branched, glabrous, tetragonal, having the angles scabrous from retrograde bristles, the rest glabrous; corymb trichomatous, few-flowered; fruit beset with bristles, which are a little shorter than it, but not hooked at the apex.—Native of Chili, about Rancagua, among bushes. Allied to G. eriocarpum, but differs in the bristles of the fruit being shorter and fewer.

63 G. boreale (D. C. fl. fr. suppl. p. 498.) stems erect, straight, tetragonal, smoothish; leaves 4 in a whorl, linear- lanceolate, 3-nerved, glabrous; peduncles axillary, trichomatous, much longer than the leaves, disposed in a terminal panicle; bracteas obvatly orbicular. 2. H. Native throughout the whole of Europe, in moist rocky shady places, by rivers and lakes; plentiful in some parts of Britain, as in the north of England and Scotland. Root creeping, brownish. Leaves with scabrous margins. Flowers milk-coloured.

Northern Bed-straw. Pl. 1 foot.

65 G. coriaceus (Bunge in Ledeb. fl. ross. alt. ill. t. 216.) stems branched, tetragonal, scabrous at the base; leaves coriaceous, shining, with revolute scabrous edges; lower ones 4 in a whorl, obovate-oblong; upper ones opposite, oval, rather scabrous, as well as the stems; peduncles axillary, 2-4-flowered; fruit hispid from hooked pili at the base, much shorter than the pedicels. 2 H. Native of Siberia, in the fissions of rocks at the river Katunga, at a place called Boom, and at the river Tschuja. Peduncles slender, bifid, trifid, rarely twice trifid, rather hispid. Flowers yellowish-white.

Coriaceous-leaved Bed-straw. Pl. 3/4 to 1 foot.

Circine-like Bed-straw. Pl. 1 to 1 1/2 foot.

67 G. lanceolatum (Torr. fl. un. st. 1. p. 163.) stems erect, glabrous; leaves 4 in a whorl, ovate-lanceolate, acute, with ciliately scabrous edges, 3-nerved at the base; peduncles terminal, dichotomous, divaricate, longer than the leaves; flowers lateral, sessile, deflexed; corollas very acute; fruit beset with hooked bristles. 2 H. Native of North America, in the states of New York, Massachusetts, and Boston; and of Canada about Quebec. G. circæ'zans β lanceolatum, Torr. cat. new York, p. 23. G. Torreyi, Bigel. fl. bost. ed. 2. p. 56. G. circæ'zans var. Nutt. Flowers milk-coloured.

Lanceolate-leaved Bed-straw. Pl. 1 to 1 1/4 foot.

68 G. brachiæ'tum (Pursh, fl. amer. sept. 1. p. 103.) stems flacid, elongated, brachiately branched, hispid; branches short; leaves 6 in a whorl, oblong-lanceolate, acuminate, glabrous, having the margins and keel ciliately bristles; floriferous branches verticillate, longer than the leaves, divaricately dichotomous; pedicels 2-flowered; fruit beset with hooked bristles. 2 H. Native of America, from New England to Virginia, in meadows, and on the margins of woods, frequent. G. longicaule, Rafin. fl. lud. p. 75.2. Flowers white.

Brachiæt Bed-straw. Pl. 1 to 1 1/2 foot.

69 G. cuspidatum (Muhl. cat. ex Ell. sketch. carol. 1. p. 197.) stems prostrate, glabrous; leaves usually 6 in a whorl, lanceolate, acuminate, a little ciliated; peduncles trifid; lobes of corolla acuminate; fruit pilose. 2 H. Native of Carolina and Georgia. Flowers white. Fruit beset with long white pili.

Cuspidate-flowered Bed-straw. Pl. prostrate.

70 G. hispis'tum (Michx. fl. bor. amer. 1. p. 79.) stems procumbent, much branched, hispid; leaves 4 in a whorl, oval-lanceolate, acuminate, with revolute edges, wrinkled, hispid on both surfaces; flowers nearly solitary, terminal; fruit hispid. 2 H. Native of Lower Carolina. Perhaps the same as G. lappaceum, fl. per. 1. p. 50. ex Pursh, fl. sept. amer. 1. p. 104. Flowers white.

71 G. densi'fIorumm (Lindl. fl. alt. ill. t. 194. fl. alt. l. 1. p. 137.) stems many from the same root, erect or ascending, glabrous; leaves 8 in a whorl, oblong-linear, cuspidate, glabrous with scabrous margins; peduncles crowded; segments of corolla mucronulate; ovarium villous. 2 H. Native of Siberia, near Smiejow. Rameal leaves sometimes 6-7 in a whorl, pale green. Panicles from the tops of the stem and branches. Corollas greenish-yellow.

Dense-flowered Bed-straw. Pl. 1 foot.

VAR. β. pilosum (D. C. prod. 4. p. 601.) stems hispid; leaves villous on both surfaces, and full of pellucid dots. 2 H. Native of the states of New York and Boston, in dry pastures and woods. G. pilosum, Ait. hort. kew. p. 145. Torr. fl. un. st. 1. p. 167. The dots on the leaves less pellucid, and villi more conspicuous than in var. α, but very like it.

73 G. triflórum (Michx. fl. bor. amer. 1. p. 80.) stems procumbent, tetragonal, hispid or smoothish; leaves 6 in a whorl, oblong, cuspidate, glabrous, scabrous along the nerves and edges, 1-nerved; peduncles axillary and terminal, 3-flowered, longer than the whorls of leaves; flowers pedicellate; fruit beset with bristles, which are hooked at the apex. 2 H. Native of Carolina, Pennsylvania, New York, Canada, Unalaska, Sitka, and Norland, in rather humid shady places. It is common from Quebec to the Rocky Mountains, and as far north as lat. 65°, and from the west side of the Rocky Mountains to the Pacific. Clam. et Schlecht. in Linn. 3. p. 222. Torrey, fl. un. stat. 1. p. 167. Willd. hort. berol. t. 66. G. cuspidatum, Muhl. cat. 1. p. 15. G. suavaleps, Wahl. fl. lapp. p. 48. Req. diss. med. ex herb. D. C. There are varieties of this with either rough stems, as in G. aparine, or glabrous stems. Flowers small, white. Habit and scent of Aspénula odorata.

VAR. β. cirrò'diòrum (D. C. prod. 4. p. 602.) stems smooth; corollas green. 2 H. Native about Moscow, in mossy woods. G. hyssopiflórum, Goldbl. in litt. 1821. Req. diss. med. in herb. D. C.

74 G. märini'tum (Lin. mant. p. 38. but not of Thunb. prod. 3.) plant villous all over; stems much branched, tetragonal; leaves 4-6 in a whorl, but the ultimate ones are opposite, all lanceolate-linear, acute; peduncles axillary, 1-flowered; corollas and fruit villous or hispid outside. 2 H. Native of Nice and
the Levant, in exposed rocky places. Corollas reddish. Stems creeping at the base.

75 G. brachychilum (Schultes, mant. 3. p. 180.) Plant smoothish, much branched, procumbent; leaves 4-6 in a whorl, but the upper ones are opposite, all lanceolate, mucronate, and reflexed; pedicels 2-3-together, axillary, 1-flowered; fruit scarious from pubescence. 2. H. Native of Caucasus, about Buduch, in the calcareous range, &c. G. brevifilium, Stev. mem. mose. 3. p. 253. but not of Smith et Sibth. G. alpestre, Stev. cat. hort. gor. 1812. p. 43. G. brachyphillum, Sieb. fl. taur. suppl. p. 107. Flowers white. This is an intermediate plant between the granular and villous fruited species.

\textit{Short-leaved Bed-straw. Pl. procumbent.}

76 G. greceum (Lin. mant. p. 38.) Stems suffrutescous, branched at the base; branches erect, hispid; leaves 6 in a whorl, linear, hairy, erect; peduncles axillary and terminal, few-flowered, a little longer than the leaves; fruit beset with long white bristles. 2. H. Native of Greece, on Mount Paramnasus, and the islands of Cos and Candi, on exposed rocks. Sibth et Smith, fl. grece t. 136. D'Urville cat. no. 129. Req. diss. mss. Linn. dict. 2. p. 584. Lodd. bot. cab. t. 1573.—F. Alp. exot. t. 166. Pedicels forming a racemose or thyrsoid panicle. Flowers small, yellowish-brown.

77 G. canum (Req. diss. mss. ex D. C. prod. 4. p. 602.) Stems suffrutescous, tufted; branches very hairy and hoary; leaves lanceolate, with revolute margins, hairy on both surfaces, hoary beneath; peduncles cymose, few-flowered, 2-3 times longer than the leaves; fruit hispid. 2. H. Native of Syria, where it was collected by Donati and Labillardiere. Flowers small, purplish. Perhaps only a variety of \textit{G. greceum.}

\textit{Hoary Bed-straw. Pl. 2} foot.

78 G. micranthemum (Pursh, fl. amer. sept. 1. p. 103.) Stems much branched, divericate, beset with retrograde prickles; leaves short, lanceolate, mucronate, glabrous, having the margins and keel prickly; floriferous branches divericately branched; pedicels finally 2-flowered; fruit hispid. 2. H. Native of North America, from Canada to New York, in mountain bogs. Said to resemble \textit{G. uliginosum} very much.

\textit{Small-flowered Bed-straw. Pl. divericate.}

§ 4. 

\textit{Coccolgo}lia (from \textit{coccol}, \textit{kokkos}, a grain, and \textit{galium}; in reference to the granular fruit). D. C. prod. 4. p. 602. \textit{Perennial plants. Leaves 4 in a whorl. Flowers on long peduncles, herna-

\textit{phrodite. Fruit granular.}

79 G. cotinoides (Chamm. et Schlecht. in Linnaea. 3. p. 227.) Stems diffuse, weak, tetragonal, beset with retrograde bristles along the angles; whorls of leaves distant; leaves 4 in a whorl, sessile, lanceolate, acute, with the nerve and margins scarious; pedicelles trichotonous, few-flowered, terminal; pedicels capillary, very long; fruit glabrous, minutely tuberculare. 2. F. Native of Chili, in hedges near Talagana, and about Concepcion. This is a very showy species, with the habit of \textit{G. uliginosum. Cotinus-like Bed-straw. Pl. diffuse.}

80 G. lanuginosum (Linn. ill. no. 1360.) Stems, branches, and peduncles clothed with long soft dense hairs; leaves 4 in a whorl, lanceolate, acute, glabrous, with scarcely margins; pedicels axillary and terminal, simple and bifid, very long, 1-flower-
ed; corolla glabrous, with acutish lobes; fruit glabrous, minutely tuberculare.—Native of the East Indies, ex herb. Lam.

\textit{Woody Bed-straw.}

81 G. tomoxeum (Thum. fl. cap. 151.) Stems scapent, glabrous, much branched, tetragonal: with the angles denticulated; branches densely clothed with white hairs; leaves 4 in a whorl, oblong, roughly serrated; pedicules dichotomous, capil-

\textit{larious, villous. —Native of the Cape of Good Hope. G. maritimum, Thum. prod. p. 30, but not of Lin.}

\textit{Tomentosum Bed-straw. Pl. climbing.}

§ 5. 

\textit{Erythroglia} (from \textit{erythros}, \textit{cratylos}, red, and \textit{galium}; in allusion to the red flowers of the species). D. C. prod. 4. p. 603. \textit{Perennial plants. Leaves 6 in a whorl. Flowers herma-

\textit{phrodite, cymose panicle, purple or red. Fruit glabrous.}

82 G. purpureum (Lin. spec. p. 150.) Stem erect, suffrute-

\textit{cosse, much branched, glabrous; leaves 4-6 in a whorl, linear, scapent; peduncles capillary, longer than the leaves; lobes of corolla apiculare; fruit glabrous.}

83 G. rubrum (Lin. spec. p. 150.) Stems herbageous, weak, glabrous; leaves 6 in a whorl, linear, spreading, glabrous; pe-

\textit{duncles axillary, many flowered; pedicels short; lobes of co-

\textit{rolla apiculare; fruit glabrous.}

\textit{Var. \beta, rubrum} (Duby, ench. 1. p. 248.) Stem pilose at the base. 2. H. Native of the meadows of Lozera, about Medas. G. purpureum var. \beta, D. C. fl. fr. 5. p. 446.

§ 6. \textit{Xanthogalia} (from \textit{xanths, yellow, and \textit{galium}; in reference to the yellow flowers of the species). D. C. prod. 4. p. 603. \textit{Plants perennial. Leaves 6-10 in a whorl. Flowers yellow, all herna-

\textit{phrodite. Inflorescence panicled.}

84 G. rupestris (Visiani, ex Bisol. in litt. 1829. ex D. C. prod. 4. p. 603.) Stems erect, tetragonal, velvety, glabrous at the apex; leaves 6 in a whorl, upper 4 in a whorl, and the uppermost ones opposite, linear-lanceolate, a little cuneated, mucro-

\textit{nate, glabrous, with rather scabrous edges; floriferous branches panicled; lobes of corolla acuminate; fruit glabrous.}

2. H. Native of Dalmatia, on rocks. Flowers small, deep yellow.

85 G. veirum (Lin. spec. 155.) Stems erect, tetragonal, almost simple; leaves 8 in a whorl, linear, sulcate, with rather revolute edges, smooth; floriferous branches panicled, almost all terminal; pedicels crowded, leafy, about equal in length to the flowers. 2. H. Native of Europe and Siberia, in meadows, way sides, margins of fields and woods, and among bushes fre-

\textit{quent; very common in Britain, in dry soil. G. liturn, Moench, meth. 486. Root creeping, tawny. Flowers yellow. Leaves each tipped by a hair.}

\textit{Var. a, leiophyllum} (Wallr. sched. crit. p. 56.) Stem and leaves quite glabrous, smooth; flowers pale yellow. 2. H. Native in rather humid shady places. G. veirum \beta glabrum, Req. diss. mss.}

Var. ε, *tenementum* (Meyer, verz. pil. p. 51.) stems and fruit densely clothed with tenementum. 2. H. Native of Caucasus, on the tops of the Taurus mountains near Dryzich.

The common name Bed-straw given to all the species is from the verb to straw, an early written straw. Before the invention of feather-beds a variety of herbs were used to straw beds with; among these doubtless this was one. In Johnson’s edition of Gerard, it is called our Ladies’ Bed-straw (p. 1127.) From the notion of its curdling milk, Dioscorides has named it γαλολοü; and it is said to have been used in many parts for this purpose, but from later experiments it has not succeeded in coagulating milk. It has probably been put into milk destined to make cheese, not so much for the purpose of curdling it, as of giving it a flavour, or as Matthioli expresses it, to make it eat the sweeter. The French formerly prescribed the flowers in hysterical and epileptic cases. Boiled in alum-water the flowering stems dye a good yellow colour. The roots dye a very fine red, not inferior to madder.

86 G. RETHECOM (Willd. spec. 1. p. 596.) leaves S in a whorl, linear-filiform, cuspidate, with revolute scabrous margins; stems also scabrous; flowers panicked; peduncles pubescent; fruit hispid from villi. 2. H. Native of Siberia and Caucasus, growing along with G. vêrum. Flowers deep yellow.

Var. β, *rosmarinifolium* (Lecom. fl. alt. 1. p. 138.) leaves 8-10 in a whorl, linear, shining above and pubescent, and clothed with hoary tomentum beneath, with revolute edges; stems tomentose suffruticoso at the base; panicle conicatitate; fruit vil-lous. 2. H. Native of Siberia, at the river Tschanja, in the Karaciea desert in dry exposed places.

Ruthen Lady’s Bed-straw. Pl. 1 foot.

87 G. VEKO-MOLOGO (Wallr. in Schiede, pl. hybr. p. 64.) stems tetragonal, rather downy; leaves sub lanceolate-linear, rather scabrous, with revolute scabrous edges, downy beneath; panicles rather divaricate; flowers rather distant; corollas cream coloured, with acutish segments. 2. H. Native of Germany. This is a hybrid raised from the seed of G. vêrum, impregnated by G. moligi. G. vêrum β, Reen. et Schults, syst. 3. p. 233. G. Moligo var. ochroleica of authors.

Veron-Mollugo or Hybrid Ladies’ Bed-straw. Pl. 1 to 2 feet.

Tunis Bed-straw. Pl. 1 to 2 feet.

89 G. MINTUM (Lin. spec. p. 154.) stems decumbent, smooth; leaves 8 in a whorl, lanceolate, mucronate, serrated from prickles, glabrous, incurved; peduncles reflexed; fruit fleshy. 2. H. Native of Russia. Gmel. sib. 3. p. 169. no. 45. Flowers yellow. The plant resembles G. vêrum very much, and is probably only a variety of it.

Minute Bed-straw. Pl. decumbent.

90 G. MIMIFILS (Bieb. fl. taur. 1. p. 104.) stems prostrate, much branched, villous; leaves 6 in a whorl, linear, spreading much, villous; floriferous branches axillary, aggregate; lobes of corolla acute; fruit downy. 2. H. Native of Caucasus, Tauris, on the lower Volga, in exposed places, and by way sides common. Corollas cream-coloured; anthers yellow. Habit and inflorescence like that of G. vêrum.

Trailing Bed-straw. Pl. trailing.

Sand Bed-straw. Pl. prostrate.

§ 1. *Ericogalia* (from *eriou*, a heath, and *galium*; the habit of the species is that of *Eriæn*). D. C. prod. 4. p. 904. *Perennial or suffruticoso plants.* Leaves 4-6 in a whorl. *Inflorescence axillary.* Flowers hermaphrodite.

92 G. EROCOIDES (Lam. dict. 2. p. 583.) stems suffruticoso, much branched, downy; leaves approximate, 4-5 in a whorl, linear-lanceolate, with revolute margins, apiculated, stiff, smoothish; flowers axillary, nearly sessile, solitary, bibracteate; corolla pilose outside; fruit covered with stiff short hairs. 2. G. Native of Monte-Video and Chili. Cham. et Schlecht. in Linna. 3. p. 125. Larger leaves 2-3 lines long, and the smaller ones only half a line. Flowers minute, cream-coloured. Fascicles of leaves sessile, hence the plant has the habit of a heath. Stems decumbent.

Var. β, *intermedium* (Cham. et Schlecht. in Linna. 3. p. 225.) plant shrubby, clothed with short down; leaves linear, quite glabrous, ending in a long cusp each. 2. G. Native of Brazil, in Campo d’Utría.

Var. γ, *atherodes* (Cham. et Schlecht. in Linna. 3. p. 225.) quite glabrous in every part, as also the fruit; leaves linear, with revolute edges. 2. G. Native of Brazil, in Estrela do Campo Aguda. G. atherodes, Spreng. cur. post. p. 39.

93 G. MIRUM (Lam. dict. 2. p. 583.) root woody; stems herbaceous, branched, tetragonal, very leafy, hispid; leaves 4-5 in a whorl, sessile, lanceolate, more or less hairy on both surfaces; flowers axillary, verticillate, nearly sessile, bibracteate; lobes of corolla acute; fruit glabrous, tubercular. 2. G. Native of the south of Brazil and Monte-Video. Cham. et Schlecht. in Linna. 3. p. 224. Reig. diss. mss. G. redéxum, Pohl, in litt. G. megapotamicum, Spreng. cur. post. p. 39. ex Cham. et Schlecht. in Linna. Stems decumbent or erect. Flowers yellow. *Inflorescence of G. verticillatum.*

Hairy Bed-straw. Pl. decumbent or erect.

94 G. CAMRORUM (Pohl, in litt. ex D. C. prod. 4. p. 601.) plant quite glabrous; stems erect, tetragonal; leaves 4 in a whorl, sessile, linear, acutish, spreading, with revolute edges, more or less ciliatæ; flowers axillary, almost sessile; fruit finely granulated.—Native of Brazil, where it was collected by Pohl. Flowers small. Fruit almost like that of G. spurium, but differs in being almost sessile. Leaves 4 lines long. Allied.
to *G. hirtum*, but differs in the angles of the stem being glabrous.

**Field Bed-straw.** Pl. 1 foot.

95 G. *nuile* (Cham. et Schlecht. in Linnaea. 3. p. 226.) stems diffuse, tetragonal, filiform, beset with stiff hairs or glabrous; leaves 4 in a whorl, petiolulate, elliptic, acute at both ends, flat, ciliate, ciliated; flowers axillary, solitary, opposite, on short pedicels, bibracteate; lobes of corolla acute, rather pilose at the apex; fruit globose, didymous, downy. —Native of the south of Brazil.

**Humble Bed-straw.** Pl. procumbent.

96 G. *coronatum* (Sibth et Smith, fl. grcec. t. 125.) stems ascending, branched from the base, smooth; leaves 4 in a whorl, elliptic, obtuse, nearly veinless, with the margins and base ciliated; peduncles quinquef dessert, glabrous, bibracteate; flowers polygamous; fruit glabrous. Y. H. Native of the East of the Mediterranean, and of Mount Olympos; and of Tauria and Caucasus. Valiénta Tarica, Bieb. fl. taur. 2. p. 457.—Buxb. cent. 5. p. 47. f. 29. *There is a variety of this with rather hispid stems. Flowers pale yellow.*

97 G. *Tauricum* (Röm. et Schultes, syst. 3. p. 250.) stems decumbent, branched, hispid; leaves 4 in a whorl, elliptic, reticulated, hispid; peduncles branched, ciliated, bibracteate, de

98 G. *veurnum* (Sop. carn. ed. 2. no. 144. t. 2.) stems erect, simple or branched from the base; leaves 4 in a whorl, 3-nerved, hispid; peduncles dichotomous, bracteate, shorter than the leaves; flowers polygamous; fruit glabrous. Y. H. Native of France and Switzerland, Upper Italy, Germany, Hungary, Galicia, Siberia, &c. in grassy places. *Stems and leaves glabrous or hispid, with the exception of the ciliate*. Flowers yellow or cream-coloured, D. C. fl. fr. ed. 3. no. 3533. Very like *G. cruciata*. Valiénlanum verna, G. Don, in Loud. hort. brit. p. 411.

**Spring Bed-straw.** Fl. May, June. Clt. 1371. Pl. trailing, 1 foot.

99 G. *Pchericum* (D. C. prod. 4. p. 605.) plant quite glabrous, smooth, erect, of many stems; leaves 4 in a whorl, oblong, not ciliated; peduncles axillary, many-flowered, 3 times shorter than the leaves, bibracteate; fruit glabrous. Y. H. Native of Persia, near Amadan, where it was collected by Olivier and Brünigerve. Flowers yellow in the dried state. Nearly allied to *G. veurnum*, but differs in the plant being perfectly glabrous.

**Persian Bed-straw.** Pl. 1/2 to 1 foot.

VAR. γ. *angustifolium* (D. C. prod. 4. p. 606.) leaves linear-oblong, very seaceous along the edges. Y. H. Cultivated in gardens; according to Req. diss. mss. ex D. C.

**Crosswort Bed-straw.** Fl. May, June, Britain. Pl. 1 foot.

### Sect. II. Annual species.—Aparine.

**Retrograde prickled Bed-straw.** Pl. 1/2 to 1 foot.

103 G. *Pedemontana* (All. nat. 2. p. 2.) stem erect, simple, slender, loosely villous; leaves 4 in a whorl, oval-oblong, hispid; peduncles bracteate, 3-4-flowered, shorter than the leaves, deflexed after flowering; flowers polygamous; fruit glabrous, globose, didymous. O. H. Native of the south of Europe, as of Portugal, Spain, Vallàis, Piedmont, &c. in sterile dry places. D. C. fl. fr. ed. 3. no. 3353. Req. diss. mss. Valiénlanum Pedemontanaum, Bell. append. 46. t. 5. act. taur. 5. t. 7. but not of Kit. G. chloranthum, Brot. fl. lus. 1. p. 149. Fruit sometimes truly globose, from one of the cells being abortive. Flowers yellow, very like those of *G. cruciataum*.

VAR. β. *reflexum* (Presl. fl. sic. prod. p. 123.) fruit rough from stiff pili. O. H. Native of Sicily, and also on grass on the mountains and in groves. Perhaps a proper species.

104 G. *Gibulaitricum* (Schott, in isis. 1828. p. 821.) stems
pilose, marricated along the angles; lower leaves ovate; cauline ones 8 in a whorl; uppermost ones opposite, all with revolute hispid edges; panicles decompound; lobes of corolla cuspitate; fruit glabrous.  

§ 10. *Xanthoparinae* (from Xanthos, xanthis, yellow, and *aphy`, aparine*, the Greek name of eleavers or goose-grass; in reference to the yellow flowers of the species). D. C. prod. 4. p. 600.  

Plants annual. Leaves 4-8 in a whorl. Inflorescence cymosely panicled. Flowers yellow, hermaphroditic. Fruit glabrous.

110 G. viscosum (Vahl, symb. 2. p. 29.) stems pilose, diffuse; leaves 4 in a whorl, oblongate, uniform, with scabrous edges; peduncles trifid, leafless; fruit glabrous.  

Native of the kingdom of Tunis, on the mountains. Corolla pale yellow, almost white.
long-linear, with hairy revolute edges; floriferous branches short, axillary, few-flowered; lobes of corolla hardly ascid; fruit glabrous.—Native of New Holland, at Port Jackson, where it was collected by Gaudichaud. Stems 8–10 inches long. Leaves 2–3 lines long, shorter than the internodes. Flowers white.

Gaudichaud’s Bed-straw. PL decumbent.

§ 12. *Euparinae* (from *exu*, well, and *aparine*, cleavers; the section is supposed to contain the true kinds of cleavers). D. C. fl. introd. 4. p. 607. Plants annual. Stem scabrous. Leaves 4–8 in a whorl. Inflorescence axillary. Flowers usually hermaphro-
dric.

**Fruit granulatum or hispid, didymously globose.**

117 G. *Saccaratum* (All. pedem. no. 39) stems weak, branched, with retrograde roughness along the angles; leaves 6 in a whorl, linear-lanceolate, scabrous from prickles along the margins; prickles not retrograde; peduncles axillary, 3-flowered, recurved when bearing the fruit, and length of leaves; fruit didymously globose, warty. O. H. Native of Europe, in corn fields; Scotland, in the Cause of Gowrie, and near Forfar; and near Malton, in Yorkshire. D. C. fl. fr. ed. 3. no. 3379. Wallr. ann. bot. 24. Req. diss. ms. G. verrucosum, Smith, in engl. bot. t. 2173. fl. grec. t. 132. Va-

The well known property of this plant of adhering to whatever it comes in contact with, acquired it the names of Cleavers or Clivers, and Catchweed or Scratchweed; and from being a favourite food or medicine of geese, Goosegrass, Gooseshare, and Goslingweed. The stalks, according to Linnaeus, are used in Sweden as a fritter to strain milk through. Dioscorides relates that the shepherds made the same use of it in his time. It is reckoned to purify the blood, and for that purpose the tops are an ingredient in spring broth. The expressed juice of the herb taken to the amount of 4 ounces or a quarter of a pint night and morning, during several weeks, is very efficacious in removing many cutaneous disorders. It has been most celebrated in scrofulous and cancerous sores, but the experiments made has not turned out in its favour. The seeds are a good substitute for coffee. The roots, like most of the genus, will dye red, and eaten by birds have tinged their tongues of that colour.

**Fruit granulatum or hispid, didymously globose.**

*Var. beta, minor* (Req. diss. ms. ex D. C. fl. introd. 4. p. 608.) stems weak; leaves usually 6 in a whorl, and smaller. O. H. Native of the island of St. Lucia, near Barbado.

122 G. *Vallantia* (D. C. fl. introd. 1805. no. 8381.) stems weak, nearly simple, glabrous at the nodi, but scabrous from retrograde prickles along the angles; leaves 8 in a whorl, linear, having the keel and margins scabrous from retrograde prickles; peduncles simple or bifid; fruit didymously globose, rather hispid from a few bristles, which are hooked at their tops. O. H. Native of Europe, in cultivated fields; plentiful in some parts of Britain. G. infestum, Waldst. et Kt. pl. rar. hung. 3. p. 292. (1808) Bess. gall. 121. G. agrése chinospermum, Wallr. schwed. p. 59. G. Aparine beta, Lam. Flowers small, yellowish. Fruit about half the size of those of *G. aparine*, and not so hispid.

**Cleavers’-like Goose-grass.** Fl. June, July. Ct. 1817. Pl. 2 to 3 feet.

123 G. *Arabica* (Forsk. descrip. p. 30.) stems weak, prickly along the angles, but the prickles are not retrograde as in most of the species, but lean forward, and the knees or joints are equal and glabrous; leaves 6 in a whorl, obovate, scabrous from retrograde prickles along the keel; fruit hispid, 3 from the top of each branch, bifid; fruit hispid from bristles, which are hooked at the tops. O. H. Native of Arabia, in shady places. Vahl. symb. 2. p. 30. Flowers white. Fruit like that of *G. aparine*.

**Cleavers’-like Goose-grass.** PL procumbent.

124 G. *Pulchrum* (Bunge, l. c.) annual; stems weak, glabrous, tetragonal, scabrous from retrograde prickles along the angles; leaves 6 in a whorl, spatulate-oblong, attenuated at the base, cuspitate by a spine, hispid above, and glabrous be-
neath, with scabrous margins; peduncles axillary, a little longer than the leaves, bracteate, 1-2-flowered; corollas very minute, obtuse; fruit didymous, very hispid from hooked bristles. 2. G. oblongus. Native of China, in humid places, near Sis-jiu-sy.

Few-flowered Goose-grass. Pl. decumbent.

125 G. austrole (D. C. prod. 4. p. 608.) stems weak, profligate, branched, tetragonal, pilose, on one side; leaves 4 in a whorl, oblanceolate, mucronately acute, rather pilose, with subacute edges; peduncles axillary, 3-flowered, hardly longer than the leaves; fruit very hispid from bristles. —Native of New Holland, at Bass Straits, where it was collected by D'Urville. Said to be nearly allied to G. recurvum, but differs in the pedicels not being recurved, and in the fruit being twice the size.

Southern Goose-grass. Pl. succulent.

126 G. gracile (Bunge, in mem. acad. sc. Petersb. 2. p. 109.) stem simple, erect, quite glabrous, shining, tetragonal; leaves 4-6 in a whorl, lower ones obovate, middle ones elliptic, superior ones oblanceolate, 1-nerved, scabrils from dots, hispid on the margins; panicules axillary, dichotomous, very slender, exceeding the leaves; corollas very minute, obtuse; fruit hispid from hooked bristles. 2. G. oblongus. Native of China, on mountains, near Hsin-liu-sy.

Slender Goose-grass. Pl. ½ foot.

127 G. tenax (Schleich. ex Gaud. fl. helv. 4. p. 442.) stem filiform, glabrous; leaves 6 in a whorl, oblong, seta-cuspidally scabrous, scabrid from retrograde prickles on the margins; peduncles by three, trifid, spreading; fruit hispid. —Native of the Alps of Switzerland. Corollas small, white.

Tender Goose-grass. Pl. succulent.

128 G. littigiosum (D. C. fl. fr. no. 3382. icon. rari. t. 26.) stem succulent, decumbent, rather scabrous; leaves 4-6 in a whorl, linear-lanceolate, acute, shorter than the internodes, rather scabrous; peduncles elongated, divaricate, bifid or trifid; fruit nearly glabrous, hispid at top from somewhat hooked hairs. —Native of the south of France, Italy, Sicily, in rough stony places, and probably about Paris, but very doubtful. G. Parisiense, Lin. spec. p. 157. exclusive of the synomymes. G. multiformum, Brot. fl. lus. t. 2. p. 251. G. axillare, Presl. prod. fl. sic. p. 61. ex Guss. Flowers small, reddish. This species differs from G. angustissimum and G. gracile in the fruit being hispid.

129 G. microstemma (Desf. fl. atl. 1. p. 130.) stems erect, tetragonal, glabrous, rough; branches divaricate; leaves 6 in a whorl, linear-acute, dentilicate; fruit hispid. —Native of Barbary, near Mascari; and of Sardinia. Asperula scabra, Moris. elench. sard. 2. p. 2. in the same. —Flowers small, white. Very nearly allied to G. divaricatum, Lam., and is perhaps only a variety of it, with hispid fruit. According to Steven, obs. inc. in herb. Willd. it is only a variety of G. ligusticum.

130 G. setacea (Lam. dict. 2. (1786.) p. 584.) stems filiform, erect, scabrous at bottom; leaves usually 5-6 in a whorl, but from 4 to 8, linear-setaceous, with rather scabrous margins; lower ones oblong; peduncles slender, divaricate, trifid; fruit hispid from bristles, which are hooked at the apex. —Native of Spain, Mauritania, Sicily, Provence, in exposed stony or rocky places. Desf. fl. atl. 1. p. 129. D. C. fl. fr. 5. p. 498. G. microcarpum, Vahl, symb. 2. (1791.) p. 30. —Stems pilose, Cav. icon. 2. (1792.) p. 75. t. 191. f. 1. Lag. gen. et spec. no. 127. —G. floribundum, Sibth. et Smith, fl. grece. t. 134. ? G. capitulare and G. microcarpum, Sprenge, syst. Flowers red. The oldest name is here admitted for this plant, as in all other cases. Setaceus-leaved Goose-grass. Pl. June, July. Ct. 1819. Pl. ½ to ¾ foot.

131 G. Sibirorum (Roem. et Schultes, syst. 3. p. 244.) stems smooth; leaves 8 in a whorl, linear, revolutely setaceous, scabrous; lower ones obovate; pedicels capillary; fruit rather pilose. —Native of the Grecian Islands, on sterile hills. G. capillare, Smith, prod. fl. grac. 1. p. 94. but not of Cav. G. Creticum annuum tenellifolium flore albidò, Tourn. cor. p. 4. Flowers pale yellow or cream-coloured. Perhaps only a variety of G. microcarpum or G. setaceum.

Sibthorp's Goose-grass. Pl. 1 foot.

132 G. brevifolium (Sibth. et Smith, fl. grece. t. 135.) stems weak; leaves in a whorl, obovate, awned, scabrous; peduncles trichotomous, terminal; lobes of corolla awned; fruit hispid. —Native of Caramania, on the seashore. Flowers cream-coloured. The bristles on the stem and leaves are not retrograde, as in most of the species. Perhaps the same as G. album, Wildf. ex Roem. et Schultes, syst. 

Short-leaved Goose-grass. Pl. 1 foot.

133 G. alatum (Forsk. descr. const. p. 26.) stems erect, branched, downy, coloured at the nodis; leaves 6-8 in a whorl, oblong, mucronate, with scabrous hardly serrulately margins, glabrous above, and villous beneath, especially on the keel; fruit hispid. —Native about Smyrna. Flowers white.

White-flowered Goose-grass. Pl. 1 ½ foot.

134 G. recurvum (Roq. syst. 1. p. 609.) leaves 6 in a whorl, the uppermost ones are only 4, obovate-oblong, narrow at the base, acute at the apex, glabrous; peduncles axillary, 3-flowered, equal in length to the leaves, deflexed when fresh, shorter than the fruit, hairy; fruit small, globose, hispid. —Native of the Grecian Archipelago, among rocks. G. micranthum, D'Urv. cat. no. 153. but not of Pursh. Sherardia muralis, Sibth. in herb. L'Her. Sherardia murallis, Stev. obs. p. 70.

Recurved peduncled Goose-grass. Pl. succulent.

136 G. filifórmë (Roem. et Schultes, syst. 2. p. 252.) stems simple, hispid, slightly tetragonal; leaves 4 in a whorl, oblong, remotely ciliately denticulate, reticulate, glabrous; male flowers nearly sessile, hermaphrodite ones on short pedicels; fruit oblong, paleaceous, longer than the pedicels. —Native of Teneriffe, and on the walls of Lagona, but not to be found elsewhere. Valánia filifórima, Ait. hort. kew. 3. p. 42. Flowers yellowish.

Var. ß, leiospermum (Req. in litt. 1828. ex D. C. prod. 4. p. 610.) stems, leaves, and fruit glabrous. —Native of Sicily, 4½ feet.
Montpelier, at Pont Juvenal, where it was collected by Re-quin.

137 G. verticillatum (Danth. in Lam. dict. 2. p. 585.)

stem branched at the base; branches nearly simple, elongated, smoothish; leaves linear-lanceolate, hispid, ½ in a whorl; uppermost ones opposite, deflexed; flowers 2-4, axillary, and therefore verticillate, almost sessile; fruit erect, hispid. Œ. H. Native of Sicily, Provence, about Salon Fox; at the foot of Mount Ventosa, Tauria, and Canecusus, in arid places, and at the places of the river salt Solis. Lois. not. 32. t. 2. D. C. suppl. fl. fr. p. 495. Req. diss. mss. Gallium murale, Bieb. fl. taur. 1. p. 105. ex Stelv. G. verteclatum, Pourr. chl. no. 508.

138 G. Smithii; branches erect, simple, bluntly quadrangular, scabrous; leaves 4 in a whorl, uppermost opposite, all deflexed, elliptic-lanceolate, scabrous; flowers axillary, by threes, therefore 6 in a whorl, erect; fruit hispid, with distinct, elongated mericarps. Œ. H. Native of the Grecian Islands, among rocks. Sherardia erecta, Smith, fl. grcc. t. 116. Flowers greenish yellow.

Smith’s Goose-grass. Pl. ½ foot.

† Species of Galium not sufficiently known.

* Species natives of Europe.

139 G. soleirolii (Lois. nov. not. 7.) stems weak, angular, downy (Lois.), villous (Spreng.); leaves 5-6 in a whorl, ovate-lanceolate, acute, hairy; peduncles dichotomous (Lois.), divaricate, trifid, few-flowered (Spreng.); fruit wrinkled. 2. H. Native of Corsica, by the sea-side, where it was collected by Soleiroli. G. Cörsicum, Spreng. curs. post. p. 39. Flowers unknown.

Soleiroli’s Bed-straw. Pl. procumbent.

140 G. Goldachiicum (Klink. in Bess. prim. fl. gal. 2. p. 337.) stems procumbent, diffuse, tetragonal; leaves 8 in a whorl, narrow-lanceolate, awned, girded by strong hairs at the apex; flowers umbellate; fruit globose. — Native of Galicia, in grassy places. Said to be like G. Le’re and G. Boccioni.

141 G. Pentandrum (Gileb. ex Klink. in Bess. prim. fl. gal. 2. p. 338.) stems erect, branched; leaves 8 in a whorl, linear-lanceolate, spotted with white at the apex, racemes few-flowered; flowers pedunculate; fruit ciliately. — Native of Galicia. Flowers yellowish. Said to be nearly allied to G. verum, and is probably merely a pentameres-flowered variety of that plant.

Pentandrum Bed-straw. Pl. 1 foot.

142 G. ochroleicum (Kit. in Schlultes, cestr. fl. ed. 2. vol. 1. p. 305.) stems erect, quadrangular, smooth; leaves 8 in a whorl, linear-subulate, with very rough margins, and ending in a long mucronate each; flowers by threes, corymbose, cymato-corymbose. 2. H. Native of Austria, on mountain rocks. Flowers cream-coloured. Perhaps a species of Asperula.

Cream-coloured-flowered Bed-straw. Pl. 1 foot.

143 G. Montanum (Lin. spec. p. 155.) stems weak, scabrous; leaves 4 in a whorl, linear, smooth; corymbs trifid. Œ. H. Native of Germany, France, England. Corolla white, purplish outside before expansion. Anthers brown. This plant is not known at the present day, as the plant under this name in the Linnean herbarium does not agree with the characters given of it by him.

Mountain Bed-straw. Pl. ¾ to ½ foot.

** A species native of the Levant.

144 G. Hierosolymitana (Lin. amen. 4. p. 451.) leaves 10 in a whorl, lanceolate-linear; flowers umbellate, fa-tigate.

—Native of Palestine. Stature of G. rubrum. The rest unknown.

Jerusalem Bed-straw. Pl. ½ to 1 foot.

* * * Species natives of Asia.

145 G. tuberosum (Lour. coeh. p. 79.) root oblong, tuber-ous; stem procumbent, simple; leaves 4-6 in a whorl, lanceolate, glabrous; pedicels axillary, 1-flowered, crowded, longish; fruit rough. — Native of China and Cochim-china, where it is cultivated for the sake of the tubers, which are farinaceous, and are eaten when boiled. Flowers hardly known. Perhaps a true species of Galium.

Tuberous-rooted Bed-straw. Pl. procumbent.

146 G. stenogamus (Thunb. nov. act. ups. 7. p. 141. t. 4. fl. 1-9.) stems decumbent, tetragonal, scabrous along the angles; leaves 6 in a whorl, elliptic, ending in a spinose point, hispid from pili above, and nearly glabrous beneath, with ciliately scabra-brous edges; flowers axillary, on short peduncles. — Native of Japan. G. uliginosum, Thunb. fl. jap. 58.

Strigose Bed-straw. Pl. decumbent.

* * * Species natives of the Cape of Good Hope.

147 G. mucronatum (Thunb. prod. p. 30. fl. cap. 151.) stems downy, weak, tetragonal, rising in numbers from the same root; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute serrated edges; branches few-flowered; fruit glabrous. — Native of the Cape of Good Hope. Perhaps the same as G. mucronatum, Spreng. pug. 2. no. 49. The G. mucronatum, Lam. and the G. mucronatum, Ruiz et Pav. are distinct species. Mucrones of leaves white.

Mucronate-leaved Bed-straw. Pl. ½ foot.

148 G. horridum (Thunb. fl. cap. 1. p. 556. phyt. bl. p. 16.) stem suffrutescent, erect, tetragonal, prickly along the angles; leaves usually 8 in a whorl, linear, reflexed, serrated by prickles. 2. G. Native of the Cape of Good Hope.

Horrid Bed-straw. Shrub 2 feet.

149 G. glabrum (Thunb. prod. p. 30. fl. cap. 152.) stems flexuons, erect, tetragonal, glabrous, serrated along the angles; leaves 6 in a whorl, obovate-oblong, acute, glabrous, with replicately-serrated edges; peduncles ample, lateral and terminal, panicled. 2. G. Native of the Cape of Good Hope. Flowers white. Very like G. upserum.

Glabrum Bed-straw. Pl. 1 foot.

150 G.asperum (Thunb. prod. 30. fl. cap. 554.) stem flexuons-ously erect, beset with white twisted hairs, and scabrous along the angles; leaves 6 in a whorl, oblong, glabrous, with replicately serrated margins; flowers few. 2. G. Native of the Cape of Good Hope. Angles of stem rough from retrograde deiculations. Fruit glabrous.

Rough Bed-straw. Pl. ½ foot.

151 G. expansum (Thunb. prod. 30. fl. cap. 152.) stem tetra-gonal, smooth, with divaricate downy branches; leaves 6 in a whorl, linear, mucronate, glabrous, with revolute margins; pedicels trichotomous, spreading, divaricate; fruit smooth. 2. G. Native of the Cape of Good Hope. Corollas white.

Expanded Bed-straw. Pl. 1 foot.

152 G. capeense (Thunb. prod. 30. fl. cap. 151.) stems frutescent at the base, erect, branched; branches terete, downy; leaves 6-8 in a whorl, linear-lanceolate, glabrous, with revolute margins; peduncles dichotomous; fruit glabrous, smooth. 2. G. Native of the Cape of Good Hope. Flowers white.

Cape Bed-straw. Shrub 1 foot.

* * * Species natives of North America.

153 G. uniflorum (Mich. fl. bor. amer. 1. p. 79.) stems falcate, smooth; leaves 4 in a whorl, linear, acute, glabrous;
peduncles axillary, solitary, 1-flowered, very short; flowers drooping; fruit glabrous. 2. H. Native of Carolina. Fertile branches ascending. Said to be nearly allied to G. tinctorium. Flowers white. G. uniflorum, Req. incd. in herb. D. C. is a variety of G. triforum.

One-flowered Bed-straw. Pl. ascending.

154. G. FRUITERUM (Rafin. med. disp. 5. and in Desv. journ. bot. 1. p. 227.) stems diffuse, angular, glabrous; leaves 5-6 in a whorl, linear-lanceolate, very acute, glabrous; flowers very numerous, panicked.—Native of North America, about New-\n

Spinulose Bed-straw. Pl. diffuse.

156. G.? MEXICANUM (H. B. et Kuntth, nov. gen. amer. 3. p. 337.) stem beset with retrograde prickles; leaves 8 in a whorl, linear, acuminate, angular, glabrous, with evolute edges, which are, as well as the middle nerve, rough from retrograde prickles, one-half shorter than the internodes; corymbs terminal, sub-trichotomous; fruit glabrous. 2. H. Native of Mexico, near Guanaxuate. Perhaps a species of Rhibia. Mexican Bed-straw. Pl. 1 1/2 foot.

******** Species natives of South America.

157. G. DENTICULATUM (Bartl. in herb. Haecke, ex D. C. prod. 4. p. 612.) stems diffuse, branched, rather hispid from bristles; leaves 4 in a whorl, ovate, cuspidate, ciliated by distant bristles, rather hairy on both surfaces, 1-nerved; flowers few, terminal, usually by threes; pedicels capillary; fruit glabrous.—Native of Mexico, at Real del Monte. Perhaps a species of Rhibia.

158. G. HIRSUTUM (Ruiz et Pav. fl. per. 1. p. 59.) stems procumbent, tetragonal, much branched, hairy; leaves 4 in a whorl, lanceolate, reflexed, hairy; peduncles axillary, 1-flowered, solitary, short; fruit scabrous. 2. H. Native of Peru, in the province of Canta, in shady places. Perhaps a species of Rhibia.

159. G. PILIFERUM (H. B. et Kuntth, nov. gen. amer. 3. p. 337.) stems weak, beset with retrograde prickles; leaves 8 in a whorl, linear-lanceolate, acuminate by hairs, glabrous, with evolute edges, which are, as well as the middle nerve, beset with retrograde prickles, much shorter than the internodes; flowers terminal, on long peduncles; fruit hispid. 2. H. Native of New Granada, on the Andes. This plant ought probably to be excluded from the genus, on account of its cannnulate corolla. Habit of G. uliginosum.

160. G. CANESCENTES (H. B. et Kuntth, nov. gen. amer. 3. p. 336.) stems almost glabrous; branches and leaves villous; leaves 4 in a whorl, ovate, acuminate, trimple-nerved, canescent beneath, much shorter than the internodes; floriferous branches bifid; flowers lateral and axillary, solitary and terminal, by threes; fruit beset with hooked bristles. 2. H. Native about the town of Quito. Habit of G. maritima, but is said to be annual. Perhaps a species of Rhibia.

Canescent Bed-straw. Pl. procumbent.

161. G. CARIPENSE (H. B. et Kuntth, nov. gen. amer. 3. p. 337.) stem glabrous, beset with retrograde prickles; leaves 8 in a whorl, upper ones 6, oblong-lanceolate, mucronate, having the margins beset with retrograde prickles, much shorter than the internodes; flowers terminal, usually by threes, pedunculate; fruit hispid. 2. H. Native of Cumaná, near Caripo, in shady places. Said to be allied to G. tinctorium, but is annual.

Caripe Bed-straw. Pl. diffuse.

162. G. LAPPACEUM (Ruiz et Pav. fl. per. 1. p. 59.) stem rather scendent, much branched, tetragonal; branches villous, dichotomous; leaves oblong or ovate, 4 in a whorl, hispid; upper ones 3 in a whorl, lanceolate; peduncles axillary, 1-flowered; fruit hispid from bristles.—Native of Peru, about Huancaco, at Puelles Collem. The fruit is said to be baccate. Perhaps a species of Rhibia.

******** Species the native habitats of which are unknown.

163. G. DICHOTOMUM (Lehm. ind. sem. hort. hamb. 1823, p. 7.) stem dichotomous, frutescent, quadrangular; leaves 4 in a whorl, ovobolate-lanceolate; fruit glabrous. 2. H. Native country unknown. Said to be allied to G. fruticosum, but the leaves are much broader and shorter, and the flowers are larger.

164. G. NIGRUM (Ait. hort. kew. 1. p. 144.) stem erect, retete, ploose, rather scabrous; leaves verticillate, linear, scabrous above; panicles divaricate. 2. H. Native country unknown.

Cult. The species of Gálium are of the most easy culture and propagation. They will all grow in any common soil. The perennial kinds are easily increased by dividing the plants, or by seeds. The seeds of annual species should be sown where the plants are intended to remain. Those species natives of bogs or marshes should be planted in a moist situation; and those natives of warmer climates should be protected during winter, either by covering with mats or haum of other herbs, or by placing them in a green-house. None of them are worth cultivating, unless in botanical gardens.

Lin. Syst. Tetradriia, Diginia. Calyx with an oblong tube, and the limb not perspicuous. Corolla 4-parted, campanulate; lobes ovate, very short. Stamens 4, very short. Stigma 2. Fruit oblong, rather incurved; one of the mericarps being abortive. Flowers 3 from each axil, on short pedicels, and therefore constituting 6-flowered whorles. Bractea large, membranous, cripicate, and as if it were holding the fruit within its hollow. Flowers small, all fertile. Fruit hispid at the apex.

Cult. Sow the seeds in a warm dry situation, where the plants are intended to remain for seed.

Lin. syst. Polygénium, Monœæticæ. Flowers by threes; middle one fertile, hermaphrodite, and the two lateral ones male, and combined with the middle one. Tube of calyx ovate; limb dentilculated, permanent, the dentilicultions many, irregular, and stiûfl. Corollas rotate; male one tridiud, and the hermaphrodite one quadrifid. Stamens 3-4. Styles 2 in the hermaphrodite flower; stigma capitate. Fruit 3-horned, in consequence of the ovaria of the three flowers being combined; the lateral horns sterile, and the middle one bivolute, but usually only 1-seeded at maturity.—Annual branched herbs. Stems tetragonal. Leaves oval, opposite, and stipules 2, very like the leaves, forming 4-5-angled whorl. Flowers 3 in each axial, sessile, small, yellow, therefore they appear 6 in a whorl. —According to the observation of A. Richard, the seeds are half naked at maturity from the rupturing of the mericarp.

1 V. Mura'alis (Lin. spec. p. 1490.) stem, leaves, and calyces glabrous. O. H. Native of the south of Europe, in rocky places, and on old walls; on the whole coast of Tuscany; on the sandy shores of the County of Nice; and in the south of France, about Nemours; also about Montpellier and Leghorn. Sibth. et Smith, fl. grac. 137. V. quadrifidum, Mench. meth. p. 640.—Sabb. hort. t. 1. 83.—Mich. gen. 13. t. 7.—Mor. oxon. 4. sect. 9. t. 21. f. 2.—Col. ephr. t. 207. Angles of fruit fringed.

Var. ß, aculeata (D. C. prod. 4. p. 614.) plant larger; fruit glabrous, longer than the dentilicultions of the calyx. O. H. Native of the kingdom of Naples, among rubbish and on old walls.

 Cult. Sow on the seeds on an old wall or on rock-work, or in any dry sandy soil and situation.

Tribe XIII.

OPERULÆRIÆ (this tribe contains plants whose fruit opens by an operculum). A. Rich. mem. soc. hist. nat. Par. 5. p. 142. D. C. prod. 4. p. 614.—Operulæria, Juss. ann. mus. 1. p. 418. and 10. p. 528.—Operulæria Gærtn. fruct. 1. p. 111. t. 24. Flowers combined: having the calyceous tubes resembling in length a peculiar operculum. Corollas 3-5-cleft. Stamens 1-5; filaments hardly adnate to the tube of the corolla at the base. Style short; stigma 2, slender, elongated, acute. Fruit 1-celled and 1-seeded by abortion, combined, 2-valved (f. 112. b.), at length dehiscing.—Herbs or sub-shrubs, usually natives of Australia. Leaves opposite. Stipulas on both sides, distinct or combined. Flowers combined into a head, girded by a partial, many-toothed involucrem. Heads of flowers sometimes umbellate and pedunculate, and sometimes sessile and capitulate, usually girded by a universal involucrem.—This tribe agrees with Spermacædæae in habit and stignmas, but the number of stigmas is variable, and therefore it approaches the order L'aletrœæae.

CCXIX. POMAX. CCXXX. OPERULÆRIA.

Lin. syst. Mono-Tetradria, Monogynia. Limit of calyx wanting. Corolla 3-4-cleft. Stamens 1-4. Seeds wrinkled from tubercles.—Suffrutescent herbs. Leaves opposite, furnished with one leaf-formed stipula on each side. Peduncles 7-10, terminal, umbellate, involucrated by the 2 floral leaves and 4 small stipulas, bearing at their tops a small distinct head of flowers each; heads girded by a blunt 8-10-toothed involucrem. Flowers 3 within each partial involucrem, joined together by the tubes of the calyces.

2 P. Glæbra (D. C. 1. c.) plant glabrous in every part; leaves elliptic, attenuated at the base. ß. G. Native of New Holland, about Port Jackson. Stipulas smaller than in the preceding species.

Glabrous Pomax. Shrub 1 foot.

 Cult. The species of this genus grow best in a mixture of loam, peat, and sand; and cuttings root freely under a hand-glass.

Lin. syst. Mono-Pentandria, Monogynia. Limit of calyx 3-lobed. Corolla 3-5-cleft. Stamens 1-5. Seeds nearly smooth.—Herbs suffrutescent at the base. Leaves opposite, furnished with distinct stipulas on both sides. Heads of flowers globose, terminal, or rising from the forks of the branches, pedunculate, or nearly sessile. Universal involucrem wanting, or composed of the 2 upper leaves and 4 small stipulas. Partial involuca acutely 8-10-toothed.

1 O. Hiatta (Spreng. syst. 1. p. 385.) stems diffuse, furrowed, tetragonal, rough from numerous hairs; leaves small, ovate, plicate; heads pedunculate, rising from the forkes of the branches, drooping. ß. G. Native of New Holland. Æ. áspera, Juss. ann. mus. 4. p. 427. t. 70. f. 1. Universal involucrem wanting; partial ones 8-10-toothed, each containing 3-5 flowers. Corolla 5-cleft, monandrous or diandrous, white.

2 O. Sessiliflora (Juss. 1. c. p. 427. t. 170. f. 2.) glabrous; stems diffuse, slender, hardly furrowed; leaves linear; heads of flowers small, hemispherical, sessile in the forks of the branches. ß. G. Native of New Holland.
Partial involuca 4-5 in the same head, each containing 2-4 flowers. Corollas 4-5-cleft, monandrous or diandrous, white. Leaves like those of the species of Linaria.

**Sessile-flowered Opecularia.** Fl. June, July. Cl. 1824. Pl. diffuse.

3. O. _apricifölia_ (Labiil. nov. holl. 1. p. 35. t. 48.) glabrous; stems diffusel, very slender, furrowed; leaves oblong-linear, short; stipulas joined in one on both sides; heads of flowers terminal, small, hemispherical, involucreated by about 4 verticillate leaves. G. Native of New Holland, in Van Lewin's Land. Juss. mem. mus. 4. p. 427. Partial involuca 1-3 in each head, each containing 3-4 flowers. Corollas 4-5-cleft; monandrous or diandrous, white. (Fig. 112.)

**Top-flowered Opecularia.** Shrub 1 foot.

4. O. _spermaceœa_ (Labiil. nov. holl. 1. p. 35. t. 47.) glabrous; stem shrubby, erect; leaves linear, almost triquetrous; stipulas combined in one on both sides, bidentate at the apex; heads spherical, pedunculate, terminal. G. Native of New Holland, in Lewin's Land. Juss. ann. mus. 4. p. 437. Leaves falsely verticillate. Partial involuca 4-5 in the same head, each bearing 4 flowers. Habit of Spermacoea verticillata. *Spermaceœa*-like Opecularia. Shrub 1 foot.

5. O. _vagina'ta_ (Labiil. nov. holl. 1. p. 34. t. 16.) glabrous; stem erect, woody at the base, rather angular; leaves linear; stipulas combined into a long sheath, which is bidentate at top on both sides; heads globose, naked, terminal. G. Native of New Holland, in Van Lewin's Land. Juss. ann. mus. 4. p. 425. Partial involuca 5-9 in a head, each containing 3-5 flowers. Corolla 4-cleft. Stamens 4, ex Labill.

**Sheathed-stipule Opecularia.** Shrub 1 foot.

6. O. _hirtella_ (D. C. prod. 4. p. 616.) stem rather angular, and rather pilose at the apex; branches elongated; leaves linear, stipulas lanceolate-subulate; heads of flowers pedunculate, drooping, hairy, rising from the forks of the branches. G. Native of New Holland. Branches, leaves, and stipulas beset with longish hairs.

**Hairly Opecularia.** Pl. 1 foot.

7. O. _hyssofori'a_ (Juss. mem. mus. 4. p. 428. t. 71. f. 1.) stem erect, rather angular, clothed with short down; leaves narrow-lanceolate, with somewhat ciliated margins; stipulas combined entire, acute; heads of flowers rising from the forks of the branches, on short peduncles, drooping a little, globose. G. Native of New Holland. Partial involuca about 5 in every head, each containing 2-4 flowers.

**Hyssofor-leaved Opecularia.** Pl. 1 foot.

8. O. _loustrifölia_ (Juss. mem. mus. 4. p. 428. t. 71. f. 2.) stem erectish, tetragonal, hairy from short down, but glabrous between the nodi; stipulas combined at the base on both sides, acutely 2-lobed; heads of flowers rising from the forks of the branches, on short peduncles, drooping. G. Native of New Holland, about Port Jackson. The rest as in the preceding species.

**P萩leaved Opecularia.** Shrub 1 foot.

**Chafly Opecularia.** Fl. July, Aug. Cl. 1793. Shrub 4 feet.

10. O. _octimöfölia_ (Juss. ann. mus. 4. p. 428. t. 71. f. 3.) glabrous; stems diffuse, tetragonal, furrowed; leaves ovate-oblong, petiolate; stipulas combined in one on both sides; heads of flowers rising from the forks of the branches, on short peduncles, drooping, globose, naked. G. Native of New Holland. Heads larger than peas, with 7-9 partial involuca in every head, each containing 4-6 flowers. Corolla 3-4-cleft. Stamens 2-3, ex Juss.

**Basil-leaved Opecularia.** Fl. June, July. Cl. 1824. Pl. 1 foot.

11. O. _ruböioides_ (Juss. ann. mus. 4. p. 428.) stems tetragonal, ascending, glabrous; leaves lanceolate, with revolute margins; margins and middle nerve scabrous beneath; stipulas combined on both sides, entire or bidentate; heads on short peduncles, rising from the forks of the branches, drooping, globose, naked. G. Native of New Holland, on the Eastern Coast. Heads of flowers larger than peas. Partial involuca 5-7 in every head, each containing 5-6 flowers. Corolla 3-4-cleft. Stamens 3-4.

**Madder-like Opecularia.** Pl. 1½ foot.

† Doubtful species.

12. O. _aspera_ (Güntr. fruct. 1. p. 112. t. 24.) leaves oblong, scabrous, venous; heads of flowers pedunculate, axillary.—Native of New Zealand, ex Solander. O. aspera, Spreng. syst. 1. p. 383. Probably the same as _O. hispidus._

**Rough Opecularia.** Pl. 1 foot.

13. O. _diphylla_ (Güntr. l. c. p. 113.) stem and leaves unknown; heads of flowers rising from the forks of the branches; partial involuca hispid, many in every head, each containing 3-4 flowers; flowers tetranodium.—Native of New Zealand. Juss. ann. mus. 4. p. 428. Rubiöoides diphylla, Soland. Icon. The rest unknown.

**Two-leaved Opecularia.** Pl. 1 foot. Cult. For culture and propagation see Pönax, p. 662.

---

**CCXXI. LIPOSTOMA.** (from _lyco_, _leipo_, to fall from, and _aropa_, _stoma_, a mouth; _lid_ from capsule.) D. Don, in edinb. new phil. journ. Jan. 1830. Sweet, h. gard. n. s. with a figure. L. _syst._ Tetrándria, Monógynia. Limb of calyx 4-parted. Corolla tubular at the base, and ventricose at the throat, and bearded inside, with a 4-lobed limb; lobes ovate, spreading, valvate in aestivation. Stamens 4, inserted in the throat, exserted; filaments compressed; anthers linear, versatile. Style capillary; stigmas 2, subulate, hispid. Capsule globose, celled, opercular, many seeded, but often 1-celled from the middle dissepiment having vanished. Placentas 2, spherical, stipitate, inserted beneath the middle of the dissepiment. Seed small, angular, scabrous. Embryo slender, with oblong plano-convex cotyledons, and a cylindrical obtuse radicle, which is a little longer than the cotyledons.—Diffuse trailing pilose herbs, natives of Brazil. Leaves opposite, petiolate. Stipulas subulate, interpetiolar. Flowers sessile, capitato, intermixed with bracteas. Heads of flowers pedunculate, solitary, axillary. Corolla blue.

**Capitate-flowered Lipostoma.** Pl. trailing.

2. L. _sericéum_ (D. Don, l. c.) plant hairy; hairs adpressed; leaves ovate, acute, when young silky. G. Native of Brazil, in pastures. The whole plant is clothed with silky adpressed hairs. Heads of flowers smaller than the preceding. Corolla
blue, hairy. Seeds triquetrous, dark brown, beset with elevated dots.

Silky Lipostoma. Pl. trailing.

Cult. For culture and propagation see Richardsonia, p. 628.

1. Genera of Rubiaceae not so sufficiently known as to be placed in any particular situation in the body of the order.

Lin. syst. Pentandria, Monogyinia. Limb of calyx spreading, 5-parted, Corolla with a short tube, and a 5-parted limb. Stamens 5, fixed to the base of the corolla. Stigma clavate, 10-winged, exserted. Fruit cylindrical, silique-formed, crowned by the permanent calyx, 2-celled, many-seeded. Seeds disposed in a double series along the axis in each cell.—Indian shrubs. Stems thinly tetragonal. Leaves opposite, petiolar, lanceolate. Stipulas broad, keeled. Flowers axillary, bracteate. Estivation valvate. It is not said whether the fruit is dehiscent or indehiscent.

1 P. xutana (Jack, L. c.) smooth; peduncles drooping, 3-petalled. ♂ S. Native of Sumatra, in the interior of the island.

Drooping-peduncled Psilobium. Shrub.

2 P. tomentosum (Jack, L. c.) tomentose; flowers almost sessile in the axis of the leaves. ♂ S. Native of the East Indies, at Katoum. Fruit said to be baccate.

Tomentose Psilobium. Shrub.

Cult. See Psychotria, p. 599. for culture and propagation.

CCXXIII. PLATYMERIUM (from πλατύς, broad, and μέρις, meris, a part; probably from the parts of the flowers being broad). Bartl. in herb. Haenke. D. C. prod. 4. p. 619.

Lin. syst. Tetra-Pentandria, Monogyinia. Calyx with a short tube, and a rotate 5-parted, rarely 4-parted limb; lobes flat, obtuse. Corolla coriaceous, funnel-shaped, with a short tube, which is woollly inside, and a 5-parted, rarely 4-parted limb; segments of the limb twisted to the right in estivation. Anthers linear, sessile within the tube of the corolla. Style clavate, spirally 10-ribbed. Ovarium 2-celled, covered by an epigynous disk. Fruit unknown.—A shrub, with slender terete branches. Leaves opposite, coriaceous, lanceolate, acuminate, downy beneath and on the branches, short petioles. Flowers numerous, glomerate, on short pedicels, axillary. Calyxes tetramerous.—This genus is nearly allied to Psilobium, but is distinguished from it in the estivation of the corolla, and in the fruit not being silique-formed.

1 P. glomeratum (Bartl. in herb. Haenke, ex D. C. prod. 4. p. 619.) ♂ ♂ S. Native of the island of Luzon, one of the Philippines. Leaves 3½ inches long and 1 broad. Flowers small. Glomerate-flowered Platymerium. Shrub.

Cult. For culture and propagation see Psychotria, p. 599.

Lin. syst. Pentandria, Monogyinia. Calyx small, tubular, with a 5-toothed border. Corolla tubular, slender. Stamens 5? Style and fruit unknown.—Stems quadrangular. Leaves opposite, petiolar, ovate, acute at the apex, acuminate at the base, yellowish beneath, soft to the touch. Stipulas large, interpetiolar, broadly ovate, acute, glabrous. Heads of flowers almost sessile, surrounded by large 5-toothed calyceiform villous involucra. The place which this genus should occupy in the order is very doubtful.

1 S. AFRICANA (Beauv. fl. d'Am. 2. p. 26. t. 75.) Native of the west coast of Africa, in deserts about the river Gallar; we have also seen it in the neighbourhood of the Gaboon river. Flowers pale yellow.

Cult. For culture and propagation see Psychotria, p. 599.

CCXXV. BENZONIA (named in compliment to the celebrated African traveller Benzoni, who died at Benin, the habitat of the present plant). Schum. pl. guin. p. 113. D. C. prod. 4. p. 620.

Lin. syst. Tetrandria, Monogyinia. Calyx with a globose tube, and a small 5-toothed limb; teeth erect. Corolla tubular, coriaceous, 5-cleft; segments concave, cup-shaped. Anthers triquetrous, sessile in the throat. Style filiform; stigma ovate-globous, acute, marked by 6-7 longitudinal furrows. Fruit inserted in the base of the tube. Antlers linear, erect, shorter than the tube of the corolla. Style truncate clavate; stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Leaves elliptic-lanceolate, petiolar, quite entire, glabrous. Flowers spicate, sessile, involucrated by a large deciduous bractea before expansion.—This tree belongs probably to Rubiaceae, but the stipules and situation of the leaves, seeds, &c. are unknown.

1 B. corticosa (Schum. pl. guin. p. 113.) ♂ ♂ S. Native of Guinea, in various parts. Corynubus-flowered Benzonia. Shrub 5 to 6 feet.

Cult. See Psychotria, p. 599. for culture and propagation.

CCXXVI. HIMATANTHUS (from ἰματιον, hitimation, a garment, and ἀνθος, anthos, a flower; the flowers are involucrated by a large bractea before expansion). Willd. ex Rottm. et Schultes. syst. 5. p. 13. D. C. prod. 4. p. 621.

Lin. syst. Pentandria, Monogyinia. Tube of calyx adnate to the ovary, turbinated; limb loose, permanent, 5-parted; segments ovate, acuminate, 5 of them one-half smaller than the other three. Corolla funnel-shaped, having the tube much longer than the calyx, dilated a little at the apex; and the limb 5-cleft, with oblong segments. Stamens 5, capillary, very short, inserted in the base of the tube. Anthers linear, erect, shorter than the tube of the corolla. Style truncate clavate; stigma subulate. Ovarium 2-celled, 2-seeded.—A tree. Leaves elliptic-lanceolate, petiolar, quite entire, glabrous. Flowers spicate, sessile, involucrated by a large deciduous bractea before expansion.—This tree belongs probably to Rubiaceae, but the stipules and situation of the leaves, seeds, &c. are unknown.

1 H. hispida (Hoffin. ex Willd. l. c.) ♂ ♂ S. Native of Brazil, in the province of Para, where it is called Sucuba by the natives.

Stiff Himatanthus. Tree.

Cult. For culture and propagation see Psychotria, p. 599.

Lin. syst. Pentandria, Monogyinia. Calyx permanent, 5-toothed. Corolla campanulate, 5-toothed; teeth oblong. Filaments 5, inserted in the middle of the corolline tube. Anthers linear, exserted. Stigma 1. Capsule woody, 2-valved. Seeds winged.—Trees, natives of Caracas. Leaves opposite. Flowers terminal, trichotonous, pinnate, sweet-scented. This is a very doubtful genus from the description given by Willdenow; but according to Richard it is related to Cinchonaaceae, in consequence of the winged seeds; but the stipules are not mentioned, and the leaves are said to be deeply and remotely toothed; and therefore it ought probably to be excluded from Rubiaceae.

1 S. erythroxylo (Willd. l. c.) leaves oblong-rhomboïd,
toothed at the apex, downy beneath. *S. Native of mountain woods, about Caraccas.

Red-wooded Sickingia. Tree or shrub.

2 S. longifolia (Willd. 1. c.) leaves oblong-ovate, quite entire, glabrous. *S. Native along with the preceding.

Long-leaved Sickingia. Tree.

Cult. See Fuchsiiaria, p. 599. for culture and propagation.

CCXXVIII. CALYSPHYRUM (from κάλυξ, κάλυξ, a calyx, and σφυρός, σφυρόν, a little hammer ; the calyx is like a peduncle). Bunge, in mem. acad. mem. Petersb. 2, p. 107.

Lin. Syst. Tetrandria, Monogyria. Tube of calyx linear-pentagonal, adnate to the ovarium, 10-striped; limb subcampanulate, profoundly 5-lobed; segments lanceolate, equal, acute, erect, deciduous. Corolla superior, funnel-shaped, about equal in length to the calycine segments; throat wide, glabrous; limb ample, spreading, 5-parted; segments roundish, imbricate in aestivation; the fifth one a little smaller than the rest. Stamens 5, inserted in the bottom of the tube of the corolla, and alternating with its segments. Anthers linear-oblong, 2-celled, dehiscing at each side by a longitudinal chink. Ovarium inclosed in the tube of the calyx, 2-celled, many-ovulate. Style filiform, exserted; stigma peltate. Capsule 2-celled; cells many-seeded. Seeds disposed in 2 rows in each cell, inserted in the disseminum, imbricate, compressed.—Perhaps the genus is more nearly allied to Lobelidæmoneae than to Rubiaceae.

1 C. floridum (Bunge, 1. c.) leaves opposite, almost sessile, oblong, acuminate, toothed; flowers 2-4, sessile, terminating the branches; corollas grumose. *S. G. Native of China, in gardens. Flowers size and form of those of Rhodolitlédron Dauertium.

Flowerly Calysphyrum. Shrub.

Cult. See Fóns, p. 602. for culture and propagation.

† † Genera referred to Rubiaceae by authors, but do not belong to the order.

Bellónia, Lin. belongs to Soláneae; and Gärtnérä, Lam., Ustéria, Willd., Pagánia, Aulbl. belongs to Logáneae.

Tube of calyx adnate to the ovarium; limb variable in the different genera, sometimes toothed or parted, sometimes going away in pappus, which is at first involute, and at length expanded. Corolla tubularly funnel-shaped, usually 5-lobed, rarely 3-4-lobed; lobes obtuse; tube equal or gibbous, or spurred at the base. Stamens adnate to the tube of the corolla, but free at the apex, alternating with its lobes when they are equal in number, but varying in number in the different genera from 1 to 5. Anthers ovate, 2-celled. Style filiform; stigmas 2-3, free, or combined in one. Fruit membranous or submucronate, indehiscent, crowned by the limb of the calyx in the younger state; sometimes 5-lobed, in this case 2 of the cells are vacant; sometimes only 1-lobed. Seed in the fertile cell or solitary fruit, pendulous, exalbomious. Embryo straight, with a superior radicle, and 2 flat cotyledons.—Annual or perennial herbs, very rarely woody at the base. Roots of the perennial species thickish, intensely sweet-scented; of the annual species slender, white, and inodorous. Leaves opposite, exstipulate, different in diverse species, and in the same plant. In the latter case the lower ones are usually entire, and the superior ones are laciniated. Flowers disposed in cymose coryums, usually hermaphrodite, very rarely dioecious by abortion, usually furnished with from 1-3 bracteas, white, rose-coloured or bluish, but in the genus Nordóstachys they are purple, and in Patriânia yellow.

The plants contained in this order are more interesting for the sake of their symmetry and neatness than on account of any particular attractions; they may be considered a connecting link between Rubiaceae and Dipsácceae. Most of them are pretty. The Valerianellas are useful esculent, known under the name of corn salads; Centãnthus ruber is also eaten in the same way in Sicily. Their medicinal properties are of a decisive character. The roots of Valeriana officinalis, Phu, Céllica, and others are bitter, tonic, aromatic, antispasmodic, and vermifugal; they are occasionally used as febrifuges. The odour of valerian is not generally agreeable, but eastern nations procure from the mountains of Austria the roots of Valeriana Céllica, with which they perfume their baths; and the natives of India at this day employ the Nordóstachys, the spikenard of old times, as a perfume, and against hysterics and epilepsy.

Synopsis of the genera.

6 Fédia. Limbo of calyx with 4 unequal subulate lobes (f. 113. c.). Corolla filiform, with an unequally 5-lobed subrigent limb (f. 113. f.). Stamens 2 (f. 113. h.). Stigma bifiid (f. 113. g.). Fruit spongy (f. 113. b.), indehiscent, 3-celled.

8 Centãnthus. Limbo of calyx involute at the time of flowering (f. 114. b.), but afterwards evolute and deciduous, of many-feathered bristles (f. 114. h.). Corolla with a narrow tube, which is spurred at the base (f. 114. c.), and a regular 5-

9 VALERIANA. Limb of calyx the same as in Centranthus. Corolla with an obovate or cylindrical tube (f. 115. b.), which is equal or gibbous at the base, and a bluntly 5-cleft limb (f. 115. b.), rarely only 3-cleft. Stamens 3 (f. 115. b.). Fruit indehiscent, 1-celled, and 1-seeded at maturity.

1. P. sinica (Juss. l. c.) stem beset with 2 rows of hairs; leaves rather fleshy; primordial ones oblanceolate or spatulate, undivided and obtuse, entire, toothed, serrated, or pinnatifid towards the apex; calyx leaves pinnate, with entire, usually oblong fragments; fruit adnate to the paleae. 2. H. Native of Siberia, among subalpine rocks. Sims. bot. mag. t. 2325. P. coronata, Fisch. in litt. Valeriana Sibirica, Linn. spec. p. 48. but not of Wild. Valeriana Rutheâônica, Wildl. spec. 1. p. 181. Fédia Sibirica, Vahl. Enum. 2. p. 122. Gertrn. 3. fr. t. 56. f. 3. Valerianella latea, Meun. Valeriana Sibirica β hâmulis, Gmel. sb. 3. p. 125. no. 5. — Anom. rath. no. 25. t. 3. Radical leaves spatulate, entire, toothed or serrated, but sometimes pinnatifid at the apex; calyx leaves pinnate. Fruit crowned by the 5-toothed limb of the calyx. Flowers yellow. Root black, strong scented.

4 P. hetrophylla (Bunge, in mem. acad. imp. peterb. 2. p. 109.) stem leafy, downy; lower leaves pinnatifid, with distant ovate-oblong coarsely toothed lobes; the terminal lobe the largest, sharply toothed or deeply lobed, acuminate; superior leaves quite entire or ternate, with oblong-linear elongated quite entire lobes; flowers corymbose; achenia bracteate. 2. H. Native of the north of China, on the mountains. Nearly allied to P. rupestris, but differs in the lobes of the leaves being fewer, shorter, broader, and in being variably cut, and in the upper leaves being of a different form.

Variable-leaved Patrinia. Pl. 1 foot.

5 P. scabiosaeolia (Link, enum. 1. p. 131.) stem glabrous; radical leaves ovate or oblong, deeply serrated and lyrate; calyx leaves pinnatifid, with lanceolate-linear acute segments; terminal segment very long; coryumbs loose, rather paniced; fruit trigonous, naked. 2. H. Native of Dahuria. Sweet. brit. fl. gard. t. 154. Lodde. bot. cab. t. 1340. P. serratulifolia, Fisch. in litt. Fédia scabiosaeolia, Trev. act. bonn. 13. p. 165. Flowers yellow. There is a variety of this plant, having the radical leaves rather palisade, and the rest glabrous. Limb of calyx wanting or truncate.

Flowers yellow.

Villous Patrinia. Pl. 1 foot.

7 P. ceratophylla (Hook. fl. bor. amer. 1. p. 290.) stem glabrous; leaves all rather fleshy, downy, petiolate; radical ones linear-lanceolate, entire, pinnatifid or bipinnatifid, with divericate lobes; calyx leaves profoundly pinnatifid, with linear segments; panicles elongated; peduncles teresately verticillate.

2. H. Native of North-West America, common on low wet soils between the Kettle Falls and Spokon; and in the valleys on the west side of the Rocky Mountains. Root thick, fusiform. Stems simple. Peduncles opposite or 3-4 in a whorl. Pedicels short, and flowers crowded. Flowers white. The roots during the spring months are collected by the Indians, baked on heated stones, and used as an article of winter and spring food. From a bitter and seemingly pernicious substance, it is thus converted into a soft and pulpy mass, which has a sweet taste, resembling that of treacle, and is apparently not unwholesome.

Horn-leaved Patrinia. Pl. 1 to 1½ foot.

Cult. The species of Patrinia grow well in any light soil, and are easily increased by seeds.

II. NARDOSTACHYS (from rapioc, nardos, a shrub, and σταχυς, stachys, a spike; but so named from the plant being spike-named). D. C. coll. mem. vii. t. 1-2. prod. 4. p. 634.

—Patrinia, D. Don, prod. fl. nep. p. 159.

Lyn. syst. Tetradria, Monogynia. Limb of calyx 5-parted; lobes ovate-oblong, acute, foliaceous, somewhat dentilliculated, permanent. Corolla regular, sparsely, bluntly 5-toothed, with a bearded throat. Stamens 4, adnate to the bottom of the corolla. Stigma capitulate. Capsule 3-celled, crowned by the calycine lobes, and shorter than them, but not adnate to the bracteae.

—Herbs, with the habit of Scrophulârium hâmulis, having very sweet-scented perennial roots, which are beset with erect fibres at the neck. Leaves entire, oblong; radical ones very long; calyx ones
III. **DUFRESNIA** (named after Peter Dufresne, M.D., author of Histoire Naturelle et Medicale de La Famille des Valerianes, 4to, Montpellier, 1811.) D. C. coll. mem. vii. t. 3. prod. 4. p. 624.

**Lin. syst. Tetrándria, Monogynia.** Limb of calyx 2-parted; lobes ovate, acute, rather unequal, permanent, reticulated, and serrated. Corolla with an obconical tube, and a 5-lobed limb; lobes roundish. Stammes 3. Style unknown. Fruit membranous, indehiscent, very villous outside, crowned by the lobes of the calyx, 3-celled inside, one of the cells fertile and flattened, and the other 2 cylindrical and sterile. —A small glabrous herb. Stem suffruticose at the base, nearly simple. Leaves opposite, oblong, obtuse, quite entire. Cymes crowded, subcapitate. Bracteas oblong, spreading, serrated. Flowers small, rose-coloured in the dry state, and probably monoeocious from abortion.

1. **N. orientalis** (D. C. coll. mem. vii. t. 3.) *H. F.* Native of the Levant, between Mosul and Bagdad, where it was collected by Olivier and Bruguiere.

**Oriental Dufresnia.** Pl. 4 ½ foot.

_Cult._ This plant should be grown in a pot in a mixture of peat, loam, and sand; and placed among other alpine plants; it can only be increased by seeds.

**Lin. syst. Triándria, Monogynia.** Limb of calyx toothed, permanent. Corolla sparsely, regular, 5-lobed. Stammes 3. Stigma nearly undivided or trífid. Fruit 3-celled, rather membranous, indiscernent, crowned by the toothed or acerate limb of the calyx.—Annual herbs. Stems dichotomous at the tops. Leaves oblong or linear, undivided, or toothed at the base, or the superior ones are pinnatifid. Flowers solitary in the forks, or in fascicled coryumbs, bracteate, small, white, rarely rose-coloured.

§ 1. _Locista_ (from _locusta_, a locust; so named from some semblance in the branches). _D. C._ prod. 4. p. 624. **Mature fruit** 2 or 3-celled; one of the cells alone fertile, and gibbous on the back; the two sterile ones equal or broader than the fertile one, sometimes distinct, and sometimes connotate, from the dissepiment having vanished.

* Mature fruit 2-celled.

**Cult._ See _Triplostegia_, p. 680. for culture and propagation.
russ. t. 24. Flowers pale blue. There is a variety of this species having the upper leaves toothed or jagged according to Vahl. Lamb's lettuce is also called corn-salad; Acker-salat in German, and Valerianella in Italian. It is a diminutive annual plant, common in corn-fields or sandy soils. The leaves are of a pale glaucous hue, and rather succulent. When cultivated it rises almost a foot high, and flowers in March. Gerard tells us that foreigners using it while in England led to its being cultivated in our gardens. It is used in salads through the winter and early in spring, both as a substitute for common lettuce in those seasons, and to increase the variety of small salads. For these purposes it has long been a favourite plant in France under the denominations of marche, doucette, salade de chavonoe, and poivre grass. It is raised from seed, of which a quarter of an ounce is sufficient for a bed 4 feet by 5. To answer the common demand 2 or at most 3 sowings will be sufficient, viz, a principal sowing at the beginning or towards the middle of August, a secondary sowing early in September, to furnish together crops in winter and early spring; and a smaller sowing in spring, at the close of February or in the course of March, if the plants are required in continuation throughout that season, though they are apt to get rank tasted in warm dry weather. If wanted throughout summer, sow once a month, and cut the crop quite young. Sow the seeds in any bed of common mellow earth, broad cast, and rake in the seed. When the plants are up, thin them to 2 or 3 inches asunder, that they may have room to acquire some small stocky growth for gathering. For seed leave some plants in spring.

Fett. fi. basincoryna (Reh. l. f. f. z.) fruit downy.

*Salad* Lamb's-lette. Fl. April, May, Britain. Pl. t. to 1 ft.

2 V. radiata (Dufr. l. f. f. z.) a slender, rather tetragonal, glabrous, smooth; limb of calyx obliquely truncate, almost wanting; sterile cells of fruit combined in one, from the dissemination being incomplete, equal in size to the fertile one; bracteas linear-oblong, spreading, ciliated a little; leaves oblong-spataulate, attenuated at the base, subdentate. O. H. Native from Pennsylvania to Carolina, in corn-fields. Valerianna radiata, Wildl. spec. l. p. 185. Fédia radiata, Michx. fl. bor. amer. 1. p. 18. Bart. comp. l. p. 20. Fruit downy, according to Michx. but in the specimen it is obviously glabrous. Flowers pink. Perhaps only a variety of *V. olitoria*. The young leaves are used as a salad.

3 V. *escapata* (Stev. mem. soc. mosc. 3. p. 251.) fruit 2-celled, one of which is sterile, obovate, ribbed, glabrous, sessile at the neck, and protruded at the apex, and 5-6-toothed: teeth oblong, straight, thick: leaves ligulate, glabrous; stem none. O. H. Native of Caucasus, near Gandha. Fédia excapa, Stev. mem. mosc. 5. p. 554. Rem. et Schultes, syst. 1. p. 366. Fédia acaulis, Biel. suppl. p. 35. Flowers pink. The fruit is said to be 2-celled, with both the cells fertile, but it is probably like the other species, having only one of the cells fertile, and the other sterile combined ones.

** Mature fruit 3-celled.

4 V. *turgida* (D. C. prod. 4. p. 626.) fruit nearly globose, compressed on one side and concave-convex, almost aplanous, glabrous; fertile cell turgid, convex and cellular on the back, and the 2 sterile cells about equal in size to the fertile one; bracteas oblong, spreading, ciliated; flowers subcapitate; leaves obovate: upper ones oblong-linear, quite entire. O. H. Native of Tauria, in corn-fields. Fédia turgida, Stev. mem. mosc. 2. p. 178. but not of others. A very distinct species.

IV. Valerianella.

*Turgid* Lamb's-lette. Pl. t. to 1 foot.

5 V. *gibbosa* (D. C. coll. mem. t. 3. f. 3.) fruit globose, somewhat compressed, glabrous, crownless, ciliate and flat on one side, and gibbous on the other, and furnished with 3 stripes on both sides; fertile cell turgid, cellular, and furnished with a furrow; and the 2 sterile ones smaller, and furrowed on the back; bracteas linear-oblong, spreading, quite entire; flowers subcapitate; leaves oblong-linear, entire. O. H. Native of Sicily, on the mountains in exposed places. Fédia gibbosa, Guss. 1. p. 28. Herb smooth, 2-3 inches high. Nearly allied to *V. turgida*.

*Gibbous-fruit* Lamb's-lette. Pl. t. foot.

6 V. *costata* (D. C. prod. 4. p. 626.) fruit roundish, a little compressed, glabrous, not crowned; fertile cell turgidly cellular and convex on the back, and the two sterile ones profusely furrowed on the back; bracteas oblong, spreading, with glabrous edges; flowers subcapitate; leaves linear-oblong, quite entire. O. H. Native of the south of Tauria, in vineyards. Fédia costata, Stev. mem. mosc. 5. p. 344. Bibb. suppl. p. 28. Herb 1-2 inches long, simple, slender, smooth. Fruit nearly allied to *V. turgida* and *V. gibbosa*, but much smaller.

*Ribbed-fruit* Lamb's-lette. Pl. 1. to 2 inches.

§ 2. *Pilosello* (from *phalos*, pilos, slender, and *calos*, bai-los, a hollow; in reference to the narrow sterile cells of the fruit). D. C. prod. 4. p. 626. Fruit 3-celled, flatish in front; fertile cell not cellularly turgid on the back; and the 2 sterile ones filiform, and much narrower than the fertile one, usually close and nere-form.

** Limb of calyx parted into recurved stifflish teeth.

9 V. *corniculata* (Meyer. verz. pfl. p. 49.) fruit oblong, with the 2 sterile cells filiform, and the fertile one convex on the back; crown of fruit tubular, tridentate; teeth elongated, linear, usually denticulated, straight or hooked at the apex. O. H. Native of Caucasus, in corn-fields near Baku. Habit of plant nearer to *V. uncinata* than to *V. echinata*.

*Hooked-fruited* Lamb's-lette. Pl. t. to 1 foot.

** Limb of calyx erect, toothed or entire, never recurved.

10 V. *ericoarpa* (Dev. journ. bot. 2. p. 314. t. 11. f. 2.) fruit ovate, obsolesly ribbed, hispid; the 2 sterile cells of fruit
VALERIANEAE

very narrow; limb of calyx obliquely truncate, campanulate, 6-toothed; teeth erect, the 3 front ones the shortest; bracteas adpressed, linear; leaves oblong-linear, quite entire, or toothed at the base. O. H. Native of Europe, in corn-fields, from Andegevany and Spain to Tauria. Lois. not. p. 49. t. 3. f. 2. Dufr. val. p. 59. t. 3. no. 4. D. C. coll. mem. t. 3. f. 5. Fédia eriocarpa and Fédia muriçaca, Rem. et Schultes. Fédia campanulata, Pers. sic. p. 11. V. campanulata, Bir. man. 4. p. 18. Fédia eriocarpa, Rechb. pl. crit. t. 65. Guss. prod. 1. p. 26. Fédia rugulosa, Stev. in litt. Mor. oxon. sect. t. 16. f. 33. Flowers lilac. There is a variety of this, having the fruit pisolis on the ribs, and glabrous at the base. Bracteas quite entire or serrated. Sterile cells of capsule very narrow.

Var. β, leiocarpa (D. C. prod. p. 4627.) fruit glabrous. O. H. Native along with the species. F. dentata, Stev. F. Morrisoni, Agardh. Fédia dentata, var. leiocarpa, Rechb. pl. crit. t. 62. There are varieties of this, having the leaves 3 in a whorl, and pinnaftid.

13 V. Fere'ula (D. C. prod. p. 4627.) fruit ovate, downy, hardish, rather angular, not umbilicated; limb of calyx very short, oblique, 3-5-toothed; the 2 sterile cells of the fruit filiform, and very narrow; bracteas linear, erect, ciliately dentilicate, with membranous margins; flowers corymbose; leaves linear-oblong, quite entire, or hardly unidentate at the base. O. H. Native of Sicily and Calabria, in corn-fields. Fédia puberula, Berol. in Guss. pl. rit. t. 14. prod. 1. p. 27. Fédia microcarpa, Rechb. pl. crit. 2. t. 111.

Downy Lamb's-lettuce. Pl. ½ foot.

14 V. praecta (D. C. prod. p. 4627.) fruit ovoid, downy, convex on the back, and bicostate in front; the 2 sterile cells of fruit filiform, much narrower than the fertile one; limb of calyx ear-formed, obliquely truncate, quite entire, equal in length to the fruit; bracteas linear, dilated and concave at the base, ciliately serrated; flowers cyamo; leaves oblong, quite entire. O. H. Native of Canàia, at Canca or Cylónia, in corn-fields; also of the Island of Melos, and in Cazor and Theodosia. Fédia trunca, Rechb. pl. v. taur. p. 115. Fédia dentata, Sibb. ex Rchb. Fl. aucrica, D'Urv. num. 5. but not of D. C.

Truncate-calyx Lamb's-lettuce. Pl. ½ foot.

§ 3. Platycæae (from πλατυς, platys, broad, and κολος, kolos, a hollow; in reference to the broad, hollow, sterile cells of the fruit). D. C. prod. p. 4627. Fruit 3-celled, arrowed in front; sterile cell not cylindrically gibbous on the back, and the two sterile cells broader than the diameter of the fertile one, or nearly equal to it; the transverse section nearly orbicular.

* Limb of calyx entire or toothed, erect; teeth not hooked at the apex.

15 V. auricula (D. C. fl. fr. suppl. p. 492. coll. mem. t. 3. f. 6.) fruit ovate, glabrous; limb of calyx obliquely truncate, almost quite entire, acutely auricle-formed; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear, glabrous; flowers disposed in dichotomous corymb, rather loose; leaves oblong, quite entire, or toothed at the base. O. H. Native of Europe, in fields, especially in the south. Fédia auriculata, Gaud. fl. helv. 1. p. 84. t. 4. Rechb. pl. crit. t. 62. Fédia olitoria, Gaut. fr. p. 86. Flowers pink. This species is often confused with V. dentata, and numerous others. There is a variety of it with pinnaftid leaves and villous fruit, according to Rchb.

Var. β, laxiflora (D. C. prod. p. 4626.) dwarf; leaves oblong-oblong.

16 V. dentata (D. C. fl. fr. no. 3331.) fruit ovate, glabrous, smoothish, chinky in front; limb of calyx obliquely truncate, auricle-formed, tridentate; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, linear-lanceolate, glabrous, hardly ciliated; flowers diatomously corymbose, rather loose; leaves oblong-linear, quite entire. O. H. Native of Europe, in woods; and of Caucasus, near Baku, in corn-fields.

Dufr. val. p. 57. t. 3. no. 5. Fédia dentata, Vahl, enum. 2. p. 20. exclusive of the syn. of Moris. Valériana dentata, Wild. Fl. Caucasian, 1831. t. 1. p. 20. Val. olitoria, Sturm, deutsch. fl. with a figure. Flowers blue. This is an intermediate plant between V. auricula and V. pumila, and probably not distinct from the former.

Toothed-calyx Lamb's-lettuce. Pl. ½ foot.

17 V. pumila (D. C. fl. fr. no. 3335) fruit nearly globose, inflated, glabrous, engraved in front, retuse at the apex; limb of calyx tridentate, short, unequal; the 2 sterile cells of the fruit broader than the fertile one; bracteas spreading, lanceolate, with membranous villously-ciliated margins; flowers corymbose; leaves oblong-linear, deeply toothed at the base. O. H. Native of the south of Europe and Tauria, in cultivated sandy fields; and of Caucasus, near Baku, in fields and on hills. Valériana pumila, Wild. spec. 1. p. 184. Fédia pumila, Vahl, enum. 2. p. 21. Rechb. pl. crit. 2. t. 113. V. membranacea, Lois. not. p. 150. V. tridentata, Link, enum. 1. p. 63. Fédia tridentata, Stev. mem. soc. mosc. 2. p. 173. Bieb. fl. taur. suppl. p. 29. Rechb. pl. crit. 1. t. 64. Flowers pink. There is a variety of this, having the leaves somewhat pinnaftid.

Dwarf Lamb's-lettuce. Fl. April, May. CIt. 1826. Pl. 1 1/2 to 1 foot.

21 V. hanna'ta (Bast, in D. C. prod. 4. p. 628.) fruit ovoid, villous outside, somewhat tetragonal, engraved in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx spreading, broader than the fruit, quite glabrous inside, and cleft into 6 lobes beyond the middle; lobes awned, hooked at the apex; bracteas adpressed, oblong, ciliated; flowers rather densely capitate; upper leaves linear, entire or triplicate, and are as well the stem glabrous. H. Native in the region of the Mediterranean. D. C. coll. mem. t. 3. f. 7. V. coronàta, Guss. prod. 1. p. 25. V. coronàta integrifòlia, Recib. pl. crit. 1. p. 54. t. 66. f. 1.—C. ecprh. t. 299. Fèdia coronàta of many authors. Flowers pink.

Hooked Lamb's-lettuce. Fl. May, June. CIt.? Pl. 1 1/2 foot. (D. C. prod. 4. p. 628.) fruit ovoid, villous, somewhat tetragonal, engraved in front: the 2 sterile cells about equal in breadth to the fertile one; limb of calyx cup-shaped, broader than the fruit, hairy inside, cleft into 6 lobes beyond the middle: lobes awned, hooked at the apex; bracteas adpressed, oblong, ciliated; flowers densely capitate; superior leaves pinnatifid, and are as well the stem downy. H. Native of the region of the Mediterranean. V. coronàta, D. C. fl. fr. no. 3333. Dufri. val. 60. t. 3. f. 2. Fèdia Sicula, Guss. prod. 1. p. 25. Fèdia coronàta, Recib. pl. crit. t. 66. f. 15. Gali, enum. 2. p. 20. Flowers pink.

Crowns Lamb's-lettuce. Fl. April, June. CIt. 1731. Pl. 1 1/2 f. ** Limb of calyx inflated, closed by the inflamed calyx teeth.

22 V. vesicâria (Monech. math. p. 497.) fruit villous, crowned; limb of calyx bladder, inflated, 6-toothed; teeth conniving, acute; the 2 sterile cells of fruit a little smaller than the fertile one, or nearly equal in size to it; bracteas adpressed, ovate, ciliated, shorter than the fruit; leaves entire or toothed; stem rather villous. H. Native in the region of the Mediterranean, in corn-fields. D. C. fl. fr. 4. no. 3332. coll. mem. t. 3. f. 8. Dufri. val. 60. t. 3. f. 9. Fèdia vesicâria, Vahli, enum. 2. p. 20. Recib. pl. crit. 1. t. 70. Valeriana vesicâria, Wild. Val. locusta, ß, vesicâria, Lin. Sibth. et Smith, fl. gracc. t. 34. Flowers lilac.

§ 4. Solenocoe'âria (from solens, solen, a tube, and coles, kolos, a hollow; in reference to the sterile cells of the fruit). D. C. prod. 4. p. 629. Fruit 3-celled, broadly furrowed in front; the fertile cell not celluilarly gibose on the back, and the 2 sterile cells broader than the fertile one, and curved, and therefore the transverse section is lunulate.

* Lobes of calyx hooked a little.

24 V. platyl'oea (Dufri. val. 59. t. 3. f. 1.) fruit ovoid, villous outside, rather tetragonal, broadly furrowed in front, boat-shaped; limb of calyx spreading, broader than the fruit, rather hairy inside, 6-lobed to the middle; lobes ovate, each furnished with a hooked mucrone; bracteas adpressed, ciliated, oblong; flowers sub-capitate; upper leaves toothed, and are as well the stem glabrous. H. Native in the region of the Mediterranean. D. C. coll. mem. t. 3. f. 9. Fèdia discoidù, Recib. pl. crit. 1. p. 54. t. 67. Fèdia rotata, Recib. l. c. p. 93. Flowers pink.

Broad-lobed Lamb's-lettuce. Fl. May, June. CIt. 1825. Pl. 1 1/2 foot.

** Limb of calyx erect.

25 V. carin'a'ta (Lois. not. p. 149.) fruit oblong, longitudinally boat-shaped, or chinky on one side, and ciliated; the 2 sterile cells compressed, curved, about equal in size to the fertile cell; fruit crowned, by the uninodert erect limb of the calyx; flowers sub-capitate; bracteas oblong, spreading, serrately ciliated; leaves oblong, almost obovate, quite entire. H. Native of France, Germany, Tauria, Sicily, &c. in corn-fields. Dufri. val. 50. t. 3. D. C. fl. fr. suppl. 492. coll. mem. t. 3. f. 10. Fèdia carinàta, Stev. mem. soc. mosc. 5. p. 316. Rom. et Schultes, syst. 1. p. 361. Recib. pl. crit. t. 61. —Morph. oxon. sect. 7. t. 16. f. 31. Habit of V. òtiora. Stem smooth, dichotomous. Flowers blue.

Keckled-fruit Lamb's-lettuce. Fl. April, June. CIt. 1819. Pl. 1 3/4 to 1/2 foot.

† Species not sufficiently known.

26 V. chenopodîfolià (D. C. prod. 4. p. 629.) plant dichotomous; leaves ovate, acute, toothed below; cymes naked, divericate, dichotomous; filaments long. H. Native of Virginia. Fèdia chenopodîfolia, Pursh, fl. amer. sept. 2. p. 727.

Goose-foot-leaved Lamb's-lettuce. Pl. cult. The seeds of all the species only require to be sown in the open ground in the early part of spring. All the species answer very well for spring salad.

V. ASTREPHEIA (from a, priv., and ðerpes, strephe, to turn; the calyx is not turned back at the time of flowering, as in Fa-lerià'ud). Dufri. val. 50. exclusive of many species. D. C. coll. mem. vii. prod. 4. p. 629.—Hemesbrià, Rafn. ann. gen. sc. phys. 6. p. 88.—Valeriana species, Ruiz et Pav. Smith.—Fèdia species, Knuth.

LAV. syst. Triântìdum, Monoygias. Tube of calyx very short, somewhat 5-toothed or subcampanulate. Corolla funnel-shaped, 5-toothed, gibbose on one side at the base, and therefore furnished with a kind of spur. Stamens 3. Style 3-cleft at the apex; stigma slender. Fruit 2-celled, one of the cells alone fertile; and the other is sterile, and marked by a furrow in the middle, and is therefore probably formed of 2 cells, having the partition between
them obliterated.—Nearly glabrous herbs. Radical leaves rhomboid, cut; cauline ones impari-pinnate, with oval-oblong, deeply toothed segments. Flowers disposed in panicles or corymbbs, white.—Habit of Valeriana, and the fruit almost of Valeriana, but is easily distinguished from both these genera in the corolla being gibbously spurred on one side at the base, and in the fruit 3-celled. Stamens 2 (f. 113. b). Ripen summer.

2. A. crispa (Dufr. val. p. 51.) stem glabrous, as also at the nodi; panicle elongated, with dichotomous branches, floriferous in the axis of the forks; corolla gibbose at the base; limb of calyx sub-campanulate, entire. (f. 2.) Native of Chili, among bushes, and in meadows and corn-fields. Valeriana crispa, Ruiz et Pav. 1. p. 41. Herb 2 feet high. Flowers white. Curved Astrephia. Pl. 2 feet.

3. A. laxa (Hook. et Arn. in bot. misc. 3. p. 364.) plant herbaceous, glabrous; radical leaves ovate-cordate, bluntly toothed; cauline leaves lorate, pinnatifid, terminal lobe the largest; panicle loose, divaricate; ultimate pedicels short, crowded; fruit ovate, excavated on one side, 3-ribbed on the back, and crowned by an annular ring.—Native of Chili, about Concepcion. Fedia laxa, Hook. et Arn. in Deech. voy. pt. bot. p. 28. This species approaches near to Fedia paniculata, but that plant is pubescent, and has a pappose fruit. Loose-flowered Astrephia. Pl. 1 foot.

4. A. lobata (Hook. et Arn. in bot. misc. 3. p. 364.) leaves pinnate-lobed; lobes distant, coarsely toothed; terminal lobe broadly ovate, lateral ones oblong, much smaller; lower teeth looking downwards, upper ones upwards; rachis glabrous; corymbbs pedunculate, opposite, distant, disposed in a panicle; fruit glabrous.—Native of Chili. Var. a; stem beset with long hairs. The stem below the last pair of opposite cauline leaves is hairy, above them it is glabrous. Var. b; stem glabrous.—Native of Chili, about Valparaiso. Lobed-leafed Astrephia. Pl. Cult. A. choriophyllodes should be treated like other tender annuals; the rest should be protected in winter by placing them in a frame or greenhouse. All are only to be increased by seeds.

Lin. Syst. Diaëndia, Monogynia. Limb of calyx short and straight; lobes 4, subulate, unequal (f. 113. c). Corolla with a filiform spurred tube (f. 113. a), and an unequally 5-lobed suborbicular limb (f. 113. b). Stamens 2 (f. 113. c). Fruit indehiscent (f. 113. d), rather spongy, 8-celled; the 2 sterile cells narrow, and the fertile one broader and 1-seeded.—Glabrous annual herbs. Leaves entire or toothed. Flowers capitately corymbose or cymose, rose-coloured or purple. Bractees adpressed.

27.—Riv. mon. t. 5. Stem purplish. Flowers red. This is a very ornamental annual. The fruit is like a cornucöpii. Cornucöpii-fruit Fedia. Pl. June, July. Clt. 1796. Pl. ½ foot, straggling.

2 F. scorpioides (Dufr. val. p. 55. t. 1.) leaves ovate, petiolate; lower ones quite entire; middle ones irregularly toothed; upper ones lanceolate, hardly pinnatifid; flowers cymose, unilateral and sessile along the two branches of the cyme. (f. 2.) Native of the north of Africa, about Tangiers. Flowers purple. Scorpion-like-cymed Fedia. Pl. ½ foot.

† Species not sufficiently known.

3 F. Panaeula (Colla, app. 3. p. 38.) lower leaves spatulate, nearly entire; middle ones lanceolate, obsolescently toothed: upper ones linear-lanceolate, quite entire; stems erect, glabrous; panicles dichotomous. (f. 3.) Native country unknown. Perhaps a species of Valerianella. Panicled Fedia. Pl. 1 foot.

Cult. The seeds of the species of Fedia only require to be sown in the open border in spring, like other hardy annuals. A light soil suits them best.

Lin. Syst. Triandria, Monogynia. Margin of calyx straight, quite entire. Tube of corolla furnished with a short spur at the base, and gibbous in front; limb 3-cleft, bilabiata. Stamens 3. Capsule cartilaginous, 1-celled, 2-winged; but the capsule may be truly said to be 3-celled, the 2 empty or abortive cells forming the wings.—A glabrous herb, with a habit between Centrianthus and Fedia, but the flowers are triandrous, and the fruit is singularly distinct. Flowers monoeccious, rose-coloured, crowded, in whorles. Bractees multifid, with subulate segments.

1 P. Congesta (D. C. prod. 4. p. 631.) (f. 2.) Native of the north-west coast of America, on the banks of streams and moist rocks, along the shore near the mouth of the Columbia, where it was collected by Douglas. Valerianella congéstá, Lindl. bot. reg. t. 1095. Var. β, minor (Hook. fl. bor. amer. 1. p. 291.) leaves narrow. (f. 2.) Native along with the species. Valerianella parviflora, Dougl. mas.

Cult. The seeds of this plant only require to be sown where the plants are intended to remain in the open border.

Linn. syst. Monandria, Monogynia. Limb of calyx involute (f. 114. b) when the flower is in blossom, but afterwards it unfolds into a deciduous pappus, composed of many plumose bristles (f. 114. b). Corolla with an obovate tube, which is spurred at the base (f. 114. c), and a regular 3-lobed limb (f. 114. d). Stamen 1 (f. 114. e). Fruit indehiscent, 1-seeded, and 1-seeded at maturity.—Quite glabrous European herbs. Leaves undivided or pinnate. Flowers red or white, unilaterial along the branches of the panicle, which is corymbose.

* Spur of flower elongated. Flowers red, very rarely white.

1. C. longifolius (Stev. obs. pl. ross. p. 76.) leaves lanceolate-linear, quite entire; spur of corolla about equal in length to the tube, and about twice the length of the ovary; genitils twice the length of the limb of the corolla. 2. H. Native of Armenia, about Tiflis, among rocks. C. angustifolius, Bieber. fl. taur. 1. p. 67. but not of D. C. The leaves are intermediate in breadth between the two following, and are probably glaucous like them. Corollas red, an inch long.

Pl. 1 to 2 feet.

2. C. angustifolius (D. C. fl. fr. 4. p. 239.) leaves linear-lanceolate, quite entire; spur one-half shorter than the tube of the corolla, and about equal in length to the ovary; genitils much exserted. 2. H. Native of Spain, south of France, Switzerland, Italy, Greece, on the mountains in stoney open places. Dufr. val. p. 39. Val. rubra, β, Lin. spec. p. 44. Valeriana angustifolia, Cav. icon. 4. t. 253. Sibth. and Smith. fl. græc. t. 29. but not of Host. Val. monandria, Vill. delph. 2. p. 236. Flowers red, half an inch long. This plant does not change under cultivation.

Narrow-leaved Spurred-Valerian. Fl. May, July. Ch. 1759.

Pl. 1 to 2 feet.

3. C. rupestris (D. C. fl. fr. 4. p. 632.) leaves ovate or lanceolate: upper ones unequal at the base, toothed a little; spur one-half shorter than the tube, and much longer than the ovary; genitils exceeding the corolla but a very little. 2. H. Native of the south of Europe, the Levant, north of Africa, and on Mount Venusus, and now cultivated in almost every garden. It is to be found in some parts of Britain, on chalk cliffs, on walls, and among rubbish, but is probably an escape from gardens. Stev. obs. pl. ross. p. 67. C. maritimus, Gray. brit. arr. 2. p. 479. C. latifolius, Dufr. val. p. 38. H. B. et Kuth, nov. 3. p. 323. Valeriana rubra, All. ped. 1. p. 1. Valeriana rubra, a, Lin. spec. p. 44. engl. bot. t. 1351.—Berg. phyt. t. 141. Don. penn. 551. f. 1.—Riv. mon. t. 3. f. 2. Plant of a glaucous hue. Flowers red.—There is a variety of this with narrow leaves, and another with white flowers. In this and the preceding the root is sweet-scented, and the stem suffruticose at the base.

* * Spur of flower very short (f. 114. c.). Flowers white.

4. C. nervosum (Moris. clench. sard. 2. p. 4.) leaves all elliptic or oblong-lanceolate, attenuated into the petioles, 3-7-nerved, quite entire; flowers cymose, corymbose; spur very short. 2. H. Native of Corsica, at a place called Alle Trinita, and on Sardinia, on the mountains. Valeriana trinervis, Viv. fl. cors. p. 3. add. fl. Ital. p. 67. Flowers white.

Nerved-leaved Spurred-Valerian. Pl. 1 foot.

Cult. All the species are elegant border-flowers. They will grow in any common soil, or on walls or rock-work, and are all readily increased by seed.

IX. VALERIANA (said by some to be named after one Valerius, who is said to have used this plant first in medicine; and by others to be from valere, to be in health, on account of the medicinal qualities of V. officinalis). Neck. elem. 1. p. 123.

Linn. syst. Triandria, Monogynia. Limb of calyx involute in the time of blossom, but it unfolds itself at last into a deciduous pappus, which is composed of many plumose bristles (f. 115. d). Corolla with an obovate or cylindrical tube (f. 115. b), which is equal at the base or gibbous, but not spurred, with a bluntly 5-cleft limb (f. 115. b.), rarely 3-cleft. Stamens 3 (f. 115. b.). Fruit indehiscent, 1-celled and 1-seeded at maturity.—Herbs or subshrubs. Leaves variable even in the same plant. Flowers corymbose, capitate or panicked, nearly all white, rarely blue, rose-coloured, or yellow.

Stiff Valerian. Pl. tufted.

2. V. tenufolia (Ruiz et Pav. fl. per. 1. p. 39. t. 65. f. d.) plant stemless; leaves crowded in a stellate manner, linear-subulate, ciliate at the base, very unequal, outer ones very long; corymba sessile, crowded, head-formed; corollas 3-cleft; genitils exserted. 2. F. Native of Peru, on the tops of the Alps. Phyllactis tenuifolia, Pers. ench. 1. p. 39. Dufr. val. p. 53. Flowers white.

Fine-leaved Valerian. Pl. tufted.
3 V. SPATULATA (Ruíz et Pav. fl. per. 1. p. 40. t. 68. f. b.)

4 V. obovata (Schultes, mant. 1. p. 214.) plant stemless, tufted; root fusiiform; leaves disposed in a stellate manner, linear-spatulate, obtuse, hairy; flowers umbracellate, capitate, involucrated.

5 V. stellata (H. B. et Kunth, nov. gen. amer. 3. p. 326.) stem suffruticosum, and is as well as the branch. quadrangular, glabrous, pilose at the nod; leaves ovate-oblong, denticulated at the base, triple-nerved, rather fleshy, glabrous; corollas dichotomous, dicate; corolla 5-cleft; stamens inclosed; fruit glabrous.

67;5 Native of Peru, on the Andes. Corolla red, gibus at the base. Pappus about 14-rayed.

Quadrangular-branched Valerian. Shrub.

11 V. TripHylla (H. B. et Kunth, nov. gen. amer. 3. p. 326.) branches woody, terete, glabrous; branchlets angularly furrowed; leaves 3 in a whorl, sessile, lanceolate-oblong, coriaceous, glabrous; heads by threes, axillary and terminal, pedunculate; corolla 5-cleft; stamens exserted. G. Native of New Granada, near Santa Fe de Bogota, in frigid places on the mountains.

Three-leaved Valerian. Shrub.

12 V. nuestrilla (H. B. et Kunth, nov. gen. amer. 3. p. 327.) stem suffruticosum, terete, hairy; branchlets hairy; leaves linear-lanceolate, quite entire, 3-nerved, somewhat coriaceous, rather pilose above, and glabrous beneath; panicles much branched; fruit glabrous.

9 G. Native of the Andes of Quito, on the top of Mount Assuay. Flowers unknown. Pappus 6-8-rayed.

Hairy Valerian. Shrub 2 to 3 feet.

13 V. Chamedrifoá (Cham. et Schlecht. in Linnaea. 3. p. 129.) stem shrubby, erect, downy at the tops, and densely leafy; leaves ovate-lanceolate, coarsely and bluntly serrated; panicles straight, pyramidal; corolla 5-cleft; genials about equal in length to the corolla. G. Native of the interior of Brazil. Flowers small. Fruit unknown.

Germander-leaved Valerian. Shrub.

§ 2. Stems scandent, shrubby, rarely herbaceous. Leaves undivided.

14 V. Tomentosa (H. B. et Kunth, nov. gen. amer. 3. p. 327.) shrubby, scandent; branches terete, clothed with hoary tomentum; leaves ovate, denticate at the base, membranous, downy above, and clothed with white tomentum beneath; corollas hairy, pedunculate, dichotomous; corolla 5-cleft; genials exserted. G. Native of the temperate parts of Quito, in the valley of Choto. Corolla small, white, gibus at the base. Fruit unknown.

Tomentose Valerian. Shrub cl.

Clematis-like Valerian. Shrub cl.

16 V. Cassifolia (H. B. et Kunth, nov. gen. amer. 3. p. 328. t. 274.) shrubby, scandent; branches terete, glabrous; leaves ovate-elliptic, obtuse, quite entire, rather fleshy, glabrous; corollas trichotomous, divericate; corolla 5-cleft, pilose outside; stamens inclosed; style exserted. G. Native of New Granada, in frigid places, near La Erre and Sebondo. Fruit unknown.

Thick-leaved Valerian. Shrub cl.

17 V. Laurus (H. B. et Kunth, nov. gen. amer. 3. p. 328.) shrubby; branches terete, glabrous, tergionwhile young; leaves ovate-oblong, acuminate, quite entire, rather coriaceous, quite glabrous and shining; panicles branched, with the branchlets and bracteas downy.

G. Native of New Granada.
Granada, in alpine situations. Flowers monocious, ex Mutis. 

Nearly allied to V. crassifolia.

18. 

Valerianae. 

Laurel-leaved Valerian. Shrub cl.

18. V. scanens (Lin. spec. p. 47. but not of Forsk.) plant glabrous, herbaceous, scandent; branches terete; leaves trifoliate; leaflets quite entire; the terminal broad-ovate, acuminate; large: lateral ones lanceolate, smaller; panicles axillary, loose; stamens exserted; fruit rather pilose. 2. S. Native of New Andalusia, near Caripe, and about Cumaná; and also of Brazil and St. Domingo, and probably of Mexico. H. B. et Kuth, nov. gen. amer. 3. p. 333. Vilm. et Schultes, 1. p. 353. mnt, 1. p. 257. V. volubilis, Moc. et Sesse. fl. mex. with a figure. Loclf. lit. p. 235. no. 64.

Climbing Valerian. Pl. cl.

§ 3. Stems herbaceous, never scandent. Leaves all undivided.

* Species natives of America.

19. V. pilosa (Ruiz et Pav. fl. per. 1. p. 39. t. 66. f. a.) stem herbaceous, erect, pilose; leaves linear-lanceolate, pilose, with revolute margins: radical leaves obtuse: cauline ones few, distant, acutish; corymb racemose; stamens exserted. 2. G. Native of Peru, in frigid places. The whole herb has the habit of Plantago alpina. Corollas white.

Pilose Valerian. Pl. 1. foot.

20. V. longifolia (H. B. et Kuth, nov. gen. amer. 3. p. 330.) stems herbaceous, terete, rather hairy; leaves quite entire, coriaceous, glabrous: radical ones linear-lanceolate, petiolate: cauline ones linear, sessile; panicle branched; corolla 5-cleft, glabrous; stamens exserted. 2. G. Native of New Granada, in alpine places. There is a variety of this with the stem 1-3 feet high, and the radical leaves 3-12 inches long. Corollas white. Nearly allied to V. pilosa and V. plantaginea.

Long-leaved Valerian. Pl. 1 to 3 feet.

21. V. salicariifolia (Vahl, enum. 2. p. 16.) plant glabrous, herbaceous; stem simple, striated, rooting at the bottom; leaves lanceolate, quite entire, sessile: upper ones cordate at the base; corymbs terminal, decomposed. —Native of Buenos Ayres.

Saliciarion-leaved Valerian. Pl. 1 1/2 foot.

22. V. plantaginea (H. B. et Kuth, nov. gen. amer. 3. p. 329.) stem herbaceous, erect, trigonar, furrowed, glabrous, pilose at the nodi; leaves quite entire, coriaceous, glabrous: radical leaves oblong-spatulate, petiolate: cauline ones lanceolate, sessile, connate at the base; panicles branched; stamens exserted; fruit glabrous. 2. G. Native of Quito, in arid places, on the plains of Antisana, and on the declivities of Mount Pichincha. Flowers white. Pappus of fruit few-rayed.

Plantain-like Valerian. Pl. 4 to 6 feet.

23. V. lariatipifolia (Vahl, enum. 2. p. 11.) stem herbaceous, striated, glabrous; leaves ovate-cordate, almost quite entire, undivided, villous above on the nerves, the rest of the leaf glabrous: superior leaves sessile; corymb trichotomous.—Native of the Straits of Magellan.

Dock-leaved Valerian. Pl. 1 1/2 foot.

24. V. urticifolia (H. B. et Kuth, nov. gen. amer. 3. p. 330. t. 275.) stem herbaceous, erect, terete, hairy: leaves roundish-ovate, subcordate, acute, simply toothed, rather pilose above; lower leaves petiolate; upper ones sessile; panicles branched; corymbs downy; corolla glabrous at the base; geniculate petals. —Native of New Granada and Peru. Flowers white. Root a round tuber.

Nettle-leaved Valerian. Pl. 1 foot.

25. V. scorpioides (D. C. pro. 4. p. 635.) stem rather herbaceous, erect, terete, downy; leaves ovate or roundish, dentately crenated, pilose above and on the margins; panicle corymbose, trichotomous; branches of panicle elongated, bearing uniseriate flowers; fruit small, ovate, glabrous. 2. H. Native of Mexico, in the valley of Tolucca, where it was collected by Berlandier. Habit almost of Fedia scorpionis.

Scorpion-like Valerian. Pl. 1 foot.

26. V. robusta (H. B. et Kunth, nov. gen. amer. 3. p. 329.) stem herbaceous, furrowed, glabrous: cauline leaves sessile, ovate-cordate, long-acuminate, sharply toothed, stiff, glabrous; panicles much branched; fruit villous. 2. F. Native of Mexico, near Pascuar. Flowers unknown. Pappus of calyx 11-12-rayed.

Tall Valerian. Pl. 3 to 4 feet.

27. V. macrorhiza (Poepp. pl. exsic. no. 918.) glabrous; radical leaves spatulate, obtuse, tapering into the petiole, which is twice the length of the limb; scalps a little higher than the leaves; panicles racemose spicate, terminal, having the racemes opposite: the lower ones pedunculate: floral leaves linear. 2. F. Native of Chili, near the baths of Villa Vicencio and La Quebrada de San Isidro, and on the Andes of Mendoza. Root thick. Flowers white. Stamens exserted. Habit almost of V. coarctata.

Long-rooted Valerian. Pl. 1 foot.

28. V. coarctata (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. a.) stems herbaceous, erect, simple, striated, downy; leaves narrow-lanceolate, attenuated, denticulated, ciliat: cauline leaves few: flowers crowded in whorles, disposed in a somewhat interrupted spike. 2. G. Native of Peru, at Huassa-Hussi, in frigid places in the province of Tarma. Flowers white. Fruit said to be oblong, and crowned by 5 scales. Astrepho coarctata, Dufr. val. p. 50.

Coarctate Valerian. Pl. 1 foot.

29. V. serrata (Ruiz et Pav. fl. per. 1. p. 40. t. 68. f. c.) plant tufted, glabrous; stems striated; leaves cuneate-lanceolate, serrated from the middle to the apex; flowers in crowded whorles, disposed in an interrupted elongated spike. 2. G. Native of Peru, in cold places. Astrepho serrata, Dufr. val. p. 51. Flowers white. Fruit as in V. coarctata, to which it comes very near.

Serrated-leaved Valerian. Pl. 1 1/2 foot.

Fleshy Valerian. Pl.

31. V. elongifolia (Ruiz et Pav. fl. per. 1. p. 40. t. 65. f. a.) plant herbaceous, pilose on the stems, few, striated, almost leafless; leaves oblong, dentate, obtuse: cauline ones linear, serrately-cut; corymbs contracted. 2. F. Native of Peru, on the alps in the province of Tarma, towards Pasco. Flowers white.

Oblong-leaved Valerian. Pl. 1 foot.

32. V. obtusifolia (D. C. pro. 4. p. 655.) plant herbaceous, erect, glabrous; root tuberous; leaves obtuse: lower ones obovate or oval, petiolate: upper ones sessile, oval-oblong, toothed at the base; corymbs coarctate. 2. F. Native of Chili. Valerianæ, no. 530. Poepp. pl. exsic. Fruit unknown. Herb 3-7 inches high. Flowers white, crowded. Stamens not exserted. Allied to V. oblongifolia, and with it is intermediate between the present and following division of the genus.

Blunt-leaved Valerian. Pl. 1 1/2 foot.

** Species natives of Europe and the Levant.

33. V. alliarifolia (Vahl, enum. 2. p. 11.) plant glabrous, erect; stem striated; leaves all cordate, undivided, equally toothed, acuminated: lower ones petiolate, upper ones almost sessile; corymbs rather contracted; fruit glabrous. 2. H. Native of Cappadocia, Iberia, and throughout Caucasus, in alpine
Valerianaæ. 675

IX. Valeriana.

places. Valeriana macrophylla, Bieb. fl. taur. 1. p. 25. Flowers white, tinged with red.

Var. γ. cuspidata, (D. C. prod. 4. p. 636.) stems humble, nearly naked; lower cauline leaves ovate, acuminate, undivided or subtrifid. 2. H. Native of Abruzzo, on the Appenines. Val. cuspidata, Bert. inded.

35 V. Alpést里斯 (Stev. in mem. soc. nat. mosc. 5. p. 342.) radical leaves ovate, almost quite entire, obtuse: cauline leaves tripartite or ternate, acute: upper ones linear, entire; flowers capitately corystis; pappus of calyx equal to the achenia in length. 2. H. Native of Siberia, about the fountains of the rivers Sentelek, Uba, and Iina; and of Caucasus, in alpine meadows. V. montana, Bieb. fl. taur. 1. p. 25. no. 67. 3. p. 28. Schiir., fig. 1. p. 256.—Gmel. sib. 5. p. 121. no. 2. The whole plant is glabrous. Corystis coarctate when in flower, but rather loose while in fruit.

Alp Valerian. Pl. 1 foot.

36 V. saxatilis (Lin. spec. p. 45.) radical leaves on long petioles, elliptic, 3-5-nerved, undivided, or a little toothed, ciliated: cauline leaves few, small, linear; stems erect; corystis racemose; fruit glabrous. 2. H. Native of the Alps of France, Austria, Italy, &c. Jacq. austr. t. 267. vind. 204. D. C. fl. fr. no. 3239. Bert. amen. ital. p. 326. Krok. sii. no. 52. t. 6.—Pluk. phyt. t. 232. f. 2. Root blackish, very smooth, and when chewed leaving a bitterness on the tongue. The whole plant shining, and about half a foot high, with the stems subdivided at top. Flowers white, often dioecy-polypogamous.

38 V. Salix (All. ped. 1. p. 8. t. 70. f. 1.) plant glabrous; leaves spatulate or obovate, obtuse, entire, on short peti-
lobes or leaflets oblong or acuminate, and the terminal one broad-ovate or roundish, cordate, serrated; corymbs ample; fruit glabrous. 4. H. Native of the Pyrenees, in woods; and of Scotland, in woods, particularly 48 about Edinburgh and Glasgow. D. C. fl. fr. no. 3317. Sowerb. engl. bot. t. 1591.—Phlom. phyt. t. 232. f. 1. V. Canadensis, Riv. mon. t. 6.—Buxb. cent. p. 2. t. 19. t. 11. A showy pale green herb, with large leaves. Flowers pale red, disposed in ample corymbs. There is also a white flowered variety of this plant.

43 V. ITALIC (Lam. ill. 1. p. 92.) plant glabrous, erect; stems terete, nearly smooth; radical leaves petiolate, undivided, ovate-oblong, remotely toothed, the rest pinnate; leaflets or lobes ovate or ovate-oblong, toothed; corymbs subpanicled; fruit glabrous. 2. H. Native of Liguria and Candia, on the mountains. Val. cinn. 2. p. 6. Dufr. val. p. 43. V. tuberosa, Imp. hist. nat. ed. 2. p. 656. with a figure. Flowers truly triunyrid, not tetranourous, as said by Lam. and Vali.

Italian Valerian. Pl. 1 to 2 feet?

46 V. elongata (Lin. spec. p. 1664.) plant glabrous, erect; stems striated; radical leaves petiolate, oval; cauleine leaves sessile, subcordate or hastate; upper leaves deeply 3-5-cleft, acute; panicle elongated, with the lateral branches short and subcorymbose; corolla very short, tubularly campanulate; fruit glabrous. 2. H. Native of Austria, Carniola, &c. on the alps. Jacq. fl. austr. 3. t. 219. vid. t. 1. Morr. ox. sect. 7. t. 13. f. 20. Root whitish, with little taste or smell. Flowers dusky. Stems 6-10 inches high.

 VAR. <i>polygama</i> (D. C. prod. 4. p. 637.) plant larger; upper leaves triunyrid. 2. H. Native of Galicia, in humid meadows. V. dioica, Bess. in litt. var. 4. p. 40. V. polygama, Bess. in litt. Flowers corymbose, a little larger than in V. elongata; but very similar in form.

47 V. ASARIFOLIA (Dufr. val. p. 44.) plant glabrous, erect; radical leaves petiolate, cordate-reniform, a little toothed; cauleine leaves few, pinnate; lobes or leaflets of the upper leaves linear; corymbs rather contracted. 2. H. Native of Crete, on the Spaeotic mountains. Sieb. herb. cact. Schultes. syst. 1. p. 356. mant. 1. p. 239.—Alp. exot. p. 132. with a figure. Flowers red. Root tuberous, black.

49 V. TUBEROBA (Lin. spec. p. 46.) plant glabrous; radical leaves ovate, lanceolate-oblong or oblong, undivided, quite entire; cauleine leaves pinnatifid, with 2-3 pairs of linear segments or lobes, the terminal segment the largest; corymbs at first coarctate; fruit ovate, hairy. 2. H. Native of the south of Europe, from Spain to Caucasus; of Siberia, near Sogra and Wydricha, and from Buchitormisk to Lake Neor Saisali. Val. cinn. 2. p. 12. Dufr. val. p. 43. D. C. fl. fr. no. 3320. Lob. icon. t. 717. f. 2. Can. epid. p. 16. Root tuberous, blackish, simple or double, ovate or oblong. There are varieties of this species with the cauleine leaves all pinnatifid, or the lower ones are quite entire, oblong-lanceolate and elongated, and the upper leaves more or less pinnatifid. Flowers pale red.

49 V. PHU (Lin. spec. p. 45.) plant glabrous, erect; stems terete, smooth; radical leaves oblong or elliptic, undivided; cauleine leaves pinnatifid, with oblong lobes; corymbs panicked; lobes of stigma 3, slender; fruit glabrous, but exhibiting 2 hairy lines. 2. H. Native of Alsaysia, Switzerland, Silesia, Caucasus, &c. in subalpine places, but not of the Pyrenees. Dufr. val. p. 40. but not of Lapwyer, nor Ruiz et Pav..—Fuchs, hist. p. 153. with a figure. Heal. arz. gew. 3. t. 33. no. 22. good. —Blackw. t. 256.—Plench. t. 28. Moris, hist. sect. 7. t. 14. f. 1. Riv. mon. t. 3. Lob. icon. t. 714. Root oblique, thick, and matted, pale green. Plant glaucous. Flowers white, with a pleasant smell.

50 V. dura (Bunge, in Led. fl. alts. 1. p. 52.) primary radical leaves quite entire or auricled; the rest nearly pinnatifid, and the cauleine leaves pinnate; leaflets oblong, obtuse, almost entire: superior ones deciduous; corymbs compound; flowers hermaphroditic. 2. H. Native of Siberia. V. officinalis, Falk. topogr. beyr. 2. no. 59. —Gmel. fl. sib. 3. p. 129. no. 1. exclusive of the synonyms. This species is very nearly allied to <i>V. officinale</i>, but differs from it in the lower leaves being undivided or auricled. Stem and margins of leaves beset with minute adpressed hardly conspicuous pili.

VAR. <i>a. latifolia</i> (Bunge, l. c.) segments of leaves 7-11, more remote and broader than in var. <i>b.</i> 2. H. Native of Siberia, frequent on schistous mountains in exposed places.

VAR. <i>b. augustinfolia</i> (Bunge, l. c.) segments of leaves 21-27, more crowded and narrower, and more elongated than in var. <i>a.</i>

2. H. Native of Siberia, near Salair and Barnaul.

Doubtful Valerian. Pl. 2 to 3 feet.

51 V. noaica (Lin. spec. p. 44.) plant glabrous, erect; stems striated; radical leaves petiolate, ovate or subpatulate, undivided; cauleine leaves pinnatifid, with linear-oblong lobes; flowers of the female corollas of the male flowers loose; of the female ones contracted; lobes of stigma almost combined; fruit glabrous. 2. H. Native of Europe and the Levant, in wet meadows and marshes, and by the sides of streams and ditches; in Britain in moaty meadows frequent. Dufr. val. p. 29. Oed. fl. dan. t. 687. Sturm, deutsch. fl. with a figure. Heyne, arz. gew. 3. p. 478. Smith, engl. bot. 628. Curt. lond. 4. t. 3. Poit. et Turp. fl. par. t. 41. V. sylvestris, Gray. brit. arr. 2. p. 478. V. montana, gen. el. no. 31. ex Wahlen. Roots horizontal, creeping, white, but sometimes tinged with red, slender. Flowers white, tinged with red or flesh coloured.

VAR. <i>β. integrifolia</i> (D. C. prod. 4. p. 637.) all the leaves both radical and cauleine are quite entire. 2. H. Native of Siberia, dioica, or dioica, Reich. icon. 1. p. 48. t. 73. —Loes. pruss. no. 724. t. 84.

** Species natives of America.**

52 V. capitata (Pall. in Wild. herb. no. 789. exclusive of Cham. et Schlecht. which is Gentiana frigida,) plant glabrous, erect; stems downy at the nodes; radical leaves petiolate, roundish, simple; cauleine ones almost sessile, simple or teregate; leaflets minutely serrated, middle one the largest; panicles terminal, capitate, girded by long linear bracteas; tube of corolla elongated; fruit ovate, compressed, glabrous. 2. H. Native of the higher ranges of the Sagan Alps, at the bay of St. Laurence; Korzeheue's Sound; on the Arctic shores of America beyond Behring's Straits; and between the Coppermine and Mackenzie rivers. Link, Jahrb. 1. pt. 3. p. 66. Cham. et Schlecht. in Linnae. 3. p. 130. Perhaps distinct from <i>V. tripteris</i>, ex Stev. obs. in herb. Wild.

CAPITATE-FLOWERED VALERIAN. Pl. 1 foot.

53 V. VULSVMICINA (Banks, miss. Richards, in Frankl. 1st journ. ed. 2. append. p. 2.) plant glabrous, erect; stems striated; radical leaves petiolate, ovate or subpatulate, undivided; cauleine leaves pinnate-parted, with ovate-lanceolate nearly entire

IX. VALERIANA.
segments; flowers hermaphrodite; lobes of stigma 2-3, minute; fruit ovoid, compressed, glabrous. 2. H. Native of Newfoundland, ex Banks, Clear-water River, ex Richards, Prairies of the Rocky Mountains abundant, ex Drummond. In every respect this agrees with the European V. dioica. It differs from V. Phl by the smaller and shorter fruit, and entire absence of the two hairy lines.

Wood Valerian. Pl. 1 foot.

54 V. LAXIFLORA (D. C. prod. 4. p. 658.) plant glabrous, ascending, suffrutescent at the base; leaves petiolate, ovate or oval, with a few coarse irregularly dentately cut teeth; floriferous branches elongated, almost naked; superior leaves pinnate-parted, with 1-2 linear quite entire leaves on each side; floral leaf linear; petiole loose, with opposite branches, which are trifid and few-flowered at the apex. 2. F. Native of Chili. Valeriana, no. 825. Poepp. pl. exsic. Fruit oblong, glabrous.

Lax-flowered Valerian. Pl. ascending.

Shining-rooted Valerian. Pl. ½ foot.

56 V. HUMBERTII (Hook. et Arn. in Bot. misc. vol. 3.) stem herbsaceous, erect, terete, and is as well as the leaves smoothish; radical leaves entire, roundish-elliptic, crenated; cauleine leaves sessile, pinnatifidly lyrate; paniciles much branched; corollas quincunciform; stamens exerted; fruit glabrous. 2. F. Native of Peru, in rocky places. V. hyalinoriza, H. B. et Kunth, nov. gen. amer. 3. p. 331. but not of Ruiz et Pav.

Humboldt’s Valerian. Pl. ¾ to 1½ foot.

57 V. PINNATIFIDA (Ruiz et Pav. fl. per. 1. p. 40. t. 69. f. b.) plant herbsaceous, glabrous; stems erect, simple, striated; two lower leaves lanceolate, quite entire; the rest pinnatifid, with oblong-serrate-toothed lobes; petiole loose; lateral corymb dichotomous; stamens exerted. 2. F. Native of Peru, at Chaney and Lima on hills. Val. brachia, Pers. exch. p. 1. 57. Root tufted, very sweet, scented, as in V. Phl. Flowers white. A variety of the present plant, or a distinct species, was gathered by Berton in the grassy pastures on Mont La Leona on Llanquihue, in Chili.

Pinnatifid-leaved Valerian. Pl. 1 foot?

58 V. LECORDA’RPA (D. C. prod. 4. p. 638.) plant herbaceous, erect, glabrous; lower leaves on long petioles, obov-oblong, obtuse, attenuated at the base, membranous; cauleine leaves very few, small, pinnate-parted at the base, with linear lobes; petiole loose, with opposite trichotomous branches; fruit pale, glabrous, compressed. 2. F. Native of Chili. Valeriana, no. 847. Poepp. pl. exsic. Stem 2 feet high. Radical leaves with the petioles 10-12 inches long. Stamens not exerted. Pappus of calyx plumose.

White-leaved Valerian. Pl. 2 feet.

59 V. YAGINATA (H. B. et Kunth, nov. gen. amer. 3. p. 331.) plant glabrous; stems tufted, simple, tetragonal; radical leaves oblong-oblongate, petiolate, toothed a little; cauleine leaves sinuatly pinnatifid, sheathed at the base, with linear plicate segments; corymbs crowded; stamens inclosed; style much exerted. 2. F. Native of New Spain, in humid places near Real del Monte. Corolla glabrous, gibbous at the base, white. Sheathed-leaved Valerian. Pl. ½ foot.

60 V. PANICULATA (Ruiz et Pav. fl. per. 1. p. 41. t. 70. f. a.) plant herbaceous, villous; stems many, erect, strictly furrowed, terete, rather 2-edged; radical leaves uniodivided, coriaceous, acute; cauleine leaves pinnate, with 3-5 ovate acute, denti- culated leaflets; petiole dilute; stamens length of corolla. gibbous at the base, white. Pappus of calyx 10-rayed.

Panicled flowering Valerian. Pl. 2 to 3 feet.

61 V. PANICLED-FLORIDA (Michx. fl. bor. amer. 1. p. 18. Hook. fl. amer. 1. p. 291. t. 101.) plant herbaceous, glabrous; stems erect, simple, furrowed; radical leaves simple, coriaceous, sinuatly crenated, petiolate; cauleine ones lyrate pinnatifid, with 5-7 segments or leaflets, those at the tip of the stem trifoliate or simple; leaflets broad-ovate, acute, sinwatly toothed; petiole scattered; corymbs few-flowered; corollas tubular; stamens exerted; fruit ovate, compressed, glabrous. 2. H. Native of North America, on the Alleghany mountains in shady places; and in woods on the Rocky Mountains north of the Smoking river, and on Wolf’s plain. Nutt. gen. amer. p. 29. Pursh, fl. amer. sept. 1. p. 28. Root thick, creeping, efiuviating fibres. Stems hairy at the nodi. Flowers white, ex Nutt., pale blue, ex Torrey, rose-coloured, ex Hook. Panicle terminal, cymose. 2. H. Native of Chili, Valeriana, no. 942. Poepp. pl. exsic. Herb 1½ foot high. From the fruit being canescent, it agrees with V. Papilla, but the fruit is 3 or 4 times smaller.

Hairy-fruited Valerian. Pl. 1½ foot.

§ 5. Stems herbaceous. Leaves all pinnate-lobed.

* Species natives of America.

63 V. Papilla (Bert. in litt. ex D. C. prod. 4. p. 638.) stems erect, glabrous; leaves glabrous, lyrate pinnatifid: having the lateral lobes linear and entire, and the terminal one large, obovate-oblong, and somewhat sinuated; petiole trichotomous; fruit oblong, very hispid. 2. F. Native of Chili, in sandy pastures along the Cachiqual, at a place called St. George, where it is called by the natives Papilla, and about the banks of Collina. Herb 1½ foot high. Pedicels plicate. Fruit large. Flowers unknown. Pappus blackish.

Papilla Valerian. Pl. 1½ foot.

64 V. PYRAMIDALIS (H. B. et Kunth, nov. gen. amer. 3. p. 331.) plant glabrous; stem herbaceous, terete, furrowed; leaves pinnate, with sessile ovate-cordate quite entire segments or leaflets; petiole much branched, pyramidal; genitales almost inclosed; fruit oblong, glabrous. 2. F. Native on the walls of the city of Quito. Corolla with a very short tube, white.

Pyramidal-paniced Valerian. Pl. 3 feet.

65 V. BRIDGES (Hook. et Arn. in Bot. misc. 3. p. 365.) glabrous; leaves lyrate pinnatifid; lobes erose, culiared: lateral ones small, terminal one much larger; radical leaves obovate, and more entire than the rest; petiole elongated, with dichotomous distichous branches; fruit ovate, glabrous.—Native of Chili, on the mountains and plains near Valparaiso. Very closely allied to V. crispa, with a totally distinct fruit, which, in this species, is not flat on one side, with a tubercle on the other, but presents a tubercle which is internally spongy on both sides, nor is it half so large as in V. crispa.

Bridge’s Valerian. Pl. 1 to 2 feet?
66 V. polemosoides (H. B. et Kunth, nov. gen. amer. 3. p. 332.) plant downy; stems herbaceous, erect, terete; leaves pinnate; leaflets oblong, on short petioles, quite entire, rather fleshy, smoothish above; pinnule much branched; genitils included. 2. F. Native of the kingdom of Quito, between Hambato and Llactacunga. Corolla glabrous, gibbous at the base, white.

Polemonium-like Valerian. Pl. 2 to 3 feet.

67 V. decussata (Ruiz et Pav. fl. per. 1. p. 42. t. 70. f. b.) plant herbaceous, downy, stems erect, striated; leaves pinnate; leaflets lanceolate, acuminated, a little dentillicated: the terminal one rather the largest; panicle loose, divaricate, downy; stamens nearly inclosed. 2. F. Native of Peru, among rocks, and in hedges. Peduncles decussata. Corolla small, white.

Decussata-peduncled Valerian. Pl. 3 feet.

68 V. Polyacthyia (Smith, icon. med. 3. p. 51.) plant glabrous, erect; stems a little striated; leaves pinnatifid, with linear quite entire acute segments; racemes compound, elongated, composed of opposite spikes.—Native of Buenos Ayres, in moist places, where it was collected by Commerson. Vahl, enum. 2. p. 5. Astrophyia polyacthyia, Dufr. val. p. 51. Oligacoea polyacthyia, Willd. Corolla hardly gibbous at the base.

Many-spiked Valerian. Pl. 2 feet.

69 V. sorbiolida (H. B. et Kunth, nov. gen. amer. 3. p. 332.) stems herbaceous, erect, terete, rather pilose below; leaves pinnate; leaflets sessile, ovate-oblong, cuneated at the base, coarsely serrated, glabrous; panicule much branched; stamens inclosed; style exerted. 2. F. Native of Mexico, on the borders of mountains between Valladolid and Pizaruaro. Corolla glabrous, gibbous at the base, white.

Mountain-ash-leaved Valerian. Pl. 2 to 3 feet.

70 V. sanguisorbofolia (Cav. icon. 5. p. 456.) plant glabrous; stems prostrate at the base, and erect at the apex; leaves pinnate; petioles naked almost to the middle; leaflets sessile, ovate, few-toothed, equal; panicule racemose, oblong, rather loose. 2. F. Native of the Cordillera of Chili, V. sanguisorbea, Pers. ench. 1. p. 37. Flowers white.

Burnet-leaved Valerian. Pl. 1 foot.

71 V. GLAUCUS (Poep. pl. exsic. no. 127.) plant herbaceous, erect, glabrous; stems terete, naked at the apex; leaves glaucescent, pinnate; leaflets obovate-oblong, toothed, those at the base of the petiole small, and those at the top of the leaf larger and confluent; branches of pinnate opposite, trichotomous; bracteas linear. 2. F. Native of Chili, where it was collected by Poepigg. Allied to V. sanguisorbofolia, but the petioles are almost leafy to the base. Leaflets narrowed into the petioles.

Glaucous Valerian. Pl. 1 to 2 feet.

72 V. VIRGATA (Ruiz et Pav. fl. per. 1. p. 42. t. 66. f. b.) plant suffruticose, almost glabrous; stem much branched, striated, rather downy; leaves pinnate; leaflets entire or bifid, with linear bluntish entire lobes; corymb pilose, with dichotomous branches, bearing a sessile flower in each fork; stamens exerted. 2. F. Native of Peru, in the province of Canta, among broken rocks. Flowers white.

Tweiggy Valerian. Pl. 3 feet.

73 V. Gloeifolium (Ruiz et Pav. fl. per. 1. p. 43. t. 65. f. b.) plant herbaceous, humpy, hispid on one side; stems striated, hardly longer than the leaves, almost naked; leaves pinnate; leaflets sinuate-toothed; flowers capitate; bracteas spatulate, membranous. 2. F. Native of Peru, on the alps in the provinces of Tarra and Canta. Corollas white.

74 V. zy.']a (Vahl, enum. 2. p. 4.) plant herbaceous, glabrous; stem bearing 2 leaves; radical leaves lyrate; leaflets oblong, dentately serrated: the terminal one rather pinnatifid:

those of the cauline leaves linear-lanceolate; peduncles trichotomous. 2. F. Native of Peru.

Lavatore-leaved Valerian. Pl. 3 to ½ foot.

75 V. interrupta (Ruiz et Pav. fl. per. 1. p. 42. t. 67. f. a.) plant herbaceous, glabrous; stems many, erect, bearing 2 opposite bipinnatifid leaves under the corymb, which is trichotomous; radical leaves pinnate-parted, and appendiculately toothed between the lobes; segments linear or oblong, unequally bluntly and coarsely toothed; stamens exerted. 2. F. Native of Peru, on the alps in the province of Tarra at Diezmo. Astréphia interrupta, Dufr. val. p. 51. Flowers capitate, sessile. Bracteas linear.

Interrupted-leaved Valerian. Pl. ½ foot.

76 V. crispa (Hook. et Arn. in Beech. voy. pt. bot. p. 27. but not of Ruiz et Pav.) leaves fleshy; inferior ones lanceately pinnatifid, with acutely toothed curved segments; fructiferous panicle coarctate; fruit cordately ovate, plano-convex, broadly margined, with a longitudinal elevated line in front, and 2 lines on the back; pappus plumose, united by a membrane at the base.—Native of Chili, about Concepcion. V. pterocarpa, Hook. et Arn. l.e.

Corded-leaved Valerian. Pl. 1 to 2 feet.

77 V. Celastrophylla (H. B. et Kunth, nov. gen. amer. 3. p. 333. t. 276.) plant glabrous; stems herbaceous, terete, striated; leaves pinnate; leaflets hastately trifid, sessile, with linear acuminated segments; coryumbs dichotomous; stamens exerted; fruit downy. 2. F. Native of Mexico, in high plains near Chapoletpec. Val. dichotoma, Moc. et Sesse, fl. mex. ined. Corolla downy, outside, gibbous at the base, white.

Horn-leaved Valerian. Pl. 1 to 2 feet.

78 V. Toluccana (D. C. coll. mem. vii. prod. 4. p. 640.) plant glabrous, herbaceous, erect; stem nearly terete; leaves pinnate, with 3-4 pairs of membranous repandly toothed leaves, with an odd one: those of the upper leaves very narrow; panicule loose, elongated; lateral corymbs dichotomous; flowers sessile in the forks; fruit oblong, downy. 2. F. Native of Mexico, in the valley of Tolucuo. Very like V. Hardwickii, but differs in the stem and leaves being quite smooth, in the segments of the leaves being more ovate, in the corymbs being dichotomous, and in the fruit being oblong.

Tolucuan Valerian. Pl. ½ to 2 feet?

79 V. Mexicana (D. C. coll. mem. vii. prod. 4. p. 640.) plant herbaceous, erect; stems nearly angular; leaves pinnate, with 2 pairs of oblong leaflets, and an odd one: the latter is larger and ovate, and usually auricled at the base, but all are repandly toothed; panicule loose, elongated, having the lateral branches elongated and trichotomous; stamens exerted; fruit ovate, scabrous. 2. F. Native of Mexico, about the city, where it was collected by Berlandier. Very nearly allied to V. Hardwickii and V. Toluccana, but is distinguished from both by its angular stem.

Mexican Valerian. Pl. ½ to 2 feet?

** Species natives of Asia.

80 V. Leschenaulti (D. C. mem. vii. prod. 4. p. 640.) radical leaves petiolate, ovate, obtuse, crenated, hairy on both surfaces; stems erect, simple, glabrous between the joints, but the joints are pilose; cauline leaves remote, small, sessile: upper ones pinnately divided into 3-5 linear glabrous lobes, the terminal lobe the longest; corymbs contracted; fruit villous. 2. F. Native of the East Indies, on the mountains of Aniguia, where it was collected by Leschenault. Stem 2 feet high. Radical leaves with the petioles, hardly 2 inches long. Habit of V. dioica.

Leschenaulti's Valerian. Pl. 2 feet.

81 V. Meyenni (Wall. cat. no. 434.) the whole plant is
but corymbs fruit those corymbs foot. flowers 171. fruit the 28.) Native of Siberia, near the city of Irkutzk. Stem erect, simple. Radical leaves wanting in the specimen examined. Upper ciliate leaves sessile, but the petals become gradually elongated to the base. Gentils exserted. Corolla 5-parted, cleft longitudinally.

Alternate-leaved Valerian. Pl. 1 to 1¼ foot.

89. **Dioscoriopsis** (Sibth. et Smith. fl. gracc. t. 33.) plant glabrous, erect; lower leaves lyrate-pinnate, with ovate toothed leaflets: the terminal one large; upper leaves with equal lanceolate toothed leaflets; cymes crowded, panediele peduncles dichotomous. 2. H. Native of Lycia. Roots tuberous. Flowers pale red.

**Dissectae** Valerian. Pl. 2 feet.

***Species natives of Europe.***

90. **Valeriana officinalis** (Lin. spec. p. 45.) plant smoothish, erect; stems furrowed; leaves all or nearly all pinnate, with 7-8 pairs of lanceolate serrated leaflets, and an odd one: those of the lower leaves ovate, and coarsely toothed, of the superior ones oblong-lanceolate, toothed, and rather decrement; panicles thyroid. 2. H. Native of Germany. Link, enum. hort. beryl. 1. p. 63. 2. Valeriana, Horn? This is a larger plant in its all parts than **V. officinalis**, and does not change by culture. Flowers pink.

**Elder**-leaved Valerian. Fl. May, June. Ckt. 1819. Pl. 2 to 4 feet.

91. **V. officinalis** (Lin. spec. p. 45.) plant smoothish, erect; stems furrowed; leaves all or nearly all pinnate, with 7-8 pairs of lanceolate serrated leaflets, and an odd one; corymbs at length panicked; fruit glabrous. 2. H. Native of Europe and Caucasus, in humid places, and about the banks of pools and rivers; plentiful in Britain. Dufr. val. p. 40. D. C. fl. fr. no. 3315. Blackw. herb. t. 171. Woodv. med. bot. t. 96. 
Heyne, arz. gew. 3. t. 32. Curt. lond. 6. t. 3. Sover. engl. bot. 695. Oed. fl. dan. t. 570. V. sylvestris, Dodon. pempt. 349. f. 2. Phil. Column. phyt. 114. Phil. Germänicum, Fusch. hist. p. 857. This is a very common and a very variable plant, having the stem from 2 to 4 feet high, glabrous or pilose: the lower leaves almost undivided, or all pinnate, with the leaflets broader or narrower, and more or less decrement, most often toothed, very rarely quite entire, shining or opaque; corymbs contracted or loose: but all these variations are hardly considered varieties. V. lucida, Hort. par. V. excelsa, Poir. dict. 7. p. 501. V. altissima, Mikan in Bess. enum. p. 4. V. répens, Host, austr. 1. p. 5. are only varieties of **V. officinalis**. Root composed of long slender fleshly fibres, uniting into a head, and sending out long fleshly creeping shoots from the crown. Leaves bearded at the base on the under side. Flowers pale red, having a singular colour. Pappus of seeds 12-rayed, purplish. In high dry pasture heaths and woods, the plant becomes smaller and more hairy, with the leaves narrower, and the roots more highly aromatic and less nauseous.

The roots have a strong, and to most people a disagreeable smell; its taste is warm, bitterish, and subacid, communicating its properties to wine, water, and spirit: but it is best in sub stance, and may be taken from half a drachm to 2 drachms to a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in

**Tschupha**, against the mouth of the river Tschegan. Root with long thick yellowish white fibres, emitting arsenna. Leaves glabrous, rather fleshy, the primary ones simple or auricled. Flowers disposed in whorles of three. Pappus of fruit greyish-violet.

**Rock-loving** Valerian. Pl. ½ to 1 foot.

88. **Alternafolium** (Led. fl. alt. t. 1. p. 52.) cauline leaves alternate, pinnate; leaflets lanceolate-linear, downy beneath as well as on the stem; flowers corymbose. 2. H. Native of Siberia, near the city of Irkutzk. Stem erect, simple. Radical leaves wanting in the specimen examined. Upper ciliate leaves sessile, but the petals become gradually elongated to the base. Gentils exserted. Corolla 5-parted, cleft longitudinally.

Alternative-leaved Valerian. Pl. 1 to 1¼ foot.

87. **Petrophila** (Bunge, Led. fl. Ross. ill. t. 19. fl. alt. t. 1. p. 54.) leaves all lyrate-pinnate-parted: the terminal segment the largest, oblong, all quite entire and obtuse; stems simple; flowers verticillately subracemose. 2. H. Native of Siberia, in rough stony places on the tops of Alps at the river

---

**Valerianae. IX. Valeriana.**
hysterical cases; and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual constiveness it is an excellent medicine. The unpleasant flavour of valerian is best concealed by a small addition of mint. A tincture of the root in proof spirit, and in volatile spirit, is ordered in the London Pharmacopoeia. Dr. Cullen says, that if it has sometimes failed, it is from the disease depending upon different causes, or the root being frequently employed in an improper condition, or in doses not large enough.—It is well known that cats are much delighted with the roots. Dr. Stokes informs us, that rats are equally fond of them, and that rat-catchers employ them to draw the rats together.

**Official Valerian.** Fl. June, July. Britain. Pl. 1 to 4 ft. 92 V. stachel'ns (Bongard, in mem. acad. imp. Petersb. 2. p. 145.) stem erect, glabrous, but pilose at the nodi; lower leaves ternate: superior ones pinnate, with 2 pairs of ovate, acuminate, coarsely toothed segments or leaflets; corymbs dense, contracted. V. H. Native of the island of Sicha, where the roots are used by the natives as a precious medicine. Very nearly allied to V. samolifolia and V. officinalis.

**Sitcha Valerian.** Pl. 2 to 3 ft. 93 V. angustifolia (Tausch. ex Host, fl. austr. 1. p. 36, but not of Cav.) plant downy, erect; stems furrowed; leaves pinnate; leaflets linear-lanceolate, obtuse, dilated, quite entire, the 3 terminal ones confluents. 2. H. Native of Bohemia, on hills and mountains. Flowers rose-coloured. Root like that of V. officinalis.

**Narrow-leaved Valerian.** Pl. 1 to 2 feet.

**** A species native of the Cape of Good Hope.****

94 V. cape'nensis (Thunb. prod. p. 7, fl. cap. p. 33.) plant glabrous, erect; stem striated; leaves pinnate; segments or lobes alternate? ovate-toothed, acute, the odd one the largest; corymbs panicled. 2. G. Native of the Cape of Good Hope, in valleys on the mountains. Habit of V. officinalis, but differs from it in the shorter lobes of the leaves. The roots are used in the same way as V. officinalis. Stem pilose at the joints.

**Cape Valerian.** Pl. 1 foot.

† *Species not sufficiently known.*

95 V. leucoph'ea (D. C. prod. 4. p. 641.) V. orientalis minima flore leucophase, Tourn. cor. p. 6. Allied to V. tuberosa, ex Stev. obs. p. 67, but the bracteas are long and distant. Flowers dusky.

**Dusky-leaved Valerian.** Pl. 1 foot.

96 V. angustifolia (D. C. prod. 4. p. 641.) V. orientalis angustifolia, floribus et radice Valerianæ hortensis, Tourn. cor. p. 6. This plant is nearly allied to V. officinalis, but differs in the narrower leaves.

**Narrow-lobed-leaved Valerian.** Pl. 2 to 3 feet.

Cult. All the hardy species thrive well in any common garden soil, and are easily increased by dividing at the root. Many of them are very ornamental border-flowers. The tender kinds, or those from warmer climates, should be grown in pots, in a mixture of peat, sand, and loam, so that they may be protected in winter by placing them in a frame or green-house.

X. **Betcke'a** (named after M. Betcke, who has described many species of Valerianella). D. C. coll. mem. vii. prod. 4. p. 649.

**Lin. syst.** Triandria, Mono'gynia. Limb of calyx 1-toothed, deciduous. Corolla funnel-shaped, 5-lobed. Stamens 3. Fruit 1-celled, triquetrous, naked at the apex. Seed 1, conforming to the fruit, and filling the cell.—Glabrous, annual, simple, erect herbs. Leaves undivided. Flowers small, white. Habit of a species of Valerianella.

1 B. samolif'olia (D. C. prod. 4. p. 643.) lower leaves obovate-oblong: upper ones ovate-roundish, sessile, stem-clasping; cymes small, on short peduncles in the axils of the leaves: bracteas oblong. 2. H. Native of Chili, in mountain pastures near La Pinta de Cortes, and about Valparaiso and Concepcion. Valeriana seu Födia samolifolia, Bert. in litt. 1829, and in bull. sc. 1830. p. 111. Habit of Samal'us or Claydònia.

**Samolus-leaved Betcke'a.** Pl. ½ foot.

2 B. Gill'esi (Hook. et Arn. in bot. misc. 3. p. 306.) plant quite glabrous; root tufted, woody; radical leaves roundish-elliptic, almost 3 times shorter than the petioles, quite entire; scapes about equal in length to the leaves; flowers in crowded heads; fruit glabrous, lanceolate, angular; limb of calyx short, urceolate.—Native of Chili, in cliffs of rocks near La Casa de Pedro, and the Andes of Mendoza, forming dense masses. B. samolifolia, Gill. but not of D. C. There is on the scape usually one pair of floral leaves: from the axil of each arises a head of flowers, in addition to the terminal one; and these three heads are often so close as to appear like one. This is probably not a species of Betcke'a; its fruit is not triquetrous, nor is the limb of the calyx 1-toothed and deciduous; but the fruit is still 1-seeded.

**Gillies's Betcke'a.** Pl. ½ foot.

Cult. The seeds will only require to be sown in the open ground in May, in a sheltered situation.

XI. **TRIPLOSTEGIA** (trip'laspho, trip'loos, triple, and stege's, stegos, a covering; the flowers are clothed by 3 coverings, a double involucrum and the calyx). Wall. cat. no. 436. D. C. coll. mem. vii. prod. 4. p. 642.

**Lin. syst.** Triandria, Mono'gynia. Flowers covered by a triple tegument, a double involucrum, and the calyx. Outer involucrum 4-parted and 4-keeled: inner one tubular, 8-toothed, and 8-ribbed. Calyx adhering to the ovarium, with a small 4-toothed limb. Corolla funnel-shaped, 5-leafed, not gibbous at the base, nor spurred. Stamens 3, arising from the base of the tube; anthers a little exerted. Stigma capitulate. Utriculus 1-seeded, beaked, covered by the double involucrum, and crowned by the teeth of the calyx, downy.—An Indian herb. Root long, fibrous, scentless. Stems obviously 4-furrowed, simple or sparingly branched, bearing longish articulated hairs towards the top, which are tipped with glands. Leaves approximate at the base of the stem, ovate-lanceolate, toothed, pinnatifid, downy above, and rather villous beneath, petiolate; cauline leaves few, pinnatifid, small. Calyx 5-toothed, deeply clothed with glandular down. Flowers small, three, downy.

**1 T. glau'dulifera** (Wall. l. c.) 2. H. Native of Nipal, on mountains about Gosaingthang, growing along with *Nard'ostachys.*

**Gland-bearing Triplostegia.** Pl. ½ to 2 feet.

Cult. This plant should be grown in a pot, in a mixture of loam, peat, and sand, and placed among other alpine plants. It may be propagated by dividing at the root, or by seed.

Limb of calyx closely girding the ovary (f. 118. d.). Limb of calyx variable, short or elongated, entire (f. 117. g.), toothed, or ending in numerous variable bristles (f. 118. d.) which are usually plumose, and pappus-formed. Corolla gamo-
petalous (f. 117. f. 118. c.), inserted in the top of the tube, rarely ringent, but usually unequal (f. 117. f. 118. c.), 4-5-cleft. Stamens 4 (f. 118. f.), inserted in the tube of the corolla, and alternating with its lobes, nearly always distinct and free; anthers 2-celled. Style filiform (f. 118. g.); stigma simple, longitudinal or subcapitate. Fruit indehiscent, membranous or subnucamentaceous (f. 118. h. f. 117. c.), crowned by the limb of the calyx (f. 117. i. f. 118. i.), 1-celled, 1-seeded, usually covered by the involucre (f. 117. g.) Seed pendulous in the fruit; albumen fleshy. Embryo straight, with a superior radicle.—Herbs or subshrubs. Leaves opposite, rarely verticillate, very variable in form, and even so in the same individual, the radical and cauline ones being very different. Flowers in dense heads, girded by involucre, very rarely in whorles. Involucre calyciform, girding the flower.

This order was formerly joined with Valerianace., but is readily distinguished from it, by the whole habit, by the flowers being in involucrated heads, and the single flowers being involucellate; by the fruit being constantly 1-celled and 1-seeded, in the stamens being always 4 in number, by the stigmas being simple, and by the seeds being ambulaceous. In this latter respect it agrees with the order Calyceraceae, but is distinguished from it in the embryo being erect, not inverted, and in the anthers being free, not combined into a tube. It agrees also with Compositae, from which it differs in its distinct stamens, and its pendulous ambulaceous seeds. What is called the involucre is a curious organ, resembling an external calyx, and is to each particular flower in the head of Dipsaceae, what the partial involucrum of Compositae is to each umbellule. In several species of Scabiösa the ovarium is entirely united with the tube of the calyx. Mr. Brown remarks that the base of the style coheres with the narrow apex of the tube of the calyx, even in those plants of the order in which the dilated part of the tube is entirely distinct from the ovarium. This kind of partial cohesion between pistillum and calyx is directly opposite to what usually takes place, namely, the base of the ovarium being coherent, while its upper is distinct. It equally, however, determines the apparent origin or insertion of the corolla and stamina, producing the unexpected combination of flos superus with ovarium liberum. The order also agrees in many respects with Nyetaginaceae and Globulariaceae.

The plants contained in this order have almost the habit of Compositae; all have the flowers growing in heads. Many of them are elegant border-flowers, and are cultivated with great facility. Some of the species of Scabiösa have been employed as diaphoretic and anti-syphilitic, but are now neglected.

Synopsis of the genera.

Tribe I.

Tribe II.

Scabiöseae. Corolla 4-5-cleft (f. 118. c.), not ringent. Stamens 4-5 (f. 118. f.), free, nearly equal. Flowers aggregate upon a receptacle (f. 118. c.), the heads involucrated by a general involucre, and each flower girded by a calyciform involucre (f. 117. g.).

Dipsacus. Involucre of many leaves, much longer than the palae among the flowers, which are foliaceous. Corolla 4-cleft. Stamens 4. Fruit crowned by the subtetragonal limb of the calyx, inclosed within the involucre.

Cephalaria. Involucre of many imbricate leaves, which are shorter than the palae (f. 116. a). Involucre terminated by a 4-8-toothed crown. Corolla 4-cleft (f. 116. c.). Stamens 4. Fruit tetragonal, crowned by the limb of the calyx, and inclosed within the involucre.

Petrógéphalæ. Involucre double, each series of 4-6 leaves. Receptacle villous or chaffy. Involucre toothed (f. 117. h.) or annoid. Limb of calyx ending in feathery bristles (f. 117. i. f. 118. i.). Corolla 5-cleft. Stamens 4, rarely 2-3.

Tribe I.

Morinæae (this tribe only contains the genus Morina). D. C. prod. 4, p. 644. Corolla ringent. Stamens 4, didynamous, or combined by twos. Flowers verticillate, bracteate.

Sect. 1. Dioctocalyx (from éc, dis, twelve, and wos wos, onus otos, an ear, and kalyx, calyx; in reference to the limb of the calyx being of 2 lobes). D. C. prod. 4, p. 644. Leaves sinuata and spinosely toothed. Lobes of calyx 2, oblong, more or less emarginate at the apex, unarmed. Stamens combined by twos, perhaps in all the species.

DIPSACEÆ. I. MORINA. II. DIPSACUS.

fig. M. orientalis, Mill. M. verticillata, Mœch. supl. Flowers white and reddish on the same plant. Stamens joined from the base to the authors by twos.

2 M. longifolia (Wall. cat. no. 426. D. C. prod. 4. p. 644.) leaves sinuate pinnatifid, and somewhat spiny-ciliated; floral leaves rather villous; lobes of calyx emarginate. 2. F. Native of Nipaul at Gosingsthan. Intermediate between M. Persica and M. longifolia, but is distinguished from them in the leaves being more elongated and acuminate, and in the lobes of the calyx being bifid beyond the middle. Corolla and genitils unknown.

Long-leaved Morina. Pl. 2 to 3 feet.

3 M. Polyphylla (Wall. cat. no. 425. D. C. prod. 4. p. 644.) leaves pinnatifid; leaves pinnately toothed; floral leaves rather villous, elongated, stiffly spiny; lobes of calyx deeply divided. 2. F. Native of Nipaul, at Gosingsthan. Intermediate between M. Persica and M. longifolia, but is distinguished from them in the leaves being more elongated and acuminate, and in the lobes of the calyx being bifid beyond the middle. Corolla and genitils unknown.

Many-leaved Morina. Pl. 2 to 3 feet.

Sect. II. Acanthocalyx (from aca, acaintos, a spine, and kalys, kalys, a calyx; in reference to the limb of the calyx being spiny-toothed). D. C. prod. 4. p. 645. Leaves quite entire, except the floral ones, which are a little spiny-toothed. Limb of calyx oblique, irregularly spiny-toothed. Stamens 4, distinct, dacyanous.

4 M. na’na (Wall. cat. no. 424. D. C. prod. 4. p. 615.) cauleine leaves quite entire; floral ones bearing spines at the base; involucre 1-leaved, ciliate by spines; limb of calyx oblique, irregularly spiny-toothed. 2. F. Native of Nipaul at Gosingsthan. Native of Nipaul, D. Don, prod. fl. nep, prod. 161. Stem villous at top, as well as the young leaves. Flowers red. Corollas villous outside, 3 times longer than the calyx.

Dreary Morina. Pl. ½ to 1 foot.

Cult. The species of Morina thrive best in a light rich soil; and may be increased by dividing at the root, or by seed.

Tribe II.

SCABIOSEÆ. (This tribe contains plants agreeing with Scabiosa in having capitate flowers). D. C. prod. 4. p. 645.—

Dipsaceæ, Wallr. sched. crit. p. 41. Corolla 4-5-cleft (f. 117, f. f. 118. f.), not ringent. Stamens 4-5, free (f. 118. f.), nearly equal. Flowers crowded in heads upon receptacles, each head girded by a general involucrum (f. 117. a.), with usually distinct pales on each side, and each flower girded by a calyciform involucel (f. 117. c. f. 118. d.).

II. DIPSACUS (said to be from ἐνδασα, dipsas, to thirst; probably in consequence of the conuate leaves having water; ἐνδασα, ἐνδας, is also the Greek name for the disease called diabetes, which is always accompanied by great thirst). Tourn. inst. t. 265. Lin. gen. 114. Gairn. fruct. 2. t. 86. Coult. dips. p. 21. f. 2-4. Wallr. sched. crit. p. 49.

LIN. SYST. Tetrádium, Manogpínia. Involucrum of the head of flowers of many leaves, longer than the pales. Pales on the receptacle acuminate, rather foliaceous. Involucel tetrándrous, 8-furred. Limb of calyx somewhat cymatoform or discol. Corolla 4-cleft. Stamens 4. Stigma longitudinal. Fruit crowned by the subteratragonal limb of the calyx, and inclosed within the involucel. Erect, pilose, or prickly biennial herbs. Leaves opposite, usually connate at the base, toothed or jagged. Heads of flowers terminal, oblong-ovate or roundish. Corolla lilacicoloured, yellow, or white.

1 D. stye’stris (Mill. dict. no. 2.) stem prickly; leaves connate at the base, ovate-lanceolate, acuminate, toothed; leaves of involucrum flexed, weak, longer than the heads of flowers; pales of heads straight, linear-lanceolate, setaceous, bent; involucel not drawn out beyond the furrows. 2. H. Native of Europe and Siberia, frequent; plentiful in some parts of Britain, about hedges and by road sides. Jacq. fl. austr. t. 402. Oed. fl. dam. t. 965. Smith, engl. bot. t. 1032. Curt. lond. 3. t. 9. D. styraxis a, Coult. dips. p. 22. D. vulgarius, Gmel. fl. bâd. 1. p. 312. D. fullenm, ßor. chlor. land, p. 36. Poll. pal. no. 137. D. purpureus, Fuchs, hist. 225. Flowers brown-purple, first breaking forth about the middle of the head. Heads of flowers ovate-oblong. The water contained in the basin formed by the leaves is said to cure warts on the hands, and to serve as a beauty-wash for the face; hence Ray conjectures it had its name, Labrum Lacteum.

Var. β, pallidus (Bess. in Roem. et Schultes, syst. 3, p. 41.) leaves of involucrum shorter, hardly ascending. 2. H. Native of Galicia, &c.

2 D. laciniátus (Lin. spec. p. 141.) stem prickly; leaves connate at the base, sinuate jagged, and the lobes sinuate-toothed; leaves of involucrum erect, stiffish, usually shorter than the head, which is ovate; pales straight, linear-subulate; involucel not drawn out beyond the furrows. 2. H. Native of Europe and Siberia, in hedges and ditches, as of Germany, France, Alsace, Austria, Caucasus, &c. Jacq. fl. austr. t. 5. 405. D. xyléstris, var. γ, Coult. dips. p. 22. Leaves downy beneath. Corolla whitish; authors reddish.

3 D. divaricátus (Presl. fl. sic. p. 57. del. prang. 117.) stem prickly; radical leaves oblong, rather lyrate, ciliate; cauline ones interruptedly pinnatifid; lobes divaricate, pinnatifid at the base; leaves of involucrum shorter than the head, which is ovate; pales spinescent, arched; involucels unknown. 2. H. Native of Sicily, on the edges of fields. Guss. prod. 1. p. 1. 157. D. laciniátus, Urta, Hort. pàp. p. 66. 2.

Divaricate Teazle. Pl. 3 to 5 feet.

4 D. fullém (Mill. dict. no. 1.) stem prickly; leaves connate at the base, oblong-lanceolate, serrate; upper ones entire; leaves of involucrum spreadingly reflexed, shorter than the heads, which are cylindrical; pales stiff, recurved; involucel not drawn out beyond the furrows. 2. H. Native of the south of Europe, where it is said to grow spontaneously in fields. It is said to be a native of England; but scarcely wild. Plenc. off. t. 50. Sowerb. engl. bot. 2080. Hayn. term. bot. t. 41. f. 8. Coult. dips. p. 22. D. sativus, Gmel. fl. bâd. 1. p. 314. D. fullém b, Lin. spec. p. 140. D. xyléstris ε, Coult. in litt. 1824. — Lob. icon. 3. p. 17. with a figure. Flowers whithish, with pale purple anthers. This and the three preceding have been combined by Coult.

Fullers’ Thistle or Teazle is called Chardon a joloulon in French, Kardwestel in German, and Cardenacho in Spanish; Dipsaco in Italian: is a biennial plant from 4 to 6 feet high, prickly and rough in the stem and leaves, and terminated by rough bur-like heads of flowers. It is cultivated in Essex and the West of England, for raising the nap upon woollen cloths, by means of the crooked palea upon the heads. For this purpose they are fixed round the circumference of a cylinder, which is made to turn round, and the cloth is held against them. There are no varieties of the cultivated Teazle, but the wild species is not
materially different, and may be used in its stead, though its chaff is not quite so rigid. The hay of the Teazle will grow the strongest are deep yellowish, clay, not over rich. The situation should be rather elevated, airy, and exposed to the south. In the rotation, it may occupy the place of a green and corn-crop, as the first year the plants are treated like turnips, and the second the crop is ripened. The soil should be ploughed deep, and well comminuted by cross ploughings or stirrings with pronged implements.

The sowing season is the beginning of April; the quantity of seed is from 1 to 2 pecks per acre, and in quality it should be fresh and plump. The mode of sowing is almost always broadcast, but no crop is better adapted for being grown in drills, as the plants require hoeing and thinning. The drills may be either sown on ridges or a flat surface, in the manner of turnips, or by ribbing. The distance between the rows may be from 18 inches to 2 feet. In Essex, carraway is commonly sown with the teazle crop, but this is reckoned a bad plan.

The after culture of this crop consists the first year in hoeing and stirring the soil, and in thinning out the plants to the distance of 1 foot every way, if sown broad-cast, or to the distance of 6 inches, if sown in rows. Vacancies may be filled up by transplanting; and a separate plantation may be made with the thinnings, but these never attain the same vigour as seedlings. The culture the second year consists also of hoeing, stirring, and weeding, till the plants begin to root. When the teazle is grown broad-cast, the intervals between the plants are dug by means of spades which have long narrow blades, about the length of 16 or 17 inches, and not more than about 4 inches in breadth. With these the soil is usually worked over in the intervals of the plants, three or four times during the summer months; and in the course of the following winter, as about the latter end of February, the land between the plants is to be again worked over by the narrow spades, care being taken that none of the mould falls into the hearts of the plants; and again, about the middle of May, when they begin to sprout, another digging over is given, the earth being raised round the root-stems of the plants, in order to support and prevent them from being blown down by the wind. Some cultivators perform more frequent diggings, that the ground may be rendered cleaner and more mellow; consequently the growth of the plants will be more effectually promoted. The business in Essex has usually the name of spuddling, and is executed with great despatch by labourers that are accustomed to the work.

The taking of the Teazle crop, when no regard is had for seed, commences about the middle of July, when the blossoms begin to fall from the heads. It is the best method to have the heads cut as they become ripe; but the work is usually executed at three different times, at the distance of ten days or a fortnight from each other. It is performed by means of a knife, contrived for the purpose, and a string attached to the hilt. This last is done in order that it may be hung over the land. A pair of strong gloves are also necessary. Thus prepared, the labourer cuts off the ripe heads along the rows or lines, with about 9 inches of stem, and ties them up in handsfull, with the stem of one that is more perfectly ripened. And on the morning of the day on which they are cut, they should be put into a dry shed; and when the weather is fine, and the air clear, they should be taken out and exposed to the sun daily, till they become perfectly dry. Much care must, however, be taken that no rain falls upon them. In doing this, some make use of long small stakes or poles, on which these handsfull are hung during the time of their preparation.

As soon as they are completely dried, they should be laid up in a dry room, in a close manner, till they are become tough, and of a bright colour, and ready for use. They should then be sorted or separated into three different kinds, by opening each of the small bundles. These are distinguished into kings, middlings, and scrubs, according to their different qualities. They are afterwards, the author of "The Somerset Report" says, made into packs, which, of the first sort, contain 9000 heads, but of the second, 20,000; the third is a sort of very inferior value. By some, before forming them into packs, they are done up into what are termed staves, by means of split sticks, when they are ready for sale.

The produce of Teazle varies from 10 to 15 packs per acre; nine packs of kings, nineteen of middlings, and two of scrubs, are reckoned a large crop, with a great bulk of haulm. Often, however, the crop fails.

The use of the heads of the Teazle has been already mentioned. Teazle is of no use but for burning as manure. Parkinson observes, that this is a sort of crop that may be grown to advantage on many lands; in rotation, as a fallow to prepare wheat; and by burning the straw and refuse stuff after the crop is reaped, it will be found not to impoverish, but rather to improve the land. In their young state, the teazle plants stand the winter without danger, and are a good crop for clearing land of all weeds, from their lateness in the process of hoeing, there being few weeds at so advanced a season; on all these accounts they become an advantageous crop for the farmer.

To save seed, leave a few of the very best plants uncropped, and then, when the seed is ripe, cut off only the largest and terminating heads, from which the seed is easily separated by beating with flails, and cleaned by a winnowing machine or a sieving operation.

The chief injury to which the Teazle is liable are those effected by the fly and slug in its infant state.

5 D. sinuatus (Wildl. miss. in Rem. et Schultes, syst. 3. p. 519.) leaves pinnatifidly sinuated: segments lacinially toothed.
G. H. Native of Persia, on the alps in the province of Gilan. Cogn. d. no. 22.

*Sinuated-leaved Teazle.* Pl. 3 to 4 feet.
6 D. efeux (Lois. fl. gall. p. 719. t. 3.) stem and leaves echinate from prickles; leaves connate at the base: radical ones sinuated: middle ones pinnatifid: upper ones entire; leaves of involucre spreading, a little longer than the heads, which are ovate; paleae subulate, straight, stiff; involucel drawn out beyond the furrows into a short membrane. G. H. Native of Siberia and Sardinia, on the edges of fields. Said to grow in plenty in Austria, Bohemia, and Moravia. Tratt. tab. 1. 235. D. C. fl. fr. suppl. p. 486. Cogn. d. p. 23. Flowers white or pale red. The central head of flowers is usually cylindrical, and the lateral ones roundish.

7 D. gralliini (Bieb. fl. taur. 1. p. 92.) stem prickly; leaves sessile: lower ones undivided or cut: superior ones pinnate-parted, with oblong acute segments; leaves of involucra deflexed, incurved, weak, shorter than the heads, which are ovate, or nearly globose; paleae membranous, acuminate unawned, straight; involucel drawn out beyond the furrows into a membranous crown. G. H. Native of Tauria, at Kuna, about the ruins of Maschar, but rare, ex Steeven; at the river Don, ex Goll.; and of Siberia, about the Irish, ex Gmel. sib. 2. p. 209.; and of the Kirghisian Steppe, between Buetskornmik and Lake Noor Shyrav, ex Led. fl. alt. 1. p. 127. Cogn. d. p. 22. D. laciniatus, Falck. top. beyt. 2. no. 140. Corollas blue.

8 D. stragádus (Wildl. miss. ex Rem. et Schultes, syst. 3. p. 520.) leaves toothed and entire, appendiculated: upper ones jagged at the base, ciliated; involucra twice the length of the paleae; paleae setaceous, twice the length of the flowers. G. H. 4 s 2

Strigosa Teazle. Pl. 3 to 4 feet.

9 D. pilosus (Lin. Hort. Ups. p. 25.) stem prickly, glabrous; prickles hair-formed under the head; leaves glabrous, petiolar, ovate, toothed, auricled at the top of the petioles; leaves of involuca deflexed, shorter than the heads, which are globose, but hardly exceeding the paleae, which are linear-subulate and pilose; involucel not drawn out beyond the furrows.  2. Native nearly throughout the whole of Europe, in woods and hedges; Caucasus, in Alpine places. In England, in moist shady places on a chalky or lime-stone soil. Oed. fl. dan. t. 1448. Jacq. fl. austr. t. 248. Smith, engl. bot. t. 577. Couth. dips. 23. Curt. Lond. t. 10. Cephalária appendiculata, Schrad. cat. sem. gett. 1814. Paleae ciliated. Corollas white. Antlers dark purple or brown.

10 D. strictus (D. Don, prod. fl. nep. 160.) stem unarmored, but beset with short retrograde hairs; leaves petiolar, lanceolate, acute, dentately serrated, beset with villi on both surfaces; leaves of involuca spreading deflexed, shorter than the heads, but hardly exceeding the paleae, which are oblong-elliptic, straight at the apex, ciliated, canescent; involucels hardly furrowed, crowned.  3. H. Native of Nipal. D. inermis, var. a. Wall. in fl. ind. 1. p. 367. Stem erect, branched, hexagonal. Flowers cream-coloured. According to D. Don, in fl. nep. the leaves are connate at the base. Heads of flowers spherical.

Straight Teazle. Fl. July, Cust. 1832. Pl. 4 to 5 feet.

11 D. inermis (Couth. dips. p. 23.) stem unarmed, downy, but having the branches hispid under the heads; leaves petiolar, ternate or somewhat pinnatifid, clothed with adpressed pili on both surfaces: lobes lanceolate, acuminate, serrated; leaves of involuca deflexed, shorter than the heads, which are globose, but exceeding the palea a little; paleae ovate, mucronate, ciliated at the apex; involucels hardly furrowed, crowned.  3. H. Native of Nipal, in Alpine places. D. inermis, var. b. Wall. in fl. ind. 1. p. 567. D. mitis, D. Don, prod. fl. nep. 161. Stem hexagonal, pilose, unarmed. Paleae about equal in length to the flowers. Corollas yellow.

Crowned Teazle. Fl. July, Cust. 2 to 3 feet.

12 D. apler (Wall. cat. no. 438. D. C. prod. 4. p. 646.) stem prickly; leaves undivided or pinnatifid, oblong-lanceolate, acuminate, serrated; scabrous on both surfaces from bristly hairs; leaves of involuca deflexed, shorter than the heads, which are globose, but exceeding the paleae, which are ovate, ciliated, and mucronate; involucels hardly furrowed.  3. H. Native of the East Indies, on the Pandua Mountains. Stem and branches angular; angles beset with stiff prickles.

Rough Teazle. Pl. 2 to 3 feet.

13 D. Leschenaultii (Couth. in litt. ex D. C. prod. 4. p. 647.) stem smooth, rather hairy; leaves lyrate-pinnatifid, very villous on both surfaces, acuminate, coarsely serrated at the apex; lower ones petiolar; lobes of leaves 3-nerved at the base; leaves of involuca spreading, shorter than the heads, which are globose, and hardly exceeding the paleae, which are oblong, acuminate and pilose; involuce drawn out a little into a membranous crown beyond the furrows.  3. H. Native of the East Indies, on the Nellighery Mountains, where it was collected by Leschenault and Noton. Scabiosa Brunoniána, Wall. cat. no. 429. The plant is called Dode Gueda by the natives. Stem 3 feet high, rather hairy, not prickly. Habit of Cephalária alpina.

Leschenault’s Teazle. Pl. 3 feet.

 Cult. None of the species are worth growing, except in botanic gardens. They will grow in any soil in which the seeds may be sown.

Ln. syst. Tetrantródia, Monogynia. Involuca surrounding the heads of many imbricated leaves (f. 116. a.), shorter than the paleae. Involucel tetragonous, rarely compressed, 8-furrowed, terminated by a 4-8-toothed crown. Linum of calyx rather cup-shaped or discoid. Corolla 4-cleft. Stamens ± (f. 116. d.). Stigma tetragonal, crowned by the limb of the calyx, inclosed within the involucel. — Perennial herbs. Leaves toothed or pinnatifid. Heads of flowers terminal, globose (f. 116. e.); paleae imbricated: outer ones sterile. Corollas white, cream-coloured, or lilac. — This genus is hardly distinct from Dipsacus, unless in the involuca being very short.

* Perennial plants. Paleae acuminate, downy.

Alpína Cephalária. Fl. June, Cust. 1570. Pl. 3 to 4 feet.

** Annual plants. Paleae membranous, arn at the apex.

3 C. Transylvánica (Schrad. l. c.) stems terete, rather pilose at the base; leaves pinnatifid: lower ones lyrate; lobes of the caulis leaves linear-oblong toothed: terminal lobes lanceolate, serrated a little; paleae glabrous, membranous, oblong, ending in a dark purple awn each; teeth of involuca 8, short, equal.  0. H. Native of the south of Europe, from Vasceny to Constantinople, in fields; and of Caucasus, on mountains near Grosnaja. Couth. dips. p. 24. t. 1.

Var. β, seminariâta (Coutt. in litt. 1824. ex D. C. prod. 4. p. 648.) alternate teeth of involucels awned, the rest as in the species.

*Joppa* Cephalaria. Pl. 1 to 3 feet.

5. C. Syriaca (Schrad. l. c.) stems more or less hirsute; leaves oblong-lanceolate, serrated; heads oval; palea broad at the base, membrane, ending each in a long awn; teeth of involu- cels 8, 4 of which are awned, and the other 4 very short; corollas equal. (O. H. Native from Spain to Persia, in fields and woods. Coutt. dpis. p. 23. t. r. 7. Scabiosa Syriaca, Spreng. 1. c.) There are hisp and glabrous varieties of this plant, with either serrated or nearly entire leaves. Flowers blue.

**Perennial plants. Outer palea alone blunt or bluntish.**

7. *C. centaurioides* (Coutt. dpis. p. 25. t. 1. f. 8.) stems terete; leaves pinnatifid: lobes oblong, quite entire, decurrent; heads nearly globose; palea awnless, whitish-yellow; outer ones obtuse; inner ones acuminate; teeth of involucel 4-8, or obsolette. (O. H. Native of the south of Europe, south of Siberia, and the Levant. The following are varieties of this plant, according to Couttler and Treveranus, in mag. nat. am. ber.

1815. Leaves glabrous, ciliated or villous: radical ones entire or very remotely pinnatifid; lobes narrow or ovate, straight or divaricate. Corollas equal or radiant, always yellow.

rigidus, Lag. Succisa rigida, Spreng. l. c.—Comm. hort. amst. t. 93. Shrubby, flowers white. Said to be allied to C. leucanthua. There are varieties of this with either glabrous or scabrous leaves. The upper leaves are cut, with revolute edges.

Var. β, menstrual (Roem. et Schultes, l. c. Coult. l. c.) leaves oblong, toothed, and somewhat pinnatifid at the base. Ό. G. Succisa verbenacea, Lam. ill. no. 1314.

† Species not sufficiently known.

Greek Cephalaria. Fl. 2 feet.

Humble Cephalaria. Fl. ¾ to 1 foot.

Ustulate-braacted Cephalaria. Fl. 1 to 2 feet.

14 C. Scabíaria (Roem. et Schultes, syst. 3. p. 44.) plant scabrous from hairs; leaves stiff, pinnatifid; lobes dentately cut; paleae ovate, obtuse, purplish at the apex; corollas equal. Ό. G. Native of the Cape of Good Hope, on hills. Coulf. dipls. p. 28. Scabiosa scábia, Thumb. fl. cap. 1. p. 529. Lepicéphalus scabíaria, Lag. Succisa scábia, Spreng. l. c. Heads about the size of fillers. Flowers white.

N. B. Scabiosa maríná, Lin. mant. p. 329. is distinct from Scabiosa maríná, Lin., and are probably referrible to the present genus, but are hardly known.

Cult. The hardy herbaceous kinds of Cephalária are of the most easy culture, and will grow in any kind of soil, and are readily increased by dividing at the root, or by seed. The seeds of the annual species only require to be sown in the open border. The green-house shrubby kinds should be grown in a mixture of loam, peat, and sand, and may be increased either by young cuttings under a hand-glass, or by seed.

Lin. syst. Tetrándria, Monogónía. Involuta of heads of many leaves. Paleae none. Receptacle hairy. Involute compressed, with 4 hollows closely girding the fruit, denticulated at the apex, having 2 of the teeth larger than the other 2, furnished with a short stipe. Limb of calyx cup-shaped, neither pappose nor awned at the apex. Corolla 4-5-cleft. Stamens 4.— Erect branched, usually villous herbs.

Eastern Knaútia. Fl. June, Sept. Clt. 1713. Pl. 1 to 1½ ft. 2 K. morphoáxica (Lin. spec. cd. 2. p. 1666. exclusive of Till. sym.) leaves serrated: superior ones lanceolate, quite entire; corollas 10, equal to the involucre; corolla of calyx 15 in number. Ό. H. Native of the Levant. Wildl. spec. p. 1 m. 561. exclusive of the sym. of Tourn. Roem. et Schultes, syst. 3. p. 87. exclusive of the Lam. syst. Coulf. dipls. p. 28. Scabiosa propótica, Lag. gen. et spec. p. 9. Plant villous. Corolla purple. Pistilla white; the corolla is said to be 4-5-cleft by Linnéus. This is a doubtful plant, and is perfectly unknown at the present day, as the plant known in our gardens under this name is K. orientalis.

Sect. II. Trichéroídes (this section contains plants having the habit of those of the next section). D. C. prod. 4. p. 650. Involute spreading, 10-12-leaved. Flowers few or many. Involute bidentate at the apex. Corollas rather irregular. Limb of calyx ciliated.—Annual herbs. Flowers bluish or rose-coloured.

3 K. Urvillei (Coulf. dipls. p. 29. t. 1. f. 10.) lower leaves pinnatifid; superior ones linear, quite entire; corollas 10-12 in each head, nearly equal, hardly longer than the involucre, which is spreading; teeth of crown of the involucre 8, a little curved. Ό. H. Native of the island of Lérin, in arid fields, where it was collected by D’Urvillé; and also of Bulgaria. K. orientalis, D’Urv. enum. p. 14. Plant villous? Stems branched, divaricate. Heads of flowers small. Corollas pale blue.

D’Urvillé’s Knaútia. Pl. 1 to 2 feet.

4 K. hybírida (Coulf. dipls. p. 30. and in litt. 1824.) lower leaves petiolar, lyrate; lobes ovate, toothed; terminal lobe the largest, ovate or roundish; caulis leaves oblong, simple, serrated; heads many-flowered; the 2 teeth of the involucre of many bristles; ciliate of calyx 20-24, obsolete. Ό. H. Native of the south of Europe. Scabiosa hybírida, All. auct. p. 9.

5 K. **Arvensis** (Coult. dits. p. 29. var. α, β, γ, t. 1. f. 13.) stems hispid; leaves sessile, villous; radii of corolla unequally pinnatifid, with lanceolate lobes: cauleine leaves pinnatifid, with linear lobes; uppermost leaves linear-lanceolate: leaves of involucre bluish. γ. H. Native of Europe, in meadows, pastures, and cultivated fields; plentiful in Britain. Duby, bot. gal. 1. p. 237. Scabiosa arvensis, Lin. spec. p. 142. Gaud. fl. helv. 1. p. 389. Scabiosa polyomorpha, Schmidt, bot. 3. p. 77. Trichèra arvensis, Schrad. Flowers bluish purple, and verging to white or purplish. Perhaps Scabiosa dubbìa, Mench. hass. no. 116. t. 3. which is said to have a 5-cleft corolla, is only a variety of this species. This plant may rather be considered a troublesome weed in corn-fields, but in grass-fields it may be considered rather useful, as it produces a large quantity of foliage, which is not refused by kine, sheep, or horses. The plant varies much in the divisions of the leaves, and in its hairiness. It sometimes occurs with white flowers. The flowers held over the smoke of tobacco in a few minutes become a beautiful green. The plant is slightly aromatic, bitter, and saponaceous. The root creeps deep in the ground.

**Var. a, vulgaris** (D. C. prod. 4. p. 651.) leaves downy: radical ones pinnatifid or entire; cauleine ones always pinnatifid. γ. H. Native of Europe, in corn-fields and meadows. Sowerby, engl. bot. t. 639. Curt. lond. 4. t. 13. Fl. dan. t. 447. —Blackw. t. 185. Flowers bluish, and varying from purple to white, outer ones more or less radiant.

**Var. γ, canescens** (Coult. l. c. var. β.) leaves canescent from hairs; lower ones ovate, acuminate, toothed; upper ones pinnatifid; outer flowers of the heads hardly radiant. β. H. Native country unknown. Scabiosa canescens, Hort. taur.

**Corn-field Knautia.** Fl. July, Qetr. Britain. Pl. 2 to 4 ft.

**Wood Knautia.** Fl. June, July. Ckt. 1633. Pl. 1 to 3 ft.

10 K. **Legionésnis** (D. C. prod. 4. p. 652.) stems hispid from retrograde hairs; leaves lanceolate, long-acuminated, remotely toothed: lower ones entire; leaves of involucre 18, exceeding the flowers. γ. H. Native of Spain, on the mountains of Leone. Scabiosa Legionénis, Lag. nov. gen. et spec. p. 9. Asteroéphalus Legionénis, Spræng. syst. 1. p. 379. Flowers red. There is a variety of this with pinnatifid leaves and white flowers. Said to be nearly allied to K. sytéctica.

**Leone Knautia.** Fl. June, July. Pl. 2 ft.

11 K. **Salcédi**; stem scabrous from hairs; leaves all undivided, lanceolate: lower ones entire; upper ones sharply toothed in the middle. γ. H. Native of Spain, on the mountains of Leone. Scabiosa Salcédì, Lagasca. Leaves downy on both surfaces, hoary beneath. Peduncles long, beset with rufous villi under the head of flowers. Involucre of many lanceolate pilose leaves, the length of the flowers, which are of a lilac colour.

Lin. syst. Tetrándria, Monogynía. Involucrum double, each series of 4-6 leaves. Heads many-flowered (f. 118. a.). Receptacles villous (f. 117. b.) or chaffy. Involucres toothed or awned (f. 117. a.). Limb of calyx ending in a many-rayed pappus (f. 117. c. f. 118. d.), which at length becomes feathery (f. 117. i. f. 118. j.). Corollas 5-eleft (f. 117. f. f. 118. c.). Stigmas 4 (f. 118. f), rarely 2-3.—Herbs or subshrubbs.

§ 1. Annual plants. Leaves pinnatifid, particularly the superior ones.

2 P. Barrius (Coult. dips. p. 32. t. 1. f. 16.) plant clothed with soft villi; stems herbaceous, erect; leaves pinnatifid; corollas hardly exceeding the involucrum; crown of involucres membranous, hardly denticate, very short, spreading; bristles of calyx 14-16, feathery, a little longer than the involucel. O. H. Native country unknown. Very nearly allied to the following.

Short-involucelled Pterocephalus. Pl. 1 foot.

4 P. Paleséntus (Coult. dips. p. 31. t. 1. f. 14.) plant clothed with silky villi; lower leaves obovate-oblong, quite entire, the rest lyrate pinnatifid; lower lobes small, decurrent; terminal lobe large, obovate-oblong; involucel having 8 foveola at the base; crown of involucres membranous; bristles of calyx 8-10, subulate, spreading, irregularly pilose at the sides. O. H. Native of the islands of Cyprus and Scio; and of Palestine. Knautiá Palestina, Lin. mant. 117.—Jacq. hort. vind. t. 1. 96. Scabiosa brahiáti and Scabiosa Stib-thorpiáná, Sibth. et Smith, fl. græc. t. 109. Flowers white or pale purple. The rays of the corollas in S. Stib-thorpiáná are entire, while in those of P. Paleséntus, they are jagged; they are, therefore, probably distinct species.

§ 2. Perennial or frutexseous species. Leaves jagged or toothed.

5 P. Lusitâ'nicus (D. C. prod. 4. p. 653.) stems ascending, sparingly pilose; lower leaves bipinnatifid; superior ones pinnatifid; segments of all linear; pale of the receptacle and leaves of involucrum scarious and hairy; involucres many-toothed; awns of calyx 6-9, feathery. O. H. Native of Portugal, between Abrantes and Casabranca. Scabiosa plumósa, Hoffm. et Link, fl. port. 2. p. 91. Cæphálária plumósa, Born. et Schultes, syst. 3. p. 70. Scabiosa Gramanttia, Broth. fl. las. 1. p. 145. Flowers pale red. Perhaps Asterocéphalus internálibus, Lag. gen. et spec. p. 8. which is the Scabiosa internálibus, Rém. et Schultes. 3. p. 76. is referable to this species, as also Scabiosa marítima and Sc. tennifóliá, Lag. leech. hort. madr. 1803. and 1805.

6 P. Broussonetí (Coult. in litt. 1824. ex D. C. prod. 4. p. 653.) leaves bipinnatifid; corollas equal; awns of calyx 6-7, linear, feathery, hardly twice the length of the involucel. O. H. Native of Gibraltar, about San Roque, where it was collected by Broussonet.

Broussonet's Pterocephalus. Pl. 1 foot.

Tomento's Pterocephalus. Pl. ½ foot.
§ 3. Perennial or frutaceous species, with entire leaves.

9 P. xv|v|e^us (Coulit. dips. p. 32.) leaves orbicular; cauleine ones obovate-spatulate, all quite entire, and are as well as the stems clothed with white tomentum; bristles of calyx 10-12, plunose, 3 times longer than the seed. 2. H. Native of Spain, on the top of Sierra Toixeda. Scabiosa nivea, Agardh, in Roem. et Schultes, syst. p. 3, 81. A very small plant.—According to Sprengel, it is the same as the following.

Smyii Pteroccephalus. Pl. 1 to 2 inches.

Spatulata-leaved Pteroccephalus. Pl. 1 to 1½ foot.

11 P. cau|c|tenus (Confl. in litt. 1824. ex D. C. prod. 4 p. 653.) leaves quite entire, obovate-oblong, hoary; peduncles scapose, bearing each one head of flowers; corollas 5-cleft; involucel lageniform, downy, without furrows; rays of calyx 20-25, plunose, linear, twice longer than the involucel; stigmas emarginate. 2. H. Native of the Levant, between Amadan and Kermancha, where it was collected by Olivier and Bruguiere. Scabiosa dumetorum var. from the Levant, Coulit. dips. p. 32.

Hoary Pteroccephalus. Pl. 1½ foot.

12 P. laso|s|os|te|re|mus (Lin. in Buch. canon. p. 150.) stem suffruticosum, with many branches; leaves on very short petioles, oblong-lanceolate, quite entire, crowned, white from short dense tomentum; involucels densely plunose. 2. G. Native of the Grand Canary island, near Trenite, and among rocks on the top of Pico Teid. Per. dumetorum var. pusilla, Coulit. dips. p. 32. Scabiosa fruticosa, Smith, miss.

Woolly-seeded Pteroccephalus. Shrubs small.

13 P. dum|et|o|re|m|us (Coulit. dips. p. 32. var. a.) stem suffruticosum, erect, bearing many heads of flowers; leaves petiolate, quite entire, oval, acuminated, attenuated at the base, smoothish on both surfaces; peduncles and involucels downy; rays of calyx 20-24, plunose, linear, hardly twice the length of the involucel. 2. G. Native of Teneriffe. Scabiosa dumetorum, Bruss. in Wildl. enum. p. 146. Trichéra dumetorum, Roem. et Schultes, syst. 3 p. 56. Leaves crowded at the tops of the branches.

Thicket Pteroccephalus. Shrubs small.

Cult. For culture and propagation see Cephalaria, p. 686.

VI. SCABIO'SA (from scabies, the itch; which disorder the common sort is said to cure). Roem. et Schultes, syst. 3 p. 2. Coulit. dips. p. 33. D. C. prod. 4 p. 654.—Asteroccephalus, Vol. III.
690 DIPSACEAE.

cells elongated, equal in length to the linear foveole; crown of seed spreading, 24-nerved; limb of calyx pedunculate; bristles of calyx 3, equal in length to the crown. Y. H. Native of Provence, north of Italy, Carniola, Pannonia, Barbary, Switzerland, on the mountains. Coult. diss. p. 34. t. 2. f. 3. Waldst. et Kit. pl. rar. hort. 188. Lindl. bot. reg. t. 835. Asterocephalus granitifolius, Spreng. Flowers pale blue, very like those of S. Cauvética. The Swiss variety of this plant is much more mufled than from other countries, and seems different altogether.

Grass-leaved Scabious. Fl. June, Oct. Ch. 1863. Pl. 1 fl. 5 S. Prolifera (Lin. spec. p. 144.) stem herbaceous, dichotomous; leaves oblanceolate, almost entire, downy; heads almost sessile in the forks of the stem; corollas 5-cleft, radiate; involucres obconical, elongated at the base, equal to the foveole, which are obovate; crown of seed spreading, exceeding the base, 32-36-nerved; limb of calyx pedunculate, hardly equal in length to the bristles of the crown. O. H. Native of Cyprus, Egypt, and Barbary. Coult. diss. p. 31. f. 2. f. 6. Sibth. et Smith, fl. gracc. t. 107. Asterocephalus pro-
life, Spreng.—Herm. part. t. 125. Flowers pale yellow.

Proliferous-stemmed Scabious. Fl. July, Aug. Ch. 1866. Pl. 1 foot. 6 S. Stella'la (Lin. spec. p. 144.) stem branched; leaves cut or subulate; the terminal lobe obovate, toothed, large; heads on long peduncles; corollas radiant; base of involucres elongated, about equal in length to the foveole, which are also elongated; crown spreading, 40-nerved, twice the length of the base; limb of calyx pedunculate, having the bristles thickened on the disk, not exceeding the crown. O. H. Native in the region of the Mediterranean, in fields and arid places. Coult. diss. p. 34. t. 2. f. 5. D. C. fl. fr. no. 3312. Succisa stellata, Monch. meth. p. 490. Scabiosa rotata, Bieb. suppl. p. 102. ex Coult. Asterocephalus rotatus, Spreng. Bristles of calyx black. Flowers very pale blue, almost white.

Var. β. pinnatifida (D. C. prod. 4. p. 655.) leaves pinnatifid, with linear lobes. O. H. Native about Montpelier, in fields. S. stellata β et γ, Coult. diss. p. 31. S. simplex, Desf. fl. atl. 1. p. 125. t. 39. f. 1. ex Coult. Gertta. fruit. 2. p. 39. t. 86. There are varieties of this with branched stems, bearing many heads of flowers; and single stems, bearing only one head of flowers.

Starry-crowned Scabious. Fl. July, Aug. Ch. 1590. Pl. 1½ foot. 7 S. Montfiél'lie'sis (Jacq. misc. 2. p. 392. lorn. rar. 1. t. 24.) hairy; stem a little branched; leaves pinnate-parted; with toothed or cut oblong-linear lobes; heads on long peduncles; corollas nearly equal; base of involucres hardly elongated, equal to the linear open foveole; crown twice the length of the base, 32-35-nerved; limb of calyx pedunculate, with much exserted bristles. O. H. Native of Spain, Barbary, and the south of France, in exposed places. Coult. diss. p. 34. t. 2. f. 7. Asterocephalus stellatus, Spreng. Scabiosa simplex, D. C. fl. fr. no. 3313. Desf. fl. atl. 1. p. 125. t. 39. f. 1. Flowers purple. Montpelier Scabious. Fl. July, Aug. Ch. 1820. Pl. 1 to 2 fl. 8 S. Palestina (Lin. mant. p. 37.) stem dichotomously branched; leaves obvate-oblong, coarsely toothed, tapering into the petioles, pinnatifid at the base; heads on long peduncles; corollas radiant; base of involucres hardly elongated, equal to the foveole, which are linear and elongated; crown spreading, twice longer than the base or more, 32-35-nerved; limb of calyx on a long peduncle; bristles shorter than the crown. O. H. Native about Aleppo, and in Palestine. Jacq. hort. vind. 1. t. 96. S. Válílitli, Coult. diss. p. 35. t. 2. f. 6. exclusive of the country. Asterocephalus Palestinus, Spreng. Flowers white or pale red; segments jagged.

VI. SCABIOSA.

Palestine Scabious. Fl. July, Aug. Ch. 1771. Pl. 1 foot. 9 S. Ale'ype'a (Coult. diss. p. 35. t. 2. f. 8.) stem branched; leaves pinnate-lobed: lobes oblong-linear, quite entire; heads of flowers pedunculate; corollas radiant; base of involucres hardly elongated, equal in length to the linear foveole; crown spreading, 3 times longer than its base, 20-24-nerved; limb of calyx on a long peduncle; bristles shorter than the crown. O. H. Native of the Levant, between Bagdad and Aleppo, where it was collected by Olivier and Bruniere. Stems humble, silvery, villous. Peduncles smoothish.

Var. β. umbelíllata (Coult. 1. c. var. β.) flowers pedicellate, within the involucrum. Y. H. Native about Venice. Morìland, fl. ven. 1. p. 84.

Ukrain Scabious. Fl. Sept. Ch. 1795. Pl. 1 foot. 11 S. mirántha (Desf. ann. mus. 11. t. 25. choix. t. 40.) stem branched; leaves hairy; lower ones liryatly pinnate, with oblong or linear lobes; lower leaves oblong or lanceo-

Small-flowered Scabious. Fl. June, July. Ch. 1825. Pl. 1 to 2 feet. 12 S. Olivie'nt (Coult. diss. p. 36. t. 2. f. 10.) stem much branched, dichotomous; leaves linear-oblong, villous, entire or auricled; heads small, pedunculate, few-flowered; base of involucres hemispherical, equal to the obovate foveole; crown entire, spreading, 20-24-nerved, hardly exceeding its base; limb of calyx almost sessile, with much exserted bristles.—Na-
tive of the Levant, between Bagdad and Kermancha, where it was collected by Olivier and Bruniere. Stem glabrous, white. Herb very slender. Flowers white.
Oliver's Scabiosa. Pl. 1 to 2 feet. 13 S. iset es (Lin. mast. p. 37.) stem much branched; leaves pubescent: lower ones bipinnate-parted; superior ones pinnate-parted; segments of all oblong-linear; heads and peduncles clothed with white tomentum; corollas radiant; base of involucres elongated, villous; crown erect, 16-20-nerved, one-half shorter than the bristles. 24. H. Native of Siberia, in stony dry places, about Isetsk, and at Cape Caucasus; in the Kirghisean steppes, between the mountains Ku and Karkaraly, and at the Don. Coulit. dops. p. 34. Biieh. suppl. p. 100. S. rupéstris, Biieh. fl. taur. p. 95. S. rupéstris and Isetiésis, Renn el Schultes, syst. 3. p. 64. 83. Asterocéphalus setiésis, Spreng. Schélerostéma Isetiiésis, Schott. ms. —Gmel. sib. 2. p. 214. no. 7. t. 88. Flowers white.

14 S. crena'ata (Cyt. pl. rar. neap. l. p. 11. t. 3.) stems suffrutescent at the base, ascending; leaves smoothish, bipinnatifid: lobes entire or tridentate; heads on long peduncles; corollas radiant, created: base of involucel equal to the oblong fo- veole; crown subdentate, 16-20-nerved; limb of calyx sessile; bristles twice longer than the crown. 2. By. H. Native of Calabria, on calcareous mountains; and of Greece. Coulit. dops. p. 26. Asterocéphalus créniatus, Spreng. S. coro- nópòfóia, Sibth. et Smith, fl. grace. t. 114. S. crenaåta and S. coronópòfóia, Renn. el Schultes, syst. 3. p. 71 and 86. —Col. phyt. 2. f. 31. There are elongated and dwarf varieties of this plant. —Corollas flesh-coloured or pale-red.

Tar. By, hir'sïta (Guss. prod. 1. p. 102.) leaves hairy; bristles of calyx 3 times longer than the crown. 2. or 9. Native of Sicily, on the mountains. —Corollas hirsuta, Bid. mant. 3. p. 6.

Lyrate-leaved Scabious. Pl. 1 foot.

17 S. acútifòra (Reich. pl. crit. 4. p. 24. t. 326.) stem branched: lower leaves spatulate, and linearly pinnatifid, serrated: superior ones pinnate-parted, with oblong-linear entire lobes; heads of fruit ovate; corollas 5-cleft, radiant, with the outer lobes acuminate; crown a little longer than the tube; bristles of calyx 5, exserted. 2. By. H. Native of the south of Europe. —Involucels spongy at the edges. Flowers pale, peach-coloured. Allied to S. Ucránica.

Acute-flowered Scabious. Pl. 1 foot.

18 S. atropûr'púrea (Linn. spec. p. 144.) stem branched: radical leaves lanceolate-ovate, lyrate, coarsely toothed; cauleine leaves pinnate-parted, with oblong, toothed or cut lobes; heads ovate while bearing the fruit; corollas radiant, a little longer than the involucella. 2. By. H. Cultivated in gardens. Said to be spontaneous in India, but Roxburgh contradicts this assertion. Said also to be a native of Sicily, but according to Schouw it has been introduced there. S. atropûr'púrea a and 9. Coulit. dops. p. 37. t. 2. f. 11. Curt. bot. mag. t. 247. Scuca atropûr'púrea, Mönch. Schélerostéma, Schott. Asterocéphalus atropûr'púrea, Spreng. Sc. calypso-céps, St. Am. fl. agen. p. 61. —There is a prolific headed variety of this species (Mor- oxon. sect. 6. t. 14. f. 27.) The flowers are very sweet- scented. There is a great variety in their colour, some being of a purple, approaching to black, others of a pale purple, some red, some white, and others variegated. It varies also in the leaves, some being more finely cut than others.

19 S. setiifera (Lam. ill. no. 1321.) stem branched, downy; lower leaves ovate-spatulate, created or cut, rather villous; superior ones pinnate, with linear-lanceolate obtuse segments, the terminal segment the largest; corollas radiant, much longer than the involucrens. 2. H. Native of the south of France, about Marseilles. S. atropûr'púrea 9 setiifera, D. C. prod. 4. p. 657. Asterocéphalus setiifera, Spreng. Corollas lilac. Bristles of calyx 5, black.

Bristle-bearing Scabious. Pl. 2 feet.

20 S. grandifòra (Scop. del. ins. 3. p. 29. t. 11.) stem branched, downy; leaves rather villous; radical ones oblong, created; cauleine ones pinnatifid, with lanceolate linear spreading segments; corollas amply radiant. 2. By. H. Native of Bar- bary, Italy, and Sicily, in fields. Desf. atl. 1. p. 123. S. arvensis, Udria, but not of Lin. Columbária vulgaris, Presl. S. atropûr'púrea 9 grandifòra, D. C. prod. 4. p. 657. Corollas cream-coloured or white, with reddish tubes. —Bristles of calyx 5, reddish brown.

21 S. marí'tima (Linn. amon. 4. p. 304.) stem branched; radical leaves pinnatifid, with toothed lobes; middle cauline ones pinnatifid, with linear entire lobes; uppermost ones linear and quite entire; fructiferous heads globose; involucrens twice shorter than the radiant flowers. 2. or 9. H. Native of the south of France, Corsica, Italy, and Sicily, in arid places by the sea side. —D. C. fl. fr. suppl. no. 5309 a. S. Cupani, Guss. prod. 1. p. 160. S. angulata, Raîm. car. p. 81. S. atropûr'púrea var. Coulit. Stem villous. Flowers lilac, rose-coloured or white.

Carrot-like Scabious. Pl. 1 to 2 feet.

23 S. ambigüa (Ten. fl. neap. append. 5. 1826. p. 77.) plant glabrous; leaves fleshy, shining, crenated; radical leaves ob- ovate: cauleine leaves lyrate or pinnatifid, with oblong remote entire lobes; heads few-flowered, radiant; tube of corolla very long; corolla spongy, involute. 2. H. Native of the king- dom of Naples, at Paeta del Fresno, in corn-fields by the sea side. —Flowers purple or blue.

Ambiguous Scabious. Pl. 1 to 2 feet.

24 S. cornu-coél (Vivian. add. fl. lin. in fl. lyb. p. 67.) plant hairy; radical leaves elliptic, toothed; cauleine ones pinnate: flowers 5-cleft, pedicellate within the involucel; involucels trid; seed triaristate. —Native of Liguria, in the valley of
DIPSACE.E. VI. SCABIOSA.

Andora, and Sicily. Perhaps a prolific variety of S. grandiflora, Guss. or S. atropurpurea.

Horn-of-Plenty Scabious. Pl. 2 feet. 225 S. integrata (Hoffm. et Link, fl. port. 2. p. 88.) lower leaves oblong, entire; inferior ones lyrate; upper ones pinnatifid or wanting; corollas 5-cleft, radiant. 2 h. Native of Portugal. Said to be allied to S. Columbária and S. grandiflora.

Entire-leaved Scabious. Pl. 2 feet.

* Species belonging to the present tribe of the genus, but are not sufficiently known.

26 S. limonifolia (Vahl, symb. 2. p. 27.) stem shrubby; radical leaves coriaceous, obovate, quite entire, glabrous, and green above, but reticulated and clothed with hoary tomentum beneath; calyces leaves ciliate at the base; corolla equal, 6-cleft; crown scarious, plicate, denticulated at the apex, broad, extended; limb of calyx sessile; bristles of calyx 4-5, exerted. 2 h. Native of Sicily, among the mountains on calcareous rocks. Guss. prod. p. 164. Coult. dips. p. 42. Astrocerophalus limonifolius, Spreng.—Cup. pamp. 2. t. 247. Lower leaves like those of Sittice Limonium. Corolla blue. Limonium-leaved Scabious. Shrub.

27 S. saxatile (Cav. icon. 2. p. 68. t. 184.) stem herbageous, glabrous; leaves lanceolate, quite entire, green above, tomentose beneath; calyx leaves very few, ciliate at the base; corolla equal, 4-5-cleft; crown white, ciliate; bristles of calyx 5, purple. 2 h. Native of Spain, in the fissures of rocks, in Valencia. Coult. dips. p. 42. Astrocerophalus saxatilis, Spreng. Corollas white; anthers violaceous. Very like S. succisa.

28 S. nitens (Roent. et Schultes, syst. 3. p. 82.) stem herbageous; leaves undivided, elliptic, serrated, shining, petiolate; corollas radiant, 5-cleft. 2 H. Native of the Azores. S. lucida, Att. hort. kew. ed. 1. vol. 2. p. 229, but not of Vill. Astrocerophalus lucidus, Spreng.

Sect. III. Succisa (from succido, to cut down; on account of the prennose root of the first species). Coult. dips. p. 37. D. C.prod. 4. p. 657, but not of others. Base of involucels not distinguishable from the tube; having the foveoate engraven from the base to the crown. Crown spreading, short, membranous. Limb of calyx sessile, with 5 bristles, of which some are sometimes abortive and sometimes all.

* Corollas 5-cleft.

30 S. Fiscaei (D. C. prod. 4. p. 658.) stem branched, smooth; leaves all pinnate, almost glabrous, with linear acute entire lobes; heads of involucel unequal in length to the corollas, which are 5-cleft and radiant; crown of the involucel, which is somewhat cylindrical, membranous, and 3 times shorter than the tube; bristles of sessile calyx pale, twice the length of the crown. 2 h. Native of Dahuria. It was sent to Gay from Fischer under the name of S. Dakhiriaca. Perhaps the same as S. comosa, Roent. et Schultes. syst. 3. p. 84., in which the corollas are said to be large, showy, and violaceous, and in this bluish-purple. Fischer’s Scabious. Pl. 2 feet.

31 S. semipapposa (Salzm. pl. exsic. 1825. ex D. C. prod. 4. p. 658.) plant hairy, rather canescent; stem herbaceous; lower leaves ovate, coarsely toothed, petiolar; superior ones pinnatifid, with oblong-linear, acute, subdentate lobes; heads of flowers pedunculate; leaves of involucelum linear-subulate, ciliated, at length reflexed; corolla radiate; heads ovate; lower fruit of the heads without bristles: the rest furnished each with 6 long exerted bristles.—About Tangers and Mogador. S. atropurpurea γ, coronar erecta, Coult. dips. p. 37.

Semi-pappose Scabious. Pl. 1 to 2 feet.

32 S. lucida (Vill. dauph. 3. p. 293.) plant glabrous; stems usually 1-flowered; leaves shining; radical ones ovate-lanceolate, crenate, ciliate. Calyces pinnatifid, with linear acute lobes in involucelum. The involucelum is rather bluish-green, crown 20-24-nerved, 3 times shorter than the tube; bristles of calyx 5, black, equal in length to the flowers, but 5 times longer than the crown. 2 h. Native of France, in alpine places, Savoy, Switzerland, Austria, Syria, and Croatia, D. C. fl. fr. 4. p. 228. Rchb. pl. crit. 4. t. 381. S. stricta, W bild. et Kit. pl. rar. hung. 2. t. 138. S. Nórica, Vest. bot. zeit. 1805. no. 5. Wahl. fl. carp. p. 39. S. Columbária α, Coult. dips. p. 38, exclusive of the two synonyms. Astrocerophalus strictus, Spreng. Corollas pale blue, or of a pale violaceous colour. In the wild plant the stems usually bear only one head of flowers. This plant, with several of the following, are combined under the name of S. polymorpha, by Wibel, and by Coultier under that of S. Columbária.

33 S. ame'na (Jacq. fil. eclog. 1. p. 86. t. 59.) stem branched, rather hairy at the base; radical leaves obovate, toothed or lyrate, rather hairy; calyces leaves pinnatifid, with lanceolate-acute nearly entire lobes; peduncules elongated, beset with retrograde villi under the heads; corolla radiant; crown 20-nerved, 3 times shorter than the tube; bristles of calyx 5, of a rich brown colour, 4 times longer than the crown. 2 h. Native of Russia. S. nitida, Berth. ex Roent. ex Schultes, syst. 3. p. 68. S. longipedunculata, Fisch. et Jaq. S. Columbária a, Coult. dips. p. 38. Astrocerophalus ame'na, Spreng. Flowers lilac or rose-coloured. There are varieties of this having the involucel either longer or shorter than the flowers. Planting Scabious. Fl. June, July. Ch. 1829. Pl. 2 to 3 feet.

34 S. angustifolia (Hoffm. verz. 1826. p. 206.) stem quite glabrous; leaves downy: radical ones petiolate, oblong, toothed: lower ones lyrately pinnatifid, serrately cut: superior ones ovate, somewhat lyrateally twice bipinnate, with linear lobes; peduncles scabrous from retrograde hairs at the apex; leaves of involucel linear, terminated each by a hair. 2 h. Native country unknown. Said to be allied to S. ame'na.

Narrow-leaved Scabious. Pl. 1 to 2 feet.

35 S. ochroleuca (Lin. spec. p. 146.) stem branched, rather hairy; radical leaves lyrately pinnatifid, downy on both surfaces; these ones pinate-parted, with flat linear lobes; peduncules elongated, rather hairy; crown 20-nerved, one-half shorter than the tube; bristles of calyx 5, 3 times longer than the crown. 2 h. Native of Europe, Caucasus, and Si-

36 S. Scovit (Link, enum. hort. berol. 1. p. 128. but not of Vis.) stem clothed with retrograde hairs above; leaves hairy: radical ones oblong, crenate; lower cauline leaves pinnaatifid; superior ones pinnaatifid; lobes linear, cut; leaves of involucrum linear, clothed with adpressed hairs. 2. H. Native of the south of Europe. Corollas cream-coloured. According to Link, this species comes nearest to *S. ochroleucata*, but according to Coulter, to *S. Banketiana*.

37 S. reversa (Ledeb. ined. sem. hort. dorp. suppl. 1821. p. 6.) radical leaves obovate, obtuse, crenate, clothed with spreading down; cauline leaves pinnate, with deeply cut segments; peduncles setet with retrograde hairs; involucre exceeding the corollas, which are rather radiant and 5-cleft. 2. H. Native country unknown. Said to be nearly allied to *S. grandiflora* and *S. Scopolii*.

*Reverse-haired Scabious.* Pl. 1 to 2 feet.

38 S. Pauciflora (D. C. prod. 4. p. 658.) stem branched, hairy at the base; radical leaves lyrately-pinnaatifid, hairy, having the terminal lobe ovate and coarsely toothed; cauline leaves pinnate-parted, with narrow lobes; flowers radiant; heads of fruit globose; crown 20-nerved, 3 times shorter than the fruit; bristles of calyx usually only one, rarely 2-3, black, 3 times longer than the crown. 2. H. Native of Italy, in fields about Pisa, Carrara, Sarzana, &c. S. unisecta, Savi. fl. pis. p. 167. f. 2. f. 6. S. Grammitica, var. Seb. et Maur. fl. rom. p. 76. S. tenuifolia, var. Savii, bot. etrus. 122. S. Columbia, var. Poll. Coul. Flowers violaceous. Perhaps the same as S. Saviiana, Rchb. hort. bot. t. 1. t. 52. but in that plant the bristles of the calyx are 5, and the heads ovate.

*Pinn-bristled Scabious.* Pl. 1 to 2 feet.

39 S. Columbia (Lin. spec. 143.) stem branched, smoothish; radical leaves ovate, obuse, peltate, crenated, membranous, clothed with tomentum on both surfaces; cauline leaves smoothish, pinnate-parted, with flat linear segments; peduncles elongated, usually trihrid, downy; corollas radiate; heads of fruit ovate-globose; crown 20-nerved, one-half shorter than the tube; bristles of calyx 5, twice longer than the crown. 2. H. Native of Europe, Canaean, and Siberia, very common; in England plentiful on chalky soils. Coul. pis. p. 39. var. et. Smith, engl. bot. t. 1311. Rchb. pl. crit. 4. t. 355. Savi. fl. pis. 1. p. 165. f. 2. f. fl. dan. t. 314. Asterocéphalus Columbia, Wallr. sched. crit. 48. Flowers purple or violaceous. This is a very polymorphous plant.

*Var. β, Columnae* (D. C. prod. 4. p. 659.) leaves villous; lobes of cauline leaves wedge-shaped, cut; bristles of fruit 3-5, deciduous. 2. H. Native about Naples, in fields. S. Columnae, Ten. fl. nep. 1. p. 29. t. 7.

*Var. γ, commutata* (D. C. I. c.) stem glabrous; leaves smoothish; radical ones on long petioles, deeply serrated or pinnatifid; cauline leaves pinnate, with linear lobes. 2. H. Native of Siberia. S. commutata, Rom. et Schultes, syst. 3. p. 65. Corollas deep blue, radiate.

40 S. Baxatica (Waldst. et Kit. hang. 1. t. 12.) stem branched, setet with reflexed white hairs at the base and at the joints; radical leaves lyrate, hairy; cauline ones somewhat bipinnate, with linear ciliated segments, which are each terminated by a white hair; involucre equal in length to the corollas; seeds furnished with 8 pilose ribs; bristles of calyx 5, long, black. 2. H. Native of Hungary, on rocks. S. diversifolia, Baum. emend. herb. trans. 1. p. 79. S. Columbia? / Banketica, D. C. prod. 4. p. 659. Asterocéphalus Banketianus, Spreng. Receptacles of heads columnar, Corollas pale red or cream-coloured, with red rays. Anters pale red.

41 S. Grumusita (Waldst. et Kt. pl. rar. hong. 3. t. 201.) stem terete, purplish at the joints, glaucous, hairy at the base; radical leaves entire and somewhat lyrate; cauline ones tripinicate and pinnate, with linear segments; peduncles hairy at top; corollas radiate; leaves of involucrum linear, downy; seeds crowned by a membrane, which at length ends in 5 teeth; angles of seeds downy. 2. H. Native of Hungary and Croatia, in dry fields. S. Columbia, var. Bieb. fl. torn. 1. p. 96. S. Columbia, Ten. prod. fl. rare. 12. fl. neap. 1. p. 29. t. 7. S. Columbia? grumusita, D. C. prod. 4. p. 659. Asterocéphalus grumusita, Spreng. Corollas pale lilac. Heads on long peduncles; hence the plant is sometimes to be found in gardens under the name of *S. longipedunculata*.

42 S. Grammitica (Lin. spec. 145.) stem rather hairy; peduncles setet with retrograde hairs under the heads; radical leaves pinnaatifid, with obtuse distant segments; cauline ones bipinnate, with linear segments; leaves of involucrum linear, acute, short; bristles of calyx 5, dark brown; corollas radiant, sometimes 4-cleft. 2. H. Native of the middle and west of France, the north of Africa, and the Pyrenees. S. triandra. Lin. spec. p. 98. S. Columbia, var. Grammitica, D. C. fl. fr. no. 3305. Asterocéphalus Grammiticus, Spreng. var. graculis, Rom. et Schultes, syst. 3. p. 104. — Gerard. herb. 584. f. 2. Leaves cinnereous from villi. Corollas lilac or red.

43 S. Ceratophylla (Tenor. prod. fl. neap. p. 12. fl. neap. 1. p. 31. t. 8.) stem fustinular, villous; radical leaves lyrate, cre- nated; cauline ones pinnaatifid, with linear falcate segments; leaves of involucrum equal in length to the flowers; bristles of calyx 5. 2. H. Native of Abruzzo, in forests. S. pilosa, Lag. Flowers red or lilac.

44 S. Hispantica (Willd. in Rom. et Schultes, syst. 3. p. 521.) leaves pinnate-parted: the terminal lobe lanceolate, and a little toothed; corollas 5-cleft, radiant, longer than the involucrum. 2. H. Native of Spain. According to Coulter, this is hardly distinct from *S. Columbia.*

*Spanish Scabious.* Pl. 1 to 2 feet.

45 S. Coronopollia (Willd. herb. but not of fl. græc.) radical leaves lanceolate-spatulate, sharply toothed, or pinnately jagged: cauline ones pinnate-parted, with divericate linear lobes; corollas 5-cleft, radiant. 2. H. Native of Siberia. S. ceratophylla, Rom. et Schultes, syst. 3. p. 521. but not of Tenore. The rest unknown.

*Coronopus-leaved Scabious.* Pl. 1 to 2 feet.

46 S. Heraclea (Willd. in Rom. et Schultes, syst. 3. p. 521.) lower leaves bipinnatifid: superior ones pinnate-lobe; corollas 5-cleft, radiant. —Native at the Straits of Gauliflava. The rest unknown.

*Heraclea Scabious.* Pl. 1 to 2 feet.

47 S. Incana (Rom. et Schultes, syst. 3. p. 521. and 67.) stem villous; leaves hoary, pinnate-parted, with linear ciliated
lobes; corollas 5-cleft, radiate.—Native of Tauria. S. Ucrâ-
Hardly distinct from S. columbâria, or S. suaveolens. Radical
leaves quite entire and lyrate, ciliated; leaves of involucrum ob-
tuse. Corollas radiant, violaceous. Pappus 5-awned.

**Hoary Scabious.** Pl. 8 to 2 feet.

48 S. KIEZSÁNTA (Viv. fl. lib. spec. p. 6. t. 3. f. a. b.) radical
leaves elliptic; cauline ones pinnate-lobel; lobes all linear;
central peduncle rising from the root, bearing one head; the
rest rising from the tops of the branches; leaves of involucrum
5, linear; corollas 5-cleft, radiant; bristles of calyx 5. ☼ H. Native
of Cyrenaica, on the mountains.

**Root-flowed Scabious.** Pl. 1 to 2 feet.

49 S. Hladnikiana (Host, fl. austr. 1. p. 195.) stem
straight, branched, downy; leaves hispid; lower ones obovate,
crenated: upper ones pinnate-parted; lobes jagged; leaves of
involucrum linear; corollas 3-cleft, radiant; bristles of calyx 5,
dark purple. ☼ H. Native of Carniola, on the mountains.

**Hladnik's Scabious.** Pl. 1 to 2 feet.

50 S. reutelis (Host, fl. austr. 1. p. 195. but not of the Thumb.)
stem branched, glabrous, ascending; lower leaves oblong, cren-
ated or jagged; superior ones pinnate-parted; lobes jagged;
peduncles beset with reflexed hairs; leaves of involucrum linear-
subulate; corollas 5-cleft, radiant; bristles of calyx 5. ☼ H. Native
of the Alps of Austria, about Genova. Corollas white,
suffused with purple. Rehb. pl. crit. 5. p. 30.

**Humble Scabious.** Pl. $\frac{1}{2}$ foot.

51 S. NEGLÉCTA (Horn. hort. fl. 1. p. 127.) leaves all lyr-
ate or pinnatifid; peduncles very long; leaves of involucrum
exceeding the corollas, which are 5-cleft and radiant. ☼ H. Native
of Italy. Flowers red or lilac. The plant we have in the
gardens under this name appears to be nothing but S. Gra-
maniaca.

**Neglected Scabious.** Pl. June, July. Ct. 1825. Pl. 1 to
2 feet.

55 S. LACNICA (Licht, in Rem. et Schultes, syst. 3. p. 87.)
plant downy; stem dichotomous; lower leaves obovate-oblong,
unequally and bluntly serrated; superior ones pinnatifid; lobes
cut, acute; corollas 5-cleft, radiate.—Native of the Cape of
Good Hope. Leaves of involucrum downy, linear, acute, and
sometimes bised, one-half shorter than the corollas, which are
pale violet.

**Jagged-leaved Scabious.** Pl. 1 to 2 feet.

53 S. Pyreneâca (All. ped. 1. p. 140. t. 25. f. 2. and 26. f.
1.) the whole plant clothed with cinerous tomentum; stem a
little branched, few-flowered; radical leaves oblong, crenated;
upper cauline ones bipinnatifid; lobes linear, quite entire; cor-
ollas radiate; leaves of involucrum lanceolate; crown 3 times
shorter than the tube, 20-nerved; bristles of calyx 5, 4 times
longer than the crown. ☼ H. Native of the south of Europe,
on the lower mountains and hills; and of Caucasus, on the Ta-
busch Mountains, in dry fields. Durb. bot. gall. p. 236. S.
columbâria, var. Coul. dups. p. 38. exclusive of the synonymes.
Corollas frequently reddish purple, but most often of a bluish
purple.

**Var. a. cinerea** (D. C. prod. 4. p. 659.) plant clothed with
hairy down. ☼ H. Native of the Pyrenees. S. cinerea, Lam.
ill. no. 2510. S. maritima, Vill. dauph. 2. p. 225. S. Pyre-

**Var. b. mollissima** (D. C. l. c.) plant clothed with hoary to-
mentose velvety down. ☼ H. Native from Nice to Sarzana.
S. mollissima, Visiani, ann. 2. p. 161. Asterocephalus mollis-
simus, Spreng. S. laxilífera, Link. enum. 1. p. 128. The plant
in the gardens, under the name of S. mollissima, has white
flowers.

**VI. SCABIOSA.**

Var. γ, tomentosa (D. C. l. c.) lower leaves lyrately pinnatifid,
obtuse: superior ones divided into linear acute lobes. ☼ H.
Native of Spain, in the kingdom of Valencia. S. tomentosa,
Cav. icon. 2. t. 183. Asterocephalus tomentosum, Spreng. Cor-
ollas pale violaceous.

54 S. holoserîcea (Berol. dec. 3. p. 49.) plant clothed with
soft hoary tomentose velvety down; lower leaves lanceolate,
crenated; superior ones pinnatifid; with lanceolate acute
entire lobes; leaves of involucrum linear; corollas radiant;
crown 20-nerved, 3 times shorter than the tube, which is hairy;
bristles of calyx 5, black, twice longer than the crown. ☼ H.
Native of the Apennines, Abruzzo, Dalmatia, and the Pyrenees.
Leaves sometimes all simple. Corollas bluish purple.

55 S. WEBBIANA (Don, in bot. reg. t. 717.) plant clothed
with soft silky hoary tomentum; lower leaves petiolate, obovate,
crenated: superior ones pinnatifid, with ovate or oblong entire
lobes; leaves on long peduncles; corollas nearly equal; crown
4 times longer than the tube; bristles of calyx 5, black. ☼ H.
Native of Phrygia, on the top of Mount Ida. Asterocephalus
Webbianus, Spreng. Flowers cream-coloured.

**Webb's Scabious.** Fl. July. Ct. 1818. Pl. $\frac{1}{2}$ foot.

56 S. mollis (Willd. enum. suppl. p. 7.) lower leaves supra-
decomposed: superior ones bipinnate-parted; lobes of all very
slender and filiform, smoothish, except the margins, which are
rather pilose; peduncles very long, scabrous; involucrum equal
to the corollas, which are 5-cleft and radiant; crown spreading;
bristles of calyx 3-5, short. ☼ H. Native country unknown.
Rehb. pl. crit. 4. t. 333. S. capillata, Rem. et Schultes, syst.
3. p. 64. Lower leaves lyrate, soft, tomentose, ex Link. enum.
1. p. 128. Flowers pale violaceous, ex Willd. Perhaps only a
variety of S. colombâria or S. Pyrenacâcia.

**Saff Scabious.** Fl. June, July. Ct. 1820. Pl. 2 to 3 ft.

57 S. pemilla (Poir. dict. 6. p. 723.) plant hispid from grey
pili; stem short, almost simple; radical leaves lyrate or pinna-
tifid, with obtuse toothed lobes: cauline leaves pinnate-parted,
with linear acute lobes, which are sometimes trifid at the apex;
leaves of involucrum lanceolate, villous, shorter than the corollas,
which are 3-cleft and radiant; bristles of calyx 5, black, nearly
equal in length to the corollas. ☼ G. Native of the Cape of
Good Hope. Asterocephalus pimilus, Spreng. S. acuillls, Lin.
1351. Corollas cream-coloured or nearly white. Plant very hairy.

**Dwarf Scabious.** Pl. $\frac{1}{2}$ foot.

58 S. suaveolens (Desf. cat. hort. par. p. 110.) rather canescent from short down; stems straight; radical leaves ob-
long, attenuated at the base, quite entire; cauline ones pinnate-
parted, with linear-thickish quite entire lobes, smoothish;
heads of fruit ovate; flowers radiant; tube of involucel cylindrical;
crown very short, 16-nerved; bristles 5, spreading, hardly ex-
serted. ☼ H. Native of France, Germany, Sweden, Hungary,
&c. on the higher hills. D. C. fl. fr. no. 3307. Coul.
S. média, Ger. hist. p. 720. Corollas of a bluish lilac colour,
having a scent like O'richs nigra.

Pl. 1 to $\frac{1}{2}$ foot.

59 S. dichôtoma (Ucria, pl. lin. add. 249. Willd. enum. 1.
114.) smoothish; stem dichotomous; heads almost sessile at
the sides, globose; leaves oblong, entire; radical ones petiolate
DIPSACEE.  695

and toothed: cauine ones almost sessile, quite entire; corollas equal; tube of involucre nearly cylindrical; crown 20-24-nerved, one-half shorter than the tube; bristles of calyx spreading, very short, inclosed.  C. H.  Native of Mauritania, Sicily, &c.  Coulter, ibid. 9.  t. 2.  f. 15.  Guss.  prod. 1.  p. 168.

Asterocéphalus dichotomus, Lag.  gen.  et  spec.  S. parviflora, Desf.  fl.  atl.  p. 1.  p. 119.  Lower leaves sometimes lyrate or jagged.  Corollas 5-cleft, and flesh-coloured; but by some authors they are said to be 4-cleft.

** Corollas 4-cleft.

61  S.  succisa  (Linn.  spec.  142.)  root prænorous, or appearing as if it was bitten off at the end; radical leaves ovate-lanceolate, acuminate at both ends; cauine leaves conuate, almost entire; heads of flowers pedunculate; leaves of involucrum disposed in 2-3 series; corollas equal; tube of involucre 4-sided; crown very short, undulated; bristles of calyx short, a little exerted, convivuent.  2.  H.  Native of Europe even to Caucaucus, very common in hogs and moist meadows and pastures; plentiful in Britain.  Fl. dan.  t. 279.  Smith, engl.  bot.  t. 878.  Curt.  lond.  t. 10.  Couth.  ibid.  p. 39.  t. 2.  f. 17.  D.  C.  fl.  f. 4.  p. 226.  Blackw.  t. 142.  Asterocéphalus succisa, Wallr.  sched.  l.  p. 52.  Succisa praténensis, Ménch.  meth.  p. 459.  The lower stem leaves are toothed, but the upper ones are entire.  Involute hairy.  Flowers violet or dark purplish blue, varying to flesh-coloured and milk-white.  The leaves are sometimes gashed according to Haller, and the heads of flowers are sometimes proliferate.  In cultivation the plant becomes more branched than in the wild state.  In days of superstition it was bailed that the Devil, envying the good this herb might do to mankind, binway to part of the root; hence the plant is commonly called Devil's-bit.  This appearance of a stamped root is not peculiar to  S.  succisa, but is observed in some species of Plantago, and many other herbs. According to Bergen the root is astringent, and the infusion of it bitterish, but not unpleasant.  A strong decoction of it, kept a while, was formerly an empirical secret for gonorrhœa.  Linnaeus says that the dried leaves are used to dye wool yellow or green.

Var.  a.  hirsuta  (Wallr.  sched.  l. c.)  stem, peduncles, and both sides of leaves hairy.  2.  H.  This is the British variety.  Succisa hirsuta, C.  Bauh.  pin.  p. 269.

62  S.  australis (Wulf.  in  Rom.  arch.  l. c.  p. 216.)  plant smoothish; leaves ovate, elongated, acuminate, almost quite entire; lowermost ones somewhat auriculated at the petioles; heads ovate; leaves of involucrum disposed in two series; corollas equal; tube of involucre lageniform; crown obsolete; bristles of calyx approximately.  2.  H.  Native of Upper Italy, Syria, and Pannonia, in marshy parts of woods, and by the sides of rivulets.  Coulter, ibid.  p. 46.  t. 2.  f. 18.  Rechb.  fl. crit.  t. 325.  S.  repens, Brög.  Fl. Jul. 19.  Nocc.  et  Balbi.  fl.  ticin.  68.  t. 2.  S.  pseudaustralis, Rom.  et  Schultes, syst.  5.  p. 60.  Roots creeping tufted.  Corollas of a bluish violet or purple colour, but Wulffen says they are yellow; there are, therefore, 2 plants probably confused under this name, or only mere variations in the colour of the flowers.

Southern Devil's-bit.  Fl. June, Aug.  Clt. 1820.  Pl. 1 ft. 63  S. tenuifólia  (Linnaea.  vol.  8.)  bristles of pappus twice longer than the denticulated calyx; corollas downy, equal, shorter than the involucrum; heads ovate; stem erect, branched; cauine leaves pinnate, with linear, acute, quite entire, elongated segments.  2.  H.  Native country unknown. Said to be nearly allied to  S.  australis.

†  Species not sufficiently known.

§ 1.  Leaves entire or serrated.

64  S.?  amplexicaulis  (Linn.  mant.  p. 155.)  stem herbaceous, brachiate; leaves stem-clasping, lanceolate, quite entire; radical ones trifid; corollas radiant, 4-cleft.—Native country unknown.  Succisa amplexicaulis, Spreng.  Said to be nearly allied to  S.  integrifólia.  Lin.  Corollas bluish.  According to Couter, it is probably a species of  Kaualtia.

Var.  a.  lyra (Rom.  et  Schultes, syst.  3.  p. 62.)  lower leaves lyrate, obtuse, crasped; superior ones lanceolate, sessile.  2.  H.  Native of France.  S.  lyra, Lam.  illl.  no. 1310.  Flowers pale red.

Stem-clasping-leaved Scabious.  Pl. 1 foot.

65  S.?  cochinchenensis  (Lour.  cochr.  p. 68.)  stem quite simple, nearly naked; leaves lanceolate, undivided, undulated; radical leaves quite entire; involucrum 3-leaved; corollas 5-cleft; pappus pilose.—Native of China and Cochinchina.  Asterocéphalus cochinchenensis, Spreng.  Flowers purple.  Corollas 5-cleft, nearly equal.  Bristles of calyx 5.

Cochin-china Scabious.  Pl. 1 foot.

§ 2.  Leaves lyrate or pinnate-lobed.

* Corollas 4-cleft.

66  S.?  dahurica  (Willd.  in  Rom.  et  Schultes, syst.  3.  p. 521.)  leaves pinnate-parted, tomentose; lobes pinnatifidly jagged; stem tomentose; corollas 4-cleft, radiate.—Native of Dahuria.  Couth.  ibid.  p. 41.  There is another plant under this name by Fischer, cultivated in the gardens.

Dahurian Scabious.  Pl. 1 foot.

67  S.  mira (Willd.  in  Rom.  et  Schultes, syst.  3.  p. 251.)  leaves all pinnate, and are as well as the stem hairy; lobes or segments linear-lanceolate, acute; corollas 4-cleft, radiate.—Native of Siberia.  Couth.  ibid.  p. 41.  The rest unknown.

Hairy Scabious.  Pl. 1 to 2 feet.

* Corollas 5-cleft.

68  S.  styriaca  (Vest, in  flora.  1821.  p. 146.)  plant clothed with fine hairs; stem much branched, many-flowered; leaves all pinnate-parted; lobes pinnatifidly jagged; stem tomentose; corollas 5-cleft, radiate, outer lobes acute; crown quite entire; bristles of calyx wanting.—Native of Styria.

Styrian Scabious.  Pl. 1 to 2 feet.

Cult.  Many of the species of this genus are very ornamental, and are well fitted for decorating flower-borders.  The perennial herbaceous kinds are easily increased by seed, or dividing at the root.  The seeds of annual kinds only require to be sown...
in the open ground. The shrubby species are increased by cuttings under a hand-glass, or by seed. The species most worthly of cultivation are *S. Caucasia*, *S. grandiflora*, *S. atropurpurea*, *S. grandiflora*, and many others.

Calyx of 5 unequal segments. Corolla regular, funnel-shaped, with a long slender tube, and 5-3-nerved segments; glandular spaces or areoles below the stamens, and alternate with them. Stamens 5, monadelphous; anthers combined by their lower half. Ovarium inferior, 1-celled. Style smooth, elevate in the upper part; stigma capitate, undivided. Fruit or achenœ indehiscent, crowned by the rigid spiny segments of the calyx. Seed solitary, inverted, sessile. Embryo in the axis of fleshy albumen, slender. —Herbaceous plants, with alternate leaves without stipules. Flowers collected into heads, which are either terminal or opposite the leaves, surrounded by an involucrum, and bearing bracteas among the flowers. Flowers sessile, hermaphrodite or neuter. This is a very small tribe of plants, differing from *Compositae* in their albuminous pendulous ovulum, and half distinct anthers; and from *Dipsaceae* in their filaments being monadelphous, and their combined anthers.

**Synopsis of the genera.**

1. **Calyceera.** Crown of fruit in some long horned, and in others short and scaly.

2. **Boopis.** Limb of corolla not contracted, campauulate. Fruit crowned by the segments of the calyx, which are stiff and membranous, but acute and spinescent at the apex.

3. **Acicarpa.** Lower flowers of the heads fertile: superior ones numerous and sterile. Tube of anthers undivided. Fruit combined into a globose echaned head.

**I. CALYCERA (from *calyx*, a calyx, and *keras*, a horn; the crown of the fruit is a long horn).** Cav. icon. 4, p. 34. t. 58. Juss. ann. mss. 2, p. 350. Pers. ench. 2, p. 500. Cassini, dict. 5, suppl. p. 28.

**Lin. syst. Syngeaësia, Necessaria.** Involutum 5-parted. Flowers fertile, dissimilar, and promiscuous. Segments of the calyx in some long and horn-formed, and in others short and scale-formed. Limb of calyx contracted a little below the lobes. Tube of stamens inserted a little below the contraction of the corolla, divided at the top.—Herbaceous plants with sub-pinnatifid leaves and terminal heads of flowers.

**II. BOOPIS (from *boeo*, hons, an ox, and *oep*, ops, an appearance; the flowers have some resemblance to the eye of an ox).** Juss. ann. mss. 2, p. 350, t. 58. f. 2. Pers. syn. 2, p. 500. C. Cassini, dict. 5, suppl. p. 28. Rich. mem. mss. 6, p. 87. **Lin. syst. Syngeaësia, Necessaria.** Involutum 7-8-echl. Flowers fertile, nearly alike. Segments of calyx shorter than the ovaria, membranous, some entire, and some deeply toothed. Limb of corolla without any contraction, campauulate, half divided. Column of stamens inserted at the base of the limb of the corolla; tops of filaments distinct.—Many stemmed branched herbs, with pectinately pinnatifid leaves, and terminal heads of flowers.

2. **B. Alpea** (Poep. coll. 2, no. 823. ex Cham. et Schlecht. in Linneæ. 6, p. 258.) leaves oblong-ovobate, fleshy, entire, or furnished with a tooth on one or on both sides, quite glabrous. **H.** Native of Chili. Root woody. Stem erect, simple, only leafy at the base. Corolla yellowish. Involutum 12-toothed. *Alpine Boopis*. Pl. 2 to 3 inches.

**Cult.** The seeds only require to be sown in a warm sheltered situation in the open ground.

**III. ACICARPHA (from *akos*, akis, a point, and *karpos*, carphos, chaff; in reference to the segments of the calyx being spiny).** Juss. ann. mss. 2, p. 347. t. 58. f. 1. Pers. ench. 2, p. 488. Cassini, dict. 1, suppl. 32. Rich. ann. mss. 6, p. 77. pl. 11-12.—Cryptocarpha. Cassini, dict. 12, p. 85. **Lin. syst. Syngeaësia, Necessaria.** Involutum 4-5-parted: outer ones adnate to the ovaria. Lower flowers of heads fertile. Superior ones much more numerous and sterile, with the ovaria of all combined. Segments of the calyx for the most part ending in acicular spines. Limb of corolla funnel-shaped. Column of stamens inserted beneath the attenuated part of the limb of the corolla, undivided to the top of the anthers. Bases of connectives knob-formed.—Herbaceous plants, with toothed or entire leaves, and terminal and lateral heads of flowers.

1. **A. Tribuloides** (Juss. l. c.) plant erect, glabrous; leaves oblong, cuticate-ovobale, obtuse, with broad teeth; style much exserted. **H.** Native of Buenos Ayres, where it was collected by Commerson. Cryptocarpha tribuloides, Cassini, dict. 12, p. 85. *Caltrop-like Acicarpha*. Pl. ½ to ¾ foot.

2. **A. Spatulata** (Br. comp. 29. Richard, mem. mss. 6, p. 78, pl. 12.) procumbent, glabrous; leaves spatulate, tapering a long way at the base, decuticulated and entire at the apex, and mucronate; style a little exserted. **H.** Native of Brazil, where it was collected by Sello. Cryptocarpha spatulata. Cassini, dict. 12, p. 85. *Spatulate-leaved Acicarpha*. Cht. 1824. Pl. proc.

3. **A. ? Lanata** (Lag. in Pers. ench. 2, p. 488.) stem woolly; leaves linear, glabrous, having a tooth on one side, and some-

Woolly-stemmed Aecicarpia. Pl. prostrate.

Cult. Being annual plants, the seeds only require to be sown in the open ground in a warm sheltered situation.

N. B. Cevallia sinuata (Lag. gen. et spec. p. 11. with a figure,) appears to be allied to the present order, but the characters of the plant are not sufficiently known.

Lobelia superior, 5-toothed, or 5-parted, seldom entire, with the tube adnate to the ovarium at the base. Corolla monopetalous, irregular, inserted in the calyx, 5-lobed, or deeply 5-cleft. Stamens 5, inserted into the calyx alternately with the lobes of the corolla; anthers cohering; pollen oval. Ovarium inferior, with from 1 to 3 cells, but usually of 2 cells. Ovula very numerous, attached to the axis or parieties of the fruit. Style simple; stigma usually 2-lobed, surrounded by a cup-like fringe. Fruit capsular or bacate, 1-2-celled, rarely 3-celled, many seeded, dehiscing at the apex. Seeds attached to the axis or parieties of the fruit. Embryo straight, in the axis of fleshy albumen, with the radicle pointing to the hylum.—Herbaceous plants or shrubs. Leaves alternate, exstipulate. Flowers axillary or terminal, of various colours.

This order appears more nearly related to Compósitæ than to Campanulacæae, in their cohering anthers, and in the irregularity of the corolla; the stigma is surrounded by hairs, which are probably analogous to the indusium of Goodeniææ, to which order Lobeliaceæ approaches very closely. It participates in all the affinities of Campanulacæae.

The plants contained in this order are all dangerous or suspicious, in consequence of the acridity of their milk. Tupá Feuillei yields a dangerous poison in Chili. The most active article of the Materia Medica of North America is said to be Lobéla inflata; it is possessed of an emetic, sudorific, and powerful expectorant effect, especially the first. When given with a view to empty the stomach, it operates vehemently and speedily, producing, however, great relaxation, debility, and perspiration, and even death, if given in over-doses. Barton, 1. p. 189. The antisiphilitic virtues ascribed to Lobéla spinghiæ are supposed to have resided in its diuretic properties; they are, however, generally discredited altogether. Barton, 2. p. 211. Hippóbrōma longiflōra, a native of some of the West India Islands, is one of the most venomous of plants. The Spanish Americans call it Rebentia Cavellés, because it proves fatal to horses that eat it; it acts as a violent cathartic, the effects of which no remedy can assuage, and which ends in death. The leaves are an active vesicatory. Lobéla cardinális is an acrid plant, which is reckoned anthelmintic. Barton, 2. p. 180. All the plants contained in this order are very ornamental, and therefore well deserving the care of the gardener. The flowers are very showy blue, white, red, scarlet, but seldom yellow.

Synopsis of the genera.

1 Clermontea. Calyx tubular, 5-cleft. Corolla arching, 5-cleft, almost regular. Stamens with united filaments and cohering anthers; the two lower anthers bearded. Stigma 2-lobed, girded by hairs. Capsule bacate, naked at the apex, indehiscent, 2-celled, many-seeded.

2 Rolla'ndia. Calyx 5-parted. Corolla compressed at the sides, with an undivided tube, and a 5-parted, somewhat bilabiate limb. Staminous column adnate to the superior part of the corolla. Anthers cohering, two lower ones bearded. Stigma pilose. Capsule bacate, crowned by the calyx, 2-celled, many-seeded, indehiscent.

3 Cya'nea. Calyx 10-surfaced, with oblong, foliaceous, curved segments. Corolla tubular, arching, with a 5-parted, somewhat bilabiate limb. Stamens, combined filaments, and cohering bearded anthers. Stigma capitate ciliated. Capsule bacate, 10-surfaced, indehiscent, crowned by the limb of the calyx, 2-celled, many-seeded.

5 Pra'nia. Limb of calyx 5-toothed (f. 119 a.). Corolla cleft on the back, even to the base, and therefore the limb is 5-parted, unilateral, or all on the lower side (f. 119 b.). Stamens combined above and the anthers cohering; the two lower anthers mucronate (f. 119 d.). Stigma 2-lobed. Capsule bacate, crowned.

6 Tu'pa. Calyx spherical, 5-parted. Corolla cleft on the back almost to the base, having the limb divided into 5 segments, which are all united at their tips. Stamens combined almost to the base; anthers cohering, bearded. Stigma 2-lobed, protruding. Capsule 2-celled, many-seeded.

7 Siphoca'mpylus. Limb of calyx 5-parted (f. 120 d.). Corolla with a curved undivided tube, which is ventricose in the middle, and a 5-parted bilabiate limb (f. 120 b.). Stamens and anthers combined; anthers bearded. Capsule 2-celled, 2-valved, dehiscent.

8 Lobélia. Limb of calyx 5-parted (f. 121 a.). Corolla with the tube cleft on the upper side, and thickened at the base, and a bilabiate limb (f. 121 g.). Anthers cohering; 2 lower ones usually bearded. Capsule 2-celled, 2-valved, dehiscent at the apex.

9 Dortma'nnia. Limb of calyx 5-parted. Corolla with the tube cleft on the upper side, and a bilabiate limb, and a bearded throat. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half superior, 3-celled, 3-valved, dehiscent, many-seeded, surrounded by the calycine segments below the apex.

10 Parastra'nlthus. Limb of calyx 5-cleft. Corolla
with hardly any tube, and a bilabiate, 5-parted, reversed limb. Column of stamens under the lower lip. Filaments and anthers combined; the latter bearded. Stigma bifid or trifid. Capsule crowned by the segments of the calyx, 2-celled, many-seeded.

11 Isòtoma. Limb of calyx 5-parted (f. 122. a.). Corolla salver-shaped (f. 122. d.), or funnel-shaped, with an entire or cleft tube, and a 5-parted, nearly regular limb (f. 122. d.). Filaments combined; anthers cohering, beardless; the two lower ones mononate. Stigma capitate, protruding. Capsule 2-celled, many-seeded, dehiscent.

13 Lysimònia. Limb of calyx 5-parted. Corolla with an entire tube, and a 5-parted sub-bilabiate limb. Anthers cohering; the 2 lower ones bearded, or terminating in a membranous process. Stigma 2-lobed, ciliated. Capsule 1-celled, opening by an operculum at the apex, many-seeded.

14 Monòris. Calyx tubular, 5-cleft. Corolla salver-shaped, with a terete tube, which is cleft on one side, allowing the stamens to escape, and a regular rotate limb. Anthers cohering. Capsule 2-celled, many-seeded, dehiscent.

16 Clintonà. Limb of calyx 5-cleft. Corolla bilabiate, with hardly any tube. Anthers cohering; the 2 superior ones bearded. Capsule siliqué-formed, triangular, dehiscing by 3 loriform valves, many seeded. Seeds attached to two parietal placentas.

17 Cýphia. Limb of calyx 5-cleft. Corolla bilabiate, 5-parted; the segments easily separated to the base. Stamens with combined hairy filaments, and free anthers. Stigma hollow, gibbous, bearded. Capsule 2-celled, many-seeded, dehiscent.

18 Campánèthus. Calyx hemispherical, with a 5-parted limb. Corolla tonguens e outside, campanulate, regular, 5-parted at the apex. Stamens with free filaments, and combined anthers. Capsule unknown.

Lin. syst. Pentádria, Monogyguna. Calyx tubular, arched, 5-cleft, coloured, length of corolla, cadaceous. Corolla tubular, arched, 5-cleft, almost regular. Stamens 5, one of which falls off along with the corolla, with combined filaments and cohering anthers; the 2 lower anthers bearded. Stigma 2-lobed, girded by pili. Capsule baccate, 2-celled, naked at the apex, indehiscent; cells many-seeded.—Shrubby or arborescent lacerent plants. Leaves alternate, entire. Flowers racemose, axillary, bracteate, showy, white, or of a rose-violet colour, blue.

1 C. oblongifolia (Gaud. l. c. t. 71.) leaves on very long petioles, oblong, acute, crenated; calyx 5-parted. G. Native of the Sandwich Islands.

Oblong-leaved Clermontea. Shrub.

2 C. persicifolia (Gaud. l. c. t. 72.) leaves oblong-lanceolate, acute, crenated; calyx 5-parted. G. Native of the Sandwich Islands. Lobélia Clermontiana, Gaud. mss.

Peach-leaved Clermontea. Shrub.

3 C. grandiflóra (Gaud. l. c. t. 73.) leaves obvate-oblong, rather acuminate, deuto-crenated; flowers large; calyx 5-parted. G. Native of the Sandwich Islands. Lobélia grandiflora, Gaud. mss.

Great-flowered Clermontea. Shrub. Cult. All the species of this genus bear ornamental blossoms, and are therefore worth cultivating in every collection of greenhouse plants. A mixture of loam, sand, and peat is the best soil for them; and they will be easily increased by cuttings planted in the same kind of soil, under a glass-house, in a little bottom heat.

II. Rolländia (named after R. M. Rolland, gunner of the expedition under Freycinet, who rendered great services to ornithology). Gaud. in Freyc. voy. pt. bot. p. 458.

Lin. syst. Pentádria, Monogyguna. Calyx closely adhering to the ovarium; limb free, 5-parted, with short obstate segments. Corolla tubular, with the sides compressed; tube curved, undivided; limb 5-parted, somewhat bilabiate; segments narrow, Stamens 5. Staminal tube adnate at the bottom to the superior part of the tube of the corolla. Anthers cohering, two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule baccate, indehiscent, 2-celled, crowned by the permanent calyx; cells many-seeded.—Lacerent shrubs. Leaves alternate, exstipulate. Peduncles axillary, few-flowered. Pedicels unbractate at the base. Flowers white.

1 R. lançolátia (Gaud. l. c. t. 74.) shrub branched; leaves large, oblong-lanceolate, doubly toothed, hairy beneath; calyx 5-parted, glabrous, with ovate obtuse segments; racemes few-flowered; stamens epipetalous. G. Native of the Sandwich Islands. Lobélia Rollandiana, Gaud. mss. Lobélia lanceolata, Hook. et Arn. in Beech, voy. pt. bot. p. 88.

Lanceolate-leaved Rollandia. Shrub.

2 R. críspà (Gaud. l. c. p. 459.) shrub branched; leaves large, oblong, tapering much to the base, sharply toothed, glabrous, with unduly curled margins; calyx 5-parted, downy, with ovate obtuse segments; stamens epipetalous. G. Native of the Sandwich Islands. Lobélia críspà, Gaud. mss.

Curlèd-leaved Rollandia. Shrub.

3 R. ? pinatidifía; leaves oblong-lanceolate, acute at both ends, running into the short petioles, remotely pinnatifid, sinuately and doubly toothed; flat and glabrous above, reticulately veined beneath and rather hairy; teeth short, and are as well as the lobes obtuse and callously mucronate; racemes axillary; calyx and corolla hairy; ovarium obconical, crowned by the auriculated, ovate, obtuse, calycine segments. G. Native of Owahu, on the mountains. Lobélia pinatidifád, Cham. in Linnæa. 7. p. 221. Leaves like those of a species of Sóntchus. Pedicels arising from a flabby peduncle, and furnished with scale-formed bracteas. Corollas 2 lines long, deciduous. Stem branched. Perhaps a species of Cýphia.

Pinnatifíd-leaved Rollandia. Shrub.

4 R.? ? anúkà; leaves oblong-lanceolate, acute at both ends, sinuately and doubly toothed, flat and glabrous above, and hairy beneath and fuscescent; teeth callously mucronate; racemes axillary; ovarium obconical, smooth; calycine segments ovate, obtuse, mucronate, rather hairy; corolla hairy, especially on the nerves. G. Native of Owahu. Lobélia ambigüa, Cham. in Linnæa. 7. p. 221. Stem simple? Corolla deciduous.
LOBELIACEA. III. CYANEÁ. IV. DELISSEA. V. PRATIA.

Ambiguous Rollandia. Shrub. 
5 R. calycina; leaves oblong-lanceolate, acute at both ends, unequally and erose-crenated, flat and pilose above, and reticulately veined, fuscous and hairy beneath; calyx glabrous, with oblong, bluntish, 1-nerved segments; ovary olive-formed, crowned by the erect calycine teeth; limb of corolla hairy; tube of anthers hairy about the base and along the furrows. L. G. Native of Oahu. Lobélia calycina, Cham. in Linnaea, 7, p. 222. Corella deciduous. Large-calyced Rollandia. Shrub. Cult. See Clermontea, p. 698, for culture and propagation.

III. CYANEÁ (from cyanos, kyaneos, blue; colour of flowers). Gaud. in Freyc. voy. pt. bot. p. 457. Lin. syst. Peniandria, Monogynia. Calyx adhering to the ovary, 10-furrowed, longer than the limb, which is folioaceous and 5-parted; segments oblong, with reflexed undulately curved margins. Corella tubular, cylindrical, arched; limb 5-parted, somewhat bilabiature. Stamens 5, with combined filaments, and cohering bearded anthers. Stigma capitate, simple, ciliated with hairs. Capsule bacate, 10-furrowed, indehiscent, 2-celled, crowned by the permanent calyx; cells many-seeded. 

IV. DELISSEA (named after A. M. Delisse, a physician from the Isle of France, and naturalist to the French expedition under D'Entrecasteaux, to the South Seas—from 1800 to 1804). Gaud. in Freyc. voy. pt. bot. p. 457. Lin. syst. Peniandria, Monogynia. Calyx closely adnate to the ovary; limb free, 5-toothed, permanent. Corella tubular, arched, deciduous; tube cylindrical, undivided; limb 5-parted, somewhat bilabiature; segments narrow. Stamens 5, with connate filaments, and cohering anthers; the two lower ones bearded. Stigma 2-lobed, girded by hairs. Capsule bacate, crowned by the permanent calyx, 2-celled, indehiscent; cells many-seeded. Shrubby laetecent plants. Leaves scattered, exstipulate, entire. Flowers racemose, axillary, pale red, or white or red; pedicels immurbacate at the base. 
1 D. SUBCORDATA (Gaud. l. c. p. 457. t. 77.) branched; leaves ovate, sharply toothed, glabrous. L. G. Native of the Sandwich Islands. Lobélia subcordata, Gaud. miss. Subcordate-leaved Delissea. Shrub. 
2 D. UNDULATA (Gaud. l. c. t. 78.) stem simple; leaves oblong, sharply and coarsely toothed, glabrous, with undulated margins. L. G. Native of the Sandwich Islands. Lobélia undulata, Gaud. miss. Undulated-leaved Delissea. Shrub. 
4 D. ANGUSTIFOLIA (Cham. in Linnaea. 7. p. 219.) glabrous; leaves on long petioles, narrow-lanceolate, flat, acute, bluntly serrated; calyx at first 5-toothed; teeth minute, ciliated, but afterwards toothless, with undulated edges; corolla smooth, without papilla. L. G. Native of Oahu. Stem quite simple. Pedicels axillary at the top of the stem, forming a corymb. Filaments eliatus. Lobes of stigma pilose on the back. Narrow-leaved Delissea. Shrub. Cult. For culture and propagation see Clermontea, p. 698.

V. PRATIA (named in memory of M. Prat-Bernon, of the French navy, who accompanied Freycinet, but died a few days after the expedition sailed). Gaud. in Freyc. voy. pt. bot. p. 456. — Lobélia species of authors. Lin. syst. Peniandria, Monogynia. Calyx adnate to the ovary; limb free, 5-toothed (f. 119. a.). Corolla funnel-shaped, cleft on the back, even to the base; limb 5-parted, spreading, unilabiature (f. 119. b.). Stamens 5, with the filaments combined into the tube above, and the anthers cohering; the two lower anthers mucronate (f. 119. d.). Stigma 2-lobed. Capsule covered by the fleshy calyx, 2-celled (f. 119 c.), indehiscent; cells many-seeded. Small herbs. Stems filiform, branched. Leaves thickish. Flowers axillary, solitary, pedunculate, rarely corysthode, of a pale violet colour; peduncules bracteolate. 
1 P. REPENS (Gaud. in Freyc. voy. p. 456. t. 79.) glabrous; stems creeping; leaves petiolate, rather reniform, undulately suberinated. L. F. Native of the Falkland Islands. Lobélia Pratiana, Gaud. miss. Flowers bluish-violet (f. 119.). Creeping Pratia. Pl. creeping. 
3 P. CORYMBOSA; glabrous; stems weak, angular, branched; superior leaves linear-spatulate; lower ones roundish, running into the petioles: all deeply serrated; flowers disposed in dense pedunculate corymbes; L. G. Native of the Cape of Good Hope. Lobélia corymbosa, Hook. in bot. mag. t. 2639. Flowers pure white, richly dotted with purple, capitate. Filaments and anthers combined; the latter bluish purple. Stigma capitate, surrounded by a circle of hairs. Corymbose-flowered Pratia. Fl. June, July. Clt. 1824. Pl. decumbent. 
4 P. HEDERA'CEA (Cham. in Linnaea. 7. p. 212.) glabrous; stems filiform, creeping; leaves on short petioles, obovate, crestedly toothed. L. F. Native of Brazil, on the banks of the Uruguay, along with Hydrocotyle pusilla, and other parts of Brazil. Corolla bluish, villous inside. Filaments ciliate inside. Pedicels exceeding the leaves. Igly-like Pratia. Pl. creeping. 
VI. TUPA. VII. SIPHOCAMPYLYS.

Cavanilles’s Tupa. Shrub 2½ to 3 ft.

6 T. secunda: leaves elliptic-lanceolate, wrinkled when dried, denticulate, with rather revolute edges; racemes terminal, short; pedicels rising from the axils of the upper leaves or bracteas, which are small and linear; column of stamens much exerted; two upper anthers bearded. \( \ddagger \). G. Native of Peru. Lobelia secunda. Ruiz et Pav. in herb. Lamb. Leaves de-nse. Segments of calyx membranes.

Second-flowered Tupa. Shrub.

7 T. ovata: leaves ovate, slightly and distantly denticulate on the edges, wrinkled when dried; raceme long, terminal, dense, second; column of stamens much exerted; anthers bearded on the lower side. \( \ddagger \). G. Native of Peru. (v. s. in herb. Lamb.).

Ovate-leaved Tupa. Pl.

8 T. obovata: leaves obovate, obtuse, clothed with rusty tomentum beneath, slightly denticulate; peduncles axillary, 1-flowered, longer than the leaves; calyx spherical; corolla rather short. \( \ddagger \). F. Native of Peru. Lobelia incana. Ruiz et Pav. in herb. Lamb. Leaves wrinkled when dried. Flowers purple or red. Anthers all bearded. Obovate-leaved Tupa. Pl. 2 to 3 feet?

9 T. Polyphylla: leaves ovate-lanceolate, mucronate, sharply serrate, quite glabrous; racemes terminal leafy; tube of corolla not much longer than the calyx; two lower anthers bearded. \( \ddagger \). F. Native of Chili, on hills about Valparaiso. Lobelia polyphylla. Hook. et Arn. in Beech. voy. pt. bot. p. 23. Pedicels filiform, about the length of the bracteas. Corolla hardly an inch long, downy, dark purple.

Cult. The species of Tupa are deserving of cultivation in every collection, on account of the beauty and singularity of their flowers. They are generally raised from seed imported from the places of their natural growth; and when the plants are of a sufficient size, they are planted out into the open border in front of a south wall, where they flower in great perfection. In winter they may either be protected with the boughs of herbs, or be taken up and potted, and placed in a greenhouse or frame till the spring, when they should again be planted out.

VII. SIPHOCAMPYLYS (from σίφος, siphôn, a tube, and καμπύλος, siphampus, a curve; in reference to the curved tube of the corolla). Pohl, pl. bras. 2. p. 104.—Lobelia species of authors.

Lin. syst. Tetradria, Monogynia. Calyx adnate to the ovary; limb 5-parted (f. 120, d.), having the segments shorter than the tube of the corolla. Corolla irregular, tubular (f. 120, a.); tube entire, dilated, rather ventricose in the middle, and rather coarctate at the base; limb 5-parted, bilabiate (f. 120, b.); upper lip of 2 straight or spreading segments; the 2 lateral segments of the lower lip diverging, and the middle one more profound. Stamens and anthers combined, 2-valved, dehiscing at the apex.—Erect shrubs or subshrubs. Leaves alternate and opposite, petiolate. Flowers axillary, solitary, rarely crowded at the tops of the stem or branches, so as
to appear racemose. The segments of the corollas are usually falcate or lanceolate; the upper ones generally the longest. The lower anthers are usually bearded, and sometimes they are all bearded.

1. S. macra'ntus (Pohl, pl. bras. 2. p. 106. t. 168.) leaves oblong-ovate, acute, denticulated, quite glabrous; tube of corolla ventricose at the apex, incurved; calyx glabrous, having the segments the length of the third part of the tube of the corolla. Π. S. Native of Brazil, about Rio Janeiro, and elsewhere in that province, in shady bushy places.—Vaud. in Rem. script. p. 147. no. 2. Stem fistular, simple, green. Flowers axillary, solitary, approximate at the tops of the stems, and forming leafy racemes. Corollas of a bluish red colour. Anthers all much bearded at the apex.

Long-flowered Siphocampylus. Shrub 3 feet.

2. S. ca'xus (Pohl, pl. bras. 2. p. 106. t. 169.) leaves ovate, acute, crenated, downy beneath; tube of corolla glabrous, rather ventricose; segments of calyx hairy, 4 times shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Minas Geraes. Stem medullary in the centre, simple, hairy, a little branched. Flowers axillary, approximate at the top of the stem and branches, forming there leafy racemes. Corollas of a bluish red colour.

Hoary Siphocampylus. Shrub 2 to 3 feet.

3. S. cre'nati'olius (Pohl, pl. bras. 2. p. 107. t. 170.) leaves acute, oblong, somewhat attenuated at the base, doubly crenated, downy beneath; tube of corolla glabrous, ventricose; calyx hairy, having the segments 4 times shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Minas Geraes, among bushes about Villa St. Joc'o del Rey. Stem suffrutescet, fistular, tetragonal, furrowed. Leaves 3 inches long, and 1 1/2 broad, yellowish green. Flowers axillary, solitary, remote, but so crowded at the tops of the stems as to appear leafy spikes; of a bluish red colour.

Crenate-leaved Siphocampylus. Shrub 2 to 3 feet.

4. S. villo'sules (Pohl, pl. bras. 2. p. 105. t. 171.) leaves oblong-oval, acute, doubly serrated, hairy, rather villous beneath, and truly villous on the nerves; corolla rather hairy; calyx having the segments 4 times shorter than the tube of the corolla. Π. S. Native of Brazil, among bushes at Extrema, not far from Rio de Jiquininhos. Stem fistular, tetragonal, rather villous. Leaves 2 inches long, and 1 1/2 broad. Flowers axillary, solitary; the upper ones forming leafy racemes. Corolla of a bluish red colour.

Villous Siphocampylus. Pl. 2 feet.

5. S. longi'peduncu'latus (Pohl, pl. bras. 2. p. 109. t. 172.) leaves coriaceous at the base, and acuminate at the apex, denticulated, quite glabrous; flowers solitary, on very long peduncles; tube of corolla ventricose, and is as well as the calyx glabrous; segments of the calyx 5 times shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Rio Janeiro, among bushes. Stem suffrutescent, filled with medulla, simple, glabrous. Leaves more than 3 inches long, and 1 1/2 broad. Flowers all remote, on peduncles 4 inches in length. Corollas bluish-red.

Long-peduncled Siphocampylus. Shrub 3 feet.

6. S. car'dophy'lu's (Pohl, pl. bras. 2. p. 110. t. 173.) leaves coriaceous, acuminate, rather undulated, quite glabrous, with remote short denticulations; flowers solitary, on long peduncles; tube of corolla as well as the calyx glabrous; calyceine segments much shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Minas Geraes, among bushes in mountains at Serra de Clunlho, not far from Rio Abaite. Stem suffrutescent, fistular, a little furrowed, glabrous. Leaves 2 1/2 inches long, and more than an inch broad; the denticulations are the extension of the veins. Upper flowers forming a leafy raceme. Corolla bluish-red, having the segments ciliated.

Heart-leaved Siphocampylus. Shrub 3 feet.

7. S. nit'idus (Pohl, pl. bras. 2. p. 111. t. 174.) leaves coriaceous, acute, simply and doubly serrated, quite glabrous, shining, opaque beneath, and the nerves are pilose when examined by a lens; tube of corolla rather ventricose, and rather hairy when examined by a lens; calyx downy, having the segments 3 times shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Minas Geraes, about Facendo do Apollinario, not far from Rio Abaite. Stem suffrutescent, filled with medulla, glabrous. Leaves 2 1/2 inches long, and more than an inch broad. Superior flowers forming a leafy raceme. Corolla bluish-red, hairy.

Shining-leaved Siphocampylus. Sh. 2 to 3 feet.

8. S. cor'nybeer'es (Pohl, pl. bras. 2. p. 112. t. 175.) leaves coriaceous, acuminate, doubly and emarginately toothed, ciliated, glabrous, rather hairy on the nerves and veins beneath; tube of corolla rather ventricose; calyx glabrous, having the segments much shorter than the tube of the corolla. Π. S. Native of Brazil, in the province of Minas Geraes, an obovate bush in mountainous places about Viceria. Stem herbaceous, fistular, glabrous. Leaves more than 2 inches long and an inch broad. Cormybs terminal, simple, many flowered. Corollas scarlet, smooth.

Corymb-bearing Siphocampylus. Pl. 2 to 3 feet.

9. S. col'u'mi'ne (Pohl, pl. bras. 2. p. 110. t. 176.) leaves ovate, rounded at both ends, cre- cored, coriaceous, emarginated above, glabrous, and shining, but clothed with viscidous tomentum beneath; pedicels axillary, longer than the leaves; corolla a little curved, with sessile tomentum outside, having the segments linear-falcate, and nearly equal. Π. S. Native of New Granada, in high places near the city of Santa Fe de Bogota. Lobelia Colominae, Mutis in Lin. suppl. p. 393. Smith, icon. med. 1. p. 22. t. 29. H. B. et Kunth, nov. gen. amer. 3. p. 392. Calyx tomentose outside. Two lower anthers bearded. Corollas red.

Colomina's Siphocampylus. Shrub.

Bearded Siphocampylus. Shrub 3 to 4 feet.

11. S. serru'genus; leaves obovate-oblong, acutish, obsolescently denticulated, smoothish above, but clothed with rusty stellate tomentum beneath, especially on the nerve and veins; flowers axillary, pedicellate, longer than the leaves; calyx segments 4 times shorter than the tube of the corolla. Π. S. Native of New Granada, near Santa Fe de Bogota; and of Peru, near Guamananga and Obragillo. Lobelia ferruginea, Mutis, Lin. suppl. p. 394. L. asclepiadea, Wildl. rel. in Rem. et Schultes, syst. 5. p. 57. Branches clothed with rusty stellate tomentum. Calyx and corolla clothed with rusty stellate tomentum. Corolla red. Genitalia exerted. Two lower anthers bearded.

Rusty Siphocampylus. Shrub.
than the tube of the corolla.  

LOBELIAE.  

13 S. umbellatus; leaves oblong-lanceolate, acuminate, denticulated, smoothish above, and downy beneath; flowers crowded into umbels at the tops of the branches, on long pedicels; segments of calyx equal in length to the tube of the corolla; lower lip of corolla entire, acute.  

14 S. giganteus; leaves oblong-lanceolate, acuminate, toothed, reticulately wrinkled, glabrous above, and downy beneath, and clothed with hoary tomentum along the nerves and veins; flowers axillary, on very long peduncles; calyx-segment equal in length to the tube of the corolla; filaments glabrous.  

15 S. erectus; leaves oblanceolate-oblong, acuminate, narrowed at the base, denticulated, hairy on both surfaces; flowers axillary, on long pedicels; segments of the calyx equal in length to the tube of the corolla; filaments glabrous.  

16 S. hirsutus; leaves oblong-lanceolate, acuminate, serrated, on very short pedicels; pedicels axillary, very long, at the tops of the stems and branches.  

17 S. corymbosa; leaves lanceolate, toothed, powdery beneath; corymbs terminal, supported by a tuft of leaves.  

18 S. cavanillesianus; leaves ovate-lanceolate, biserrated; flowers axillary, solitary, pedicellate, the whole forming a leafy raceme.  

19 S. escleroides; leaves oblong-elliptic, rounded at the apex, denticulated, hairy on both surfaces; flowers axillary, pedicellate, shorter than the leaves; segments of calyx 4 times shorter than the tube of the corolla.  

20 S. spectabilis; leaves oblong, acute, obtuse at the base, minutely denticulated, glabrous; flowers axillary, pedicellate, shorter than the leaves; corolla glabrous, 3 times longer than the calyx.  

21 S. surinamensis; leaves oblong-lanceolate, acute, obtuse at the base, remotely denticulated, glabrous; flowers pedicellate, axillary, shorter than the leaves; corolla glabrous, with the tube 3 times longer than the segments of the calyx.  

22 S. macropoda; leaves elliptic-oblong, serrulated, villous; flowers axillary, on long pedicels; branches downy.  

23 S. wesstianus; leaves in a whorl, oblong, acute, serrated, villous beneath, and glabrous above; pedicels axillary, villous; tube of corolla pentagonal.  

24 S. gran'der; leaves oblong, acute, minutely serrulated, glabrous; umbels terminal, bracteolate; corolla hairy; segments of the calyx 10 times shorter than the tube of the corolla.  

25 S. glabra; leaves oblong-elliptic, acute, rounded at the base, obliquely toothed at the apex; flowers axillary, pedicellate, longer than the leaves; calyx-segments crenated,
about equal in length to the tube of the corolla. \( \text{S.} \) Native along with the preceding species. Lobelia glabrata, H. B. et Kunth, nov. gen. amer. 3. p. 307. t. 270. Branches glabrous. Leaves 3-4 inches long, glabrous, pale green, petiolate. Pedicels bractless. Calyx and corolla glabrous; the latter greenish. Segments of corolla fallate. Filaments downy; anthers glabrous. 

**Sphyocampylus.** Shrub.

26 S. Mutisianus; leaves oblong, short-acuminated, narrowed and acute at the base, remotely and bluntly toothed, glabrous, except the nerve and veins beneath, which are hairy; flowers axillary, pedicellate, shorter than the leaves; corollas glabrous, much longer than the calycine segments. \( \text{S.} \) Native of New Granada, on frigid mountains. Lobelia Mutisiana, H. B. et Kunth. nov. gen. amer. 3. p. 308. Branches rather hirsute. Leaves 6-7 inches long. Petioles hairy. Pedicels bractless. Segments of calyx smooth, irregularly crenated. Corolla greenish, with falcate segments. Column of stamens glabrous; two lower anthers bearded.

**Mutis's Sphyocampylus.** Shrub.

27 S. volcellifolium; stem twining; leaves ovate, acuminate, coriaceous, sharply toothed, glabrous above, and clothed with fine down beneath; flowers axillary, pedicellate; corolla hairy; segments of calyx 5-6 times shorter than the tube of the corolla. \( \text{S.} \) Native on the shady banks of the Orinoco. Lobelia volcellifolia, H. B. et Kunth, nov. gen. amer. 3. p. 309. L. cordata, Willd. rel. ex Rœm. et Schultes, syst. 5. p. 58. Branches glabrous. Leaves coriaceous at the base. Pedicels downy, bractless. Corollas scarlet. Genitals exerted, glabrous. Anthers bearded (f. 120.).

**Twining Sphyocampylus.** Shrub twining.

28 S. Berteriana; leaves remote, on long petioles, ovate-oblong, acuminate, closely suberect, membranaceous, quite glabrous; pedicels solitary, axillary, long; stem scandent. \( \text{S.} \) Native of Guadaloupe. L. scandens, Bertero. L. Berteriana, Spreng. syst. 1. p. 712.

**Bertero's Sphyocampylus.** Shrub cl.

29 S. scandens; stem scandent; leaves oblong, obtuse, quite entire, rather fleshy, with revolute edges, glabrous; racemes terminal; flowers reflexed; corollas glabrous; calycine segments linear, slightly denticulated, 5-6 times shorter than the tube of the corolla. \( \text{S.} \) Native of Peru, in cold plates between Paramo de Saraguro and the city of Loxa. Lobelia scandens, H. B. et Kunth, nov. gen. amer. 3. p. 309. Lobelia obtusifolia, Willd., ex Rœm. et Schultes, syst. 5. p. 57. Branches glabrous. Pedicels furnished with one bractea at the base. Calyx glabrous. Corolla scarlet, with falcate segments. Column of stamens glabrous. Two inferior anthers bearded. Stigma girded by a pilose ring.

**Climbing Sphyocampylus.** Shrub cl.

30 S. Duploserratius (Pohl. pl. bras. 2. p. 114. t. 177.) leaves oblong or coriaceous at the base, twice serrated, petiolate; pedicels longer or shorter than the leaves; genitals exerted. \( \text{S.} \) Native of Brazil. Lobelia triphylla, Présl, symb. bot. 4. p. 61. t. 4. Corollas red or scarlet.

**Doubly-serrate-leaved Sphyocampylus.** Shrub 2 to 3 feet.

31 S. Andröpogon; leaves ovate, glabrous, hardly denti
crated, soft; flowers axillary, solitary, pedicellate; corolla glabrous, curved. \( \text{S.} \) Native of the province of Quito, on Mount St. Antonio, in shady woods. Lobelia Andröpogon, Cav. icon. 6. p. 10. t. 315. Stem glabrous, furrowed. Leaves 3 inches long, petiolate. Pedicels shorter than the leaves, villous at the base, bibracteate. Corolla scarlet, having the lower lip rounded, with 3 small acute teeth. Anthers bearded.

**Bearded-anthered Sphyocampylus.** Shrub 5 to 6 feet.

32 S. cirriformis; leaves linear-lanceolate, toothed, glabrous; teeth subulate, distant; raceme terminal, leafy. \( \text{S.} \) Native of the Antilles and St. Vincent. Lobelia cirrhifolia, Lam. dict. 3. p. 584. no. 12.—Plum. spec. vol. 5. t. 116. Stem straight, simple, naked at the base, glabrous. Corolla curved, green or yellowish green.

**Cirrus-leaved Sphyocampylus.** Shrub 1\( \frac{1}{2} \) foot.

33 S. verticillata (Cham. in Linn. 7. p. 202.) leaves 6-8 in a whorl, almost sessile, narrow-long or linear-oblong, sharply and finely serrated, pale beneath; pedicels axillary, verticillate, shorter than the leaves, but the flowers exceed the leaves; calycine segments acute, more than 6 times shorter than the corolla; anthers glabrous on the back, and bearded in front; stem filled with medullary erect, simple, densely leafy, foot oblique. \( \text{S.} \) Native of the south of Brazil. Top of stem and ribs of leaves rather hairy, and the peduncles, calyxes, and corollas downy. Corollas red, 2 inches long, curved before expansion.

**Whorled-leaved Sphyocampylus.** Shrub 3 to 6 feet.

34 S. betulefolius (Cham. in Linn. 7. p. 204.) leaves scattered, petiolate, cordately triangular or ovate, acuminate, somewhat doubly and acutely serrated, nervcd, and veined; pedicels axillary, solitary, exceeding the leaves; pedicels axillary, sol
tary, much longer than the leaves; ovarium oblong; teeth of calyx small; corolla long; anthers a little exerted, naked on the back. \( \text{S.} \) Native of Brazil. Corolla red, about 2 inches long. Leaves 3 inches long. Very like S. scandens and S. volcellifolium.

**Birch-leaved Sphyocampylus.** Shrub 3 feet.

35 S. convolvulacea (Cham. in Linn. 7. p. 205.) shrubby, climbing, and twining, glabrous; branches terete, slender; leaves petiolate, narrow, ovate-lanceolate, acuminate, with reflexed obliquely denticulated edges; pedicels axillary, solitary, much longer than the leaves; ovarium oblong; teeth of calyx small; corolla long; anthers a little exerted, naked on the back. \( \text{S.} \) Native of Brazil. Corolla red, about 2 inches long. Leaves 3 inches long. Very like S. scandens and S. volcellifolium.

**Convolvulaceae-like Sphyocampylus.** Shrub cl.

36 S. irmberica (Cham. in Linn. 7. p. 206.) leaves imbricated, almost sessile, ovate, coriaceous, hardly acute, serrulate, with rather reflexed edges, scabrous from hairs above, shining, flat; paler beneath, and more hairs, and reticulately veined; pedicels axillary, shorter than the leaves, and as well as the calyxes hairy; calycine segments linear, acute, 4 times shorter than the corolla; corollas downy, exceeding the leaves; anthers exerted, naked on the back; stem with many prominent cicatrices, occasioned by the falling of the leaves, clothed at bottom with brown stiff hairs, and densely leafy at the top. \( \text{S.} \) Native of Brazil. Leaves 6 in a whorl, by threes. Corolla red.

**Imbricated-leaved Sphyocampylus.** Shrub.

37 S. lycoides (Cham. in Linn. 7. p. 207.) erect, glabrous; leaves sessile, erect, narrow-lanceolate, acute, remotely and bluntly serrulate; lower ones somewhat verticillate, by threes, alternate; raceme less terminal; floral leaves 6 in a whorl, having the pedicels by threes, verticillate; pedicels erect, a little shorter than the leaves; segments of the calyx ovate,
lobed-acuminated, 6 times shorter than the corolla; anthers a little exserted, glabrous. * S. Native of Brazil. Stem angular. Corolla red.

Lycurus-like Siphocampylus. Shrub 3 feet.

38. S. DEFENDER; leaves coriaceous, ovate-lanceolate, somewhat cordate at the base, acuminate, finely and sparsely dentilculated, tomentose beneath, glabrous above; branches and inflorescence downy or tomentose; pedicels from the axils of the upper leaves, and longer than them; column much exserted; calyx lobes linear-subulate. * S. Native of Peru. Lobelia dependens, Ruiz et Pav. in herb. Lamb. Flowers racemose, at the tops of the branches. Plant scendent.

Dependent-branched Siphocampylus. Shrub cl.

39. S. ESOMARINIFOLIS; erect; leaves linear-lanceolate, entire, with revolute margins, tomentose beneath, and glabrous above; pedicels axillary, about the length of the leaves; column of stamens exserted; calyx with a spherical tube, and long linear segments. 2. or 3. S. Native of Peru. Lobelia purpurea, Ruiz et Pav. in herb. Lamb. Corollas red. Lower anthers bearded at top. Leaves dense, like those of some species of willow.

Rosemary-leaved Siphocampylus. Pl. 2 to 3 feet.

40. S. MACROPHYLLUS; leaves broad, obovate, acuminate, glabrous, slightly dentilculated, tapering much to the base; flowers almost forming a terminal corymb, much shorter than the leaves; calyx with a hemispherical tube and ovate-lanceolate segments; column of stamens exserted: the lower anther bearded at top. * H. Native of Peru. Lobelia lasciata, Ruiz et Pav. in herb. Lamb. Corollas red or scarlet.

Large-leaved Siphocampylus. Pl. 2 to 3 feet.

41. S. LACINIA; leaves deeply jagged, acuminate; lobes acuminate; branches downy; lobes of corolla falcate; column of stamens downy; anthers glabrous, except the two lower ones, which are bearded at the apex; calyx spherical. * H. Native of Peru. Lobelia lasciata, Ruiz et Pav. in herb. Lamb. Corollas red or scarlet.

Jagged-leaved Siphocampylus. Shrub.

42. S. EUSCUS; clothed with rusty tomentum in every part; calyx spherical, with reflexed dentilculated lobes; leaves elliptic-lanceolate, dentilculated; peduncles axillary, 1-flowered; corolla clothed with rusty wool; two lower anthers bearded. * S. Native of Peru. Apparently a climbing shrub. (v. s. in herb. Lamb.)

Brown Siphocampylus. Shrub cl.

Cult. The species all bear large, showy, scarlet, or red flowers, and are therefore worth cultivating in every collection of store plants. They are of easy culture. The soil best suited to them is a mixture of loam, sand, and peat; and cuttings of them strike readily in the same kind of soil under a hand-glass in heat.

VIII. LOBELIA (in honour of Matthew Lobel, author of various works, and particularly that called Icones Plantarum; he was born at Lisle in 1538, became physician and botanist to James I, and died in London in 1616). Pohl, pl. bras. 2. p. 99.—Lobelia species, Lin. and other authors.

Lin. syst. Pentandria, Monogynia, Calyx adnate to the ovary; limb 5-parted (f. 121. a.). Corolla irregular, tubular; tube cleft on the upper side, thickened or ventricose at the base; limb 5-parted, bilabiate; the 2 segments of the upper lip linear-lanceolate (f. 121. f.); lower lip trifid and pendulous, with lanceolate or roundish segments (f. 121. g.). Filaments combined above (f. 121. c.). Anthers cohering (f. 121. c.), bearded; the 2 lower ones usually bearded, and sometimes all. Capsule oval, 2-celled, 2-valved, many-seeded, dehiscing at the apex.—Erect or procumbent herbs. Leaves alternate, usually sessile. Flowers on short pedicels, usually disposed in terminal leafy spikes or racemes, rarely solitary and axillary, blue, red, or white, rarely yellow.

§ 1. Species natives of America.

* Corollas blue.

1. L. CAMPNFUR (Pohl, bras. 2. p. 100. t. 165.) leaves linear, acute, remotely toothed, ciliated on the margins, glabrous, rather decurrent; flowers spicate, rather remote on short pedicels; bracteas oblong, acuminated, rather toothed, pilose; calyx pilose, a little shorter than the tube of the corolla. * H. Native of Brazil, in the province of Minas Geraes, in dry fields about Villa de Barbacena. Anthers all bearded. In the plant collected by Sello the lower leaves are ovate, and the upper ones lanceolate. Stem filiform, simple, pilose. Corollas blue.

Field Lobelia. Pl. 1 foot.

2. L. EXALTATA (Schott, in Pohl, pl. bras. 2. p. 101. t. 166.) leaves sessile, lanceolate, acuminated, rather attenuated at the base, dentilculated, quite glabrous; flowers racemose, coarctate, pedicellate; bracteas lanceolate, acuminated, rather hairy; calyx pilose, exceeding the tube of the corolla in length. * S. Native of Brazil, in marshy places in the province of Rio Janeiro, at Fazenda Malheas Ramos, as well as of the province of Minas Geraes. Stem fistular, arrowed, quite simple, glabrous, of a yellowish green colour. Bracteas ciliated. Corollas blue.

Exalted Lobelia. Pl. 5 feet.

3. L. TAPSOIDES (Schott, ex Pohl, bras. 2. p. 102. t. 167.) leaves sessile, lanceolate, attenuated at the base, very long, dentilculated, ciliated, rather pilose; flowers racemose, coarctate, on short pedicels; calyx segments lanceolate, acuminated, pilose, shorter than the tube of the corolla. * S. Native of Brazil, about Rio Janeiro; and of the province of Goyaz. Stem tough, filled, simple, rather pilose, of a greenish brown colour. Bracteas ciliated. Flowers dense blue.

Thapsis-like Lobelia. Pl. 6 feet.

4. L. PACHFLOREA (H. B. et Kunth, nov. gen. amer. 3. p. 314.) stem herbaceous, erect, simple; leaves sessile; radical ones lanceolate; calyx ones linear, remotely dentilculated, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on short pedicels; calyx segments hairy, as well as the corolla, one-half shorter than the tube of the corolla. * S. Native of Brazil, in the province of Minas Geraes, in dry grassy places about Villa Barbacena; and of Mexico, near Vallahold de Mechoacan. L. communata, Wildl. rel. ex Rasm. et Schultes, syst. 5. p. 73. L. simplicis, Wildl. herb. Corollas blue. Stem glabrous, striated. Bracteas linear, hairy, longer than the pedicels.

5. L. RAPUFLOCULIDES (H. B. et Kunth, nov. gen. 3. p. 312.) leaves linear-lanceolate, acute, denticulated, glabrous, sessile; racemes terminal, loose-flowered; calyx segments equal in length to the tube of corolla; stems branched, procumbent. * S. Native near the town of Mexico. L. draconculeoides, Wildl. rel. ex Rasm. et Schultes, syst. 5. p. 56.? Stem hairy at bottom. Flowers remote, pedicellate. Bracteas linear, about the length of the pedicles. Corolla blue, glabrous. Leaves 1 1/2 inch long. Two lower anthers bearded.

Ramphion-like Lobelia. Pl. procumbent.

6. L. COLLINA (H. B. et Kunth, nov. gen. amer. 3. p. 312.) leaves lanceolate-linear, acute, denticulated, glabrous, sessile; racemes terminal, ascending; segments of the calyx one-half shorter than the tube of the corolla; stems procumbent; branches ascending, glabrous. * S. Native of Peru, on dry
Hills between Malacatis and Gonzanama, at the altitude of about 3000 feet. L. limifolia, Willd. sub. ex Roem. et Schultes, syst. 3. p. 67. Leaves 1 to 1\(\frac{1}{2}\) inch long. Pedicels recurved, about equal in length to the bracteas, which are linear. Flowers of a violaceous blue colour. Two lower anthers bearded.

**Hill Lobelia.** Pl. procumbent.

7. **L. Fazzigita** (H. B. et Kunth, nov. gen. amer. 3. p. 313.) leaves lanceolate, remotely dentilicate, glabrous, almost sessile; racemes terminal, elongated; calyce segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, with fastigiate branches. **S.** Native of Quito, near Popayan and Chillo, at the altitude of about 3000 feet. Lobélia tenuifolia, Willd. sub. ex Roem. et Schultes, syst. 5. p. 56. Stems and branches angular, glabrous. Leaves 12-15 lines long. Bracteas linear, absolutely dentilicate, shorter than the pedicels. Corolla violaceous. Two lower anthers bearded.

**Fastigiate-branched Lobelia.** Pl.

8. **L. mollis** (Graham, in edinb. phil. journ. Decem. 1829.) stem erect, branched, downy; leaves petiolate, cordately ovate, acute, downy above, and along the veins beneath, mucronately and doubly serrated; superior leaves lanceolate; racemes terminal, elongated; pedicels loose; segments of the lower lip of the calyx subulate, shorter than the corolla. **Q.** Native of Dominicana, where it was collected by Dr. Krauss. Leaves 8 lines long and 6 broad. Calyce segment equal in length to the tube of the corolla, which is purplish, with the tube cleft along the upper side. Anthers purplish, having 2 short white awns projecting from their lower edge. Stigma almost simple, bearded. Perhaps a distinct genus.

9. **L. Rupestris** (H. B. et Kunth, nov. gen. amer. 3. p. 313.) leaves sessile, hairy or downy, toothed; lower ones oblong or obovate-oblong, obtuse; superior ones lanceolate, acute; racemes terminal; segments of the calyx hairy, about equal in length to the tube of the corolla; stem erect, branched a little. **S.** Native of the province of Popayan, on the declivities of the burning Mount Purace. Lobélia polygalina, Willd. sub. ex Roem. et Schultes, syst. 5. p. 56. Stems rather angular, and are as well as the branches downy. Bracteas linear, lanceolate, twice the length of the pedicels, which are distant. Flowers violaceous. Anthers blue, 2 lower ones bearded.

**Rock Lobelia.** Pl. 1 foot.

10. **L. Tenera** (H. B. et Kunth, nov. gen. amer. 3. p. 314.) leaves sessile, lanceolate-linear: lower ones lanceolate, remotely dentilicate, glabrous; racemes terminal, few-flowered, on long peduncles; flowers on long pedicels; calyce segments glabrous, about equal in length to the tube of the corolla; stem herbaceous, erect, simple, glabrous. **S.** Native of the province of Quito, on hills near Puembo. Leaves 12-15 lines long. Flowers blue, remote, about the size of those of **L. exann.** Filaments ciliated at the base. Two lower anthers bearded.

**Tender Lobelia.** Fl. July. Pl. \(\frac{1}{4}\) foot.

11. **L. Xalapeensis** (H. B. et Kunth, nov. gen. amer. 3. p. 315.) leaves on long petioles, ovate-deltoid, irregularly crenated, hairy above, glabrous beneath; racemes terminal, pedunculate; calyce segments about equal in length to the tube of the corolla; stem erect, paniculately branched, angular, glabrous. **S.** Native of Mexico, near Xalapa and Maculipe. Leaves nearly as broad as long. Bracteas linear, much shorter than the pedicels. Filaments ciliated at the base. Two lower anthers bearded.

**Xalapa Lobelia.** Pl. \(\frac{1}{4}\) foot.

12. **L. Xanthina** (Lin. spec. 1818.) radical leaves spatulate, hairy: calyce one linear, glabrous, sessile, decompound or nearly entire; racemes loose, leafy; pedicels furnished with 2 bracteas at the apex, longer than the capsules; stem erect, slender, glabrous.

2. **F.** Native of North America, in Canada, Carolina, and New York. Sims, bot. mag. 2238. Corollas beautiful blue, with the segments of the lower lip obovate, acute, marked by 2 white confluent spots in the centre. The variety of this which grows in Carolina has the radical leaves roundly spatulate; the stem more slender, and the flowers smaller.

**Kad’s Lobelia.** Fl. July, Aug. Clt. 1820. Pl. 1 to \(\frac{1}{2}\) foot.

13. **L. Nuttalii** (Roem. et Schultes, syst. 5. p. 39.) leaves oblong-linear, dentilicate, obtuse, reniform; flowers loosely racemose, distant; pedicels coloured, shorter than the flowers, biflirate at the base; segments of the calyx obtuse; stem erect, minutely scabrous, branched. **S.** Native of North America, from New Jersey to Carolina, on the dry sandy edges of bogs. L. gracilis, Nutt. gen. amer. 2. p. 77. but not of R. Br. Pedicels and corollas blue; the lower lip marked by 2 acute white stripes, and 2 green dots, and other 2 towards the base of the tube. Very like **L. Kalmii**, and probably a variety of it.

**Nuttall’s Lobelia.** Fl. July, Sept. Clt. 1824. Pl. 1 to \(\frac{1}{2}\) foot.

15. **L. Cliffordiana** (Lin. spec. p. 1320.) leaves on long petioles, oval or roundish-ovate, rather cordate, bluntly and sinuately toothed, glabrous; racemes terminal, on long peduncles; calyce segments glabrous, about equal in length to the tube of the corolla; stem erect, nearly simple, glabrous. **S.** Native of North America, in humid places; and of Cuba, about the Havana; and of Mexico, near San Andres and Jalapa, in bushy places. Stem angular. Root perpendicular. Bracteas linear, much shorter than the pedicels, which are long and filiform. Corollas blue or violaceous.

**De Clifford’s Lobelia.** Pl. \(\frac{1}{2}\) to 1 foot.

16. **L. Spicata** (Ruiz et Pav. in herb. Lamb.) glabrous; stem simple; leaves obovately lanceolate, obtuse, dentilicate; upper ones lanceolate, sessile, dentilicate; racemes simple; pedicels rising from the axils of the linear bracteas. **S.** Native of Peru. Flowers small, blue. Like **L. urens.** Calyx tubular, with subulate segments.

**Spike-flowered Lobelia.** Pl. 1 foot.

17. **L. Monticola** (H. B. et Kunth, Nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, obtuse, rather cordate, doubly serrated, hairy on both surfaces; racemes terminal, on long peduncles; segments of calyx glabrous, about equal in length to the tube of the corolla; stem erect, almost simple, rather angular, glabrous, or a little hairy. **S.** Native of New Granada, on the mountains between Fusagasga and Pande. L. palmariis, Willd. sub. ex Roem. et Schultes, syst. 5. p. 56. Root perpendicular, branched. Bracteas linear, much shorter than the pedicels. Corollas blue, glabrous. Anthers puberulous at the apex, but beardless.

**Mountain Lobelia.** Pl. \(\frac{1}{2}\) foot.

18. **L. microstoma** (H. B. et Kunth, Nov. gen. amer. 3. p. 316.) leaves petiolate, ovate, acuminate, dentately serrated, nearly glabrous; racemes terminal, sessile; calyce segments glabrous, about equal in length to the tube of the corolla; stem erect, paniculately branched, angular, hairy. **S.** Native of the province of Quito, near Puebbo. Lobélia ruderális,
LOBELIACEÆ.

Wildl. rel. ex Rœm. et Schultes, syst. 5. p. 56. Root perpen-
dicular. Bracteas linear, shorter than the pedicels. Corolla blue.
Two lower anthers bearded.

Small-flowered Lobelia. Pl. ½ foot.

19 L. subtilis (H. B. et Kunth, nov. gen. amer. 3. p. 317.)
leaves on short petioles, sharply toothed, hairy above, and gla-
brous beneath; lower ones nearly opposite, and sessile;
perianth ones lanceolate; flowers axillary, on long pedicels, race-
mose; calyce segments glabrous, about equal in length to the
tube of the corolla; stem erect, simple or branched, angular,
hairy. 2. H. Native along with the preceding species. L. Drábä, Wildl. rel. ex Rœm. et Schultes, syst. 5. p. 67.
Flowers size and colour of those of the preceding.

Slender Lobelia. Pl. ½ foot.

20 L. nañá (Wildl. rel. ex Rœm. et Schultes, syst. 5. p. 67.)
H. B. et Kunth, nov. gen. amer. 3. p. 317. t. 272.) leaves spa-
stulate, quite entire, thickish, glabrous; flowers axillary and
dense, on long pedicels; calyce segments glabrous, hardly
equal in length to the tube of the corolla; stem short, erect,
throwing out runners. 2. F. Native of Mexico, near Real del Monte and Moran. Herb almost stems, stoloniferous.
Root with thick fibres. Corolla pale, violaceous. Filaments
downy. Two lower anthers bearded.

Dwarf Lobelia. Pl. stoloniferous.

21 L. clatonia-na (Michx. fl. bor. amer. 2. p. 153.) leaves oblong, obtuse, almost quite entire; lower ones spathulate, quite
entire: cauleine ones a little dentilicate; spikes twiggy, naked;
bracteas subulate; stem downy, erect, simple. 2. H. Native of
North America, from New York to Carolina, in mountain woods
Leaves rather villous on the edges. Flowers very small, nu-
merosous, pale blue; segments of the calyx subulate, almost the
length of the corolla. Lower lip of corolla reflexed. Capsules	
turbinate, very short.

22 L. syphilicēta (Lin. spec. 1820. Jacq. icon. 3. t. 597.)
leaves ovate-oblong, acuminate at both ends, unequally ser-
rated; flowers axillary, solitary, forming altogether a long leafy
cracme; sinuses of calyx reflexed, and are as well as the pe-
duncles hairy. 2. H. Native of Virginia, in dry woods.
Woodv. med. bot. 177. t. 63. Ker. bot. reg. 537. Rapuntium
syphilicētum, Mill. dict. no. 2. Geert. fruct. 1. p. 152. t.
Calyce serrately dentilicate. Corolla angular, with nearly equal
segments, having the keel ciliated, and the palate furnished
with 2 gibbosities. The root is the part of the plant directed to
be used in medicine; it resembles tobacco in taste, and is apt to
excite vomiting. It derives its trivial name from its efficacy in
the cure of syphilis, as experienced by the North American
Indians, with whom it was a secret. A decoction is made of a
handful of the roots, in 3 measures of water. Of this half a
measure is taken in the morning fasting, and repeated in the
evening; and the dose increased till its effects become too
violent, when it is intermitted for a day or two. Although the
plant is said to cure the disease in a very short time, yet its vir-
tues have not been confirmed by any instances in European
practice.

Var. β, maculáta; stem more attenuated; leaves sharply
dentilicate, spotted with rust colour. 2. H. Lam. dict. 3. p.
586. no. 21.

23 L. dilata (Lin. spec. 1820. act. nup. 1741. p. 23. t. 1.)
leaves sessile, dentitely serrated; lower ones ovate-oblong:
superior ones ovate; pedicels axillary, 1-flowered, forming a
terminal leafy raceme; stem hairy; capsules inflated. 2. H.

VIII. Lobelia.

no. 5. Stem branched at the top. Leaves rather villous be-
neath. Flowers small, pale blue. Segments of the calyx subu-
late, equal in length to the corolla. Leaves about 2 inches long.

1 to 2 ft.

24 L. colorátā (Sweet. fl. gard. b. s. t. 180.) glabrous;
leaves lanceolate, acuminate, closely toothed; raceme spicate,
elongated, leafy; calyce segments linear-subulate. 2. H.
Received from North America, but probably a hybrid between
L. syphilicēta and L. cardinātis. Corollas deep azure blue,
crowded. Ovarium half inferior. This is probably the L. co-
lectēs, Nutt. and L. crispa, Graham. ex Loud. hort. brit. p. 75.

Coloured Lobelia. Pl. 4 to 5 ft.

25 L. celéstis (Nutt. ex Loud. hort. brit. p. 592.) this
plant is in the gardens, but we are not aware of where it is
described; it comes very near to L. syphilicēta, and may only be
a variety of that species. 2. H. Native of North America.
L. crispa, Graham. ex Loud. hort. brit. p. 75. Flowers of a
beautiful blue, disposed in long dense terminal racemes.

26 L. uránocōmā (Cham. in Linneæa. t. 5. p. 324.) stem erect,
angular, fistular; leaves hairy, erect, linear, attenuated, acute,
finely dentilicate; pedicels disposed in a terminal leafy raceme,
shorter than the floral leaves, which are densely imbricated,
ovate, acute, and shorter than the others, of a bluish colour;
segments of the calyx linear, attenuated, about equal in length
to the middle of the corolla, which is clothed with fine glandular
down; anthers bearded in front. 2. S. Native of tropical
Brazil. Leaves a foot long. Corolla ed on the back, nearly
2 inches long, blue.

Blue-tufted Lobelia. Pl. 5 feet.

27 L. glandulōsa (Walt. ex p. 218.) leaves lanceolate,
 glandularly serrated, rather fleshy, glabrous; flowers on short
pedicels, racemose; segments of the calyx revolute, toothed;
stem erect, branched, rather downy. 2. H. Native of Caro-
olina, by the sea side in marshes among grass. L. crassissicula,
Pedicels furnished with 2 bracteas, which are terminated by a
gland each. Corollas blue, having the disk of the lower lip
bearded. Stigma beset with white hairs.

Glandular-leaved Lobelia. Pl. 1 to 2 feet.

28 L. pūrēkula (Michx. fl. bor. amer. 2. p. 152.) plant
very simple, downy; leaves oblong, obtuse, repandly serrated;
flowers almost sessile, forming altogether a leafy elongated 
spike; calyx downy; calyce segments erect, lanceolate-subulate, entire,
having the sinuses a little reflexed; stamens inclosed. 2. H.
Native from Virginia to Carolina, in mountain tracts. Pursh. fl.
Ovarium hispid. It differs from L. Clatonia-na in the flowers
being thrice the size, and of a more beautiful blue.

Var. β, glabēlla (Hook. bot. mag. t. 3292.) leaves hardly
downy; calyx glabrous. 2. H. Native of Louisiana, about
Jacksonville. Corolla bright purplish blue.

29 L. amēνa (Michx. fl. bor. amer. 2. p. 153.) plant quite
labrous; leaves broad-lanceolate, serrated; spikes second,
masy-flowered; segments of the calyx entire; segments of the
lower lip of the corolla ovate, acute. 2. H. Native from
Virginia to Carolina, on the mountains. Leaves usually gla-
brous, 6-8 inches long, and 1 inch broad. Corollas pale blue.
Juss. ann. mus. 18. p. 16. t. 1. no. 1.

30 L. gruīnā (Cav. icon. 6. p. 8. t. 511. f. 3.) leaves sessile,
lanceolate-linear, toothed; stem naked at the top, therefore the raceome of flowers is naked and terminal; bracteas subulate. 2. S. Native of New Spain. Stem striated, glabrous. Leaves 2 inches long, glabrous. Corollas blue. Tube of corolla 3-4 lines long, segments of the upper lip narrower than those of the lower, and reflexed. Stigma villous. Filaments exerted, and resembling a stork's head. Very like L. urceus.

Stork's Lobelia. Pl. 1 foot.

31 L. nemularioides (Cham. in Linnaea. 7. p. 209.) glabrous; leaves rather fleshy, ovate, cordate, rather reniform, obtuse, quite entire, or obductly subsinually crenated, on short petioles, and sessile; flowers axillary, on long pedicles; calyce segments a little shorter than the corolline tube; anthers glabrous on the back, all bearded; fruit globose; stems prostrate, radicant, but ascending and flowerous at the apex. 2. S. Native of Brazil, within the tropics, in marshy places. Nearly allied to L. Zeylanica. Corolla blue or violaceous.

Moneywort-like Lobelia. Pl. prostrate and creeping.

32 L. reniforme (Cham. in Linnaea. 7. p. 210.) herbaceous, hairy; stems rather capillary, branched, creeping, rooting; leaves on short petioles, obductly reniform, obductly angular, membranous, nerved, and reticulately veined, pale green above, and glaucous beneath; pedicels terminal and axillary, elongated; corolla glabrous outside, villous inside, with a broadish tube, and triangular segments; anthers glabrous on the back; calyce teeth ovate, acute, much shorter than the tube of the corolla. 2. S. Native of Brazil. Plant tufted, creeping. Leaves hairy, ciliated on the edges. Flowers blue.

Kidney-shaped-leaved Lobelia. Pl. creeping.

33 L. aquatica (Cham. in Linnaea. 7. p. 211.) a glabrous aquatic herb; stem erect or floating, flattened in the dry state; leaves opposite, the upper erect, sessile, narrowed-lanceolate, acute, obductly serrated, 1-nerved; pedicels axillary at the top of the stem, capillary, erect, twice the length of the leaves; ovary semi-elliptic, crowned by the calyce segments, which are a little shorter than the tube of the corolla; anthers all bearded, glabrous on the back, exceeding the corolline tube, but shorter than its segments. 2. S. Native of Brazil, on the banks of rivers, or in marshes among grasses. Flowers blue. Leaves half an inch long.

Aquatic Lobelia. Pl. 1$\frac{1}{2}$ to 2$\frac{1}{2}$ foot.

34 L. sessilifolia (Lamb. in Lin. trans. 10. p. 260. t. 6.) leaves sessile, oblong-lanceolate, serrulated, glabrous; pedicels axillary, shorter than the leaves; stem erect, leafy, glabrous, very simple. 2. H. Native of Kamtschatka. L. Camtschatica, Pall. miss. Habit of a Euphorb. Leaves of an obscure green. Flowers blue? Sessile-leaved Lobelia. Pl. 2 to 3 feet.

35 L. umbellata (Vest. ex Rœm. et Schultes, syst. 5. p. 58.) glabrous; leaves sessile, linear, toothed, dilated and trifid at the apex; flowers terminal, umbellate; stem erect. 2. S. Native country unknown. Stem angular. Leaves like those of Chrysanthemum leucanthemum. Inflorescens of umbel shoot. Corollas blue, nearly an inch long, with the segments of the upper lip linear and reflected, and of the lower one oblong. Stamens a little shorter than the tube of the corolla. Anthers bearded at the apex.

Umbellate-flowered Lobelia. Pl. 1 foot.

* * * Corollas red, purple or scarlet, rarely yellowish.

36 L. Graminea (Lam. dict. 3. p. 583.) glabrous; leaves linear, ensiform, acute; racemes long, simple; stem erect, simple; bracts lanceolate, acute, shorter than the flowers.—Native of Peru. Leaves 5 inches long, and 2-3 lines broad. Flowers scarlet, on short pedicles, form of those of L. cardinallis. Filaments and stamens combined.

Grass-leaved Lobelia. Pl. 2 feet.

37 L. pulv. erule'stata (Pers. encyc. 2. p. 212.) leaves ovate, on very short pedioles, glabrous above and wrinkled, but clothed with white tomentum beneath; corollas campanulate, powdery; stem shrubby. 2. S. Native of South America, on the road from Guaranda to Mount Chimborazo. Stem branched, tomentose. Leaves obtuse, with subrevolute edges, 3 inches long. Pedicels longer than the leaves, altogether forming a leafy raceme. Corollas white from powdery tomentum outside, and reddish inside, less than an inch long, with equal oblong acute segments. Perhaps a species of Clermontia.

Ponderay Lobelia. Pl. 6 to 8 feet.

38 L. cordigera (Cav. icon. 6. p. 14. t. 523.) leaves ovate, acute, half-stem-chasing, villous, denticulated; pedicels villous, axillary; stem villous, furrowed. 2. F. Native of Chili. Leaves 3 inches long. Calyx villous. Corolla scarlet, 1$\frac{1}{2}$ inch long, with the segments of the lip linear, elongated, of the lower lip ovate, acute. Gentils glabrous.

Heart-bearing Lobelia. Pl. 3 feet.

39 L. decurrens (Cav. icon. 6. p. 13. t. 521.) leaves ovate-lanceolate, biseriated, decurrent, glabrous, approximate; flowers solitary, axillary, altogether forming a long leafy raceme; calyx villous, with the segments deeply serrated; tube of corolla cleft even to the base. 2. F. Native of Chili, on the banks of the river Charo. Sweet, fl. gard. n. s. 86. Stent glabrous. Leaves 2 inches long and an inch broad, with 2 small teeth between each large one. Corolla purplish-violet, 1$\frac{1}{2}$ inch long; upper lip of 2 linear segments, which are villous at the apex, of the lower acute, and are as well as the anthers pilose.

40 L. congl. olata (Lam. dict. 3. p. 585.) leaves oblong-cuneiform, acuminate, shining; racemes glabrous, terminal; segments of calyx fringed; stem simple, filled with medulla. 2. S. Native of Martinico and St. Domingo. Lin. spec. 4. t. 117. Stem thick, naked at the base. Leaves a foot and more long, and 3 inches broad, exceeding the corymb of flowers. Flowers very numerous, disposed in a short raceme. Bracteas lanceolate, denticulated, shorter than the flowers. Corollas shorter than the calyx, scarlet, but in the larger variety greenish-red. Perhaps a species of Tëpa.

Congolata-racemed Lobelia. Pl. 1 foot.

41 L. cavanielle'sana (Rœm. et Schultes, syst. 5. p. 43.) glabrous; leaves ovate-lanceolate, acuminate, serrated, sessile; pedicels solitary, axillary, longer than the leaves, the whole forming a leafy raceme; corollas downy. 2. S. Native of New Spain, near Acambaro. L. persicifolia, Cav. icon. 6. p. 12. t. 518. Stem herbaceous, striated, branched. Serratures of leaves sessate. Calyx glabrous. Corolla red; with the tube nearly an inch long. Probably a species of Tëpa. Anthers bearded with white hairs.

Cavenilles Lobelia. Fl. June, July. Ct. 1825. Pl. 3 ft. 42 L. per. sicifolia (Lam. dict. 3. p. 584.) leaves narrow-lanceolate, serrated; pedicels axillary, solitary, shorter than the leaves, the whole forming a leafy raceme. 2. S. Native of Guadaloupe, in marshes. Stem fistular. Leaves numerous. Corolla purplish, glabrous, a little curved, 1$\frac{1}{2}$ inch long. Perhaps a species of Siphocampylus.

Peck-leaved Lobelia. Fl. June, July. Ct. 1824. Pl. 11 ft. 43 L. Kraussi (Graham, in edib. phil. journ. Marcb, 1830. botan. mag. 3012.) sessile, lanceolate, decurrent, sharply serrated, glabrous; pedicels axillary, solitary, longer than the leaves, the whole forming a leafy terminal raceme; calyce segments subulate, a little toothed, spreading, and are as well as the corolla glabrous; stem herbaceous, glabrous, erect, branched. 2. S. Native of Dominica, where it was collected by Dr. Krauss. Leaves 4$\frac{1}{2}$ inches long. Corolla 1 inch long, red, 4 x 2
lobeliae

8. Lobelia.

51. L. toloba (Wildl. rel. ex Roem. et Schultes, syst. 5. p. 56. H. B. K., Kunth, nov. gen. amer. 2. p. 310.) leaves sessilis, decurrent, lanceolate, doubly toothed, glabrous; flowers axillary, pedicelled, the whole forming a leafy raceme; corollas hairy; stem erect, simple, glabrous. L. S. Native of the kingdom of Quito, in humid places near Guancabamba. Leaves crowded on the stem, 3 inches long. Pedicels hairy. Segments of the calyx furnished at the base with remote subulate teeth, about equal in length to the tube of the corolla. Corolla pale purple. Two lower anthers bearded. Allied to L. decorrens, Cav. and L. cardinalis.

Leafy Lobelia. Pl. 2 to 3 feet.
52. L. laxiflora (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves almost sessile, oblong, acuminate, serrulate, glabrous; racemes terminal, secund; flowers on long pedicels; corollas hairy; stem erect, simple, angular, glabrous. L. S. Native of Mexico, between Quasininiqalpa and Acaquirilla. L. fissa, Wildl. rel. ex Roem. et Schultes, syst. 5. p. 57. Leaves 2 3/4 inches long. Racis of raceme hairy. Calyx hairy. Corolla pale purple. Allied to L. cardinalis.

Loose-flowered Lobelia. Pl. 2 to 3 feet.
53. L. rigidula (H. B. et Kunth, nov. gen. amer. 3. p. 311.) leaves short, sessile, oblong-lanceolate, acutish, sharply serrulate, stiffish, glabrous above, but rugose and hairy beneath; flowers axillary, on long pedicels; corollas hairy. L. S. Native of New Spain. Stems hairy above. Leaves 2 inches long. Flowers and fruit like those of the preceding species, to which it is very nearly allied.

Stifflobus Lobelia. Pl. 2 to 3 feet.

55. L. cardinalis (Linn. spec. 1329.) leaves oblong-lanceolate, cartilagineously denticate, glabrous as well as the stems; racemes terminal, unilaterial, leafy. L. F. Native of Virginia and Carolina; and of Mexico, near Jalapa. Pursh, fl. amer. sept. 2. p. 448. Curt. bot. mag. 320.—Kor. del. 2. t. 1 f. 2. Rapuntium cardinalis, Mill. dict. no. 1.—Mor. hist. 2. p. 466. sect. 5. t. 5. f. 54.—Herr. mex. p. 879. t. 880. Leaves purplish beneath, 3 inches long, and 1/2 broad. Flowers scarlet. It differs from L. fulgentis in being glabrous, and in the segments of the lower lip of the flower being obtuse, not lanceolate, and acute.

56. L. splendens (Wildl. hort. berol. 2. t. 86.) leaves lanceolate, denticate, with flat margins, quite glabrous as well as the stems; racemes terminal, somewhat secund. L. F. Native of Mexico. Ker. bot. rep. 66. Stem purplish. Pedicels compressed, purplish. Corolla scarlet, glabrous, very like those of the two last species.

57. L. speciosa (Hort. Lindl. bot. rep. 1445. Sweet. fl. gard. n. s. 174.). This is a hybrid between L. syphilitica and L. cardinalis, splendens or fulgenst. The flowers are purple. Splendid Lobelia. Fl. June, Oct. Hybrid. Pl. 2 to 5 feet.

§ 2. Species natives of the East Indies and other parts of Asia.
58 L. chinensis (Lour. coch. p. 514.) glabrous; leaves sessile, lanceolate, quite entire; flowers solitary, terminal; stem creeping; branches ascending. O. H. Native of China, about Canton. Flowers pale blue, pedicellate. Segments of the corolla lanceolate, unequal. Stigma bifid, revolute.

China Lobelia. Pl. creeping.

59 L. heyneana (Roxb. et Schultes, syst. 5. p. 56.) stem filiform, erect, winged; leaves subhomboid, serrated, decurrent, setosely ciliated at the base; peduncles axillary, solitary, length of leaves; calyces glabrous.—Native of the East Indies. L. deciduus, Roth, nov. pl. spec. miss. The stem is winged from the leaves being decurrent.

Heyne's Lobelia. Pl. ½ to 1 foot?

60 L. zeylanaica (Linn. spec. 1822.) stems prostrate and creeping, downy; leaves on short petioles, ovate, somewhat cordate, serrated, acute; lower ones obtuse; peduncles solitary, 1-flowered, axillary, equal in length to the leaves, villous; capsules rather villous. O. S. Native of China and the East Indies, in fields. L. nummulariifolia, Lam. dict. 3. p. 568.?—Seb. thes. 1. p. 37. t. 22. f. 12. Var. β, hirta, Linn. spec. 925. Plant small. Leaves like those of l. erosaica chamee'drys, fleshy, beset with a few pellucid hairs; lower ones serrated; upper ones serrated. Peduncles downy. Flowers purple. This is a very pretty plant when in blossom. It differs from l. trigonia, Roxb. by its petiole more rounded leaves, terete stems, and its pubescence.

61 L. chenopodiifolia (Wall. cat. no. 1312.) stem branched at the base; lower leaves roundish-ovate, obuse, broadly creased; upper ones ovate-lanceolate or deltoid, acuminate, coarsely toothed; peduncles elongated, terminal, bearing loose racemes of flowers at the apex; calyce segments subulate. O. H. Native of the East Indies?. Flowers small, probably pale blue.

Goose-foot-leaved Lobelia. Pl. 1 foot.

62 L. affinis (Wall. cat. no. 1311.) plant downy, creeping at the base; leaves ovate, petiolate, membranous, cuneate at the base, slightly dentilicate; peduncles axillary, 1-flowered; calyx hairy, with linear segments; stems angular. O. S. Native of the East Indies, in Silhet and Goalpara. Flowers blue. Stems creeping at the base. This species is very like L. zeylanica and L. trigonia.

Allied Lobelia. Pl. ½ foot.

63 L. nummularia (Linn. dict. 3. p. 589.) stems creeping, filiform; leaves roundish, sessile, cuneate at the base, slightly dentilicate; peduncles 1-flowered, axillary, a little longer than the leaves. O. S. Native of Java. Habit of Sibthorpia. Stem rather villous. Leaves small, rather villous beneath, unequal. Petioles 2-3 lines long. Corolla 4-5 lines long, longer than the stamens.

Money-wort-leaved Lobelia. Pl. creeping.

64 L. pumila (Burm. prod. 1. t. 60. f. 3.) glabrous; stems procumbent; leaves opposite, ovate, quite entire; panicles terminal. O. S. Native of Coromandel. Leaves petiolate. Flowers small.

Dwarf Lobelia. Pl. procumbent.

65 L. triaillata (Ham. spec. ex D. Don, prod. fl. nep. p. 157.) leaves roundish-ovate, serrated, glabrous; petioles dilated, decurrent at the base; pedicels solitary, axillary, longer than the leaves. Flowers somewhat pedicellate; segments of the calyx filiform; stem ascending, triquetrous, branched, winged, glabrous. O. F. Native of Nipaul. L. micrantha, Hook. ext. fl. t. 44. Stem hardly a hand high, rooting at the base. Pedicels longer than the leaves. Corollas small, red. Very like l. gratioloides, Roxb., but in that species the leaves are sessile and cordate.

66 L. trigona (Roxb. fl. ind. 2. p. 111.) glabrous; leaves subobtuse, cordate, coarsely serrated; pedicels axillary, bilobate, longer than the leaves; stems creeping at the base, erect to subverticillate. O. H. Native of the East Indies, delighting in pasture-ground, appearing in the wet season. L. stipularis, Roth. Flowers small, blue. Corolla inserted in the mouth of the calyx. Roth has mistaken the 2 small bracteae on the pedicels to be stipulas.

Trigonal-stemmed Lobelia. Pl. ½ to 1 foot.

68 L. pyramidalis (Wall. in asiat. res. 13. p. 379.) smooth; leaves lanceolate, long-acuminated, serrated: upper ones linear, attenuated; racemes panicked, leafy; calyce segments linear-subulate, about equal in length to the corolla; stems erect, branched. O. H. Native of Nipaul, on the mountains at Nai-rainhett. This is the most common and most ornamental plant in Nipaul, where it grows both in low and elevated situations. It is found from the entrance of that country at Behilaco, up to the mountains that bound the valley to the north, and where it grows at an elevation of at least 8000 feet. It is also found in the hilly country of Silhet. D. Don, in bot. mag. t. 2357. L. stimulans, Hamilt. mss. ex D. Don, prod. fl. nep. p. 157. Plant variable in height, and is often found altogether of a deep purple, but chiefly the floral branches and leaves. Stem pyramidal branches. Leaves downy beneath. Corollas purplish-violet. Anthers deep blue, pilose. Lobes of stigma hollow beneath.

69 L. excelsa (Wall. in Roxb. fl. ind. 2. p. 114.) leaves oblong-lanceolate, acuminate, decumented, attenuated at both ends, densely clothed with villi, on short petioles; racemes terminal, erect, villous, leafy, dense-flowered; calyce segments linear, as long as the tube of the corolla. O. H. Native of the Nelligberry mountains, near Coimbatore, where it was collected by Leschenault, and where it is called by the natives Oomar. Leaves 10 inches long, and 1 broad. Petioles marked by the decurrent base of the leaf. Flowers large.

Tall Lobelia. Pl. 10 to 12 feet.

70 L. rosea (Wall. in Roxb. fl. ind. 2. p. 118.) plant covered with glaucous short dense villi; stem panicked; leaves lanceolate, ensiform, acuminate, finely denticulated; racemes terminal, with unilateral flowers; calyce segments equaling the tube of the corolla. O. F. Native of Nipaul, in the valley of Noakote. Leaves from 8-12 inches long; floral ones linear-lanceolate, rounded at the base. Flowers numerous, nodding, downy, like those of L. pyramidalis, but larger, of a pale rose-colour. Anthers connected into a long purple incurvate tube, bearded. Filaments downy. Ovarium bi-trilocular. Stigma pubescent.

Rose-coloured-flowered Lobelia. Pl. 4 to 6 feet.

71 L. scotianella (Heeye, mss. ex R. et Schultes, syst. 5. p. 47.) leaves oblong-lanceolate, attenuated at both ends, serrated, rather scabrous; stem erect, angular; racemes terminal, equal, downy; flowers very numerous. O. ?. H. Native of the East Indies, in the vicinity of Bangulore. A stout plant. Leaves 1 foot long. Racemes angular, above a foot long. Corollas downy, showy. Calyx and capsules downy, and the anthers glabrous.
\textbf{LOBELIACEÆ. VIII. \\ \textit{Loboelia.}}

\textit{Tobacco-leaved Lobelia.} Fl. June, July. Clt. 1822. Pl. 2 to 3 feet.

§ 3. \textit{Species} natives of Africa, particularly of the Cape of Good Hope. Flowers generally violaceous or blue, rarely white or yellow.

* Stems erect. Leaves entire.

72 \textit{L. linearis} (Thumb. \textit{prod.} 1. p. 39. fl. cap. 2. p. 35.) leaves linear, quite entire, glabrous; stems erect, terete, striated, glabrous; pedicels solitary, axillary, much shorter than the leaves.  

73 \textit{L. erecta} (Thumb. \textit{phyt.} bl. p. 21. act. gorenk. 1811. f. 11. fl. cap. 2. p. 34.) leaves filiform, setaceous, glabrous, quite entire; pedicels axillary, solitary, length of leaves.  

75 \textit{L. scabra} (Thumb. \textit{phyt.} bl. p. 21. fl. cap. 2. p. 35.) leaves linear, emarginate, scabrous, quite entire; stems weak, filiform, hairy; pedicels axillary, solitary, flexuous, longer than the leaves.  

76 \textit{L. bellidifolia} (Thumn. \textit{fl. cap.} 2. p. 40.) leaves ovate, superior ones oblong; all sessile, retuse, and emarginate, with revolute margins, beset with a few hairs on the nerve and on the edges; filiform branches and stems naked at the apex; flowers racemose, on short pedicels, reflexed.  

\textit{Changled Lobelia.} Pl. ascending.

79 \textit{L. finifolia} (Lin. spec. 1318. Thumbl. fl. cap. 2. p. 36.) shrubby; leaves linear-lanceolate, erect, crowded, quite entire, but according to Thumberg they are trinodal; pedicels terminal, few.  

80 \textit{L. bellidifolia} (Thumb. \textit{prod.} 1. p. 40. fl. cap. 2. p. 44.) leaves ovate, toothed, hairy, or obovate, crenated, downy beneath; stems hispid at the base, simple, divided into a panicle at the top; lower pedicels the longest.  

81 \textit{L. rigida} (Spreng. noc. nov. 1818. ex Reem et Schultes, syst. 5. p. 44.) lower leaves petiolate, obovate, rarely toothed, glabrous, rather flexile; superior ones lancelolate, sessile, rather decurrent. Uppermost ones ellated, quite entire; pedicels short, axillary; capsules cylindrical, glabrous; stems radicant at the base, and ascending at the apex, tricuspid, glabrous.  

82 \textit{L. corymbosa}, G. Native of the Cape of Good Hope. Flowers white, marked with blue. It differs from \textit{L. bellidifolia} in the smoothness of its parts; and from \textit{L. cuneiformis}, R. Br. in the decussate radicant stems.

83 \textit{L. triquetra} (Linn. mant. p. 1.290.) glabrous; leaves lanceolate, pinnafially toothed, sessile; racemes terminal; branches and pedicels trinodal.  

84 \textit{L. bellidifolia}, Hott. Calycine teeth short, spreading, subulate. Flowers blue, smaller than in \textit{L. bicolor}, with a white or yellowish throat.

\textit{Grey Lobelia.} Pl. ½ foot.

86 \textit{L. tomentosus} (Lin. fil. suppl. p. 394.) tomentose; leaves linear, toothed; peduncles terminal, very long, 1-2-flowered.  

87 \textit{L. bellidifolia}, G. Native of the Cape of Good Hope. Stems numerous, ascending, simple, having the leaves imbricated at the base. Leaves like those of \textit{Corydaea}, having 4-6 obtuse teeth on each side, with revolute edges, clothed with hairy tomentum; peduncles clothed with adpressed hairs, bearing 2 small opposite leaves in the middle, or towards the base, and above these 2 opposite setaceous ones. Corolla blue or violaceous, half an inch long. Anthers beset with white hairs at the apex.

88 \textit{L. secund} (Lin. fil. suppl. p. 355. Thumbl. fl. cap. 2. p. 45.) glabrous; lower leaves oblong, toothed; superior ones lancelolate, entire; peduncles racemose, secund.  

89 \textit{L. bellidifolia} (Thumbl. \textit{prod.} 1. p. 40. fl. cap. 2. p. 47.) leaves ovate, toothed, hairy, or obovate, crenated, downy beneath; stems hispid at the base, simple, divided into a panicule at the top; lower pedicels the longest.
of the Cape of Good Hope, in sandy inundated places. The plant can hardly be said to be truly glabrous. There are floriferous branches in the axils of nearly all the leaves, and the flowers are all drooping to one side. Stems numerous, filiform, striated and downy, simple. Lower leaves obovate, oblongly, dentilicate, obtuse. Pedicels solitary, 1-flowered, shorter than the leaves. Corollas white, and are as well as the calyx downy outside.

87 L. patula (Thunb. prod. 1. p. 40. fl. cap. 2. p. 411) leaves ovate, minutely toothed, villous; stems diffuse, spreading, filiform; pedicels solitary, axillary, capillary, downy, longer than the leaves. 2. G. Native of the Cape of Good Hope. Leaves petiolate; superior ones lanceolate. In Lin. fl. suppl. p. 395. the plant is said to be glabrous.

**Spreading Lobelia.** Pl. 1 foot.

88 L. fedeva (Thunb. fl. cap. 2. p. 46.) leaves sessile, ovate-oblong: upper ones lanceolate: all serrated, glabrous; pedicels 1-flowered, much shorter than the leaves in the superior axils. 2. G. Native of the Cape of Good Hope. Stems erectish, branched a little, glabrous. Flowers blue.

**Ferent Lobelia.** Pl. 1/2 foot.

89 L. bifida (Thunb. prod. 1. p. 40. fl. cap. 2. p. 46.) leaves obovate, toothed, glabrous; stems filiform, downy, bifid or twice bifid at the apex; flowers terminal, solitary. 2. G. Native of the Cape of Good Hope, on Mount Bockland. Stems erect, simple. Radical leaves subpetiolate, oblong, dentilicate, hardly downy, a line long; but only a solitary cauline one on each stem, or 2 small alternate ones. Flowers blue. Bracteae lanceolate in the forks of the stem.

**Ehrl-stemmed Lobelia.** Pl. 1 to 2 inches.

90 L. dehli (Lin. fl. suppl. p. 395. Thunb. fl. cap. 2. p. 45.) leaves lanceolate, serrated, glabrous; pedicels lateral, longer than the leaves; stems much branched from the base; calyce segments linear-subulate, a little shorter than the corolla. 2. G. Native of the Cape of Good Hope. Very like L. depreissa. 2. G. Upper leaves nearly linear. Corollas blue, villous outside.

91 L. minia (Lin. mant. p. 2929.) leaves radical, ovate, obtuse, hardly crenated; scarpe or pedicels capillary, 1-flowered, 2 inches long; corolla funnel-shaped. 2. H. Native of the Cape of Good Hope, in fissures of rocks on Mount Tafelfberg. Sims, bot. mag. t. 2590. Root throwing out off-sets. Flowers pale blue. Habit of Montia fontana or Bélliurn minium.

**Minute Lobelia.** Fl. June, Sept. Ct. 1772. Pl. 1 inch.

92 L. minima (Sims. bot. mag. 2077.) stems prostrate; leaves ovate, crenated, petiolate, glabrous; pedicels long, axillary, 1-flowered, furnished with 2 to 3 linear hairy bracteae below the middle. 2. G. Native of the Cape of Good Hope. Flowers white inside, and red outside, with a yellow throat.

**Small Lobelia.** Pl. 1 inch.

*** Stems prostrate. Leaves cut or toothed.

94 L. erinus (Lin. spec. 1321. Thumb. fl. cap. 2. p. 39.) leaves toothed; lower ones obovate, petiolate: superior ones almost sessile, narrow-lanceolate; pedicules 1-flowered, longer than the bracteae; stems spreading. 2. G. Native of the Cape of Good Hope. Curt. bot. mag. 901. Rapiniun erinum, Mill. dict. no. 8.—Herm. ligdb. 110. t. 110. Stems branched at bottom. Leaves glabrous. Pedicels axillary, solitary, naked, much longer than the leaves. Flowers slender, blue, with a white or yellowish throat. Fruit 3-celled. According to Thunberg there is a variety of this, having numerous radical stems, which are as well as the leaves villous.

95 L. alpinoides (Lam. dict. 3. p. 586. no. 29.) plant creeping, glabrous; stems branched; leaves roundish-ovate, toothed; peduncles long, 1-flowered, axillary, much longer than the leaves. 2. G. Native of the Cape of Good Hope. Stems erect at the top, but radicate at the base. Radical leaves like those of Sibthorpiia; the rest ovate, toothed, and subpetiolate.

**Chick-ned-like Lobelia.** Pl. 1/4 to 1/2 foot.

96 L. musgoide (Cham. in Linna. 7. p. 215.) herb small, slender, trailing, quite glabrous; stems filiform, rooting at the nodi; leaves roundish, deeply 5-7-cleft, truncate or cuneate at the base: segments elliptic, acute, mucronulate; pedicels axillary, bracteate, erect, much longer than the leaves; ovary obconical. 2. G. Native of the Cape of Good Hope. Herb tufted, pale green. Corollas purple.

**Mass-like Lobelia.** Pl. tufted.

97 L. mundita (Cham. in Linna. 7. p. 215.) plant trailing; stems filiform, angular; leaves sessile, decurrent, lanceolate and elliptic, acute at both ends, with a few acute serratures; flowers axillary, solitary, on short pedicels; calyce segments lanceolate, acute, erect, more than one-half shorter than the tube of the corolla; anthei all bearded. 2. G. Native of the Cape of Good Hope, at Gamka, where it was collected by M. Mundt. Ovarium, calyces, pedicels, stems, and outside of corolla beset with long spreading white hairs.

**Mundt's Lobelia.** Pl. trailing.

98 L. campanulata (Lam. dict. 3. p. 588. no. 20.) plant small; leaves linear-lanceolate, toothed; pedicels very long, 1-flowered; calyx hairy, a little reflexed. 2. H. Native of the Cape of Good Hope. Stem simple, slender, leafy, glabrous. Leaves glabrous, sessile, hardly an inch long. Pedicels filiform, 21/2 inches long, pilose at the apex, solitary in the axils of the superior leaves. Flowers erect, campanulate, blue. Limb spreading, hardly divided, rather irregular. Calyce segments narrow.

99 L. brevifilis (Lam. dict. 3. p. 588.) leaves sessile, lanceolate, toothed, minute, usually unilateral; flowers almost sessile; the pedicels are short and alternate; stems procumbent. 2. G. Native of the Cape of Good Hope. Breyn. cent. p. 175. t. 89. Stems long, filiform. Flowers blue. Bracteae much shorter than the flowers.

**Breynius's Lobelia.** Pl. procumbent.

100 L. champefyllis (Lam. dict. 3. p. 590.) leaves linear, channelled, numerous, bidentate at the apex, clothed with hairy tomentum; pedicels very long, naked, axillary and terminal, furnished with narrow acute scales; stem shrubby. 2. G. Native of the Cape of Good Hope. L. scabra, Spreng. neun. entd. ex syst. Habit of Lactandula, with the leaves of Ajania champefyllis. Stems leafy, slender. Pedicels longer than the stem, 6 inches long. Corollas of a pale violaceous colour, 6 lines long, inflated at the base.

**Ground-pine-like Lobelia.** Pl. 1/4 to 1/3 foot.

101 L. erinoides (Lin. mant. p. 291. Thumb. fl. cap. 2. p. 39.) leaves petiolate, oblong, toothed, bluish, glabrous; pedicels axillary, solitary, shorter than the leaves; corolla funnel-shaped; stems prostrate or erectish. 2. or 2. G. Native of the Cape of Good Hope. Rapiniurn erinoides, Mill. dict. no 9.—Herm. ligdb. p. 108. t. 109. Corollas funnel-shaped, an-
cular, equal, blue, with spreading segments. Filaments combined into a 5-striped, club-shaped tube. Stigma hairy.

102 L. sect. Curvirostis (Curt. bot. mag. t. 514.) leaves downy, serrated; lower ones oblong, nearly sessile; superior ones lanceolate; pedicels solitary, axillary, longer than the leaves. 2. G. Native of the Cape of Good Hope. Willd. enum. 1. p. 218. Corollas blue, with a sulphur-coloured throat. Curtis says the leaves are downy and nearly sessile, while Willdenow says they are glabrous and petiolate.

103 L. Ilicifolia (Ker. in bot. mag. t. 1896.) leaves ovate-lanceolate, deeply and remotely toothed: teeth acute; pedicels axillary, solitary, much longer than the leaves. 2. G. Native of the Cape of Good Hope. Lower leaves ovate-spatulate; superior ones lanceolate: all glabrous. Calyx with salutate toothed segments. Corollas resupinate, twice the length of the calyx, pink or flesh-coloured. Antlers almost naked. Barren stems prostrate; floriferous stems erect. Perhaps a species of *Parastratanthus*.

106 L. Thermaulis (Thumb. prod. 1. p. 40. fl. cap. 2. p. 42.) leaves ovate, serrated, attenuated at both ends, acute, glabrous above, and pilose beneath; pedicels solitary, axillary, shorter than the leaves, and are as well as the calyces clothed with striate white hairs; stems decumbent, hairy. 2. G. Native of the Cape of Good Hope, in the region of the hot springs near Eland's river. Calyx yellow. *Cape lobelia*. Clt. 1800. Petioles much longer than the leaves.

Hot-spring Lobelia. Pl. decumbent.

107 L. leptocarpa (Griess. in Linnaea. 5. p. 419.) stem hermaphroditic, decumbent, branched; branches flaccid; leaves ovate-lanceolate, sharply serrated, quite glabrous, with cartilaginous edges; pedicels axillary, solitary; capsule elongated, clavate, hispid from bristles. 2. G. Native of the Cape of Good Hope. Branches beset with white hairs. Leaves sessile. Calyx bristly. Corolla downy, white, having the segments bearded at their tips, and ciliated on the margins. Filaments and style glabrous.

Slender-fruited Lobelia. Pl. decumbent.

108 L. hisruta (Lin. spec. 1822.) leaves ovate, toothed, or crenated, hairy or woolly; peduncles lateral, solitary, very long. 2-3-flowered; stem shrubby, hairy, prostrate, or erect. 2. G. Native of the Cape of Good Hope. Thumb. fl. cap. 2. p. 37. Rapúnion hirsutum, Mill. dict. no. 9.—Burnm. afr. 105. t. 40. f. 2. Flowers blue, drooping, small.

109 L. serpens (Lam. dict. 3. p. 588.) leaves ovate, crenated, glabrous; pedicels axillary, solitary, shorter than the leaves; stems prostrate, a little branched. 2. G. Native of the Cape of Good Hope. Stems slender, flexuous. Leaves thin, hardly an inch long. Flowers small, blue.

Creeping Lobelia. Pl. prostrate.

110 L. pygméa (Thumb. prod. 1. p. 40. fl. cap. 2. p. 43.) leaves roundish, serrated, hairy; stems decumbent, hairy, branched; pedicels axillary, solitary, longer than the leaves. 2. G. Native of the Cape of Good Hope, on Mount Ribeck-Castel. Stems very slender. Petioles capillary, hairy. Corollas white.

Pygmy Lobelia. Pl. decumbent.

111 L. coronopifolia (Lin. spec. 1822.) leaves lanceolate, toothed; peduncles long, few-flowered. 2. G. Native of the Cape of Good Hope. Curt. bot. mag. 644.—Brey. cent. t. 88. Stems and petioles hairy. The 3 segments of the lower lip of the corolla obvate, emarginate. Leaves with 3 or more teeth on each side. Flowers beautiful blue. Stems procumbent.

113 L. crenula (Hook. bot. mag. 3701.) stem short, decumbent at the base, densely leafy; leaves lanceolate, dentately pinnatifid, downy, attenuated at the base; peduncles terminal, very long, bearing a few-flowered second racemes at the apex; segments of the corolla longer than the tube. 2. G. Native of the Cape of Good Hope. Pedicels bracteated. Corolla drooping, large, purple-blue; lower lip of 3 obvate emarginate mucronate segments, having 3 small yellow raised marks at the base, the upper lip of 2 small bent back segments. Antlers purple, fringed at the top. *Like L. coronopifolia.* (i. 121.)

Blue-flowered Lobelia. Pl. 1 foot.

114 L. Simsii (Sweet, hort. brit. p. 247.) leaves petiolate, recurved, pinnatifid, with bifurcate lobes; peduncles elongated, lateral, 2-3-flowered; stem shrubby. 2. G. Native of the Cape of Good Hope. L. pedunculata, Sims, bot. mag. t. 2251. Flowers blue, having the tube purple outside. Calycine segments short. Lower lip furnished with 2 yellow marks at the base.

Sims' Lobelia. Shrub 1 foot.

115 L. crenata (Thumb. prod. 1. p. 39. fl. cap. 2. p. 40.) leaves lanceolate, crenated, glabrous; stems hermaphroditic, filiform, decumbent; pedicels capillary, axillary, hardly the length of the leaves. 2. G. Native of the Cape of Good Hope. Stems branched a little. Leaves about an inch long: lower ones acute: superior ones smaller and obtuse. Flowers blue?

§ 4. Species natives of the Isle of France, the Society Islands, and New Zealand.

116 L. arbores (Forst. prod. no. 308.) stem arborescent; leaves petiolate, ovate-oblong, serrately toothed; peduncles axillary, solitary, 1-flowered. 2. G. Native of the Society Islands.
LOBELIACEÆ.

VIII. Lobelia.

Tree Lobelia. Tree.

117 L. suprema (Cham. in Lindm. 7. p. 223.) arboreous, palm-form'd; stem quite simple, straight, with a tuft of leaves at top; leaves glabrous, oblong-obovate, acuminate, narrowed into the petioles, undulated, dentilicate, with reflexed edges, almost quite entire towards the base, and revolute; inflorescence and corollas tormento-se. P. S. Native of the Island of Owhyee, in woods. Ribs of leaves thick, and prominent beneath; veins feathered and prominent. Peduncles longer than the leaves, declinate, nutant, furnished with many oblong-elliptic sessile densely imbricated bracteas, bearing a globose head of flowers each. Corolla curved, cleft on the back, $\frac{3}{4}$ inches long. Column of stamens glabrous, exceeding the corolla. Two lower anthers bearded. Leaves 2½ feet long and 1 foot broad. This is a most superb species.

Superb Lobelia. Tree 10 to 15 feet.

118 L. macrostachys (Hook. et Arn. in Beech. voy. pt. bot. p. 88.) glabrous; stem tall, straight; leaves linear-lanceolate, attenuated at both ends, subterete; racemes simple, terminal, very long; pedicels secund, horizontal; bracteas linear, shorter than the pedicels; tube of calyx hemispherical, with the segments obverse; corollas twice the length of the pedicels. P. S. Native of the Sandwich Islands. Calyx closely adhering to the ovarium; with a free 5-parted limb, which is about equal in length to the tube. Corolla tubular, 3 inches long; tube cylindrical, 5-cleft, split on the back. Stamens with a free tube, and cohering anthers; the two lower ones bearded. Stamina 2-lobed; lobes flat, thick, cartilagineous, rounded, divaricate, beardless. Fruit unknown.

Long-spiked Lobelia. Shrubs tall.

119 L. filiformis (Lam. dict. 3. p. 588.) leaves linear, narrow, toothed; pedicels 1-flowered, axillary, length of leaves; stem filiform, quite simple. G. H. Native of the Isle of France. Leaves sessile, glabrous. Flowers minute, ringent, violaceous. Calyces teeth subulate. Said to be nearly allied to L. Laurinii.

Var. 3. Luzoniana (Roem. et Schultes, syst. 5. p. 61.) lower leaves ovate, very minute.—Native of the island of Luzon, near the town of Santa Cruz de la Laguna. L. filiformis, Cav. icon. 6. p. 7. t. 511. f. 2. Flowers pale blue.

Filiform Lobelia. Pl. $\frac{3}{4}$ to 1 foot.

120 L. angulata (Forst. prod. no. 309.) stem prostrate, quite simple; leaves roundish, repandly toothed; pedicules axillary, solitary, 1-flowered. G. Native of New Zealand. L. repanda, Mart. Mitt. no. 35. Perhaps a species of Pratia.

Angular-leaved Lobelia. Pl. prostrate.

§ 5. Species natives of New Holland.

* Herbaceous plants, with axillary 1-flowered pedicels.

121 L. alata (Labill. nov. holl. 1. p. 51. t. 72.) plant glabrous, erect; stem trigonal: angles a little winged; leaves linear or cuneated, decurrent, toothed; teeth divericate or reflexed; pedicels shorter than the leaves; ovarium glabrous; capsules cylindrical. G. Native of New Holland. Flowers blue?

Var. a. angustifolia (Roem. et Schultes, syst. 5. p. 68.) superior leaves linear; angles of stem margined; radical leaves ovate-lanceolate. G. Native of the south coast of New Holland, and about Port Jackson; and of Van Diemen's Land.

Var. b. cuneiformis (Roem. et Schultes, l. c.) leaves cuneiform, toothed at top, decurrent; flowers axillary. G. Native of the south coast of New Holland. L. cuneiformis, Labill. nov. holl. 1. p. 51. t. 78.

122 L. quadrangularis (R. Br. prod. p. 562.) glabrous; stem tetragonal, ascending; leaves ovate, toothed, almost sessile, 3 or 4 times shorter than the pedicules; segments of the superior lip of the corolla narrow, linear. G. Native of New Holland, on the shore, within the tropic. Quadrangular-stemmed Lobelia. Pl. ascending.

123 L. repandula (Graham. in edinb. phil. journ. Dec. 1829.) leaves roundish, repand, wrinkled with the nerves, glabrous; pedicels much longer than the leaves; calyces segments entire, glandular at the base; stem spotted, prostrate, rooting. G. Native of New Zealand. L. muculata, Penny. Plant glabrous. Corolla white, split on the upper side. Segments of corolla rather unequal, arranged like the radii of a semi-circle. Anthers lead-coloured, with 2 or 3 angles projecting downwards from their apex. Nearly allied to L. membranacea, R. Br. prod. Perhaps a species of Pratia.

Wrinkled-leaved Lobelia. Pl. creeping.

124 L. membranacea (R. Br. l. c.) glabrous, procumbent; leaves roundish, repandly toothed, membranous; somewhat 2-angled; shorter than the pedicules; segments of the calyx toothed a little. G. Native of New Holland, within the tropic, on the shore. Flowers beautiful, purple.

Membranous-leaved Lobelia. Pl. procumbent.

125 L. purpureascens (R. Br. l. c.) glabrous; stem ascending, tetragonal; leaves ovate-lanceolate, deeply serrated, one-half shorter than the pedicules; segments of the upper lip of corolla narrower, linear. G. Native of New South Wales, about Port Jackson. Flowers purplish or blue.

126 L. fluitatilis (R. Br. l. c.) plant creeping, smoothiol; branches ascending; leaves ovate, serrated on the outside, rather ciliated; pedicules bractless, downy, as well as the calyces and ovaria; stamens epipetalous. G. Native of New South Wales, at Port Jackson.

128 L. pedunculata (R. Br. l. c.) plant creeping, rather downy; branches ascending, filiform; leaves remote, ovate, angularly toothed, acute, a little ciliated; pedicules very long, furnished with 2 minute bracteas; stamens epipetalous. G. Native of New South Wales, at Port Jackson. Flowers blue.

129 L. irrigua (R. Br. l. c.) plant creeping, moss-like, glabrous; leaves roundish, thickish, dentately crenated, petiolate, longer than the pedicules, which are bractless and glabrous; segments of the calyx a little shorter than the tube of the corolla; stamens epipetalous. G. Native of Van Diemen's Land, and on the south coast of New Holland. Flowers purplish? Irrigated Lobelia. Pl. creeping.

* * Racemes or pedicules few-flowered, terminal. Tube of corolla cleft longitudinally, with the lips of the limb very unequal.

130 L. graecilis (Andr. bot. rep. t. 340.) plant glabrous, erect, branched a little,stem sessile rather secund; calyx length of filaments? superior lip of the corolla densely bearded; middle segment of the lower lip almost square, broader than long; lower leaves nearly ovate, deeply pinnatifid; superior ones 4 Y

131 L. dentata (Cav. icon. 6. p. 14. t. 592.) plant erect, glabrous, a little branched; racemes few-flowered, second; calyx one-half shorter than the filaments; superior lip of corolla a little bearded: segment of the lower lip oblong; lower leaves ovate-lanceolate, deeply toothed on the outer side: superior ones lanceolate, toothed. 2. G. Native of New South Wales, about Port Jackson. Root fusiform, fibrous. Segments of the calyx subulate. Corolla blue, with a white throat. Two upper segments of the corolla very short.

132 L. gibosa (Labill. nov. holl. 1. p. 50. t. 71.) glabrous; stem terete, simple; racemes secund, many-flowered; leaves linear, quite entire, rather fleshy; superior lip of corolla beardless: and with the segments of both lips lanceolate; capsule gibbous on one side. 2. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Root perpendicular, almost simple. Racemes very long. Bracteas subulate, hardly the length of the pedicels. Corollas blue. Anthers hispid at the apex.

133 L. simplicicaulis (R. Br. prod. p. 564.) glabrous; stem quite simple, terete; raceme secund, few-flowered; leaves linear, toothed, remote: lower ones lanceolate; upper lip of corolla bearded, the segments of both lips acute; capsules erect, rather gibbous on one side. 2. G. Native of Van Diemen's Land. Flowers blue.

Simple-stemmed Lobelia. Pl. 1 foot.

134 L. Brownii'ana (Röm. et Schultes, syst. 5. p. 71.) stem terete, a little branched; raceme secund; leaves linear, lower ones toothed; superior lip of corolla ciliated: the segments of both lips acute; capsules gibbous on one side. 2. G. Native of New Holland, within the tropic, on the shore. L. stricta, R. Br. 1. c. Flowers blue.

Brown's Lobelia. Pl. 1 foot.

135 L. heterophylla (Labill. nov. holl. 1. p. 52. t. 74.) plant smoothish; stem angular, simple; raceme secund; leaves thickish: lower ones dentately pinnatifid: superior ones linear, quite entire; middle segment of the lower lip of the corolla obcordate, and the lateral ones dimidiate. 2. G. Native of New Holland, in Van Lewin's Land. Root simple, perpendicular. Bracers lanceolate, solitary or twin, shorter than the pedicels. Calyx inflated, with very acute segments.

Variable-leaved Lobelia. Pl. 1 foot.

136 L. tenusior (R. Br. in prod. p. 564.) plant rather pilose; stem filiform, divided; branches peduncle-formed, 1-flowered; lower leaves pinnatifid, of an ovate outline: superior leaves linear, trifid or quite entire: middle segment of the lower lip of the corolla obcordate: lateral ones dimidiate: capsule sub-cylindrical. 2. G. Native of New Holland, on the south coast, within the tropic. Flowers blue.

Slender Lobelia. Pl. 1 foot.

137 L. farfölia (R. Br. 1. c.) glabrous; stem subpaniculate, terete: branches usually 1-flowered, peduncle-formed: superior lip of corolla beardless: segments of the lower lip oblong, obnivous. 2. G. Native of New Holland, on the south coast.

Small-leaved Lobelia. Pl. 1 foot.

§ 6. Species natives of Europe.

139 L. serulata' (Brot. fl. lus. p. 304.) glabrous; leaves linear-lanceolate, sharply serrated; racemes long; stem erect. O. H. Native of Gibraltar, in sandy humid places. Bractees a little longer than the pedicels. Corolla rather roughish. Middle segment of the lower lip narrower than the lateral ones; segments of the upper lip linear. Flowers blue. Perhaps not distinct from L. ürense.

V. 8. 8. (Vall. 8. 8.) leaves somewhat spatulate. Gourn. l. c.

141 L. Salzmanni'ana (Presl. symb. bot. p. 31. t. 29.) plant quite glabrous; stem quite simple, erect, leafy; leaves lanceolate, crude, crenated, tapering into the petioles; uppermost ones disposed in aggregate whorles; pedicels axillary, filiform, bifracteate in the middle. O. H. Native of Corsica, at Ajaccio by the sea side. L. Laurentites, Salzm. pl. cors. excis. Flowers blue?

Salzmann's Lobelia. Pl. ½ foot.

143 L. Farset'ia (Vand. in Rœm. script. pl. hisp. p. 66. Vittm. suppl. 1. p. 261.) lower leaves ovate-lanceolate, obsoletely toothed; floral leaves linear. O. H. Native of Portugal, in humid places. Stem 2 hands high, many-angled, branched at the base. Leaves glabrous. Calyx gibbous, with linear spreading segments. Corolla pentagonal, blue, the segments of the lower lip the largest. In the base of the inner part of the limb there are two oblong parallel callousities, as in the genus Dölichos. Style longer than the stamens. Capsule ventricose.

Var. a; leaves oval-oblong, acuminated, dentilicate; stem leafy, somewhat sinate; anthers hairy, joined at the apex.

Var. β; stem suffruticoso; leaves cordate, acute, serrated; flowers axillary, pedunculate.

Farseti's Lobelia. Pl. 1 to 1 ½ foot.

† Species not sufficiently known.

144 L. cornut'a (Lin. spec. 1319.) leaves ovate, petiolate;
stamens very long.  
Horned Lobelia. Pl. ?
145 L. brvoides (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 41.) stems tufted; leaves sessile, lanceolate, quite entire, acute. Flowers in corymb, terminal. 2 S. Native of South America, on Mount Antisana, Humb. et Bonpl. Habit of a moss or Aëria. Leaves imbricated, shining, coriaceous, denticulated. Flowers among the terminal connivent leaves. Perhaps a species of Lysipomia.

Brynna-like Lobelia. Pl. 4 foot.
146 L. veronicaefolia (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 57.) stem erect; leaves downy: radical ones obtuse, obovate; cauline leaves lanceolate, dentate, acute; flowers terminal, racemose. 2 S. Native of South America. Humb. et Bonpl.

Speedwell-leaved Lobelia. Pl. ?
147 L. amygdalina (Willd. l. c. p. 57.) stem erect; leaves ovate, acuminate, serrated; pedicels axillary; corolla cleft.—Native of South America. Humb. et Bonpl.

Almond-like Lobelia. Pl. ?
148 L. retorta (Willd. l. c.) stem arboreous; branches scabrous; leaves petiolaris, elliptic, mucronate, with retrograde serratures, wrinkled, veiny; flowers terminal, racemose. 2 S. Native of South America. Humb. et Bonpl.

Retrograde-serrated-leaved Lobelia. Shrub.
149 L. bonplandiana (Willd. l. c.) stem arboreous; leaves lanceolate, sharply serrated, flat, downy, on short petioles; pedicels axillary, shorter than the leaves. 2 S. Native of South America. Humb. et Bonpl. L. dentata, Willd. herb.

Bonpland’s Lobelia. Shrub.
150 L. elliptica (Willd. l. c.) stem arboreous; leaves elliptic, obtuse, rugose, acute; flowers terminal, racemose. 2 S. Native of South America. Humb. et Bonpl.

Elliptic-leaved Lobelia. Shrub.
151 L. nivea (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 58.) stem arboreous; leaves elliptic, with revolute edges, toothed, shining and wrinkled above, but clothed with white tomentum beneath, as well as on the pedicles and corollas; flowers axillary. 2 S. Native of South America. Humb. et Bonpl.

Snowy Lobelia. Shrub.
152 L. reticulata (Willd. l. c.) stem arboreous; leaves ovate-lanceolate, acuminate, crenated, wrinkled from veins, downy beneath; corollas terminal, racemose. 2 S. Native of South America. Humb. et Bonpl.

Reticulated-leaved Lobelia. Shrub.
153 L. madagascariensis (Rœm. et Schultes, syst. 5. p. 67.) lower leaves ovate: superior ones lanceolate, denticulated, decurrent; flowers axillary, length of leaves; stem prostrate. 0. H. Native of Madagascar. L. decerrena, Willd. herb.

Madagascar Lobelia. Pl. prostrate.
154 L. phytomoides (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) leaves lanceolate, toothed, sessile, glabrous; racemes terminal; stem ascending, a little branched. 2 S. Native of South America. Humb. et Bonpl.

Phytomene-like Lobelia. Pl. ascending.
155 L. humboldtiana (Rœm. et Schultes, syst. 5. p. 68.) leaves roundish, acute, sessile, with cartilaginously serrated edges; flowers sessile, axillary; stem weak. 2 S. Native of South America. Humb. et Bonpl. L. sessilifolia, Willd. herb.

Humboldt’s Lobelia. Pl. ?
156 L. polyomorpha (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 68.) stems prostrate; lower leaves serrated, oblong; superior ones quite entire, lanceolate; pedicels axillary, elongated. 2 S. Native of the island of Bourbon, Bory de St. Vincent.

Polymorphous Lobelia. Pl. prostrate.
157 L. loxia (Willd. herb. ex Rœm. et Schultes, syst. 5. p. 72.) plant clothed with scabrous tomentum; leaves oblong, peltate, wrinkled, and shining above; flowers terminal, panicled. 2 S. Native of South America, about Loxa. Humb. et Bonpl.

Loxia Lobelia. Shrub.
158 L. megapotamica (Spreng. syst. add. p. 75.) stem erect, branched, glabrous; leaves linear, very narrow, crenately spreading, glabrous; flowers terminal, corollas. 2 S. Native of Brazil, at the banks of the Rio Grande, where it was collected by Sello.

Rio Grande Lobelia. Shrub.

Culture. All the species of this genus are truly ornamental when in blossom. The hardy herbaceous kinds thrive and flower best in light rich earth or peat soil; but in winter most of the kinds require to be protected by planting them in pots and placing them in a frame or greenhouse. They increase freely by the suckers from the roots or by seed. The green-house and stove perennial herbaceous kinds grow well in a mixture of peat and sand, and are easily increased by dividing, and by seeds. The shrubby, stave, and greenhouse kinds grow well in the same kind of soil recommended for the perennial herbaceous species, and are easily increased by cuttings in the same kind of soil. The seeds of annual species require only to be sown where they are intended to remain.

Lin. syst. Pentàdria, Monogyniæ. Calyx of 5 deep segments. Corolla bilabiate, with a bearded mouth, cleft on the back; lower lip trilab; upper lip of 2 smaller segments. Stamens with free filaments, and cohering bearded anthers. Stigma capitate, hairy. Capsule half superior, 3-valved, 3-celled, 5angled, surrounded by the segments of the calyx beyond the summit, many-seeded. — Aquatic, smooth, fleshy plants. Leaves numerous, mostly radical, recurved. Scapes hollow, with a few leaves at the base, bearing a lax raceme of flowers at the top. Bracteas solitary at the base of the pedicels.

2 D. paludosâ; leaves flat, linear-oblong, with obsolescent crenate margins; scape nearly simple and naked, bearing a few remote flowers at the apex. 2 S. Native of North America, in deep sphagnum swamps, from Sussex county in Delaware to Georgia. Lobelia paludosa, Nutt. nov. gen. 2. p. 75. Leaves 4-6 inches long, and hardly 5 lines wide. Flowers pale blue, small. Corolla with the disk of the lower lip downy.

Marsh Dortmann. Pl. 2 feet.

Culture. The species of Dortmanniana are singular, and beautiful plants, but difficult of culture. However, D. lacustris may be 4 Y 2.
grown for a time, if planted in a pot of gravel, and placed in a pond or cistern, so that the plants may be about 6 inches below the surface of the water; and D. patlodus may be grown in a pot half filled with peat earth, and the other half with sphagnum, in which the plants are to be set, and the pot placed in a shallow pan of water, or in a cistern or pond, but not so deep as to immerse the plants.

X. PARAESTRANTHUS (from παραστρέφω, parastrepho, to invert, or to distort, ar στροφή, anthos, a flower; the flowers are upside down, compared with those of other genera of Lobeliaceae). Lobelia species, Lin. Thunb.

L. L. Pentandria, Monogyonia. Calyx 5-cleft. Corolla bilabiata, with hardly any tube: upper lip of 3 segments, lower one of 2 segments, smaller. Stamina column under the lower lip. Anthers and filaments connected into a column; the former bearded at the apex. Ovary inferior, 2-3-celled. Style bifid or trifid.—Herbaceous plants, with toothed leaves, and terminal racemes of almost sessile yellow flowers.

1. P. simplex; glabrous; stems assurgent, simple; leaves lanceolate, serrated; flowers almost sessile, at the tops of the stems, forming a loose spike; bracteas toothed, shorter than the calycine segments. 

2. P. variifolia; stems erect, branched at top; leaves linear, quite entire, and toothed, particularly the upper ones; flowers blue, or violet, nearly terminal, almost sessile; stigma tripartite. 

3. P. unidentata; leaves linear-lanceolate, furnished with a tooth on each side, rather hairy above, and discolorous beneath; pedicels solitary, terminal; stems angular from the decurrent bases of the leaves. 

Cult. Beautiful plants, of easy culture. A mixture of loam, peat, and sand is the best soil for them; and they are easily increased by dividing at the root.

XI. ISOTOMA (from ἰσός, ἰσος, equal, and τομα, toma, a section; in reference to the segments of the corolla being nearly equal.) Lindl. bot. reg. 964. Lobelia Isotoma, R. Br. prod. fl. nov. holl. p. 564.

L. L. Pentandria, Monogyonia. Limb of calyx 5-parted (f. 122. c.), nearly equal. Corolla salver-shaped (f. 122. d.) or funnel-shaped, with an entire or cleft tube, and a nearly equal 5-parted limb. Filaments combined into a tube. Anthers cohering, beardless; two lower ones mucronate. Stigma capitata, protruding beyond the anthers. Capsule 2-celled, many-seeded.—Herbaceous plants. This genus differs from all the other genera of Lobeliaceous plants, in the 2 lower anthers being mucronate, except Pratia.

1. I. axillaris (Lindl. bot. reg. 964.) plant rather downy; leaves sessile, pinnatifid, toothed; peduncles axillary, naked, elongated, 1-flowered; corolla salver-shaped, with an entire tube. 

2. I. Brozhii; glabrous; stems mostly simple; leaves linear, quite entire; corolla salver-shaped, with an entire tube, and a somewhat unequal limb; flowers racemose. 

3. I. scopiger; stems short; leaves lanceolate, a little toothed; corolla funnel-shaped, having the tube cleft above at the apex; pedicels scap-formed, 1-flowered. 

4. I. scapa, biuncilis (Br. Br. l. c.) stem 6-10 lines long; leaves ovate-lanceolate, 4-6 lines long; scapes many, 2-3 lines long. 

5. I. scopiger. 

6. I. scopically. 

7. I. scopiger. 

8. I. scopically.
the apex, or terminating in a membranous process. Stigma 2-lobed, ciliated outside. Capsule somewhat 6-ribbed, 1-celled, opening by an orbicular cell, undulate, deciduous operculum. Seeds numerous, adnate to parietal placenta.—Small, tufted, stemless or canescent herbs, with the habit of *Aréria* or *Montia*. Leaves alternate, linear or spatulate, quite entire, stiff and crowded, or fleshy and remote. Flowers minute, axillary, solitary, white, pedunculate. This genus is easily distinguished from all the other genera of the present order.

1. **L. Montoides** (H. B. et Kunth, nov. gen. amer. 3. p. 320. t. 266. f. 2.) stems creeping; leaves spatulate, rather fleshy; peduncles axillary; calyces segments unequal, glabrous, 4 times shorter than the tube of the corolla. *L. S.* Native of Quito, in humid places on the high plains of Mount Antisana, at the altitude of above 6000 feet. Lobélia limoselloides, Wild. in Reem. et Schultes, syst. 5. p. 41. Herb glabrous, with the habit of *Montia fontana*.

*Montia*-like *Lysipomia*. Pl. procumbent.

2. **L. Reniformis** (H. B. et Kunth, nov. gen. amer. 3. p. 320. t. 266. f. 1.) stems creeping; leaves orbiculariform, emarginate; flowers axillary; calyces segments equal, acute, glabrous, 8 times shorter than the tube of the corolla. *L. S.* Native of South America, near the Cave of Antisana. Herb glabrous, with the habit of *Viola pavástis*.

*Reniform*-leaved *Lysipomia*. Pl. creeping.

3. **L. Arethoides** (H. B. et Kunth, nov. gen. amer. 3. p. 321. t. 267. f. 1.) plant tufted; stems short, leafy; leaves crowded in a stellate manner, oblong-spatulate, acute, stiff; peduncles axillary; segments of the calyx equal, acute, ciliate, one-half shorter than the corolla. *L. S.* Native of the Andes of Peru, near Loxa, in Cerro de Vinajacu, at the altitude of about 4000 feet. Lobélia glandulosa, Wild. in Reem. et Schultes, syst. 5. p. 41. Plant glabrous, with the habit of a species of *Aréria*.

*Arethia*-like *Lysipomia*. Pl. tufted, an inch high.

4. **L. Acaulis** (H. B. et Kunth, nov. gen. amer. 3. p. 321. t. 267. f. 2.) plant tufted, stemless; leaves radical, crowded in a stellate manner, linear, obtuse, stiff; peduncles radical; segments of the calyx unequal, obtuse, glabrous. *L. S.* Native of South America, on the high plains of Mount Antisana, and roots of Chussulonig, above the altitude of 6000 feet. Lobélia androsácea, Wild. in Reem. et Schultes, syst. 5. p. 41. Plant glabrous, with the habit of *Valeriana rigida*.

*Stemless* *Lysipomia*. Pl. tufted.

5. **L. Subularia**; leaves radical, crowded in a stellate manner, subulate, mucronate, hairy at the base; peduncles elongated; calyces lobes acute. *L. F.* Native on the Cordillera of Peru. Peduncles 1-flowered, an inch long. (v. s. in herb. Lamb.)

*Subulare*-leaved *Lysipomia*. Pl. 1 inch.

**Cult.** The species of *Lysipomia* are very remarkable little plants, but none of them have been as yet introduced to our gardens; but should they ever be, we would recommend their being grown in a mixture of loam and peat, in small pots, well drained with sherd. They will be easily increased by division.

**XIV. Monopsis** (from mones, monos, one, and opis, opis, a face; in reference to the flowers being regular, not bilabiate). Sáisíb.—*Lobélia spéculum*, Andr. bot. rep. 604. *Specularia*, Soland. ms.

**Lin. syst. Pentándria, Monogynia.** Calyx adhering to the ovarium, with a 5-lobed equal limb. Corolla bilabiate, with hardly any tube; lower lip cuneated, 3-lobed; superior one straight, bipartite. Stamens combined into an incurved tube: anthers cohering; the 2 lower ones bearded at the apex. Ovary siliqué-formed, triangular, twisted, 1-celled, with 2 parietal placenta. Capsule dry, chartaceous, many-seeded, opening by 3 thong-formed valves.—Herbaceous, procumbent, glabrous plants, with small linear-lanceolate leaves: and axillary, solitary, almost sessile blue flowers.

1. **C. Klégans** (Dougl. l. c.) glabrous; root annual; stem procumbent, branched, rather angular; leaves sessile, ovate, 3-veined; flowers solitary, axillary, sessile; ovary sessile, long, acuminate. *O. H.* Native of North America, on the banks.
of the Columbia river. Flowers blue; the lower lip having a large white streak on the base. Stigma girded by a papillose beard. Two lower anthers alone bearded.

**Fl.** 1827. Pl. 2517. glabrous; root perennial, creeping; stems erect or decumbent, branched, triangular at bottom; leaves linear-lanceolate, acute, remotely dentated, sessile; lower ones ovate; flowers axillary, almost sessile, at the tops of the branches; ovarium elongated. 9. S. Native of the Cape of Good Hope, near Hangkliph, where it was collected by M. C. Captured elongated, crowned by the segments of the calyx, which are spreading, fleshy, and stellately disposed; anthers all bearded. Corolla pale blue.

**Bergius's** Cl. Pl. decumbent.

3. C. pusilla; we have not been able to see the work in which this plant is described, as it has not been received in this country. 10. H. Native of Chili. L. pusilla, Poepp. Pl. chil. exsic. 2671. syn. pl. amer. austr. misc. diat. 791. Flowers blue.

**Small Cl.** Pl. decumbent.

**XVII. CYPHIA** (from κυφος, κυφος, curved; in reference to the stigma being gibbous). Berg. 3 Fl. cap. p. 173. Lobelia species, Thunb.

**Lin. Syst.** Pentändria, Monogyâma. Calyx turbinata, 5-cleft. Corolla bilabiata; segments easily separated to the base, spreading at the apex. Filaments hairy, cohering; anthers free, bearded. Stigma drooping, hollow, gibbous. Capsule 2-celled, many-seeded.—Herbaceous plants, natives of the Cape of Good Hope, with alternate, undivided, pinnate, and pinnatifid leaves; and blue or red flowers.

Var. a. vulgâtor (Cham. in Linn.Î. 7. p. 224.) flowers nearly an inch long; genitals half an inch, one-half shorter than the tube; segments of corolla narrow-lanceolate.

Var. b. intermedia (Cham. l. c.) flowers 9 lines long; throat of corolla more bearded; segments of corolla more elliptic; genitals shorter than the corolline tube.

Var. c. variiflora (Cham. l. c.) flowers not half an inch long; genitals exceeding the corolline tube; filaments villous. Perhaps a proper species.

**Twining Cl.** Fl. 1827. Cl. 1795. Pl. twining.

**Digitate-leaved Cl.** Pl. twining.

5. C. serrâta (Spreng. syst. 1. p. 809.) leaves radical, oblong, attenuated at the base, sessile, crestedly serrated, quite glabrous, as well as the scape, which is sealy; flowers racemose; segments of the calyx reflexed, serrated. 9. G. Native of the Cape of Good Hope.

**Serrated-leaved Cl.** Pl. 1/2 foot.

**Phyteuma-like Cl.** Fl. Feb. Cl. 1822. Pl. 1 to 1/4 foot.

8. C. ? pinâta (Rom. et Schultes, syst. 5. p. 477.) stem shrubby, erect, branched at top; leaves pinnate, smooth; leaflets very narrow, capillary. 9. G. Native of the Canary Islands. Lobelia pinâta, Lam. dict. 3. p. 591. no. 44. Shrubs milky. Leaves like those of Iysonêa Quandlaleit. Branches very leafy. Leaves shining; leaflets 1/2 inch long.

**Pinnate Cl.** Shrub 3 feet.

9. C. éctye (Willd. rel. ex Rom. et Schultes, syst. 5. p. 477.) leaves bipinnatifidly jagged; stem furrowed. Native of the Cape of Good Hope. There is a smoother and broader leaved variety of this, with larger pinnatifid bracteas, which are about the length of the flowers.

**Racemed Cl.** Pl. 1 foot.

**Cult.** The species of this genus thrive well in an equal mixture of loam, peat, and sand; and cuttings of them root readily under a hand-glass. Some of the species have large tuberous roots; these must be kept quite dry when not in a growing state, or they will rot. These tuberous-rooted kinds may be increased just as the stems begin to push out from the root, by cutting off as many of the shoots as are wanted, and planting them in a small pot, in the same kind of soil recommended for the species, keeping them dry till the wound has healed, but never covering them with glass; they will soon form tubers of themselves, and the old plant will make fresh shoots.

**XVIII. CANONANTHUS** (from κανονικος, κανονικος, regular, and ἄρσεις, ἄρσεις, a flower; the flowers are regular, like those of Campanulaeae, not bilabiate, as in the rest of the Lobeliaeae genera). Lobélia species, Cav. icon. 6. p. 11. t. 517.
STYLIDEE. 1. STYLiDiUM.

1 C. Campanula'tus; b. f. Native of Peru, on the road from Guaranda to Chimbora. Lobelia campanulata, Cav. Icon. 6, p. 11. t. 517. Campamulate-flowered Canonanthus. Shrub 8 feet. Cult. See Tupa, p. 700, for culture and propagation.

Order CXXXV. STYLIDEA (plants agreeing with Stylidium in important characters). R. Br. prod. fl. nov. holl. p. 565.

Calyx superior, 2-6-parted, bilabiate or regular (f. 123. a.), permanent. Corolla monopetalous, with a 5-6-cleft, irregular (f. 123. b.), rarely equal limb, which is imbricate in a stivation, and at length falling off. Stamens 2 (f. 123. d.); filaments combined with the style into a column. Anthers didymous (f. 123. d.), and sometimes simple, lying upon the stigma. Pollen globose, simple, sometimes angular. Ovary 2-celled, but sometimes almost 1-celled from the middle dissepiment being short, many-seeded; furnished with a gland in front, or crowned by 2 opposite glands. Style one; stigma undivided or biform. Capsule 2-valved, 2-celled, with a parallel dissepiment; or almost 1-celled from the dissepiment being short, or at length released from the inflexed margins of the valves. Seeds fixed to the axis of the dissepiment, erect, small, sometimes pedicellate. Albumen conforming to the seed, fleshy, and rather oily. Embryo inclosed, minute.—Canlescenc scarpigerous nonlactescent herbs or shrubs, beset with simple hairs, which are either tipped with capitate glands or acute. Leaves usually scattered, but sometimes verticillate, entire, with naked or ciliated edges; radical leaves crowded in the scarpigerous species. Flowers spicate, racemose, corymbose, and solitary; terminal, rarely axillary; pedicels usually furnished with three bracteae.

This order is nearly allied to both Campasulaceæ and Goodeniaceæ, from both of which it is distinguished by the gynandrous stamens, and from the latter by the want of an indusium to the stigma. The structure of the sexual organs is highly curious; the stamens and style are closely combined into a solid irritable column, at the top of which is a cavity, including the stigma, and bounded by the anthers.

Synopsis of the genera.

2 LEVEnhOÖXiA. Calyx 5-parted, bilabiate. Column erect, adnate to the lower side of the tube. Lobes of anthers one above the other, divaricate. Stigmas 2. Capsule 1-celled.

3 FORSTE'Ra. Calyx double, both composed of 2-3 sepals.
racemes of scape umbellate, involucrated. 2. G. Native of Van Diemen's Land.

**Umbellate-flowered Stylidium.** Pl. 14 foot.

5 **S. armis** (Labi. nov. holl. 2. p. 66. t. 216.) leaves linear, ensiform, with quite entire margins; scape glabrous; raceme simple, downy; lip of corolla appended. 2. G. Native of Van Diemen's Land. Perhaps the same as the following.

**Thid-like Stylidium.** Pl. 1 foot.

6 **S. melan*chlo** (R. Br. prod. p. 568.) leaves linear, with rather revolute smooth margins; scape rather pilose; spike simple, bested with glandular hairs; flowers imbricate, almost sessile; lip of corolla appended at the base. 2. G. Native of Van Diemen's Land. The leaves are sometimes bested with a few denticulations.

**Black-spiked Stylidium.** Pl. 1 foot.

7 **S. Graminifolium** (Swartz, in nov. act. script. berol. ex Willd. spec. 4. p. 146.) leaves linear, with denticulate edges; raceme subsimple, simple, and is as well as the scape bested with glandular hairs; lip of corolla appended at the base. 2. G. Native of New South Wales and Van Diemen's Land. Ker. bot. reg. t. 60. Ventenatia major, Smith, exot. bot. 2. p. 13. t. 66. Candollea serrulata, Labill. in ann. mus. 6. p. 414. t. 64. f. 1. Flowers purplish red.

8 **S. linearia** (Swartz, l. c.) leaves compressed, filiform, 1-1/2 inch long, with denticulated margins; raceme simple; pedicels equal in length to the ovarium; scape glabrous, filiform; lip of corolla appended at the base. 2. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 568. Ventenatia minor, Smith, exot. bot. 2. p. 15. t. 67. Flowers purple or red.

**Linear-leaved Stylidium.** Fl. June, July. Clt. 1812. Pl. 1 foot.

9 **S. setaceum** (Labi. nov. holl. 2. p. 65.) leaves setaceous, mucronate, an inch long; raceme simple, subscape; scape quite glabrous; capsule elongate-oblong; lip of corolla inappendiculate. 2. G. Native of New Holland, on the south coast. Flowers red.

**Setaceous-leaved Stylidium.** Pl. 1 foot.

§ 3. Leaves radical, crowded, without scales. Scape leafless or with a very few small scattered leaves. Outer lip of calyx bipartite, inner one tripartite.

10 **S. spinulosum** (R. Br. prod. p. 569.) leaves linear, mucronate, attenuated at the base, with spinulose edges; scape clothed with glandular pubescence; raceme simple, rarely subcorymbose; throat of corolla crowned; lip inappendiculate. 2. G. Native of New Holland, on the south coast.

**Spinulose-leaved Stylidium.** Pl.

11 **S. cespitosum** (R. Br. l. c.) leaves linear, glabrous, setaceous mucronate, with quite entire edges; raceme often divided; rachis and scape glabrous; throat of corolla naked; lip appended. 2. G. Native of New Holland, on the south coast.

**Tufted Stylidium.** Pl. tufted.

12 **S. piliferum** (R. Br. l. c.) leaves linear-lanceolate, glabrous, piliferous, with entire margins; raceme simple; rachis downy; scape glabrous; throat of corolla naked; lip appended. 2. G. Native of New Holland, on the south coast.

**Piliferous Stylidium.** Pl.

13 **S. assauceum** (R. Br. l. c.) leaves narrow-spatulate, glabrous, thickish, with quite entire margins; raceme divided a little; rachis and scape downy; throat of corolla naked; lip appended. 2. G. Native of New Holland, on the south coast.

**Similar Stylidium.** Pl.

14 **S. spatulatum** (R. Br. l. c.) leaves spatulate, clothed with glandular pubescence on both surfaces, with quite entire edges; raceme many-flowered, and as well as the radical scape glabrous; throat of corolla crowned; lip appended. 2. G. Native of New Holland, on the south coast.

**Spatulate-leaved Stylidium.** Pl. 1/2 to 1 foot.

15 **S. glaucum** (Labi. nov. holl. 2. p. 64. t. 214.) R. Br. Br. lanceolate-spatulate, clothed with glandular down on both surfaces, with quite entire edges; raceme few-flowered, subcorymbose, glabrous; scape furnished with a few leaves. 2. G. Native of New Holland, on the south coast. Perhaps the plant of Labillardiere is referrible to the following.

**Glaucous Stylidium.** Pl. 1/2 foot.

16 **S. eriophorum** (R. Br. l. c.) leaves spatulate, setaceously mucronate, glabrous on both surfaces, but somewhat tomentose on the margins; raceme somewhat panicked, and as well as the scape clothed with glandular down; root thick, woolly; throat of corolla naked; lip appended. 2. G. Native of New Holland, within the tropic.

**Woolly-rooted Stylidium.** Pl.

17 **S. floccosum** (R. Br. l. c.) leaves oblong, glabrous on both surfaces, with quite entire margins; scape numerous, panicked, woolly from acute villi; throat of corolla naked; lip appended. 2. G. Native of New Holland, within the tropic.

**Bundle-flowered Stylidium.** Pl.

18 **S. junceum** (R. Br. l. c.) radical leaves linear, those of the scape minute, distant, and as are well as the bracteas adnate to the middle; calyceine segments subulate, simple at the base; throat of corolla crowned by stipitate glands; lip inappendiculate. 2. G. Native of New Holland, on the south coast. Scape straight, glabrous.

19 **S. violaceum** (R. Br. l. c.) radical leaves narrow, linear, those of the scape, which is quite glabrous, small and adpressed, and are as well as the bracteas sessile; calyceine segments gibbous at the base; throat of corolla crowned; lip inappendiculate. 2. G. Native of New Holland, on the south coast. Flowers violaceous.

**Violaceous-flowered Stylidium.** Pl.

§ 4. Leaves of scape or stem verticillate. Outer lip of calyx bipartite, inner one tripartite.

20 **S. luteum** (R. Br. prod. p. 570.) scape inarticulated, glabrous; whorls of leaves 1-2 on each scape, besides some scattered leaves at the top; radical leaves linear; calyceine segments rather gibbous at the base; throat of corolla crowned; lip inappendiculate. 2. G. Native of New Holland, on the south coast. Flowers yellow.

**Yellow-flowered Stylidium.** Pl.

21 **S. ame借用um** (R. Br. prod. p. 570.) scape inarticulate, glabrous, furnished with one whorl of leaves beyond the middle, without any scattered leaves above the whorl; radical leaves spatulate, acuminate; throat of corolla crowned; lip inappendiculate. 2. G. Native of New Holland, on the south coast. Flowers red?

**Pleasant Stylidium.** Pl.

22 **S. articulatum** (R. Br. l. c.) scape furnished with 2 joints, and 2 whorls of leaves; radical leaves spatulate, coriaceous; lip of corolla inappendiculate. 2. G. Native of New Holland, on the south coast.

**Jointed-scaped Stylidium.** Pl. 1/2 foot.

23 **S. diversifolium** (R. Br. l. c.) scape straight, inarticulate, furnished with 3-4 whorls of filiform leaves; radical
leaves lanceolate; throat of corolla crowned; lip appendiculate. 2. 2. Native of New Holland, on the south coast.

**Diverse-leaved Stylidium.** Pl. 1 ft.

24 S. *sandadiens* (Br. l. c.) stem scendent; leaves linear, spiral, and cincinnous at the apex; throat of corolla crowned; lip appendiculate; column downy above. 2. 2. Native of New Holland, on the south coast. Flowers lilac or rose-coloured. Leaves whorled.

**Climbing Stylidium.** Pl. July, Nov. Cl. 1803. Pl. cl.

§ 5. Stem shrubby. Leaves numerous, scattered.

**Shrubby Stylidium.** P1. May, Oct. Cl. 1803. Shrub 1 to 1½ foot.

§ 6. Tube of corolla very short. Lip of corolla stretched out.

26 S. *calcarea* (Br. l. c.) plant small; stem few-flowered; leaves ovate; corolla with a naked throat, and rather toothed segments; lip appendiculate. 2. 2. Native of New Holland, on the south coast.

**Spurred Stylidium.** Pl. small.

**Section 11. Andersonia.** J. G. König, ms. ex R. Br. prod. p. 570. Capsules linear, or linear-lanceolate.

§ 1. Scapigeroes. Flowers spicate or corymbose, rarely almost solitary.

28 S. *capilla* (Br. l. c.) scape capillary, 1-2 inches high, 1-2-flowered; leaves radical oval; calyx glabrous, very acute; limb tripartite, with the middle segment bifid; throat of corolla crowned; lip appendiculate. 2. 2. Native of New Holland, within the tropic.

**Capillary-scaped Stylidium.** Pl. 2 inches.

29 S. *tenellum* (Br. Br. prod. p. 571.) scape capillary; spike few-flowered; leaves radical roundish; lips of calyx parted, glandular; the 2 larger segments of the limb of the corolla semi-bifid; throat naked; lip appendiculate. 2. 2. Native of New Holland, within the tropic.

**Slender Stylidium.** Pl. ½ foot.

30 S. *rotundifolium* (Br. l. c.) scape capillary, 1-4-flowered; leaves radical roundish; lips of calyx undivided; 4 of the segments of the limb of the corolla nearly equal; throat naked. 2. 2. Native of New Holland, within the tropic.

**Round-leaved Stylidium.** Pl. ½ to 3½ foot.

31 S. *crassifolium* (Br. l. c.) scape terete, 1-2 feet high; spike racemose, elongated; leaves radical lanceolate, elongated. 2. 2. Native of New Holland, on the south coast.

**Thick-leaved Stylidium.** Pl. 1 to 2 feet.

32 S. *corymbosum* (Br. l. c.) scape terete, 2-3 inches high, coriaceous; leaves radical linear, ending each in a setaceous mucrone; lips of calyx parted. 2. 2. Native of New Holland, on the south coast.

**Corymbose-flowered Stylidium.** Pl. ½ foot.

§ 2. Cauliflorous plants. Flowers alternate or solitary. Capsules terete-linear, the same breadth at the apex.

33 S. *inundatum* (Br. Br. prod. p. 571.) stem branched, an inch and a half high, leafy below the division; leaves linear; larger segments of the limb of the corolla obvate: smaller ones linear; throat naked; lip appendiculate, adnate to the tube at the base. 2. 2. Native of New Holland, on the south coast, in inundated places.

**Inundated Stylidium.** Pl. ½ inch.

34 S. *despectum* (Br. l. c.) stem parted, an inch and a half high; branches few-flowered; leaves linear; segments of the limb linear-oblong, rather unequal; throat naked; lip appendiculate, adnate to the tube at the base. 2. 2. Native of Van Diemen's Land. Very like S. *inundatum*.

**Despised Stylidium.** Pl. ½ inch high.

35 S. *diffusum* (Br. l. c.) stem branched, diffuse, filiform; leaves linear; calyx ones distant; the 2 larger segments of the limb bifid; throat crownet; lip appendiculate, adnate to the tube at the base. 2. 2. Native of New Holland, within the tropic.

**Diffuse Stylidium.** Pl. diffuse.

36 S. *pygmaeum* (Br. l. c.) stem simple, erect, an inch high, 2-3-flowered; leaves linear; lips of calyx parted; segments of the limb entire; throat naked; lip appendiculate. 2. 2. Native of New Holland, on the south coast.

**Pygmy Stylidium.** Pl. 1 inch.

§ 5. Peduncles 1-flowered from the sides of the leaves or top of the scape or branches, which are crowded. Capsule nearly terete, not tapering at the top.

37 S. *repens* (Br. prod. p. 571.) stem creeping; branches ascending; leaves subulate, adnate; upper ones much crowded; throat of corolla crowned; lip appendiculate. 2. 2. Native of New Holland, on the south coast.

**Creeping Stylidium.** Pl. creeping.

38 S. *guttatum* (Br. l. c.) scape simple; flowers nearly sessile, in fascicules; bracteas foliaceous; throat of corolla crowned; lip appendiculate; leaves radical linear. 2. 2. Native of New Holland, on the south coast.

**Spotted-flowered Stylidium.** Pl. ½ foot.

39 S. *pedunculatum* (Br. l. c.) scape simple; flowers umbellate; pedicels capillary; leaves of involucrum linear; segments of the limb of the corolla unequal; throat naked; lip appendiculate; leaves radical lanceolate. 2. 2. Native of New Holland, within the tropic.

**Pedunculate Stylidium.** Pl.

§ 4. Racemes terminating the leafy stems. Capsule compressed, lanceolate or linear, compressed at the neck.

40 S. *evansii* (Br. Br. prod. p. 572.) stem simple; leaves compressed, filiform; upper ones much crowded; raceme pedunculate, rather panicled, having the rachis villous; capsule lanceolate, equal-valved, downy. 2. 2. Native of New Holland, on the south coast.

**Raceme Stylidium.** Pl. ½ foot.

41 S. *fasciculatum* (Br. l. c.) stem branched a little, glabrous; leaves linear; spikes pedunculate, subracemose, having the rachis glabrous; capsule lanceolate, having both the cells seminiferous. 2. 2. Native of New Holland, on the south coast. Lindl. bot. reg. 1459. Flowers pink. (f. 123.)

**Fascicled-leaved Stylidium.** Pl. Aug. Cl. 1830. Shrub ½ ft.

42 S. *falcatum* (Br. l. c.) stem nearly simple, and is as 4 Z
well as the rachis downy; leaves linear; spike pedunculate, sub-racemose; capsule divaricate, lanceolate, with both the cells seminiferous, the superior one one-half narrower than the other, and closed. \( \text{v.}\) G. Native of New Holland, on the south coast. Flowers pink?

*Falcate Stylidium.* Shrub ½ foot.

43 S. *aldnoideae* (R. Br. l. c.) stem multiple; branches undivided; leaves linear; spike almost sessile, divided, with the divisions few-flowered; capsule linear, adnate at the base, having the neck shorter than the calyx: the superior cell very small and very narrow. \( \text{v.}\) G. Native of New Holland, on the south coast. Lindl. bot. reg. t. 914. Flowers pink.

44 S. *pernum* (R. Br. l. c.) stem multiple; partial ones divided in an umbellate manner; leaves linear; spikes sessile, nearly simple; capsule adnate at the base, linear, having the neck equal in length to the calyx: the superior cell very narrow and empty. \( \text{v.}\) ? \( \text{v.}\) G. Native of New Holland, on the south coast. Flowers pink. Very nearly allied to the preceding.

*Opposed Stylidium.* Pl. ½ foot.

45 S. *alegordae* (R. Br. prod. p. 572.) stem erect; leaves ovate; floral ones opposite; flowers axillary, sessile, solitary, bracteate. \( \text{v.}\) ? S. Native of New Holland, within the tropic.

*Chickweed-like Stylidium.* Pl. ½ to 1 foot?

*Cult.* All the species of this genus are rare, elegant, and singular. The best soil for them is a mixture of sand, loam, and peat. Some of the species may be increased by parting at the root; but most of them by seed. Cuttings of the shrubby kind strike root readily under a hand-glass either in sand or mould.

**II. LEVENHOOKIA** (named in memory of Anthony Van Leeuwenhoek, a celebrated micrographist, whose numerous works and observations on the structure of plants are still extant). R. Br. prod. p. 572.

Lin. Syst. *Gynandria, Diandria.* Calyx 5-parted, bilabiata. *Limb of corolla 5-parted,* irregular: the fifth segment or lip dissimilar to the others, arched, and longer than the column, articulated with the tube, moveable. Column erect, adnate to the side of the tube where the labelium is. Lobes of anthers one above the other, divaricate. *Stigmas* 2, capillary. *Capsule* 1-celled.—A small glabrous plant, with the habit of *Radiola malegrina.* Leaves alternate, petiolate, crowded at the tops of the branches, intermixed with fascicles of flowers. The irritability of the joint of the lip is analogous to that of the column in *Stylidium,* and answers the same end, the protection of the sexual organs at the time of flowering. In *Levenhoookia* the labelium is deflexed when the flower is expanded, but from its irritability when touched it rises up, and is applied with great force to the erect immovable column, which it covers by its spoon-shaped lamina.

*Cult.* See *Stylidium* above for culture and propagation.

**III. FORSTERA** (in honour of John Reinhold Forster, and his son George Forster, who both accompanied Captain Cook in his second voyage in the quality of naturalists). Lin. nov. act. ups. 3 t. 9. Swartz, in Schrad. journ. 1799. 1. t. 1, 2, f. 2.—Phyllachne, Forst. char. p. 58.

1 F. *ediololia* (Lin. nov. act. ups. 3 t. 9.) leaves imbricated, ovate-oblong, coriaceous, marginated, smooth, recurved; pedicels terminal, solitary, elongated, 1-flowered; involucrum short, spreading. \( \text{v.}\) G. Native of New Zealand.

*Edible-leaved Forsteria.* Shrub.

2 F. *muscifolia* (Swartz, in Schrad. journ. 1779. 1. t. 1, 2, f. 2.) leaves imbricated, erect, lanceolate, triquetrous, and mucronated at the apex, having the keel and margins serrulate; flowers terminal, solitary, sessile; involucrem exceeding the calyx. \( \text{v.}\) G. Native of Terra del Fuego. Phyllachne uliginosa, Forst. char. p. 58. and Lin. fil. suppl.

*Moss-leaved Forsteria.* Shrub.

*Cult.* See *Stylidium* above for culture and propagation.

Order CXXXVI. GOODENOVIÆ (this order contains plants agreeing with *Goodenia* in important characters). R. Br. prod. p. 578.—*Genera of Campanulaceae,* Juss.

*Calyx* superior (f. 124. a.) or semi-superior (f. 126. a.), rarely inferior, 5-cleft (f. 124. a. f. 125. a.), sometimes 5-5-parted, sometimes short, entire, and sometimes obsolete, usually equal, rarely unequal, permanent. *Corolla* monopetalous (f. 124. b. f. 125. h.), more or less irregular, deciduous or marcescent; tube cleft on the back (f. 125. h.), sometimes 5-parted, and only adhering with the ovary at the base, while that of the calyx is free; limb 5-parted (f. 124. b. f. 125. h.), bilabiata (f. 124. b.), or unlabiata (f. 126. b.); disks of the segments lanceolate, flat: having the sides thinner in texture and elevated, induplicate in estivation, rarely obsolete or wanting. *Stamens* 5, free; from the corolla and style (f. 125. c.), alternating with the segments of the corolla; filaments distinct (f. 125. c.); anthers distinct or cohering, linear, vertical, fixed by the base, undivided, 2-celled; cells delisising lengthwise; pollen usually simple, but sometimes compound. *Ovarium* 1-2-celled, rarely 4-celled, sometimes furnished with a gland between the 2 anterior filaments: ovula definite or indefinite. *Style* 1, simple, rarely divided; stigma fleshy, obtuse, or 2-lobed, girded by a rather membraneous, entire or 2-lobed, cup-shaped indium. *Capsule* 2-celled or half 2-celled, (rarely 4-celled); dissepiment usually parallel, rarely contrary to the valves, which are entire or bipartite; having the axis seminiferous when the seeds are indefinite; but when the seeds are definite, there is one in each cell. Seeds sometimes nuculentaceous, but usually with a thickish testa. *Albumen* fleshy, conforming to the seeds, rarely deficient. *Embryo* erect, almost the length of the albumen, with middle-sized usually foliaceous cotyledons, and an inconspicuous plumule.—*Non-lactescent herbs or shrubs,* usually clothed with simple and sometimes with glandular down, rarely with stellate down. Leaves scattered, exstipitate, simple, usually undivided, sometimes lobed, and often toothed. *Inflorescence* terminal or axillary, variable. *Flowers* distinct, rarely aggregate, yellow, blue, and purplish, rarely reddish.

Nearly related to *Campanulaceae* and *Lobeliaceae,* from which it differs in the estivation of the flower, and in the peculiar in-
On tube Indusium limb segments limb valves GooDE^NiA. or stigma, in adopting cohering deciduous, bilabiate, sole not celled, the connected imperfect be this to compressed. Having stigmas, in Calogyne. DisTVLis. Eutha'les. Velle'ia. having the tube cleft on the upper side, and the limb bilabiate; segments of the upper lip auricled on the inner side. Anthers cohering. Ovarium 2-celled, many-seeded. Indusium of stigma contrary to the lips of the corolla.

 Tribe II.

SCEVOLVEÆ. Seeds definite. Drupe inferior.

8 SCEVOLA. Corolla cleft on the upper side, exceeding the genitals; limb unilabiate, secund, 5-parted, with equal winged segments. Anthers free. Indusium of stigma ciliated. 9 DIASPÆS. Corolla nearly regular, salver-shaped; tube 5-parted, inclosing the genitals. Anthers free. Ovarium 1-celled, 2-seeded. Indusium of the stigma with a naked border. Nut ciliate.

 Tribe III.

BRUNONIÆ. Utriculus superior, 1-seeded.

 Tribe IV.

CAMPANIEÆ. Corolla campanulate, regular. Capsule 3-4-celled, many-seeded.

12 PENTHA'BONIA. Calyx 5-lobed. Corolla 5-lobed, regular. Stamens 5. Indusium of stigma 3-lobed.

 Tribe I.

GOODENIEÆ (this tribe contains plants agreeing with Goodenia, in the capsules being many-seeded). Capsules 2-celled, containing an indefinite number of seeds.

7 ANTHÔTUM. Calyx superior, 5-parted. Corolla having the tube cleft on the upper side, and the limb bilabiate; segments of the upper lip auricled on the inner side. Anthers cohering. Ovarium 2-celled, many-seeded. Indusium of stigma contrary to the lips of the corolla.

 Tribe I.
GOODENOVIÆ.  I. GOODENIA.

axillary or terminal; pedicels bibracteate or brassate. Corollas usually yellow, although sometimes blue and purplish, bilabiate, rarely unlabiate; segments winged, rarely wingless; wings in duplicate in activation; tube sometimes furnished with a little nectariferous sack, which is opposite to the fissure of the corolla, adnate to the ovary. Anthers cohering before expansion, beardless, rarely bearded at the apex. Capsule variable in form, with the top for the most part superior; valves entire or bipartite.

SECT. I. OCHROSA'THUS (from ὑποχρός, ochro, yellow, and αὔφος, aóthos, a flower; colour of flowers). Corolla bilabiate, yellow; segments winged. Capsule 2-celled, or almost 1-celled from the dissepiment being short. Stigma parallel with the lips of the corolla.

§ 1. Peduncles terminal, spicate or panicled; pedicels bibracteate.

1 G. BELLIDIFOLIA (Smith, in Lin. trans. 2. p. 349.) stem naked; spike nearly simple, downy; corolla clothed with simple hair down outside; radical leaves flat, lanceolate-spatulate, toothed or cut. 2. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 575. Corolla yellow.

2 G. STELLICOEA (R. Br. prod. p. 575.) stem nearly naked; spike almost simple, downy; corolla clothed with simple hairs and stellate down outside; valves of capsule bipartite; radical leaves fleshy, semi-terete or linear, glabrous, a little toothed at the apex. 2. G. Native of New South Wales, about Port Jackson. Corolla yellow.

Stellate-haired Goodenia. Pl. 1 ½ to 2 foot.

3 G. PANICULATA (Smith, in Lin. trans. 2. p. 348. R. Br. prod. p. 575.) stem few-leaved; panicle almost simple, downy; ovary beset with glandular and simple hairs; radical leaves long-lanceolate, a little toothed or cut. 2. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 5. t. 507. Corollas yellow.

4 G. B. F. HUMMELIS (R. Br. prod. p. 575.) stem few-leaved; panicle simple, downy; ovary beset with large hairs; radical leaves long-lanceolate, a little toothed. 2. G. Native of New Holland, on the south coast. Corollas yellow.

Humble Goodenia. Pl. ½ foot.

5 G. GRAECUS (R. Br. l. c.) plant glabrous; stem few-leaved; panicle simple; ovaries glabrous; corolla clothed with glandular down outside; radical leaves linear-lanceolate, elongated, thickish. 2. G. Native of New Holland, within the tropic. Lodd. bot. cab. t. 1082. Corollas yellow.

6 G. DECURDENIS (R. Br. l. c.) plant quite glabrous; stem many-leaved; spike racemose, divided a little at the base; corolla downy outside; cauline leaves oblong, toothed, decurrent. 2. G. Native of New Holland, about Port Jackson. Corollas yellow.

Decurrent-leaved Goodenia. Pl. 1 foot.

§ 2. Peduncles axillary, trifid or simple; pedicels bibracteate.

7 G. ACMINATUM (R. Br. prod. p. 575.) suffruticose, erect, glabrous, painted; pedicelles trifid or trichotomous; leaves ovate, acuminate, dentately serrated, with beardless axils; calyce segments flat, one-half shorter than the capsule, which is prismatic; seeds disposed in 2 rows. 2. G. Native of New South Wales, about Port Jackson. Corollas yellow. Like the following, and probably only a variety of it.

Acreminated-leaved Goodenia. Pl. 1 to 2 feet.

8 G. OVALEA (Smith, in Lin. trans. 2. p. 347. R. Br. l. c.) suffruticose, erect, glabrous, sometimes painted; pedicelles trifid or trichotomous; leaves ovate, acute, dentately serrated, bearded in the axils; calyce segments subulate filiform, a little shorter than the capsule, which is linear; seeds disposed in one series. 2. G. Native of New Holland, about Port Jackson and the south coast, as well as of Van Diemen’s Land. Andr. bot. rep. t. 68. Vent. cels. t. 3. and in mem. de l’institut. sc. phys. 2. p. 321. pl. 10. Cav. icon. 6. p. 4. t. 506. Corollas yellow.

9 G. F. V. H. VARIA (R. Br. prod. p. 576.) suffruticose, glabrous; pedicelles trifid or simple; leaves obovate and obtuse, or ovate and acutish, toothed, coriaceous, with naked axils; calyce segments shorter than the stamens; corollas and styles glabrous; capsule ovate. 2. G. Native of New Holland, on the south coast. Corollas yellow.

Var. a; leaves obovate and oval, a little toothed, attenuated at the base; branches flexuous; stems diffuse. 321.

Var. b; leaves roundish, almost sessile, toothed; pedicelles usually 1-flowered; stems depressed. 2. Var. c; leaves oval, acutish, toothed; pedicelles 3-flowered; stem erect.

Variable Goodenia. Shrub ½ to 2 feet.

10 G. GRANDIFLORA (Sims, bot. mag. 309. R. Br. prod. 576.) plant herbaceous, erect, clothed with glandular pubescence; pedicelles trifid, trichotomous, or simple; branches angularly striated; lower leaves lanceate; rameal ones rather ovate, acute; style longitudinally woolly. 2. G. Native of New South Wales, about Port Jackson. Corollas yellow.

11 G. HETEROPHYLLA (Smith, in Lin. trans. 2. p. 349. R. Br. prod. p. 576.) plant herbaceous, erectish, downy, intermixed with glandless hairs; leaves ovate, cut or lobed; bracteas one-half shorter than the upper half of the one-flowered peduncle; style glabrous. 2. G. Native of New South Wales, about Port Jackson. Cav. icon. 6. p. 6. t. 508. Corollas pale red.

Var. p. 321.

Var. c; plant downy; hairs simple, sometimes diffuse. Round-leaved Goodenia. Pl. 1 foot.

13 G. BARBATA (R. Br. prod. p. 576.) plant herbaceous? erect, clothed with glandular down, scabrous; leaves lanceolate-linear, entire; pedicelles 1-flowered; throat of corolla bearded; styles longitudinally hairy; capsule 1-celled, 2-3-seeded. 2. G. Native of New South Wales, about Port Jackson, and of Van Diemen’s Land. Corollas yellow.

Bearded Goodenia. Pl. 1 foot.

14 G. LANA (R. Br. prod. p. 577.) plant herbaceous, downy, glandless, almost stemless; branches prostrate; leaves obovate or oval, obtuse, a little toothed, hairy; young leaves and ovaria woolly; pedicelles scapiform; corolline segments ciliated on the margins. 2. G. Native of Van Diemen’s Land. Corollas yellow.

Woolly Goodenia. Pl. prostrate.

15 G. GENICULATA (R. Br. l. c.) plant herbaceous, downy,
glandless; stem erect, sometimes short; leaves long-lanceolate, a little toothed; peduncles scape-formed, elongated, when bearing the fruit gomphologically compressed. 2. G. Native of New Holland, on the South Coast.

Gomphologically-peduncled Goodenia. Pl. 1 foot.

16 G. hederaea (Smith, in Lin. trans. 2. p. 349. R. Br. l. c.) plant herbaceous, downy, glandless, almost stemless; branches filiform, prostrate; leaves oval, toothed; radical leaves sometimes lobed; peduncles 1-5-flowered; corolline segments naked on the margins. 2. G. Native of New South Wales, about Port Jackson, and of Van Diemen's Land. Corollas yellow.

17 G. glabra (R. Br. prod. p. 577.) plant herbaceous, glabrous, almost stemless; branches prostrate; radical leaves somewhat oval and spatulate, few-toothed; rameal leaves almost sessile; pedicels 1-flowered; corollas glabrous outside. 2. G. Native of New Holland, within the tropic. Corollas yellow.

Glabrous Goodenia. Pl. prostrate.

§ 3. Peduncles bracteless, axillary or terminal, 1-flowered.

18 G. mollis (R. Br. l. c.) peduncles axillary; leaves ovate, subcordate, acute, serrated, villous, soft; tube of corolla sacate. 2. G. Native of New Holland, within the tropic. Corollas yellow.

Soft Goodenia. Pl. ½ to 1 foot?

19 G. elongata (Labill. nov. holl. l. p. 52. t. 75.) pilose; peduncles solitary, axillary and nearly terminal, elongated, reflexed while bearing the fruit; stem erect, filiform; radical leaves oblong-spatulate, toothed; calyce leaves lanceolate, nearly entire, attenuated at the base. 2. G. Native of Van Diemen's Land. R. Br. prod. 577. Corollas yellow.

Elongated-peduncled Goodenia. Pl. 1 foot.

20 G. hispida (R. Br. prod. 577.) plant erect, beset with strigose hairs; calyce leaves sessile, elongated, lanceolate, a little toothed; peduncles solitary, axillary, elongated, erect while bearing the fruit; calyxes hispida. 2. G. Native of New Holland, within the tropic. Corollas yellow.

Hispid Goodenia. Pl. 1 foot?

21 G. coronopifolia (R. Br. l. c.) glabrous; leaves linear; radical ones pinnatifidly toothed; calyce leaves quite entire, and the semina1 ones permanent; peduncles almost solitary, alternate, erect while bearing the fruit. 2. G. Native of New Holland, within the tropic. Corollas yellow.

Buck-horn-leaved Goodenia. Pl.

22 G. tenella (R. Br. l. c.) plant rather downy, intermixed with a few adpressed hairs; stem simple or wanting; radical leaves flat, lanceolate or spatulate; peduncles radical or terminal, elongated, erect while bearing the fruit. 2. G. Native of New Holland, on the South Coast. Sims, bot. mag. 1137. Erithobodes tenella, Ait. hort. kew. Corollas yellow.

Slender Goodenia. Pl. ½ to 1 foot.

23 G. filiformis (R. Br. prod. p. 575.) plant smoothish; stem simple; radical leaves filiform; calyce leaves small; peduncles terminal, subumbel late. 2. G. Native of New Holland, on the South Coast. Corollas yellow.

Filiform-leaved Goodenia. Pl. ½ foot.

FIG. 194.

SECT. II. Tetraphyllax (from τετρας, tetras, four-fold; and 

60ολας, thlyax, a cell: capsule 4-celled). Corolla bilabiate, yellow, having the segments winged. Capsule 4-celled.

24 G. quadriflora (R. Br. prod. p. 578.) plant glabrous, erect; leaves nearly oval, toothed; flowers spicate or axillary. 2. G. Native of New Holland, on the South Coast.

Four-celled-fruited Goodenia. Pl.

SECT. III. Porphyraanthus (from πορφυρος, porphyros, purple; and ανθος, a flower; colour of flowers). Corolla bilabiate, purple or blue, having the segments winged. Capsule 2-celled, or half 2-celled. Stigma parallel with the lips of the corolla.

25 G. purpureascens (R. Br. l. c.) plant glabrous; panicle effuse; stem naked; leaves radical, elongated-lanceolate. 2. G. Native of New Holland, within the tropic. Corolla purple.

Purple-flowered Goodenia. Pl. ½ foot.

26 G. tetragonophylla (R. Br. l. c.) plant glabrous; stem almost simple, few-flowered; flowers alternate; radical leaves linear, a little toothed; calyce ones smaller, remote; calyx bluntish, and is, as well as the ovarium, glabrous. 2. G. Native of New Holland, on the South Coast. Corollas blue or purple.

Wing-seeded Goodenia. Pl. ½ foot.

27 G. cerulea (R. Br. l. c.) plant glabrous; partial stems or branches nearly simple, few-flowered; radical leaves linear; calyce ones remote; calyxes acute, and are, as well as the ovarium, glabrous. 2. G. Native of New Holland, on the South Coast. Corollas blue.

Blue-flowered Goodenia. Pl. ½ foot.

28 G. iscaena (R. Br. l. c.) plant clothed with hoary tomentum; partial stems or branches almost simple, few-flowered; calyce leaves remote, oblong-linear; corollas woolly on the outside, as well as the ovaria. 2. G. Native of New Holland, within the tropic. Corollas blue or purple.

Hoary Goodenia. Pl. ½ foot.

SECT. IV. Monochila (from μονος, monos, alone; and χείλος, cheilos, a lip, in reference to the unilabiate corolla). Corollas unilabiate, having the segments winged. Stigma 2-lobed, having the indusium dilated, and contrary to the lip of the corolla.

29 G. scaphigera (R. Br. l. c.) plant glabrous, erect; leaves toothed; spike terminal, pedunculate; segments of the calyx subulate, longer than the ovarium, which is tubuliferous on one side. 2. G. Native of New Holland on the South Coast.

Var. a.; common peduncle elongated, scape-formed; leaves linear-lanceolate, elongated.

Var. b.; common peduncle not elongated; leaves oval-lanceolate.

Scape-bearing Goodenia. Pl. ½ foot.

30 G. viscosa (R. Br. l. c.) plant glabrous, painted, erect; leaves lanceolate, toothed; peduncles axillary, 1-flowered, very short; stigma bifid. 2. G. Native of New Holland, on the South Coast.

Viscid Goodenia. Pl.

SECT. V. Selliera (named after Natali Sellier, a Spanish artist). Selliera, Cav. icon. 5. p. 49. t. 47. f. 2. Corolla subumbilicate, purplish, having the segments wingless, and valvate in aestivation.

31 G. repens (Labill. nov. holl. l. p. 53. t. 76.) plant gla bros, creeping; leaves lanceolate, fleshy. 2. G. Native of New Holland, on the South Coast, and about Port Jackson; and of Van Diemen's Land; and of Chili, about Talenguana, in humid sandy places by the sea shore. Selliera radicans, Cav. icon. 5.
GOODENOVEL. I. Goodenia. II. Distylis.

III. Calogynæ. IV. Euthales. V. Vellelia.

Creeping Goodenia. Pl. creeping.

52. Peduncles bracteate. Induuseum of the stigma ciliated. Capsule membranous.

32. Pumilio (R. Br. prod. p. 579.) Plant creeping, downy; leaves ovate, membranous: upper ones crowded; peduncles 1-flowered, from the axils of the upper leaves. G. G. Native of New Holland, within the tropic. Corolla purplish. Perhaps the corolla is unlabiate, or probably nearly regular.

Dwarf Goodenia. Pl. creeping.

Cult. All the species of this genus are worth cultivating for ornament. They grow freely in a mixture of sand, loam, and peat; and young cuttings of most of the species strike root freely in the same kind of soil, under a glass- and all may be raised from seed, which ripen plentifully.

II. DISTYLLIS. (from εἰς, dis, twice, and στύλος, stylus, a style; in reference to the style being bipartite.) Gaud. In Freyc. voy. pl. bot. p. 45. t. 80.

Lin. syst. Pentandria, Monogynia. Calyx adnate to the ovarium; limb free, 5-parted. Corolla deciduous, with the tube cleft behind, 5-parted; spreading, somewhat bilabiata; segments with winged margins. Stamens 5, distinct. Style bipartite. Induuseum of stigma membranous, cup-shaped, and ciliated. Capsule crowned by the permanent calyx, semi-bilocular in consequence of the dissepiment being short; valves parallel. Seeds imbricate, compressed, orbicular, girded by a membranous border.—An annual hairy plant, with almost simple stems. Leaves alternate, toothed. Flowers axillary, solitary, on long peduncles, racemose, bracteate, yellow.

1. D. Berardiana (Gaud. l. c.). G. Native of New Holland, on the Western Coast, in Sharks’ Bay. Goodenia Berardiana, Gaud.

Berard's Distylis. Pl. 1/2 foot.

Cult. Rear the seeds in a frame in the spring, and about the end of May put the plants out into the open border in a warm situation.

III. CALOGYNE. (from καλός, beautiful, and γυνα, a female; in reference to the stigma). R. Br. prod. p. 579.

Lin. syst. Pentandria, Monogynia. Calyx superior; limb 5-parted, with equal segments. Corolla bilabiata. Anthers distinct. Style trifid. Glabd epigynous between the 2 lower filaments. Capsule subbilocular from the dissepiment being short. Seeds imbricate, compressed.—A pilose annual herb, with the habit of Goodenia, and when dry having an odour like that of vernal grass. Leaves toothed or cut; floral ones auriculated at the base. Peduncles axillary, 1-flowered, bracteate, reflexed while bearing the fruit.—This genus is separated from Goodenia alone from the trifid style; each division being furnished with an indusiate stigma.

1. G. pilosa (R. Br. l. c). G. Native of New Holland, within the tropic.

Pilosa Calogynæ. Pl. 1/2 foot.

Cult. Sow the seeds of this plant in spring, in a pot filled with a mixture of sand, loam, and peat, and place it in a hot-bed; and when the plants are of sufficient size, plant them separately into other pots.

IV. EUTHALES. (from εὖ, eu, well, and θάλλω, thallo, to sprout). R. Br. prod. p. 579.

Lin. syst. Pentandria, Monogynia. Calyx inferior, tubular, 5-cleft, unequal. Corolla adhering to the tube beneath the ovarium, cleft on one side at the apex; limb bilabiata. Anthers distinct. Style indiundate. Indusium of stigma bilabiata. Capsule 4-valved, 2-celled at the base. Seeds imbricate, compressed.—A stemless herb, with the habit and inflorescence of Velleia. The corolla in this genus and Velleia is semi-superior, and joined with the calyx at the base. The genus is intermediate between Goodenia and Velleia, but differs from them in the calyx being tubular.

Cult. A mixture of loam, peat, and sand is the best soil for this plant; and it must be but sparingly watered, as it is very delicate, and apt to damp off. It is increased, but sparingly, by dividing, and by seed.

Lin. syst. Pentandria, Monogynia. Calyx inferior, 3-cleft, unequal. Corolla having the tube joined with the ovarium at the base, and cleft on the upper side at the apex; limb bilabiata. Anthers distinct. Style indiundate. Glabd epigynous between the 2 anterior filaments. Capsule 2-celled at the base; valves bipartite. Seeds imbricate, compressed.—Stemless herbas. Leaves radical, subpatulate, usually toothed, but sometimes lyrate. Scaops dichotomous, with the most of the axils floriferous. Bracteas opposite, foliaceous, sometimes large, and sometimes connate. Upper segment of the calyx broad, and often toothed at the base. Corolla yellow, adhering at the base, beneath the glososity or spur. Style somewhat tetragonal. Indusium of stigma large.

Sect. 1. Menoceras (from μεσος, mesos, to abide; and κερας, kera, a horn; in reference to the permanent spur). R. Br. prot. p. 580. Calyx 3-cleft. Corolla spurred at the base; spur permanent.

1. V. paradoxa (R. Br. prod. p. 580.) Plant downy; leaves bluntly toothed. G. G. Native of New South Wales, about Port Jackson; on the south coast of New Holland; and of Van Diemen's Land. Lind. bot. reg. 971. Corolla yellow.

2. V. aequata (R. Br. l. c.) Plant glabrous; leaves sharply toothed. G. G. Native of New Holland, on the south coast. Corolla yellow.

Sect. 2. Vellel'ea-ve're (this section is supposed to contain the true species of the genus). R. Br. prod. p. 580. Calyx 3-leaved. Corolla rather gibbous on one side at the base.

3. V. tenuata (R. Br. l. c.) Glabrous; bracteas of the forks distinct; leaves lyrate or deeply toothed at the base; segments of the calyx ovate-orbicular. G. G. Native of New South Wales, about Port Jackson. Ker. bot. reg. 551. Corolla yellow.

4. V. spatulata (R. Br. l. c.) Glabrous; bracteas of the forks distinct; leaves spatulate, almost toothless, but quite at the entire, with the axils bearded. G. G. Native of New South Wales, about Port Jackson; and of New Holland, within the tropic. Juss. ann. mus. 18. t. 1. Corolla yellow.

Filiform-leaved Lechenaultia. Pl.

Cult. The species of Lechenaultia are elegant plants while in blossom. They thrive best in a mixture of turfy loam, peat, and sand; and young cuttings strike root freely in the same kind of mould under a hand or bell-glass.

VII. ANTHOTIUM (from arbuci, anthos, a flower, and ove ovis, our oos, an ear; in reference to the segments of the superior lip of the corolla being auriculated on the inner margin). R. Br. prod. p. 582.

1 A. BUMILE (R. Br. l. c.)  

G. Native of New Holland, on the south coast. There are two varieties of this plant, one twice the size of the other in all its parts. 

Humble Anthotium. Pl. ½ foot. 

Cult. See Velleia, above, for culture and propagation.

Tribe II.

SCEVOLÆ.A (this tribe contains plants agreeing with Scovel in important characters). R. Br. prod. p. 582. Seeds definite. Drope or nut inferior.

LIN. SYST. Pentandria, Monogynia. Corolla cleft longitudinally on the upper side; limb 5-parted, all to one side; segments winged, about equal in size and shape. Anthers free. Indusium of stigma cleft.—Shrubs and herbs very variable in habit. Down on hairs simple. Leaves alternate, rarely opposite, hardly divided, often toothed. Inflorescence axillary or disposed in a leafy spike. Ovaria bibracteate, usually 2-celled (rarely 4-celled); cells 1-seeded; sometimes 1-celled and 1-2-seeded. Calyx 5-cleft, equal, sometimes obsolete. Corolla white or blue, rarely yellow, deciduous, for the most part downy outside; wings of the segments often fringed at the base, rarely longitudinally; the fringe for the most part floccosely branched at the top, and appears capitate to the naked eye; tube villous inside, and the throat beset with ramenta, which are disposed in continuous lines, with the fringes of the segments. Stamens iliacoid after the dehiscence of the corolla, and falling off with it. Anthers for the most part bearded, but sometimes bearded at the apex.—This genus is divided into natural groups below. Those species with 1-celled ovaria will probably constitute a separate genus from those with 2-celled ovaria.—S. spinucus has a very different habit from the other species, and is probably a distinct genus, from the bracteas being deciduous, and the wings of the segments of the corolla being fringed lengthwise, but the mature fruit is not known.

SECT. I. SARCOCARPA (from σαρκως, sarx, sarx, flesh; and καρπος, karpos, a fruit; in reference to the baccate fruit of the species). Drape baccate, 2-celled. Peduncles axillary, dichotomous, bearing flowers in the forks, rarely 1-flowered. Leaves alternate, bearded in the axils. Shrubs, natives of the sea shore.

1 S. KEOU (Vahl, symb. 2. p. 96): gymes glabrous; flowers...
pedicellate in the forks of the peduncles; calyx 5-parted, equal in length to the ovarium; leaves obovate, subepend at the apex, quite glabrous on both surfaces, as well as the branches. 6. S. Native of New Holland, within the tropic; of the East Indies, Cochin China, and the Sandwich Islands, on the sea shore; and of Romanzoff's Island, in the South Sea. S. Lobelia, Lin. herb. Cerbera salutaris, Lour. coeh. 136. Flowers pale red or white.

Plumier's Scævola. Clt. 1724. Shrub 2 to 3 feet.

4 S. GAUDICHAUDI (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, densely clothed with down; leaves oblong-lanceolate, glabrous above, and clothed with silky tomentum beneath, petiole, glandularly denticulated, with bearded axes; peduncles shorter than the petioles, axillary, diacrate, with five flowers in the branches; calyces subulate, recurved; corolla clothed with silky tomentum; calyceal teeth 5, very short, obtuse. 9. G. Native of the Sandwich Islands. Very closely allied to S. sericen, Forst. The whole plant is very brittle.

Soft Scævola. Shrub 2 to 3 feet.

5 S. CILLATÀ shrubby, erect, glabrous; leaves rather membranous, broad-lanceolate, acuminate at both ends, acute, with a few almost obsolete teeth on the margins, narrowed into the short petioles, toothed at the base, with bearded axes; peduncles axillary, equal in length to the leaves or exceeding them, 5-8-flowered, cymosely dichotomous; bracteas linear; flowers sessile; calyceal teeth short, ciliated; corolla glabrous on the outside, and inside of the tube rather villous; segments winged; style villous; drupe olive-formed, containing one 2-seeded pyrene. 7. G. Native of the island of O Wahu. Scævola Chamissoniana, Cham. in Linneæa, 7. p. 226, but hardly of Gaudichaud's Scævola. Shrub 2 to 3 feet.

6 S. TACCA (Roxb. fl. ind. 2. p. 146.) shrubby, with smooth branches; leaves sessile, obovate, rounded at the apex, tapering much to the base, entire, shining, with bearded axes; peduncles axillary, solitary, 2 or 3 times forked. 7. S. Native of the East Indies, on the sea shore. Lobelia Taccâ, Gerra. fruct. 1. p. 119. t. 25. Buglossum littorale, Runph. amb. 4. t. 54. Flowers white, slightly fragrant, villous inside, and shaggy round the mouth. Drupe size of a gooseberry, white when ripe, 2-celled; cells 1-seeded.

7 S. SERVÈCEA (Forst. prod. no. 504.) cymes and corollas tomentose outside; flowers pedicellate in the forks of the peduncles; calyx 5-parted, about equal in length to the ovary; leaves obovate, entire or repand, clothed with soft tomentum on both surfaces, and on the branches. 7. S. Native of New Holland, within the tropic; and of the Society Islands, on the sea shore. Vahl, symb. 2. p. 37. R. Br. prod. p. 583. S. Koenigii, Lamark, aus. p. 108. Very like the two preceding species, but differs in being tomentose. There are varieties of this with more or less tomentose entire and repandly toothed leaves, and with the style either glabrous or longitudinally villous.

Silky Scævola. Shrub 2 to 3 feet.

8 S. CHAMISSONII (Gaud. in Freyc. voy. pt. bot. p. 461. t. 81.) shrubby, erect, glabrous; leaves oblong, acuminated at both ends, sharply denticulated with bearded axes; peduncles axillary, dichotomous, with the margins equal in length to the leaves, with sessile flowers in the forks; calyx short, 5-toothed; corollas downy; drupe 2-celled. 9. G. Native of the Sandwich Islands.

Chamisson's Scævola. Shrub 2 to 3 feet.

9 S. TOMENTOSA (Gaud. in Freyc. voy. pt. bot. p. 460. t. 81.) shrubby, erect, clothed with brownish stellate tomentum; leaves soft, somewhat rhomboid-ovate, obtuse, minutely toothed; flowers axillary, solitary, pedunculate; calyx short, 5-toothed; corollas downy; bracteoles unilateral, half connate, quite entire; fruit 2-seeded. 9. G. Native of New Holland, on the western coast, in Shark's Bay.

Tomentosa Scævola. Shrub 2 to 4 feet.

10 S. MENZIESII (Cham. in Linneæa, 7. p. 227.) shrubby, erect, glabrous; leaves obovate, axillary, obtuse or acute, quite entire, or a little serrated, narrowed into the petioles, bearded at the axis, rather fleshy, downy beneath or glabrous; peduncles shorter than the leaves, bearing 5 flowers at the apex, and often only one; bracteas linear; flowers sessile; calyceal teeth short, ciliated; corolla pilose outside or glabrous, villous inside, having the segments hardly winged; style villous; drupe olive-formed, 1-2-seeded. 9. G. Native of O Wahu. Staminæ glabrous. Fruit 2-celled, fleshy.

Var. β, glabra (Cham. i. c.) leaves narrower, and more cuatred at the base, obtuse, mucronulate, nearly entire, glabrous on both surfaces. Corollas glabrous on the outside.

Menzis's Scævola. Shrub 2 to 3 feet.

11 S. GLabra (Hook. et Arn. in Beech. voy. pt. bot. p. 89.) shrubby, erect, glabrous; leaves cuneate-obovate, obliquely acuminated, on long petioles, with obscure remote glandular denticulations, and bearded axes; pedicels axillary, 1-flowered, naked, one-half shorter than the leaves; corolla glabrous, equal in length to the teeth of the calyx. 9. G. Native of the Sandwich Islands. Very like S. Chamissoniana, Gaud.

Glabra Scævola. Shrub 2 to 3 feet.

12 S. MONTANA (Labi. sect. cal. p. 41. t. 42.) cymes and corollas tomentose; flowers sessile in the forks of the corymb; leaves obovate-oblong, glabrous, rather coriaceous. 9. G. Native of New Caledonia. Leaves entire, undulated or crenulated, with silky hairy axes.

Mountain Scævola. Shrub 4 to 6 feet.

13 S. OPPORTIFLORA (Roxb. fl. ind. 2. p. 148.) leaves opposite, on short petioles, elliptic, entire, smooth; peduncles axillary, few-flowered. 9. S. Native of the Moluccas. A slender shrubby species, very different in habit from S. Koenigii.

Opposite-leaved Scævola. Shrub.

Sect. 11. Xerocarpa (from ἕρως, εξερ, dry; and καρπός, a fruit; in reference to the dry fruit of the species). Drupe usually dry, 1-4-celled. Bracteae foliaceous, lateral, permanent. Spikes terminal, but sometimes axillary.

§ 1. Leaves all or for the most part toothed or cut.

14 S. ATTENUATA (R. Br. prod. p. 583.) shrubby, erect, pilose; leaves lanceolate, toothed; bracteae stretched, quite entire; corolla hairy outside, with the margins naked above; styles very villous. 9. G. Native of New Holland, on the south coast. Attenuated-leaved Scævola. Shrub 2 to 3 feet.

15 S. nitida (R. Br. prod. p. 584.) shrubby, erect, quite

828

GOODENOVIE.
G. Native of New Holland, on the south coast.

Shrub. 1 to 2 feet.

17. S. globulifera (Labill. nov. holl. 1. p. 55. t. 78.) suffruticose, erect; leaves elliptic, sharply toothed; bracteae ovary and calyx bracteas entire; ovarium 4-celled. G. Native of New Holland.

18. S. ovatifolia (R. Br. prod. p. 584.) suffruticose, ascending; leaves ovate or elliptic, toothed; bracteae rhomboid-elliptic, very acute, nearly entire; calyx obsolete; style bearded at the top on one side. G. Native of New Holland, within the tropic.

Far. α, cineracea (R. Br. l. c.) clothed with fine cinereous tomentum; corolla downy outside.

Far. β, glabra (R. Br. l. c.) glabrous; corolla beardless on the outside.

Oval-leaved Scævola. Shrub 1 to 2 feet.

19. S. ænulea (R. Br. l. c.) plant herbaceous, erect; leaves cuneated or obovate, toothed, smoothish; spike simple; bracteas lanceolate, nearly entire; calyx lobed; style glabrous below, furnished on one side at the apex with a straight coloured beard, which is equal in length to the indium of the stigma; ovarium 2-celled. G. Native of New Holland, on the south coast. It agrees with the figure given of the next species, except in the lower bracteas of the spikes being many-flowered, while in the present plant they are always 1-flowered.

Emulating Scævola. Pl. 1 foot.

20. S. cuneifórema (Labill. nov. holl. 1. p. 56. t. 80.) plant herbaceous, erect? rather pilose; leaves cuneated, toothed; spike divided at bottom into 2-3-flowered spikellets; bracteas lanceolate, entire; calyx lobed; style glabrous below, but furnished with a straight beard on one side at the apex, which is equal in length to the indium of the stigma. G. Native of Van Diemen’s Land. Flowers blue?

21. S. sinuata (R. Br. prod. p. 584.) plant herbaceous, diffuse, downy, with the hairs adpressed; leaves obovate or cuneated, toothed or sinuately; spike compound; spikellets few-flowered; bracteas elliptic, entire; calyx lobed; style glabrous below, but furnished at the apex on one side with a straight, coloured beard, which exceeds the indium of the stigma. G. Native of New Holland, on the south coast. An intermediate plant between S. ænulea and S. cuneifórema.

Sinuated-leaved Scævola. Pl. diffusæ.

22. S. humilis (R. Br. prod. p. 585.) plant herbaceous, ascending or diffuse, downy; leaves sharply toothed; lower ones obovate-cuneated; rameal ones lanceolate; spike simple; bracteas linear-lanceolate, a little toothed; calyx lobed; style furnished with a straight coloured beard on one side at top, which is equal in length to the indium of the stigma; ovarium 2-celled. G. Native of New Holland, on the south coast.

Humble Scævola. Pl. ascending.

23. S. microcarpa (Cay. icon. 6. p. 6. t. 509.) plant herbaceous, downy; leaves cuneate, ovate, or orbicular, toothed, attenuated at the base; spike simple; bracteas toothed; calyx lobed; tube of corolla bearded inside; hairs in the throat of the corolla, acute, and capitate; style longitudinally villous; ovarium 1-celled, 2-seeded. G. Native of New South Wales, about Port Jackson; and of Van Diemen’s Land. R. Br. prod. p. 585. 2. G. Native of New Holland, on the south coast. Flowers white.

24. S. pallida (R. Br. prod. l. c.) plant herbaceous, diffuse, downy; leaves toothed, attenuated at the base, cuneate or lanceolate; spike simple; bracteas usually toothed; calyx lobed; tube of corolla almost naked inside; style glabrous; ovarium 1-celled, 2-seeded. G. Native of New Holland, on the south coast. Like the preceding, but smaller in all its parts.

Pale-flowered Scævola. Pl. diffuse.

§ 2. Leaves all or for the most part quite entire.

25. S. suaveolens (R. Br. prod. p. 585.) plant herbaceous, diffuse, downy; leaves spatulate, fleshy, with bearded axils; bracteas linear-lanceolate; ovarium 2-celled; drupe baccate. G. Native of New Holland, on the south coast, and within the tropic; and of New South Wales, about Port Jackson. Flowers purple, with a white throat. This is a very polymorphic species, sometimes diffuse, and sometimes erect, varying much in the consistence and form of the leaves.

26. S. cepitosa (R. Br. l. c.) plant suffruticose, erect, diffuse, downy; leaves cuneated, toothed, smoothish; ovary 2-celled. G. Native of New Smith’s Shrub.

Scaevola. Cutt. bot. mag. 287. Willd. spec. 1. p. 954. Flowers purple, with a white throat. This is a very polymorphic species, sometimes diffuse, and sometimes erect, varying much in the consistence and form of the leaves.

27. S. revoluta (R. Br. prod. p. 586.) suffruticose, erect, downy, greyish; leaves oblong-lanceolate, sessile, with revolute edges; spike compact; bracteas lanceolate, rather concave; calyx obsolete and crenate; ovarium 2-celled. G. Native of New Holland, within the tropic.

Revolute-leaved Scævola. Shrub 1 foot.

28. S. linearis (R. Br. l. c.) suffruticose, erect, much branched, pilose, and scabrous; leaves and bracteas linear, recurved on the margins; spike terminal; ovarum 1-seeded. G. Native of New Holland, on the south coast.

Linear-leaved Scævola. Shrub 1 foot.

29. S. paludosa (R. Br. l. c.) plant subherbaceous, erect, a little branched, pilose, scabrous; leaves linear-lanceolate, flatish, about equal in length to the axillary spikers; ovarium 1-seeded. G. Native of New Holland, on the south coast.

Marsh Scævola. Pl. 1 foot.

30. S. angulata (R. Br. l. c.) suffruticose, erect; branches angular; leaves scabeous; ovarium 1-celled. G. Native of New Holland, within the tropic.

March Scævola. Pl. 1 foot.

31. S. angulata (R. Br. l. c.) suffruticose, erect; branches angular; leaves scabeous; ovarium 1-celled. G. Native of New Holland, within the tropic.

Marsh Scævola. Pl. 1 foot.

32. S. angulata (R. Br. l. c.) suffruticose, erect; branches angular; leaves scabeous; ovarium 1-celled. G. Native of New Holland, within the tropic.

Sect. III. Pogonanthæ (from ρογός, pogan, a beard; and ανθος, anthos, an anther: the anthers are bearded). Calyx length of ovarium. Anthers bearded at the apex. Drupe nearly dry. Herbaceous plants. Peduncles axillary, 1-flowered, elongated, each furnished with 2 foliaceous permanent bracteas.
GOODENOVIÉ. VIII. SECOVLA.

32 S. striata (R. Br. prod. p. 586.) wings of the segments of the corolla furnished with parallel veins. 7. G. Native of New Holland, on the south coast.

Striated Seccvola. Pl. 1 foot?

Sect. IV. Crossotoma (from κροσσός, krosis, a fringe; and τομα, toma, a section; in reference to the fringed segments of the corolla.) Calyx obsolete. Wings of the segments of the corolla fringed longitudinally. Peduncles axillary, 1-flowered, furnished with deciduous bracteas at the apex.

33 S. spinifrons (R. Br. prod. p. 586.) shrubby, spinescent; leaves oval or obvate, quite entire. 7. G. Native of New Holland, on the south coast.

Spiniflent Seccvola. Shrub.

Cult. All the species grow freely in a mixture of turf, loamy, turfey, and sand; and cuttings planted in the same kind of soil, with a hand-glass placed over them, strike root readily; those of the stover species in heat.

Thread-leaved Diaspasia. Pl. 1 foot?

Cult. See Secovla above for culture and propagation.

X. DAMPIERA (named in memory of Capt. William Dampier, R.N., the celebrated circumnavigator; he paid great attention to natural history in all his voyages). R. Br. prod. 587.

Juss. ann. mus. vol. 18.

Lin. Syst. Pentándria, Monogynia. Corolla bilabiata (f. 126. a.), having the tube eleft on the upper side (f. 126. c.); segments of the upper lip auricled on the inner margin. Anthers closely coherent (f. 126. d.). Ovarium 1-seeded. Indusium of stigma with a naked border (f. 126. c.). Nut crustaceous. Arid downy subshrubs or herbs; hairs usually of two forms; the longer ones in most of the species are branched, and rather pubescent; and the shorter ones puberulent. Leaves alternate, undivided, or a little toothed, coriaceous. Flowers axillary or terminal, sub-spicate or solitary; bracteas small or wanting. Calyx short, usually obsolete. Corolla blue or purple, 5-parted; with the margins of the claws truly inflexed, and the laminas hairy on the outside: deciduous, but sometimes with the base permanent and entire. Stems remaining after the corolla has fallen; anthers beardless.

1 D. elegalata (R. Br. prod. p. 587.) suffruticose, erect, tomentose; leaves petiolate, roundish, toothed, undulated, scarious above, longer than the peduncles, which are axillary and 2-4-flowered; corolla bearded with black plumose villi outside. 7. G. Native of New South Wales, about Port Jackson. Flowers blue.

Undulate-leaved Dampiera. Shrub 1 foot.

2 D. roscendaria (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, roundish, entire, flat, scarious above, very blunt at the base; peduncles axillary, usually 1-flowered, very short; terminal ones subcoriaceous; corolla bearded with black plumose villi outside. 7. S. Native of New South Wales, about Port Jackson. Flowers blue.

Round-leaved Dampiera. Shrub 1 foot.

3 D. ovalifolia (R. Br. prod. p. 588.) suffruticose, erect, with closely set tomentum; leaves petiolate, ovate, nearly entire, flat, scarious above; peduncles 2-4-flowered, axillary, about equal in length to the leaves: terminal ones coriaceous; corolla bearded with black plumose villi outside. 7. G. Native of New Holland, about Port Jackson. Juss. ann. mus. 18. t. 2. no. 1. Flowers blue. (f. 126.)

4 D. purpurea (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutely toothed, scarious above; peduncles axillary, 1-3-flowered; corolla bearded with black plumose villi outside. 7. G. Native of New Holland, about Port Jackson. Flowers purple. In this and the preceding species the outside of the corollas, as well as the peduncles, are densely bearded with spreading plumose villi.

Purple-leaved Dampiera. Shrub 1 foot.

5 D. ferruginea (R. Br. l. c.) suffruticose, erect, tomentose; leaves petiolate, ovate, acutish, repandly toothed, 3-nerved at base, smooth above in the adult state; flowers almost terminal; corollas clothed with branched wool outside. 7. S. Native of New Holland, within the tropic. Flowers blue.

Rusty Dampiera. Shrub 1 foot.

6 D. hederacea (R. Br. l. c.) plant herbaceous, procumbent, tomentose; leaves for the most part petiolate, somewhat coriaceous, cut: superior ones quite entire, glabrous above in the adult state; corollas bearded on the outside by spreading plumose cincereous villi. 7. G. Native of New Holland, on the south coast. Flowers blue.

Ivy-like Dampiera. Pl. proclive.

7 D. incana (R. Br. l. c.) suffruticose? erect? clothed with hoary tomentum; leaves sessile, obovate, quite entire. 7. G. Native of New Holland, on the western coast about Cape Lewin and Wit’s Land, where it was collected by Dampier and Baudin.

Heart Dampiera. Shrub.

8 D. cuneata (R. Br. l. c.) plant herbaceous, erectish, downy; leaves sessile, toothed, obovate-spatulate, upper ones elliptic-lanceolate, adult ones smoothish; spikes pedunculate; bracteas opposite; flowers alternate; corollas woolly on the outside from simple spreading villi. 7. G. Native of New Holland, on the south coast. Flowers blue.

Cuneate-leaved Dampiera. Pl. ½ to 1 foot.

9 D. linealis (R. Br. l. c.) plant herbaceous, erect, downy; leaves sessile, for the most part linear and few-toothed, lower ones cuneate, adult ones smoothish; spikes pedunculate;
bracteas opposite; flowers alternate; corollas woolly outside from simple spreading villi. **2 G.** Native of New Holland, on the south coast. Flowers blue. In this and *D. cuneata* the calyx is obsolete, the base of the corolla entire and permanent, clothed with simple villi on the outside; and the inflorescence is peculiar in these two plants.

**Linear-leaved Dampiera.** Pl. 1/2 to 1 foot?

10. *D. fasciculata* (R. Br. c.) plant herbaceous, erect; stem compressedly tetragonal; leaves sessile, cuneated, a little toothed, upper ones crowded in a verticillate manner, adult ones glabrous and smooth on both surfaces; peduncles in fascicles, few-flowered; corollas clothed with adpressed hairs outside: branches of pili approximate and parallel. **2 G.** Native of New Holland, on the south coast. Flowers blue.

*Fascicled*-peduncled Dampiera. Pl.

11. *D. oblonga* (R. Br. c.) plant herbaceous, erect; stem compressedly trigonal; leaves sessile, oblong, entire, and few-toothed, glabrous and smooth on both surfaces in the adult state; peduncles almost terminal, very short, 1-3-flowered; corollas clothed with adpressed pili on the outside: divisions of pili approximate and parallel. **2 G.** Native of New South Wales, about Port Jackson. Flowers blue.

*Oblonga*-peduncled Dampiera. Pl. 1/2 to 1 foot?

12. *D. stricta* (R. Br. prod. p. 589.) plant herbaceous, erect; stem compressedly trigonal; leaves sessile, cuneated, a little toothed, sebaceous above in the adult state; peduncles few-flowered, axillary and terminal; corollas clothed with adpressed pili on the outside: divisions of pili parallel and approximate. **2 G.** Native of New Holland, on the south coast, and about Port Jackson; as well as of *Van Diemen's Land*. Juss. ann. mus. 18. t. 2. no. 2. Goodenía stricta, Smith, in Lin. trans. 2. p. 549. Flowers blue. This and the two preceding species are very nearly allied, and are easily distinguished from the rest on account of the peculiar hairs on the outside of the corolla.

Small-leaved Dampiera. Pl. 1 foot?

*Cult.* See *Secevola*, p. 730. for culture and propagation.

**Tribe III.**

**BRUNONIE**E (this tribe only contains the genus *Brunonia.*) Urticulus superior, 1-seeded.

**Lin. syst.** Pentándria, Monogynia. Calyx semi-superior, ovate, villous, 5-lobed; lobes obtuse. Corolla campanulate, permanent, inserted in the calyx; with a recurved 5-lobed limb; lobes obtuse. Stamens 5, short. Anthers distinct, linear. Ovarium surrounded by the calyx, and connected with it by 5 longitudinal septa or processes, from which the staminodium springs, 5-4-seeded, many-seeded. Placenta from the inner angle of the cells. Style short, thick. Stigma concave, surrounded by the thick fleshy 3-lobed indusium. Capsule 3-4-seeded, combined with the villous tube of the calyx in its lower part, and surrounded by the segments. Seeds adhering to long filament free receptacles, which are attached to the apex of the capsule.—A creeping woolly herb. Leaves alternate, broad, semi-cordate, like those of some species of *Begonia*, petiole, serrated, acute, pretty smooth. Racemes axillary, secund, recurved, twice the length of the petioles. Flowers unilateral, arrayed in 2 rows, nearly sessile. Corollas white.

*Begonia*-leaved Pentaphragma. Pl. creeping.

*Cult.* A mixture of vegetable mould and sand will be a good soil for this plant; and it will be easily propagated by dividing the creeping stems.

5 A 2
CAMPANULACEÆ.

Calyx regular, of from 3 to 8 lobes, but usually of 5 lobes, very rarely destitute of the limb. Corolla monopetalous, regular, permanent, usually 5-lobed, rarely 3 to 8-lobed; lobes alternating with the calycine segments, each having a conspicuous central nerve, valvate in aestivation. Stamens like the corolla, inserted in the margin of the disc of the ovarium, and combined with it, distinct from the corolla, but equal in number to its segments, and alternating with them; filaments usually expanded at the base and membranous, and bending towards the base of the style above the disc; anthers fixed by the base, free, rarely more or less combined into a tube, 2-celled; cells dehiscing lengthwise when the flower is in bud; pollen copious, adhering, yellow or violaceous, and clothed with very short papilla. Style one, more or less hairy; stigma naked (not covered by an indusium, as in the order Scrophulariaceæ), rarely capitate, but usually divided into from 2 to 8 lobes, or as many lobes as there are cells in the ovarium; lobes erect while the flower is in aestivation, pliose on the back, and hardly distinct, but they diverge and become recurved and glabrous on the expansion of the flower. Ovary combined with the tube of the calyx, sometimes half superior, many-celled; cells from 2 to 8 in number, but usually 2, 3 or 5, (never 4, unless a monstrosity) opposite the calycine lobes, and sometimes alternating with them. Capsule many-seeded, dehiscing at the sides or apex, having the valves usually septiferous in the middle. Seeds numerous, small, inserted in the placentas on the inner side of the cells. Albumen fleshy. Embryo slender, straight, with opposite, ovate or roundish small follicaceous cotyledons.—Usually milky herbs, rarely shrubs. Leaves exstipulate, alternate, but sometimes opposite, rarely entire, usually toothed or crenated, never fleshy; the radical ones often different from the cauline ones. Flowers rarely involucrated, number and situation variable, terminal and axillary, racemose, panicked or spicate, and glomerate, usually drooping; pedicels always reflexed in those species in which the capsules burst at the base, but on the contrary they are erect in those species whose capsules burst at the apex.—Corollas usually blue or white, rarely yellow or purple.

Campanulaceæ differ from Compositæ in not having the flowers in heads, in their usually distinct anthers; in their polyserpervous fruit. It differs from Lobeliaceæ in the regular flowers, and in the usually distinct anthers, and from Goodeniæ in the flowers being regular, and in the want of an indusium to the stigma. All the plants are pretty, and some highly ornamental. The roots of Camp. Rapunculus are used as a vegetable under the name of Rampion.

Synopsis of the genera.

Tribe I.

Jasioneæ. Capsule dehiscing at the apex. The plants contained in this tribe are most frequent in the southern hemisphere.

§ 1. Corolla 5-parted.

* Anthers distinct.

1 Jasionæ. Capsule 2-celled, inferior: valves dehiscing but a very little way at top.—Herbs with capitulate flowers.

2 LIGHTFOOTIA. Stigmas filiform. Capsule 3-5-celled, half superior; when 5-celled the cells are opposite the stamens and calycine segments.—African subshrubs or herbs.

3 CEPHALOSTYMA. Stigma capitate. Capsule 2-3-celled.—Herbs.

4 CAMPANUMEA. Corolla without a limb. Stigmas ovate, thick. Capsule 3-celled.—Herbs, with opposite leaves, and large involucrated flowers.

§ 2. Corolla 3-6-cleft or 3-6-lobed at the apex. Anthers always distinct.

* Capsule with the valves opening regularly.

6 CANARINA. Coraly and corolla 6-lobed. Stamens 6. Stigmas 6. Cells of fruit opposite the stamens and calycine segments.—Climbing glaucous herbs, with opposite leaves.

7 PLATYCODON. Coraly and corolla 5-lobed. Stamens and stigmas 5. Capsule 3-5-celled; cells when 5 alternating with the stamens and calycine segments. Seeds ovate, flat.—Rather glaucous herbs, with alternate or subopposite leaves, and large campanulate corollas.

8 MCKCODON. Coraly and corolla 5-lobed. Stamens and stigmas 5. Capsule 5-celled; cells alternating with the stamens and calycine segments. Seeds small, ovoid. —Humble herbs, with narrow alternate leaves, and small cylindrical corollas.

9 WAHLENBERGIA. Coraly and corolla 3-5-lobed. Stamens 3-5; stigmas 2-5. Capsule 2-5-celled; cells when 5 opposite the stamens and calycine segments. Seeds small, usually ovoid. Herbs usually with alternate and narrow leaves.

* Capsule elongated, bursting at the top or opening by a pore.

10 PRISMACOCA'RIUS. Coraly and corolla 5-lobed. Stamens 5. Capsule 2-celled, naked, at length bursting irregularly at the apex. Seeds angular, thick.—Herbs or subshrubs, with alternate narrow stiff leaves, and axillary sessile flowers.

11 ROUL’LA. Coraly and corolla 5-lobed. Stamens 5. Capsule 2-celled, always terminated by the permanent calycine segments, dehiscing irregularly at the apex.—Small shrubs, with alternate narrow stiff leaves; and sessile, usually solitary, terminal flowers.

Tribe II.

CAMPANULACEÆ. Capsule dehiscing at the sides.—The plants contained in this tribe are all indigenous to the southern hemisphere.

§ 1. Capsule dehiscing by valves, which are equal in number to the cells.

* Coraly 5-8-parted.

12 PHYTE'MA. Coraly and corolla 5-parted. Stamens 5. Capsule 2-3-celled. Stigmas filiform.—Herbs, with small usually glomerate flowers.

13 PETROMA'RAULA. Coraly and corolla 5-parted. Stigma
capitate. Capsule 3-celled.—Herbs, with pinna-tifid leaves, and racemose flowers.

14 Michæli'x. Calyx and corolla 8-parted. Stigmas 8, filiform. Capsule 8-celled.—Herbs, with the radical leaves pinnate.

** Corolla 5-cleft or 5-lobed at the apex.

15 Camp'nula. Corolla campanulate, funnel-shaped, or broadly tubular. Nectarium none. Capsule 3-5-celled, not elongated; cells when 5 opposite the stamens and calycine segments.—Herbs variable in habit.

17 Trache'lium. Corolla salver-shaped, with a very narrow elongated tube. Nectarium wanting. Style only pilose at the apex; stigmas small, hardly distinct. Capsule 2-3-celled, not elongated.—Herbs.

§ 2. Capsule dehiscing laterally by numerous transverse fissures.

20 Mu'scia. Calyx and corolla 5-cleft. Stamens 5. Capsule 5-celled; cells alternating with the lobes of the calyx and stamens.—A subshrub, with broad serrated leaves, and racemose yellow flowers.

† A genus doubtful whether it belongs to the order.

21 Merc'eria. Calyx 5-lobed, with a very hispid tube. Corolla 5-lobed, with a narrow tube as in Trachelium. Stamens 5, free; filaments long and slender. Stigmas 2, very short. Capsule inferior, indeschiscent? 1-celled, containing probably always 4 ovula in the bottom.—Cape shrubs, with the leaves of Reel'a, and slender lateral flowers.

Tribe 1.

JASION'E. (this tribe contains plants agreeing with Jasiona in the dehiscence of the capsule). Capsule dehiscing at the apex.

LIN. SYST. Pentándria, Monog'ynia. Calyx 5-cleft. Corolla deeply 5-parted; segments linear-lanceolate. Stamens 5, with slender filaments, and the anthers combined into a tube at the base; pollen blue or purplish. Style pilose from the middle to the apex: the pili or hairs disposed in 10 rows; stigmas 2, short. Capsule 2-celled, spheroid or ovoid, dehiscing by a broad hole at top, with very short valves. Seeds small, ovoid, shining. —Dwarf herbs, with the habit of Scabiosa. Leaves alternate, narrow. Flowers collected into terminal bracteate heads: the flowers expanding from the top of the head.

Mountain or Common Sheep's Scabious, or Sheep's-bit. Fl. June, July. Britain. Pl. ½ to 1 foot.

2 J. cor'ynoba (Poir. suppl. 3. p. 131.) stems erect, branched, angular; leaves decurrent, oblong-linear, rather hairy, undulated; peduncles leafy; bracteas pilose. γ H. Native of the kingdoms of Tangiers and Morocco, in sandy places. J. arena-'ria, Salzm. in herb. D. C. Root perpendicular. Heads of flowers numerous, globose, terminating the branches; stems therefore somewhat corymbous. Corollas blue.

Cory'mbose-flow'red Sheep's Scabious. Pl. ½ foot.

Portug'ol Sheep's Scabious. Pl. ½ foot.

Humble Sheep's Scabious. Pl. ¼ feet.

6 J. foliö'sa (Cav. icon. 2. p. 38. t. 148. f. 1.) glabrous; stems ascending, simple; radical leaves rosulate, rather spinu-late; cauline ones linear-lanceolate. γ H. Native of Spain; plentiful near the top of Mount Orospeda, on the north side, in the fissures of rocks; and in the boundaries of the kingdoms
of Valencia and Murcia. Phyteuma? rigidifolium, Duf. ined. in herb. D. C. Root simple. Heads globosum, few-flowered. Flowers pedicellate, of a deep violet colour. This is a dwarf, but very elegant plant, when in blossom.

*Leaves* of *Sheep’s Seabious*. Fl. Aug. Pl. 1 to 3 inches.

7 J. tristis (Bory, ann. gen. 3. (1820) p. 3.) stems prostate, diffuse, almost simple; leaves alternate, rather spathulate, ciliately tomentose; flowers in dense heads; bracteas ovate, coloured. 2. H. Native of Spain, on Sierra Nevada, at a place called Valleta. Flowers of a greyish-blue colour.

*Sad-coloured-flowered Sheeps’ Seabious*. Fl. prostrate.

*Cult.* The species of *Jasionae* are all very elegant while in blossom, and they are, therefore, well fitted for decorating the front of flower-borders and rock-work. They grow best in light soil, and are readily increased by parting at the root, by seed, or by cuttings. Plants of all the kinds should be kept in pots, so as to be placed under shelter in severe weather in winter, or else they are liable to be killed, and the species lost to the gardens.

[Lm. syst. Pentádria, Monogynía. Calyx 5-cleft. Corolla usually 5-parted, sometimes 5-cleft. Stamens 5; filaments broad, ciliated; anthers free, caducous. Stigmas 3-5, short, filiform. Capsule 3-5-celled, usually half superior, dehiscing by the valves at the apex; cells, when 5, opposite the stamens and calyce segments. Seeds ovoid-trigonal, minute. Small shrubs, rarely perennial herbs. Leaves alternate, and sometimes opposite, sessile, small, scattered equally over the whole plant. Flowers usually racemose, and on short pedicels; pedicels erect after the flowers begin to fade, and usually stiff. All natives of the Cape of Good Hope, except one, which is a native of Madagascar.]

§ 1. *Capsule 5-celled.*

1 L. subulata (Lher. sert. angl. t. 5.) stem ascending or erect, rather woody, simple or branched; leaves alternate, erectish, ciliately, subulate, narrow, somewhat denticulated; flowers racemose, on short pedicels; corolla 5-parted, with the segments rather longer than the calyce lobes; valves acute, longer than the entire base of the capsule. 2. G. Native of the Cape of Good Hope; very common on the mountains about Cape Town. Roem. et Schultes, syst. exclusive of the synonyme of Campanula capillacea. Campanula subulata, Spreng. syst. 1. p. 728. Lightfootia, Burch. cat. af. austral. no. 284. Campanula truncicosa, Lin. spec. 1. p. 238.9? Root simple, perpendicularly. Leaves numerous, stiff. Flowers numerous, terminal and axillary, solitary, disposed along the branches in a racemose manner, blue.

§ 2. *Capsule 3-celled.*

Var. *b. canescens* (Cham. in Linnae. 7. p. 192.) stem, leaves, and corollas clothed with hoary down; leaves 4 lines long, straight, with revolute edges; inflorescence more loose than in the species; axillary flowers nearly sessile; terminal ones on long pedicels.

1ăr. *c. lanuginosa*, (Cham. l. c. p. 193.) corollas, inflorescence, and stem rather woolly from long white villi; leaves 2 lines long, with finely-revoluted edges, densely imbricated; inflorescence contracted, subcapitate.

*Long-leaved Lightfootia*. Fl. 1 foot.

*One-toothed-leaved Lightfootia*. Shrub 1 foot.

4 L. ? adpressa (Alph. D. C. mon. p. 110.) stem erect, woody, simple; leaves alternate, reflexed, linear-lanceolate, setaciously-toothed; flowers panicked; corolla semi-5-cleft, twice longer than the calyce lobes. 2. G. Native of the Cape of Good Hope. Campanula adpressa. Thum. prod. p. 38. mem. acad. Petersb. 4. p. 365. t. 7. f. 2. Leaves a little decurrent, ciliated with white hairs at the base. Flowers panicked on the upper part of the stem, which is leafless.

*Adnerved Lightfootia*. Shrub 1 foot.

5 L. albescens (Spreng. in Zeicher, fl. cap. excis. p. 266.) stem erect, woody, branched; leaves alternate, usually in fascicles, spreading, linear, very narrow, entire; flowers loosely racemose; corolla 5-parted, having the segments 3 times longer than the calyce lobes; valves acute, about equal in length to the base of the capsule. 2. G. Native of the Cape of Good Hope. Campanula campanulata. Burch. cat. geogr. af. no. 1720. Flowers terminal and axillary, loosely racemose at the tops of the branches.

*Whitish Lightfootia*. Shrub 1 foot.

*Slender Lightfootia*. Shrub 1 foot.

*Fascicled-flowered Lightfootia*. Shrub 1 foot.

8 L. oxyacoides (Lher. sert. angl. t. 4. exclusive of the syn. Campanula tenella, Lin.) stem erectish or ascending, much
branched, woody at the base; branches diffuse; leaves alternate, reflexed, ovate-lanceolate, acute, thin, denticulated at the base; flowers loosely racemose; corolla 5-parted, having the segments hardly twice the length of the calycine lobes; valves acute, equal to the base of the capsule. ⅲ. G. Native of the Cape of Good Hope, on the Table Mountain. Smith, exoth. fl. 2. t. 99. Alph. D. C. mon. p. 113. Lobélia tellénæ, Lin. mant. p. 120. Thumb. prod. p. 40. Lobélia partifórra, Berg. cap. 45. Capsula Alp. Ornatæ, var. sp. sys. t. 5. p. 113. Branches purplish. Flowers terminal and axillary, at the tops of the branches, white, with reddish nerves.

9 L. lanceolata (Link, enum. 1. p. 217.) stem decumbent, downy; leaves lanceolate, glabrous, furnished with 1 or 2 teeth; peduncles downy; calyx glabrous, one-half shorter than the corolla. ⅲ. G. Native of the Cape of Good Hope. L. oxyccocoides, var. sp. sys. t. 1. p. 809. Corollas white and bluish, larger than those of L. oxyccocoides.

10 L. vesicosa (Link, enum. 1. p. 217.) stem decumbent, glabrous; leaves lanceolate, glabrous, quite entire; rameal ones opposite; peduncles glabrous; calyx shorter than the corolla. ⅲ. G. Native of the Cape of Good Hope. L. oxyccocoides, var. sp. sys. t. 1. p. 809. Leaves 5-4 lines long, and half a line broad. Corolla 2-3 lines long, whitish-blue.

Mossy Lightfootia. Shrub decumbent.

11 L. lodgdgesit (Alph. D. C. mon. p. 114.) stem decumbent, woody at the base, branched; leaves alternate, somewhat reflexed, ovate-lanceolate, acute, entire; flowers loosely racemose; corolla 5-parted, having the segments 4 times longer than the calycine lobes. ⅲ. G. Native of the Cape of Good Hope. L. tenellæ, Lodg. bot. cab. t. 1038. Branches purplish. Flowers axillary and terminal, disposed in loose racemes at the tops of the branches. Corolla bluish.

12 L. lyccocoides (Alph. D. C. mon. p. 114.) branches woody, simple, very leafy; leaves alternate, and sometimes sub-verticillate, erect, adpressed to the branches, linear, very narrow; flowers few, sessile; corolla 5-parted, with the segments 3 times longer than the calycine lobes. ⅲ. G. Native of the Cape of Good Hope. Leaves revolute on the margins. Flowers sessile, usually 3 on the top of each branch, the middle one expanding before the lateral ones.

Club-moss-like Lightfootia. Shrub 1 foot.

13 L. oppositifolia (Alph. D. C. mon. p. 115.) branches erect, slender, stiff, simple; leaves opposite, somewhat reflexed, linear, acuminate, narrow, slightly denticulated; flowers few, usually terminal; corolla deep 5-cleft, twice longer than the calycine lobes. ⅲ. G. Native of the Cape of Good Hope, on the Table Mountain. Campánula ericoides, Lam. Lightfootia, Burch. cat. geogr. pl. sér. austr. no. 606. Branches reddish. Flowers solitary, terminal, rarely axillary. Habit of L. oxyccocoides. L. muscósæ and L. lanceolata, Link, are probably hardly varieties of this species.

Opposite-leaved Lightfootia. Shrub 1 foot.

14 L. rubioides (Alph. D. C. mon. p. 116.) branches pro-cumbent, diffuse; leaves opposite, spreading, or a little reflexed, lanceolate, acute, remotely denticulated; flowers few, terminal and axillary; corolla 5-parted, with the segments longer than the calycine lobes. ⅲ. G. Native of the Cape of Good Hope. Campánula rubioides, Banks, herb. Plant trailing, much branched. Branches reddish. Leaves glabrous, or furnished with a few white hairs. Flowers axillary and terminal, solitary, at the extremities of the branches.

III. CEPHALOSTIGMA. IV. CAMPA NULUMEA.

Madder-like Lightfootia. Pl. trailing.

15 L. Madagascaricæn (Alph. D. C. mon. p. 116.) stem erect, woody at the base, simple; leaves alternate, erect, linear-acuminate, remotely denticulated; flowers somewhat panicked; segments of the corolla, which is deeply 5-parted, about 5 times longer than the calycine lobes; capsule wholly inferior, with short valves. ⅲ. S. Native of Madagascar, where it was collected by Commerson. Campánula Madagascaricæn, Juss. herb. Flowers at the top of the stem, and along one side of the peduncles, about 10 towards the upper part of the stem.

Madagascar Lightfootia. Pl. ⅓ to 1 foot.

Cult. All the species grow freely in a mixture of loam, peat, and sand; and young cuttings strike root readily in the same kind of soil, with a hand-glass over them.

III. CEPHALOSTIGMA (from κεφαλή, kephalē, a head, and στίγμα, stigma, a stigma; in reference to the stigma, which is capitulate). Alph. D. C. mon. p. 117.—Campánula species, Wall. herb.—Wahlenbergia species, Perrott. et Lepr. herb.

Lin. syst. Pentádria, Monogyiæ. Calyx 5-cleft. Corolla 5-parted; segments alternating with the calycine lobes, and longer than them. Stamina 5, free; filaments broadest at the base; anthers 2-celled; style usually exerted, more or less hairy; stigma simple, capitate, pilose. Capsule 2-3-celled, dehiscing by 2-3 short valves at the apex, which are septiferous in the middle. Seeds numerous, small, ovoid, triquetrous.—The species of this genus have a habit intermediate between Wahlenbergia and Lightfootia, but differs from both these genera in the capitulate stigma; but it has a capsule like that of the first, and a corolla like that of the latter.

§ 1. Capsule half superior, 3-celled. Style rather shorter than the segments of the corolla.

1 C. paniculata (Alph. D. C. mon. p. 117.) stem herbaceous, much branched, leafy; leaves ovate, acute at both ends, broad, subsinuated; flowers loosely panicked; segments of corolla 2 or 3 times longer than the calycine lobes; capsule obconical. ⅲ. F. Native of the Burmese empire, about Prome, on the banks of the Irrawaddy. Campánula paniculata, Wall. mass. Stem hairy. Leaves downy beneath. Panicule much branched; pedicels filiform, 1-flowered, glabrous.

Panicled-flowered Cephalostigma. Pl. 1 foot.

§ 2. Capsule 2-celled, almost wholly inferior. Style rather longer than the segments of the corolla.

Perrottet’s Cephalostigma. Pl. ½ foot.

3 C. Prieuri (Alph. D. C. mon. p. 118.) stem woody, humble, much branched, naked at the base; leaves small, linear; flowers panicked; segments of corolla hardly twice the length of the calycine lobes; capsule obconical. ⅲ. S. Native of Senegal, about Jonal, where it was collected by Leprieur and Perrottet. Root simple. Branches very slender, many-flowered, glabrous.

Le Prieur’s Cephalostigma. Pl. ¼ foot.

Cult. For culture and propagation see Micrococcus, p. 737.

CAMPANULACEÆ. IV. CAMPAŅUMÆA. V. CODONOPSIS. VI. CANARINA.

LIN. syr. Pentándria, Monogynia. Flowers involucrated. Involucrum 5-parted. Calyx hemispherical, combined with the involucre at the base, truncate at the apex, bearing the corolla. Corolla 5-parted! (5-petalled, ex Blum.). Stamens 5, free, opposite the lobes of the involucre, inserted at the base of the corolla or top of the calyx, and in the ovarium; filaments broadest at the base; anthers 2-celled. Style inclosed, divided into 3 ovate thick stigmas at the apex, which are pliose before the expansion of the flower. Ovarium combined with the tube of the calyx, 3-celled. Capsule globose, terminated by a broad flat 5-angled umbilicus, which is girded by the eiacretas occasioned by the falling of the corollas and stamens, many-valved, ex Blum.

Seeds very numerous, ovoid-cylindrical, dotted, inserted on the thick placentas, which are inflected on both sides, and situated at the inner angle of the cells. — Quite glabrous lacinseet herbs, with tuberous roots, ex Blum. Stems and branches terete. Leaves opposite, glaucescent beneath. Peduncles axillary and terminal.

1. C. Javanica (Blum. bldr. p. 727.) stem climbing; leaves on long petioles, obvate-cordate; flowers solitary, scattered. \( C. \). 
2. Native of Java, in humid woods on the mountains of Salak and Gede. Leaves 1-2 inches long, and 6-12 lines broad. Flowers green, axillary, and terminal. Peduncles 1-flowered.

Javan Campanumæa. Pl. cl.

2. C. Celleba (Blum. bldr. p. 727.) stem erect; leaves on short petioles, oblong-lanceolate; flowers subcorunose, terminal. \( C. \). 
3. Native of Celebes. Leaves ovate, acute; superior ones lanceolate, nearly entire, or serrulated.

Celleba Campanumæa. Pl. 1 foot.

Cult. A mixture of sand, loam, and peat will be a good soil for the species of Campanumæae; and they are to be increased by cuttings or seeds.

V. CODONOPSIS (from κώδον, kodon, a bell, and ὀπής, opis, resemblance; in reference to the shape of the flowers). Wall. in Roxb. fl. ind. 2. p. 103. Alph. D. C. mon. p. 120.

LIN. syr. Pentándria, Monogyenia. Calyx 5-lobed or truncate. Corolla inserted in the top of the calyx, 5-lobed; lobes alternating with the calycine segments when there are 5. Stamens 5, free, alternating with the lobes of the corolla; filaments broadest at the base; anthers 2-celled, length of filaments. Style inclosed; stigma 3, thick. Ovarium 3-celled, almost combined with the whole of the tube of the calyx. Capsule dehiscing by 3 acute valves at the apex, which are septiferous in the middle. Seeds inserted in the inner angle of the cells to a thick placenta, furnished with albumen and a straight embryo. — Usually quite glabrous herbs, inhabitants of the north of India on the mountains. Stems erect or scendent, and even twining, branched, terete, rising from a woody root, probably always. Leaves usually strictly opposite, ovate, acuminate, not entire, on short petioles, glauceous, rarely hoary beneath. Branches usually opposite, more or less articulated at their origin. Flowers terminal and axillary, pedunculate, sometimes involucrated. Corollas white, yellowish or deep purple. The habit of the species is variable.

1. C. viñata (Wall. fl. ind. 2. p. 103.), stem ascending, twining; leaves alternate and opposite, downy, hoary beneath, a little crenulatæ; corollæ large, yellowish-green. \( C. \). 
2. Native of Nipaul, about Gossingshan, Kamaon, and in an obscure wood on the top of Sheepore. Plant scandent, much branched, with the habit of Consolénæus. Leaves ovate-oblong. Flowers axillary and terminal, solitary, often opposite the leaves, with an ungrateful scent.

2. C. pears (Wall. in Roxb. fl. ind. 2. p. 105.) stems ascending, twining a little, manifestly articulate; leaves strictly opposite, glabrous, glaucescent beneath, a little crenulatæ; corollæ deep purple. \( C. \). 
2. Native of Nipaul, on the mountains towards the Himalaya. Leaves obovate-oblong. Flowers solitary, usually terminal, and terminating axillary branchlets.

Purple-flowered Codonopsis. Pl. twining.

SECT. II. MICROSA’NTHES (from μικρός, mikros, small, and ἀνθος, anthos, a flower; in reference to the small flowers). Flowers small, white, involucrated. Calyx probably always truncate. Seeds rather lenticular, small. Leaves strictly opposite, glabrous, glaucescent beneath.

3. C. trunca’ta (Wall. cat. no. 1301.) stem erect; leaves sharply serrated; involucrum combined with the base of the calyx. \( C. \). 

Truncate-calyx Codonopsis. Pl. 1 to 2 feet?

4. C. Paryflora (Wall. cat. no. 1303). Alph. D. C. mon. p. 123.) stem erect; leaves remotely and setaceous denticulated; involucrum distinct from the calyx. \( C. \). 
4. Native on the Pundua mountains, on the north-east of Bengal. Stem branched; branches opposite. Leaves ovate-acuminated. Flowers small, numerous, and as if they were panicked; peduncles trichotonous or dichotomous.

Small-flowered Codonopsis. Pl. 2 feet.

Cult. For culture and propagation see Canpumæae above.

LIN. syr. Hexándria, Monogyenia. Calyx 6-cleft. Corolla 6-lobed at the apex, large, campanulate. Stamens 6, free; filaments thickest at the base, glaucescent. Style inclosed, hispid above, the hairs disposed in 12 rows. Stigmas 6. Capsule 6-celled, dehiscing at the apex; cells opposite the calycine lobes and stamens. Seeds small, angular. Large herbs, with thick perennial roots: having the stem, leaves, and calyxes glaucescent, and quite glabrous. Leaves opposite. Flowers terminal, solitary.

1. C. campanula’ta (Lam. d. t. 259. ill. t. 598. plant glaucescent; root tuberous, fusiform; stems ascending; leaves hastately subcorulate, irregularly toothed; flowers solitary, terminating axillary branchlets. \( C. \). 

Cult. 8. vag. f. t. 8. — Hort. cliff. p. 65. t. 8. — Pluck. phyt. t. 276. f. 1. alm. p. 76. Flowers drooping, of a yellowish purple or orange colour, having the nerves red.

2. C. Zanguebra (Alph. D. C. mon. p. 125.) stem shrubby, scendent, branched; leaves hastately corulate, quite en-
tire, glabrous; flowers solitary, lateral. b. S. Native of Africa, on the coast of Zanquebar. C. Zanquebrica, Lour. coch. p. 195. Flowers pale. This plant agrees with the present genus in the calyx being 6-cleft, in the corolla being 6-lobed, in the stamens being 6, and in the capsule being 6-celled; but differs in the capsule dehiscing at the base, not at the apex, in the flowers being lateral, and in the leaves being alternate.

Zanquebar Canarina. Shrub climbing.

Cult. C. campanulata is very desirable, as it flowers in autumn and winter, when few other plants are in bloom. After flowering the stem dies down, and the root continues dormant all the summer, when it needs but little water. When the stem begins to push forth the plants had better be removed to the stove, as they will not flower so abundantly in the greenhouse. A light loamy soil, or a mixture of loam and peat, is the best soil for it; and the plant is readily increased by dividing at the root or by cuttings, planted in the same kind of soil under a hand-glass. The C. Zanquebrica being a three-stemmed plant will grow in the same kind of soil recommended for the first species, and will be easily increased by cuttings.

VII. PLATYCODON (from πλάτυς, platys, broad, and κόους, kouos, a bell; in reference to the shape and breadth of the flowers). Alph. D. C. mon. p. 125.—Campanula species, Jacq. hort. vind. 3. p. 4. t. 2. Lam. ill. no. 2513.—Wahlenbergia species, Schrad. cat. hort. gott. ann. 1814.—Campanula sect. Codonia, Spreng. syst. 1. p. 735.

Lin. syst. Pentandra, Monogynia. Calyx 5-cleft (f. 127. c.). Corolla 5-lobed at the apex (f. 127. d.), large, funnel-shaped, Stamens 5 (f. 127. a.), free; filaments broad at the base. Stigmas 3-5 (f. 127. b.). Capsule 3-5-celled, dehiscing by 3-5 valves at the apex, which are septicidere in the middle; cells when at the apex with the calyce lobes and stamens. Seeds ovoid, larger than in any genus of the order, shining, but not angular.—Perennial usually glansceent herbs, natives of Eastern Asia. Leaves alternate or nearly opposite, sessile, of a middle size; upper ones the smallest. Flowers few, terminal, solitary, pedunculate.

2 P. homallanthum (Alph. D. C. mon. p. 126.) plant rather pilose at the top; leaves lanceolate or linear-lanceolate; corolla deeply 5-cleft; stigmas 3; capsule 3-celled. 2. H. Native of the east of Siberia, near Ilga, ex Fisch.; of Kamtschatka, ex Redowsk; and of China, ex Sir G. Staunton. Stems simple. Leaves coarsely and unequally serrate-toothed, glabrous. Flowers usually 4-6, disposed in a loose raceme; pedicels hairy, 1-flowered. Calyx hairy. Corolla downy.

Equal-flowered Platycodon. Pl. 1/2 to 1 foot.

Cult. These species of Platycodon are neat elegant plants when in blossom. They do best in pots in a mixture of sand and peat, placed among other alpine plants; they will also grow very well planted in a peat border. We know of no way of increasing them but by seeds.

Lin. sys. Pentandra, Monogynia. Calyx 5-cleft. Corolla 5-lobed at the apex, small, cylindrical, permanent. Stamens 5, free; filaments very slender, not expanded at the base. Style filiform; stigmas 5. Capsule 5-celled, dehiscing by 5 valves at the apex; cells alternating with the calycine segments and stamens. Seeds ovoid, small, shining, but not angular.—Humble annual herbs, natives of the Cape of Good Hope. Leaves alternate or nearly opposite, small, narrow, sessile; superior ones rather the longest. Branches at the base of the plant opposite and diverging. Flowers almost sessile. Tube of calyx spherical and very hairy.

Glomerate-flowered Microcodon. Pl. 1/2 to 3 foot.

Scattered-flowered Microcodon. Pl. 1/4 foot.

Cult. The seeds of these plants should be raised on the hot-bed; and when the plants are of sufficient size they may be planted out into the open border in May in a warm sheltered situation.

Lin. sys. Pentandra, Monogynia. Calyx 5-cleft (f. 128. a.). Corolla 3-5-lobed at the apex (f. 128. b.), rarely divided to the middle. Stamens 3-5, free; filaments rather broad at 5 B
the base. Style inclosed, pilose, but most so towards the upper part. Stigma 2-5 (f. 128. c.). Ovarium combined with the tube of the calyx. Capsule 2-5-celled (f.128.c.) each opening by so many valves at the apex, which bear each a dissepiment in the middle. Seeds very numerous, minute.—Herbs, rarely shrubs, for the most part annual. Leaves usually alternate, rarely opposite, generally most numerous towards the lower part of the plant. Flowers for the most part on long peduncles; pedicels drooping at first, but when bearing the capsules are perfectly erect. The species of this genus are most plentiful in the southern hemisphere, particularly at the Cape of Good Hope.

**Sect. I. Edraiantha (from εδραίανθ, edraios, sedentary, and ἄνθος, anthos, a flower; in reference to the flowers being sessile, and usually capitate).** Alph. D. C. mon. p. 150. - Campánula species, Lin. and others. Corolla and calyx 5-lobed. Stamens 5. Capsule 2-3-celled. Seeds ovate, flat.—Humble perennial herbs. Leaves alternate, narrow; radical ones crowded; cauline ones stem-clasping. Flowers sessile, usually capitate. — Inhabitants of Italy and the adjacent countries.

* * Plants cauline. Flowers aggregate.

1 W. *graminifolia* (Alph. D. C. mon. p. 130.) stems clothed with soft down; leaves entire; radical ones linear or linear-spatulate; cauline ones linear, and somewhat stem-clasping; bracteas ovate, acute, entire, rather downy; tube of calyx smoothish; but the lobes are downy, and the sinuses are toothless. 

2 W. *Gargarina*; perennial, downy, canescent; stems diffuse or pendulous, simple; leaves roundish, cordate; lower ones on long petioles, deeply and unequally crenated; upper ones dentate; crenatures and teeth mucronate; racemes loose, leafy; pedicels filiform, 1-flowered; calycine segments lanceolate, acuminate, reflexed.

3 W. *Kitaibelii* (Alph. D. C. mon. p. 131.) stems beset with soft pilis; leaves ciliate a little; radical ones linear-subsessile, remotely dentilicate; bracteas ovate, acuminate, dentately suberreted, ciliated with villi; tube of calyx villous, and the lobes subdenticulate, as well as the sinuses, and downy on both surfaces.

4 W. *tenellifolia* (Alph. D. C. mon. p. 133.) stems pilose; leaves linear, entire, with bristly margins; bracteas ovate, acuminate, ciliated with bristles; tube of calyx rather pilose; lobes of calyx ciliated with bristles, and the sinuses toothless.

**IX. Wahlbergia.**

5 W. *Dalmatica* (Alph. D. C. mon. p. 131.) stems glabrous; leaves linear-lanceolate, entire, ciliated with hairs; bracteas ovate-acuminated, entire, ciliated; tube of calyx rather pilose; lobes of calyx entire, ciliated, rather pilose on the back, with the sinuses toothless.

6 W. *Pumilio* (Alph. D. C. mon. p. 134.) plant tufted; stems short, very leafy; leaves linear, entire, glabrous beneath, revolute on the margins at top, and pilose in the middle; hairs adhered, pencilled or in tufts at the tops of the leaves; upper leaves broadest at the base, and covering the flower; tube of calyx obconical, glabrous; lobes of calyx entire, similar to the leaves.

**Dwarf Wahlbergia.** Pl. tufted.

1 Capsule 5-celled. Seeds shining. Stems erect or ascending. Pedicules elongated, naked. Leaves alternate, sessile. All natives of the Cape of Good Hope.

8. W. DIFFUSA (Alph. D. C. mon. p. 137.) stem weak, much branched, glabrous, or rather pilose; leaves linear, acuminate, somewhat dentilicate; calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calyceine lobes; capsule spherical, glabrous. H. Native of the Cape of Good Hope. Campánula rubioides, Banks, herb.—Comm. Hort. t. 97 (?). Calyx quardrilab.

9. W. LINEARIS (Alph. D. C. mon. p. 132.) stem flexuosus, erect, ciliiform, simple and glabrous at the base; leaves linear, entire, glabrous; calyx glabrous or pilose, with a spherical tube; corolla 5-lobed at the apex, hardly longer than the calyceine lobes; capsule spherical, glabrous. H. Native of the Cape of Good Hope, in sandy places. Campánula lineáris, Lin. suppl. p. 140. Thumb. prod. p. 38. mem. acad. petersb. 4. t. 5. f. 5. Stem purplish. Flowers somewhat panicked, white; peduncles and pedicels capillary, drooping when bearing the flowers, and erect while bearing the fruit.

Linear-leaved Wahlenbergia. Pl. 1½ foot.

§ 2. Capsule 3-celled. Seeds shining or dotted. Stems erect or procumbent. Peduncles naked, more or less elongated. Leaves alternate, rarely opposite.

* Seeds usually dotted. Stems branched, slender, usually procumbent. Leaves sessile or petiolate, and opposite or alternate in the same specimen.

10. W. FLACCÍDA (Alph. D. C. mon. p. 198.) rather pilose; stem erect, simple, rather leafy; leaves opposite and alternate, ovate, acute, entire; calyx pilose; with an oval tube; corolla 5-lobed, one-half longer than the calyceine lobes; capsule ovoid, spherical. H. Native of the Cape of Good Hope, where it was collected by Masson. Campánula flácida, Banks, herb. Flowers solitary, terminal. Peduncle not different from the stem, being leafy like it.

Flaccid Wahlenbergia. Pl. 1½ foot.

11. W. DIVERSIFÓLIA (Alph. D. C. mon. p. 139.) stem procumbent, branched, not very leafy, glabrous above, and pilose below; leaves alternate and opposite, smooth: lower ones obovate-roundish, crenately toothed: the rest ovate-lanceolate, acute, toothed; calyx glabrous, with an ovoid-spherical tube; corolla one-half longer than the calyceine lobes; capsule obconically ovoid. H. Native of the Cape of Good Hope. Campánula Eklon, in herb. Dumont. Flowers on long pedicels, which are either terminal or axillary on the upper part of the plant.

Diverse-leaved Wahlenbergia. Pl. procumbent.

12. W. MADAGASCARENSIS (Alph. D. C. mon. p. 139.) stem erect, branched, glabrous, not very leafy, rather pilose above; leaves strictly opposite, ovate, acute, crenated, glabrous; calyx rather pilose, with a spherical tube; corolla profusely 5-cleft, length of the calyceine segments; capsule spherical. H. Native of Madagascar. Stems branched from the base. Flowers solitary, pedicellate, situated in the axils of the forks of the branches.

Madagascar Wahlenbergia. Pl. ¾ foot.

Var. β, foliósá (Alph. D. C. mon. p. 140. t. 15. f. 6.) stems shorter; leaves approximately smaller. G, Y. Campánula, Burch. cat. pl. afr. no. 361. and no. 508.

Procumbent Wahlenbergia. Pl. creeping.

* * * Seeds dotted. Stems branched, slender, usually procumbent. Leaves petiolate, alternate.

14. W. HEDERÆCÆA (Alph. D. C. mon. p. 146.) glabrous; stems slender, ascending; leaves on long petiodes, coriaceous, bluntly 5-angled; corolla 5-lobed at the apex, 4 times longer than the calyceine segments; capsule hemispherical.

*** Seeds shining. Stems more or less erect. Leaves alternate, sessile, narrow.

a. Peduncles elongated.

15. W. GRÄCÍLIS (Alph. D. C. mon. p. 142.) stem simple or branched, glabrous or pilose; leaves alternate or nearly opposite, linear-lanceolate, sinuate-toothed, glabrous; calyx smoothish, with an ovoid tube; corolla funnel-shaped, 5-cleft; capsule obovate. G. Native of Van Diemen's Land; and of New Holland, about Port Jackson; and of New Caledonia and New Zealand. All the varieties grow in New Holland, except var. ε, which only grows in New Zealand. Campánula grácilis, Forst. prod. no. 84. Sims, bot. mag. 691. R. Br. prod. p. 561. Campánula vincéiflora, Vent. malm. t. 12. Campánula capillaris, Lodd. bot. cab. t. 1406. Peduncles terminal and axillary, elongated, 1-flowered. Corolla blue, with a white or yellowish bottom. Anthers yellowish.

Var. β, stricta (Alph. D. C. mon. p. 142.) stem branched, straight; leaves numerous, opposite, linear-lanceolate; calyceine segments linear, exceeding the tube of the corolla a little, which is discoloured on the outside. G. Campánula grácilis, Smith, exot. fl. t. 45. Campánula gráciíis, β, stricta, R. Br. prod. p. 561.

Var. γ, littorális (Alph. D. C. l. c.) stem simple, elongated; leaves few, alternate, linear, narrow; calyceine lobes acuminate, length of the tube of the corolla. G. Campánula littorála, Labill. nov. holl. 1. p. 69. t. 70. Camp. gráciíis, γ, littorála, R. Br. prod. p. 561.

Var. ε, capilláris (Alph. D. C. l. c.) stem capillary, panicked; leaves linear, remote; segments of the calyx one-half shorter than the capsule, which is nearly globose. G. Campánula grácilis, ε, capilláris, R. Br. prod. p. 561.

Var. ι, polymórpha (Alph. D. C. l. c.) lower leaves obovate, obtuse; middle ones lanceolate; upper ones linear-lanceolate; calyceine segments broadish, one-half shorter than the corolla. 5 p 2
CAMPANULACEÆ.

9. H. Native of New Holland. Campánulae, Sieb. fl. nov. holl. n. 577. Peduncles naked, divided into 1-flowered pedicels; the flowers are therefore somewhat panicked. Corolla blue, small. Stem angular at the base.

Sieber's Wahlenbergia. Pl. ½ foot.

Field Wahlenbergia. Pl. 1 foot.

24. W.рева (Alph. D. C. mon. p. 145.) stem branched, rather pilose at the base; leaves linear, rather pilose, entire; acuminate; tube of calyx ovate, glabrous; corolla one-half longer than the calyces; capsule obovoid. O. H. Native of the East Indies, on the Nellygherry mountains, where it was collected by Leschenault, and where it is called Aleka. Habit of W. trinervis. Peduncles 1-flowered, glabrous. Flowers terminal, mutant. Capsule erect.

Indian Wahlenbergia. Pl. ½ foot.

25. W. rīpa (Alph. D. C. mon. p. 146.) plant pilose at the base, and glabrous at top; leaves few, undulated toothed, rather hairy; lower ones obovate-lanceolate; the rest narrower, glabrous, and acuminate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calyces; capsule ovoid. O. H. Native of Senegal. Stem very leafy at the base, divided into many 1-flowered pedicels at top.

River-side Wahlenbergia. Pl. 1 to 1½ foot.

26. W. hуmullis (Alph. D. C. mon. p. 147.) plant pilose at the base, and glabrous at top; leaves much crowded at the bottom, linear-lanceolate; upper ones ligulate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calyces; capsule ovoid. O. H. Native of Senegal. Stem very leafy at the base, divided into many 1-flowered pedicels at top.

Humble Wahlenbergia. Pl. ½ foot.

Naked Wahlenbergia. Pl. 1 foot.

Sieber's Wahlenbergia. Pl. ½ foot.

Field Wahlenbergia. Pl. 1 foot.

24. W.рева (Alph. D. C. mon. p. 145.) stem branched, rather pilose at the base; leaves linear, rather pilose, entire; acuminate; tube of calyx ovate, glabrous; corolla one-half longer than the calyces; capsule obovoid. O. H. Native of the East Indies, on the Nellygherry mountains, where it was collected by Leschenault, and where it is called Aleka. Habit of W. trinervis. Peduncles 1-flowered, glabrous. Flowers terminal, mutant. Capsule erect.

Indian Wahlenbergia. Pl. ½ foot.

25. W. rīpa (Alph. D. C. mon. p. 146.) plant pilose at the base, and glabrous at top; leaves few, undulated toothed, rather hairy; lower ones obovate-lanceolate; the rest narrower, glabrous, and acuminate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calyces; capsule ovoid. O. H. Native of Senegal. Stem very leafy at the base, divided into many 1-flowered pedicels at top.

River-side Wahlenbergia. Pl. 1 to 1½ foot.

26. W. hуmullis (Alph. D. C. mon. p. 147.) plant pilose at the base, and glabrous at top; leaves much crowded at the bottom, linear-lanceolate; upper ones ligulate; calyx glabrous, with an ovoid narrow tube; corolla one-half longer than the calyces; capsule ovoid. O. H. Native of Senegal. Stem very leafy at the base, divided into many 1-flowered pedicels at top.

Humble Wahlenbergia. Pl. ½ foot.

Naked Wahlenbergia. Pl. 1 foot.

branched, pilose at the base; lower and middle leaves ovate, acute, irregularly toothed, and pilose: superior ones narrower, nearly entire, smoothish, tube of calyx glabrous and obconical; lobes of calyx with revolute serrately ciliolate margins; corolla funnel-shaped, 2 or 3 times longer than the calyceine lobes, somewhat 5-crenate at the apex; capsule obovate. ○ H. Native of the Cape of Good Hope. Campánula cérnea, Thunb. prod. p. 39. mem. acad. peteburg. 4. p. 376. t. 7. f. 1.—Comm. Hort. 2. t. 36. Stem very leafy at the base. Peduncles erect, elongated, terminating in numerous 1-flowered filiform pedicels. Corolla funnel-shaped, with a white base, and blue lobes, drooping in the bud state.

**Undulated-leafed Wahlenbergia.** Pl. 1 to 1 1/2 foot.

30 W. nudicaulis (Alph. D. C. mon. p. 149.) stem branched, rather pilose at the base; leaves ovate or lanceolate, undulate crenated, rather pilose; calyx glabrous, with a nearly spherical tube, and entire lobes; corolla broadly funnel-shaped, deeply 5-crenate, 3 or 4 times longer than the calyceine lobes; capsule spherical. ○ H. Native of the Cape of Good Hope. Root cylindrical at its top, branched at the base. Stems numerous, branched, usually dichotomous. Leaves nearly all at the base of the plant, obtuse or acute. Flowers very numerous, terminating the slender naked pedicels. Corolla funnel-shaped, blue, drooping in aestivation.

**Natural-flow ered Wahlenbergia.** Pl. 1 foot.

31 W. androsacea (Alph. D. C. mon. p. 150. t. 19. f. 1.) stem simple, naked, few-flowered, glabrous; radical leaves rostrate, ovate-lanceolate, on short petioles, acute, denticulated, pilose; calyx glabrous, with a hemispherical tube, and short broad entire lobes; corolla broadly funnel-shaped, profusely 5-crenate, 2 or 3 times longer than the calyceine segments; capsule spheroid. ○ H. Native of the Cape of Good Hope. Campánula androsaéæ, Burch, cat. geol. pl. afr. austr. no. 2273. Stem twice dichotomous at top, and nearly naked, except the bracteae at the base of the pedicels. Branches 2, divided into 2 1-flowered pedicels at the apex. Flowers erect in the expanded state, but drooping in the bud state, probably blue.

**Androsace-like Wahlenbergia.** Pl. 1 1/2 foot.

32 W. stellarioides (Cham. in Schlecht. in Linnaea. 7. p. 196.) stems ascending, a little tufted, filiform, tetragonal, glabrous; leaves opposite, somewhat connately approximate, lanceolate, acute, with revolute edges, and the nerve slender, pilose, or glabrous beneath; flowers terminal and lateral, on long pedicels; ovary elliptic, short; calyceine segments very like the leaves, but one-half shorter than the corolla; corolla funnel-shaped, 5-crenate to the middle, with acute oval ovate segments. ○ H. Native of Caffraria. Stem branched at the base. Stamens 5. Calyceine segments reflexed.

**Stichwort-like Wahlenbergia.** Pl. 1 to 1/3 foot.

33 W. nutate좌 (Alph. D. C. mon. p. 151.) plant pilose at the base; stem simple, or branched at the base; lower leaves lanceolate-obovate, nearly entire, with the nerves and margins pilose: the rest lanceolate, acute, smoothish, and irregularly toothed; calyx glabrous, with an ovoid tube; corolla cylindric, 5-lobed, hardly one-half longer than the calyceine lobes; capsule obovate. ○ H. Native of Calabria, near Reggio, on very arid hills; and of Sardinia, in the fields of Carbonara and Tortoreto, ex Moris. Campánula nutate, Guss. in Ten. append. 5. ad fl. nec. prod. p. 8. pl. rar. p. 94. t. 18. Mor. strap. sard. elench. p. 30. Habitat of H. lobeloides. Leaves numerous at the base of the plant. Peduncles nearly naked, elongated, drooping when bearing the flowers, but at length erect, 1-flowered, glabrous. Corolla white.

**Nodding-flow ered Wahlenbergia.** Pl. 1 1/4 foot.

b. Peduncles shorter.

34 W. exilis (Alph. D. C. mon. p. 151.) stem much branched, rather pilose at the base; branches glabrous, filiform; leaves linear, subulate, entire, rather pilose; tube of calyx glabrous or roughish, obconical; corolla tubular, 5-crenate at the apex, scarcely one-half longer than the calyceine lobes; capsule obovate, narrow. ○ H. Native of the Cape of Good Hope. Burch. cat. no. 105. Stem quite glabrous at top. Pedicels mostly axillary, 1-flowered, reddish.

**Slender Wahlenbergia.** Pl. 3 to 1 1/2 foot.

**Tar. β. scabra (Alph. D.C.I. e.) peduncles and calyces rather scabrous.** Burch. cat. pl. afr. no. 2502.

36 W. kriebi (Cham. in Schlecht. Linnaea. 7. p. 195.) stems rather herbaceous, filiform, procumbent, very leafy at the origin of the fertile branches, tetragonal: angles beset with retrograde bristles; leaves crowded, spreading, rather stiff, lunate or obovate-oblong, obtuse or acute, minutely-toothed, with reflexed margins, having the keel and margins pilose or glabrous; branches erect, naked above, elongated, divided into an irregular branched panicle; bracteoles quite entire, acute; ovary globose; calyceine segments oblong-triangular, bluish, almost nerveless, pellucid, with scabrous edges; corolla funnel-shaped, quinquefid, 3 times longer than the calyx; lobes short. ○ H. Native of Caffraria. Stem tufted below the leaves. Stamens 5. Stigma bilabiate. Panicle 4-8-flowered. Pedicels half an inch long, furnished each with one bract. Capsule half inferior, 3-celled, 3-valved. Seeds ovate or elliptic, smooth, shining brown.

**Krebs's Wahlenbergia.** Pl. procumbent.

37 W. dunantii (Alph. D. C. mon. p. 152.) stem branched, stiffish; leaves linear-lanceolate, narrow, acuminate, entire, pilose; tube of calyx pilose, small, hemispherical; lobes of calyx long, subulate; corolla tubular, 5-lobed at the apex, rather longer than the calyceine lobes. ○ H. Native of the Cape of Good Hope, where it was collected by Eklo. Stem slightly pilose. Peduncles dichotomous, diverging, rather pilose. Pedicels 1-flowered. Flowers drooping.

**Dunant's Wahlenbergia.** Pl. 1 1/2 foot.

38 W. massonii (Alph. D. C. mon. p. 153.) plant small; stem branched, pilose; leaves linear, narrow, entire; calyx pilose, with a hemispherical tube and capillary lobes; corolla narrow,
funnel-shaped, 5-lobed at the apex; 2 or 3 times longer than the calycine lobes; capsule spherical. O. G. Native of the Cape of Good Hope. Flowers racemose or panicled at the tops of the branches, numerous. Pedicels 1-flowered.

CAMPANULACEAE.

_Masson's Wahlenbergia._ Pl. 3 in foot.

_Paniced-flowered Wahlenbergia._ Pl. ½ to 1 foot.

41 W. Banksi_s (Alph. D. C. mon. p. 151.) stem glabrous, simple at the base, but panicled at the apex; leaves linear, narrow, remotely denticulated, acuminate; tube of calyx quite glabrous, spherical; calycine lobes linear, narrow, denticulated; corolla funnel-shaped, 5-lobed at the apex, one-half longer than the calycine lobes. O. H. Native of the Cape of Good Hope. Campânula paniculata, Smith. in herb. Banks. Peduncles and pedicels slender, but stiff and divericate. Flowers erect, 6-10 in number.

_Banks's Wahlenbergia._ Pl. ½ to 1 foot.

43 W. spinulosa (Alph. D. C. mon. p. 155.) plant humble, much branched; branches stiff, glabrous, or rather scabrous; leaves narrow-linear, glabrous or pilose, denticulated, stiff, ending each in a hard point; tube of calyx glabrous, ovoid; calycine lobes very revolute ciliated margins; corolla narrow, 5-lobed at the apex; capsule spherical.—Native of the Cape of Good Hope. Campânula spinulosa, Banks, herb. Flowers terminal and axillary, solitary; pedicels stiff, and appearing like spines after the capsules have fallen. _Spinulose Wahlenbergia._ Pl. 1 to 3 inches.

IX. Wahlenbergia.

HABIT—An humble annual herb. Leaves alternate, sessile, narrow. Flowers on short pedicels.

45 W. cervicina (Alph. D. C. mon. p. 156.) plant small; stem much branched; branches diverging, rather pilose; leaves linear-lanceolate, a little denticulated; tube of calyx rather pilose, ovoid; corolla tubular, rather longer than the calycine lobes; capsule spherical. O. F. Native of Egypt and Sénégal, in sandy and arid places. Cervicina campánuloides, Del. hfl. eygpt. p. 7. t. 5. f. 2. Leaves with white margins. Flowers numerous, pedicellate, solitary from the axils of all the leaves and tops of the branches.

_Throatwort Wahlenbergia._ Pl. ½ foot.

Linaria-like Wahlenbergia. Pl. 1 foot.

§ 1. Capsule 2-celled.

48 W. Fernándeziana (Alph. D. C. mon. p. 160.) stem rather woody, erect, glabrous or pilose, leafy in every part; leaves lanceolate, acute, serrated, glabrous or pilose; calyx with a glabrous obconical tube, and subsessile lobes; corolla funnelform, semiquinquefidi; 3 times longer than the calycine lobes; capsule obconical. 2. F. Native of the island of Juan Fernandez. Flowers panicled, numerous. Pedicels erect, terminal and axillary, with a small subulate bracteae at the base of each. Corolla white, with purplish nerves. 

Juan Fernandez Wahlenbergia. Pl. 1/2 to 1 foot.

49 W. foliös (Alph. D. C. mon. p. 160. t. 18.) stem woody, erect, very leafy in every part; glabrous, or rather pilose; leaves linear, acute, serrated, glabrous or pilose on the middle nerve; tube of calyx glabrous, obconical; lobes of calyx sessile; corolla cylindrical, semi-5-angled, one half longer than the calycine lobes; capsule turbinate. 2. G. Native of St. Helena and Ascension. Stem branched or simple, inflated at the origin of the leaves, as in many species of Scroéléa. Leaves sessile, an inch long, paler beneath. Peduncles terminating the branches, rather leafy; pedicels slender, erect, 1-flowered, reddish. (C. 128.)

Leaffy Wahlenbergia. Pl. 1 to 2 feet.

50 W. clivös (Alph. D. C. mon. p. 161.) glabrous; stems subherbaceous, procumbent, leafy at the origin of the peduncles; leaves linear-lanceolate, deeply serrated; calyx with an obconical elongated tube, and entire segments; corolla campanulate, 3 times longer than the calycine segments, 5-lobed at the apex; capsule obconical. 2. G. Native of St. Helena. Campanula clivosa, Banks, herb. Stems hanging from rocks, naked at the base. Flowers and capsules erect, but the albastra are drooping.

Craggy Wahlenbergia. Pl. procumbent.

Roxburgh's Wahlenbergia. Shrub.

52 W. angstiosifolia (Alph. D. C. l. c.) plant diffuse; branches elongated, slender, scabrous; leaves linear-lanceolate, remotely and acutely glabrously serrated; peduncles lateral, much longer than the leaves, dichotomous, many-flowered. 3. G. Native of St. Helena, in the fissures of rocks in Sandy Bay. Flowers pure white, erect, and rather large. Roellia angustifolia, Roxb. in Beasts. St. Hel. p. 320. Perhaps the same as W. clivös.

Narrow-leaved Wahlenbergia. Pl. procmount.

Flax-leaved Wahlenbergia. Shrub.

§ 2. Capsule 3-celled. Perhaps a proper genus.

54 W. ensifolia (Alph. D. C. mon. p. 163.) plant frutescent, simple; stem thick, erect, naked at the base, but very leafy in the middle; leaves long-lanceolate, acuminate, ciliolate, sharply serrated; teeth setaceous; calyx with a glabrous obconical tube, and entire ciliolate lobes; corolla large, campanulate, somewhat 5-angled, one half longer than the calycine lobes. 3. G. Native of Bourbon, on the Burning Mountains. Campanula ensifolia, Lam. diat. f. p. 382. Ill. no. 2518. Bracteas ciliolate. Flowers 1-3 at the top of each peduncle. Corollas large, an inch long, dirty yellow, marked with 5 purple spots at bottom. Habit between Misschia and Wahl. foliös.

Sword-leaved Wahlenbergia. Shrub 1 foot.

† A doubtful species.

Ovate-leaved Wahlenbergia. Pl. 1/2 foot.

Cult. For the culture and propagation of the annual species of this genus, see Microchon, p. 737. The frame and greenhouse perennial and shrubby species, as Lightfoictia, p. 735. The hardy perennial species should be grown in pots, in a mixture of peat and loam, and kept rather moist; and they are easily increased by division.

Lin. Syst. Pentándría, Moinogynía. Calyx 5-lobed, with a cylindrical elongated tube. Corolla 5-lobed at the apex. Stamina 5, alternating with the lobes of the corolla. Anthers distinct. Style permanent at the base; stigma 2. Capsule 2-celled, wholly inferior, prismatic or cylindrical, elongated, splitting from the top towards the base into 5 segments. Seeds inserted the whole length of the central placenta, ovoid, somewhat compressed, obtuse, dotted.—Subshrubs and stiff herbs, all natives of the Cape of Good Hope. Leaves alternate. Flowers sessile, solitary or appressive; always inserted in the axils of the leaves or bracteas.

* Corolla narrow. Style exerted. Leaves few on the upper parts of the plants.

1 P. diffúsus (Alph. D. C. mon. p. 164.) suffrutecent; leaves linear, very narrow, entire; flowers in loose panicles; peduncles diverging, stiff; bracteas subulate; calycine lobes

* * Corolla funnel-shaped. Style inclosed. Leaves few on the upper part of the plant.

**Panicled-flowered Prisomatocarpus.** Shrub 1 ft.

**Interrupted Prisomatocarpus.** Fl. May, July. Clt. 1818. Shrub 1 ft.

**Subulate-leaved Prisomatocarpus.** Shrub 1 1/2 foot.

5 P. acutiflorus (Lher. sert. angl. p. 1. Alph. D. C. mon. p. 167.) suffrutescent; leaves linear-subulate, entire, ciliated; flowers few, approximate at the tops of the peduncles; bracteas subulate; lobes of calyce ovate, acute, velvety. G. Native of the Cape of Good Hope. Roehla erecta, Banks, herb. Campanula aciculata, Poir. suppl. 2. p. 66.—Habit of P. paniculatus. Stem nearly simple, glabrous, naked at the base and top, but leafy in the middle, divided at the top into 2 peduncles. Leaves often having fascicles of smaller ones in their axils.

**High-flowered Prisomatocarpus.** Shrub 1 foot.

6 P. fruticosus (Lher. sert. angl. p. 2. Alph. D. C. mon. p. 167.) suffrutescent; leaves linear, very narrow, erect, entire, a little ciliated; flowers few, racemose; bracteas subulate; calyce lobes ovate, acute, glabrous. G. Native of the Cape of Good Hope. Roehla fruticosa, Lher. in herb. Banks, Campanula fruticulosa, Banks, herb. Stem nearly simple, glabrous, ending in a naked few-flowered raceme.

7 P. eklonii (Alph. D. C. mon. p. 168.) suffrutescent; leaves linear-subulate, long, erect, entire, glabrous; flowers disposed in loose spikes; bracteas subulate, broader than the leaves at the base; calyce lobes linear-lanceolate, glabrous. G. Native of the Cape of Good Hope. P. fruticosus, Eklon, in herb. Dunant, but not of Lher. Stem branched; branches erect, leafy at the base and rather velvety, and reddish at top. Flowers solitary in the axils of the bracteas.

**Eklon's Prisomatocarpus.** Shrub 1 1/2 foot.

**Curled-leaved Prisomatocarpus.** Fl. 1 1/2 foot.

9 P. linearifolius (Alph. D. C. mon. p. 169.) stem herbaceous; leaves few, linear, narrow, ciliated a little at the base; flowers in fascicled; bracteas ovate, acute, setaceous ciliated; lobes of calyce linear, acuminate, glabrous. G. Native of the Cape of Good Hope. Lightfooti sessiliflora, Spreng. in Zeyhr. fl. cap. no. 203. and probably of Spreng. syst. 1. p. 809. Stem simple, stiff, furnished at top with few-flowered peduncles, glabrous, very leafy from the base to the middle, but naked at top. Leaves decurrent. Flowers sessile, usually 2-3 in a fascicle, from the axils of the bracteas, at the upper part of the stem.

**Straight Prisomatocarpus.** Pl. 1 foot.

* * * Corolla funnel-shaped. Style inclosed. Leaves scattered equally over the whole plant.

12 P. seseformis (Eklon, in herb. Dunant. ex Alph. D. C. mon. p. 171.) plant rather woody, glabrous; leaves spreading, linear, narrow, entire; flowers solitary, in the axils of the upper leaves; calyce lobes subulate, glabrous. G. Native of the Cape of Good Hope. Stem much branched; branches diffuse, erect or ascending, reddish. Flowers small.

**Nuttal-flowered Prisomatocarpus.** Pl. 1 1/2 foot.

Cult. All the species of this genus are rather showy when in flower. A mixture of sand, loam, and peat is the best soil for them. They are readily increased by seed; or young cuttings grow freely if planted in the same kind of soil, with a handglass placed over them.

LIN. SYST. Pentádia, Monegineia. Calyx 5-clus. Corolla funnel-shaped or tubular, large, 5-lobed (129, 6). Stamens 5; filaments broad at the base. Anthers free. Stigmata 2, thick. Capsule cylindrical, 2-celled, wholly inferior, perforated by the permanent base of the style, and therefore appearing as if it was covered by an operculum, and at length discharging by a large hole at the apex, without valves. Seeds angular, scabrous, thick.—Subshrubs, rarely herbs. Leaves numerous, always alternate, scattered over the whole plant, usually narrow and stiff. Flowers sessile, terminal, and sometimes axillary. All the species are natives of the Cape of Good Hope. *

* Plants perennial. Stem woody, more or less erect. Leaves stiff. Tube of calyx covered by the leaves.

1 R. incúrva (Banks, herb. ex Alph. D. C. mon. p. 172.) leaves linear, acuminate, incurved at the apex; lower ones setaciously ciliated; superior ones laciniate toothed; flowers solitary; lobes of calyx glabrous, laciniate toothed; corolla variegated, length of the calyces lobes. G. Native of the Cape of Good Hope. Flowers solitary, terminal, surrounded by imbricate leaves.

Incurved-leaved Roella. Shrub 1 foot.

2 R. criúta (Lin. spec. 1. p. 241.) leaves erect, linear, acuminate, ciliated; superior ones longer and entire; flowers solitary; lobes of calyx ciliated, and laciniate toothed; corolla variegated, large, longer than the calyces lobes. G. Native of the Cape of Good Hope and Barbary. Gaertn. fruct. 1. p. 154. t. 21. f. 3. Lam. ill. t. 123. f. 1. Curt. bot. mag. t. 378. Lodd. bot. cab. 1156. Delam. herb. anat. 56. fasc. t. 232. Roell. Lin. hort. clff. p. 492. t. 35. Flowers solitary, terminal, surrounded by imbricate leaves. Corollas white at bottom, even to the base of the lobes, where there is a deep purplish circle, and above the circle pale violet, girded by white, and lastly the lobes themselves are rose-coloured (f. 129).

3 R. reticulátà (Lin. spec. 1. p. 241.) leaves erect, subulate, ciliated; flowers solitary; lobes of calyx ciliated, short, entire; corolla white, twice the length of the calyces lobes. G. Native of the Cape of Good Hope. Lam. ill. 2527. Petiv. mus. 21. f. 157. ex Lin.—Roy. hortg. 248. Stems or branches pilose, very leafy. Flowers solitary, terminating the branches, and axillary at the top of the stem.

Reticulated-leaved Roella. Shrub ½ to 1 foot.

FIG. 129.

Thunberg’s Roella. Shrub 1 foot.

5 R. Dunánthi (Alph. D. C. mon. p. 175.) leaves ciliate, linear, acuminate, ciliated; flowers solitary or glomerate; lobes of calyx downy inside, remotely toothed; corolla longer than the calyces lobes. G. Native of the Cape of Good Hope. Roella, Eklom, in herb. Dunant. Stem branched, naked at the base; branches diffuse. Leaves most numerous on the upper part of the branches. Flowers terminal, solitary, or 1-5 in a fascicle. Corollas white.

Dunant’s Roella. Shrub 1 foot.

6 R. cineára (Alph. D. C. mon. p. 175.) leaves ciliate, linear-subsulate, remotely dentilated, rather tomentose at the base; flowers solitary or in fascicles; lobes of calyx entire, glabrous; corolla twice the length of the calyces lobes. G. Native of the Cape of Good Hope. Campánula cínéreá, Thunb. prod. p. 38. mem. acad. peterb. 4. p. 368. t. 6. f. 4. R. glabrilla, Banks, herb. Stem simple. Leaves usually furnished with smaller ones in their axils. Flowers sessile, 4-6 at the top of each stem, surrounded by leaves.

Cinerea Roella. Shrub 1 foot.

Spiked Roella. Shrub decumbent.

8 R. squarrosá (Thunb. in Lin. suppl. p. 134.) leaves ovate, acute, decurrent, cuspitate at the apex, and recurved, with ciliated and setaciously toothed margins; flowers glomerate; bracteas broad, ovate, acuminate; lobes of calyx ovate, acuminate, ciliated, one-half shorter than the corolla, which is white. G. Native of the Cape of Good Hope. Lam. ill. 2579. Att. hort. kew. ed. 2d. vol. 1. p. 354. Stem branched, reddish; branches diffuse, reddish. Flowers disposed in terminal fascicles.

** ** Perennial, trailing, branched plants. Branches filiform, very leafy. Leaves stiff. Tube of calyx naked, filiform.

9 R. muscósá (Thunb. in Lin. suppl. p. 143. prod. p. 38.) leaves spreading, ovate, acute, remotely serrate, glabrous; flowers solitary; lobes of calyx ovate-acuminated, entire; glabrous, or a little ciliated, 3 or 4 times shorter than the corolla, which is blue. G. Native of the Cape of Good Hope, in a large ditch in front of the Table Mountain. Rœm. et Schultes, syst. 5. p. 75. Alph. D. C. mon. p. 177. R. esnótissa, Banks, herb. Burch. cat. pl. afr. no. 636. A humble trailing plant, with diffuse branches. Flowers terminal, sessile.

** ** Plant annual. Stem herbaceous, erect. Leaves thin, broad. Tube of calyx naked, ovoid.

10 R. decúrrentes (Lher. sert. angul. p. 2, t. 6.) leaves spreading, decurrent, ovate-oblong, ciliated at the base, nearly entire; flowers solitary; lobes of calyx acuminated, ciliated, 3 times shorter than the corolla. G. Native of the Cape of Good Hope. Att. hort. kew. ed. 1st. vol. 1. p. 236. Lam. ill. no. 2582. Rœm. et Schultes, syst. 5. p. 74. exclusive of syn. bot. rep. t. 238. Stem branched, very leafy, pilose. Flowers terminal, blue?

5.
CAMPANULACEÆ. XI. ROELLA. XII. PHYTLEUM.

† Doubtful species.

Peduncled-flowcred Roella. Shrub 1 foot.

Bracteate-flowcred Roella. Shrub 1 foot.

CAMPANULÆ (this tribe contains plants agreeing with the genus Campánula in the fruit dehiscing laterally. Capsules dehiscing at the sides.)

Lin. syst. Pentandria, Monogynia. Calyx 5-cleft. Corolla 5-parted; segments cohering together a long time, and in one species always. Stamens 5, alternating with the lobes of the corolla; filaments long, filiform, broadest at the base; anthers free; pollen vacuolous or reddish. Style filiform, pilose. Ovarium inferior, 2-3-celled. Capsule dehiscing laterally by 2-3 valves at the base or middle part. Seeds ovoid, sometimes a little compressed, usually shining. Perennial herbs. Leaves alternate; radical ones petiolate, different from the cauline ones, larger and broader. Flowers sessile, or on short pedicels, disposed in spikes or heads. —Natives of the temperate parts of Europe, or nearly in the same latitudes in Asia.

Sect. I. Syzygotama (from συζυγοϛ, συζυγοϛ, together; and τον, τον, a section; in reference to the cohesion of the segments of the corolla). Segments of corolla always cohering at the apex. Filaments hardly broader at the base. Stigmas 2. Capsule 2-celled.

Sect. II. Hydrastrum (from ἴδρα, ἴδρα, a seat; and ἄνθος, ἄνθος, a flower; in reference to the flowers being sessile). Segments of corolla cohering a long time at the apex, but at length becoming free. Filaments expanded at the base. Stigmas 2-3. Capsule 2-3-celled. Flowers sessile, densely crowded, usually many from the axil of each bractea.

§ 1. Heads at the time of blossoming hemispherical or globose, but at length either globose or somewhat egg-shaped.

* Bracteas numeros, equal, and broad.

2 P. globulariaefolium (Stemmb. in Hoppe, denk. bot. in regensb. 2. p. 109.) radical leaves crowded, obovate, broad, a little toothed at the apex: cauline leaves few, sessile, obovate-lanceolate, somewhat ciliated; heads few-flowered; bracteas very broad, obovate-roundish, ciliated, a little toothed at the apex. ‡ H. Native of Illyria, Carniola, and Carinthia, on the Alps, and on the Alps of Salisburgh. Rechb. icon. bot. cent. 4. p. 49. t. 178. Rem. et Schultes, syst. 5. p. 76. exclusive of syn. of All. Vill. Lam. and D. C. Hall. and Bauh. P. pauciflorum, Henke, in Jacq. coll. 2. p. 63. Host, fl. austr. l. p. 274. but not of Lin.—Mor. oxon. 2. p. 464. sect. 5. t. 5. f. 50. Plant glabrous, except the cilié at the base of the leaves. Corollas blue. Globularia-leaved Ramplion. Fl. May, July. Cit. 1820. Pl. 1 to 2 inches.

Few-flowered Ramplion. Fl. May, June. Cit. 1823. Pl. 2 to 5 inches.

6 P. hemisphæricum (Lin. spec. 1. p. 241.) leaves entire; radical ones narrow-linear; cauline ones linear-lanceolate; bracteas ovate, acuminate, nearly entire, ciliated. ‡ H. Native of the Alps from Provence to Carinthia, towards the east, even to Transylvania; and on the north, to the woods of Herceg and Hassia; and on the west, on the mountains of Auvergne and Cevennes, as well as of the Pyrenees and Arragone. Jacq. icon. rar. t. 333. Lam. ill. no. 2584. t. 124. f. 2. Rechb. icon. bot. t. 363. P. Michélii, Lapeyr. aabr. p. 109. P. pauciflorum, Lapeyr. aabr. p. 109. P. intermedium, Hegeschw. reis. 147. t. 17. P. graninifolium, Sieb. herb. fl. austr. no. 71.—Column. ephir. 2. p. 23. t. 26.—Mor. hist. 2. p. 465. sect. 5. f. 58. Plant glabrous. Heads of flowers globose; corollas blue. Far. §; flowers white or yellow. ‡ H. Native of Switzerland and Monaco.

5 P. carestei (Biroî, in act. taur. 5. p. 315. with a figure). radical leaves crowded, lanceolate, on long petioles, nearly quite entire; cauline leaves linear-lanceolate, somewhat serrated; bracteas spreading or reflexed, broad-ovate, acuminate, acutely serrated, glabrous. ‡ H. Native of Corsica, on the moun-

Carestia Rampon. Pl. 1/2 to 1/2 foot.

For, c, Colinaeus (Alph. D. C. mon. p. 188.) radical leaves small, ovate-cordate; lower cauline leaves lanceolate, serrated — Column. cephr. pt. 2. p. 223 t. 224.

* * * Bracteas few, unequal, narrow.*

10 P. Schenchzéri (All. pedem. no. 428. t. 59. f. 2.) radical leaves petiolate, ovate-lanceolate, bluntly serrated; lower cauline ones linear-lanceolate, acutely serrulated; upper ones linear, nearly entire; heads spherical; bracteas very long, reflexed. 2. H. Native of Vallais, and nearly throughout the whole southern declivities of the Alps from Piedmont, through Provence, even to Tyrol. Sims, bot. mag. 1797. Rechb. icon. bot. t. 366. P. ovatum, Lam. ill. no. 2585. exclusive of the syn. All. t. 7. f. 3. P. corculatum, Clairv. man. p. 63. Gaud. fl. helv. 2. p. 177. —Schenchz. in. 6. p. 400. Plant glabrous. Corollas deep blue.

§ 2. Heads cylindrical, conical, or ovate at the time of flowering, but at length they become more elongated.

Var. β; flowers deep blue. 2. H. P. scorzonerifolium, Sims, bot. mag. t. 2271.

12 P. Michelii (All. pedem. 1. p. 115. no. 427. f. 7–8.)

13 P. betonicifolium (Vill. dauph. p. 2. p. 518. t. 12. f. 3.) lower leaves oblong, acuminate, simply serrated; superior ones linear-lanceolate, nearly entire; spikes ovoid, almost bracteate; stigmas 3. 2. H. Native of the Pyrenees, Provence, alps of Dauphiny, Savoy, Switzerland, Apennines, Carniola, Bohemia, &c. Richb. Icon. bot. t. 250. but not of Sims. bot. mag. Stems glabrous. Leaves glabrous or pilose. Corollas blue.

Var. γ. sessilifolium (Alph. D. C. l. c.) radical leaves sessile, crowded, linear-lanceolate, not coriaceae. 2. H. Native of Savoy, on the mountain called Cranmont, and on St. Bernard.

14 P. veronicetifolium (Schr. in litt. ex Alph. D. C. mon. p. 196.) lower leaves on long petioles, coriaceae, linear-lanceolate, simply serrated; superior ones sessile, linear-lanceolate, serrulate; spikes cylindrical, acuminate; bracteae setaceous, glabrous; calyxes glabrous; stigmas 2-3. 2. H. Native of Salisbury, in the valley of Cillara. Root turnip-formed. Leaves pilose. Stem downy at the base, simple. Corollas blue.

Speedwell-leaved Rampon. Pl. 2 feet.

Peacht-leaved Rampon. Pl. 1 to 2 feet.

Var. β. bracteatum (Alph. D. C. mon. p. 198.) plant pilose; cauline leaves large, on long petioles; bracteae long. 2. H. Native of the Pyrenees. P. Hallér, D. C. et Dub. bot. gall. p. 313. but not of Lam.

Black-flowered Rampon. Fl. June, July. Cl. 1820. Pl. 1 to 2 feet.

Balbis's Rampon. Pl. 1/2 foot.

Sect. III. Podanthum (from ποδός, ποδός, a foot; and ἄνθος, ἄνθος, a flower; in reference to the flowers being pedicellate). Segments of corolla cohereing a long time at the apex, but not at length. Filaments expanded at the base. Stigmas 3. Capsule 3-celled.—Flowers on short pedicels, disposed in loose spikes, 2 or 3 rising from the axil of each bract.

22 P. collimum (Guss. pl. rar. p. 97. t. 10.) stem nearly simple; radical leaves lanceolate, attenuated at both ends, roughish, repandly denticulated; spikes somewhat interrupted; capsules turbinate, scabrous. 2. H. Native of Javgyra, on arid hills, by the sea side. Campánula virgata, Ten. fl. neap. 1. p. 66. but not of Labill. Stems downy, simple or a little branched. Leaves glabrous or downy. Corollas blue.

Hill Rampon. Pl. 1 foot.

23 P. lobeloides (Wild. phyt. 1. no. 20. t. 1. f. 2.) stem
nearly simple, roughish; leaves scabrous, petiolate, linear-lanceolate, acutely dentilicate; flowers scattered, on short pedicels; calyxes scabrous. \*II. H. Native of Armenia.—Tourn. cor. p. 4. Flowers solitary or twin, blue.

\*Lobelia-like Rampion. Pl. \(\frac{1}{2}\) foot.

24 P. \*Lanceolatum (Willd. spec. i. p. 924. Desf. in ann. mus. 11. p. 55. t. 5. or coirsi, des. pl. p. 84. t. 24.) glabrous; stems branched; radical leaves crowded, on short petioles, lanceolate, serrated; flowers scattered, solitary, on short pedicels. \*II. H. Native of Armenia. Alph. D. C. mon. p. 204.—Tourn. cor. p. 4. Stems 2-3, rising from the middle of the radical leaves, almost naked. Flowers scattered on the tops of the stems. Corollas white, with red nerves.

\*Lanceolate-leaved Rampion. Fl. June, July. Clt. 1826. Pl. \(\frac{1}{2}\) to 1 foot.

25 P. \*Rhipidium (Sibth. et Smith, prod. fl. græc. i. p. 149.) stem glabrous; radical leaves crowded, petiolate, elliptic-oblanceolate, repand, glabrous; petioles imbricate at the base; flowers spike-like; bracteas fringed. \*II. H. Native of Mount Olympus. Leaves rosulate, very like those of Globularia acadus. Flowers disposed in a loose spike.

\*Repand-leaved Rampion. Pl. \(\frac{1}{2}\) to \(\frac{1}{2}\) foot.

26 P. \*Sigillum (Willd. spec. i. p. 925. exclusive of the syn. of Tourn.) stem very simple, glabrous; radical leaves linear-lanceolate, furnished with very minute teeth on the edges; flowers scattered. \*II. H. Native of the Levant. Peduncles branched a little, 3-flowered.

\*Stiff Rampion. Pl. \(\frac{1}{2}\) foot.

27 P. \*Canescens (Waldst. et Kt. pl. hung. i. p. 12. t. 19.) plant scabrous; stems simple; cauleine leaves sessile, ovate-lanceolate, crenulat; flowers disposed in long spikes. \*II. H. Native of Hungary, Transylvania, Galicia, Podolia, Tauria, and Caucasus. Leaves greyish. Flowers 1-3 from the same bracteae, sessile. Corolla of a violet blue colour. Plant yielding a yellow viscid juice.

\*Willow-leaved Rampion. Pl. \(\frac{1}{2}\) to 1 foot.

30 P. \*Amplexicaule (Willd. spec. i. p. 925.) glabrous; stems simple; cauleine leaves somewhat stem-clasping, ovate-acute, broad, acutely serrated; spikes dense, fascicled; calyce capillary. \*II. H. Native of Armenia. Sibth. et Smith, fl. græc. t. 219.—Tourn. cor. p. 4. Flowers sessile, 1-3 from the same bracteae. Corollas blue.

\*Stem-clasping-leaved Rampion. Pl. 1 to 1\(\frac{1}{2}\) foot.

†Species little known.

31 P. \*Siérraen (Vest, ex Rom. et Schwantes, syst. 5. p. 77.) heads many-flowered; flowers all bracteate; bracteae oblong, stiff, acute; leaves all linear-cuneate, toothed; stem erect, leafy. \*II. H. Native of Siberia. P. pauciflorum, Johann. herb. ex Rom. et Schwantes. Stem 2 inches high. Leaves 3-4 lines long. Heads of flowers like those of some species of Scabiosa or Globularia.

\*Siérraen-leaved Rampion. Pl. 2 inches.

32 P. \*Inequatum (Kit. ex Schwantes, fl. austr. ed. 2d. no. 883.) heads nearly globose; radical leaves lanceolate, unequal at the base, cordate, serrated; cauleine leaves linear; superior leaves sessile, quite entire. \*II. H. Native of Austria. Rom. et Schwantes, syst. 5. p. 80. Very nearly allied to P. Charnelii.

\*Unequal-leaved Rampion. Pl. \(\frac{1}{2}\) to 1 foot.

33 P. \*Fistulorum (Reich. fl. desd. fl. bot. zeit. 5. p. 531.) leaves lanceolate, a little toothed, acuminated; stem erect, simple, striated; heads cylindrical. \*II. H. Native of Austria. P. Schuebërii, Schmidt, fl. bohem. f.i. f. fl. desd. ed. 2. P. orbiculare, Buch. fl. desd. f. fl. desd. ed. 1. P. orbiculare alpinum, Jacq. fl. austr. 437. left-hand figure. This plant has a very peculiar habit, but the flowers have not been seen.

\*Fistular Rampion. Pl. 1 foot.

34 P. \*Stylosum (Bess. cat. hort. crem. 1816. Rom. et Schwantes, syst. 5. p. 86.) Nothing is known of this plant but the name.

\*Long-styled Rampion. Pl.

\*Minute Rampion. Pl. decumbent.

36 P. \*Surisica (Sieb. in Spreng. syst. 1. p. 810.) stem creeping, diffuse; leaves spatulate, suberubinate; heads terminal; bracteae ovate, crenulat, equal in length to the flowers. \*II. H. Native of Asia Minor.

\*Sinue Rampion. Pl. creeping.

\*Cult. All the species of Phyteuma being hardy and ornamental, they are well fitted for decorating flower-borders, or rock-work. They grow in any common garden soil, and are readily increased by division or by seeds.

XIII. PETROMARULA (from πετροσ, petros, a rock; and μαρων, maron, a bitter herb; the plant is bitter, and grows on rocks by the sea side). Bellus. episc. 1. in Clus. hist. pt. 2. p. 299. Alph. D. C. mon. p. 209. Phyteuma species. Lin.

\*Lin. syst. Pentandria, Monogyza. Calyx 5-cleft. Corolla 5-parted. Stamens 5, alternating with the lobes of the corolla; filaments broad at the base, longer than the anthers; pollina violaceous. Style glabrous; stigma capitate, 3-lobed, rather pilose. Ovarium 3-celled, inferior. Capsule erect, dehiscing laterally by 3 pores in the middle part.—An herb, native of Candaia.—First radical leaves petiolate, ovate, acute; those afterwards pinnate, with the petioles margiunated and lobed. Flowers pedicellate, disposed in loose racemes.

1 P. \*Pinnata (Alph. D. C. mon. p. 203.). \*II. or \*III. H. Native of Candaia, on rocks by the sea side. Sweet, fl. gard. n.
CAMPANULACEAE. XII. PETROMARULA. XIV. MICHAXIA. XV. CAMPAANULA.

Var. 𝜋, pubescens (D. C. prod. 4. p. 209.) panicle and calyxes downy. §. or H. Native of Caudia. Phyteuma pinnatum. Rchb. hort. bot. t. 137. 

CULT. A light rich soil, and a warm sheltered situation, are the best for this plant. It is increased slowly by division, but plentifully by seed. The plant requires shelter in severe weather in winter.

LIN. SYST. OCTANDRIA, Monogyinia. Calyx 8-10-cleft, with the leaves covering by appendages. Corolla 8-10-parted, rotund. Stamens 8, free; filaments very broad, membranous, approxi- mately at the base; anthers yellow, capitate at the apex. Style covered by hairs, which are disposed in 16 rows; stigmas 8, filiform. Ovarium wholly inferior, 8-celled: cells opposite the calyce lobes. Capsule drooping, 8-10-valved, dehiscing at the base. Seeds numerous, ovate, rustic, inserted in fleshy receptacles, which are situated at the inner angles of the cells. —Handsome biennial herbs, natives of the Levant, with the habit of Campánula, but the racemes or sinuses of the calyx are covered, and the leaves are lyrate.

2 M. LEVIAGÁTA (Vent. cels. t. 81.) stem glabrous; leaves hispid, doubly toothed; radical ones ovate, on long petioles; cauline ones sessile, oblong, lower ones attenuated at the base, upper ones cordate; appendages of the sinuses of the calyx longer than the lobes. §. H. Native of Persia. Gärtn. fruct. suppl. p. 162. t. 211. f. 6. Hook. bot. mag. 3128. M. decándara, Fisch. Root branched. Stem and leaves glaucescent, the latter stigrose. Flowers on short pedicels, horizontal, solitary, and scattered along the top of the stem and branches, decandrous, whitish. Calyx, corolla, and stigma, 10-parted.

CULT. The seeds only require to be sown in the open ground, and the plants treated like other biennials. They require some protection in severe weather in winter.

LIN. SYST. PENTÁDRIA, Monogyinia. Calyx 5-cleft, having the sinuses usually covered by appendages. Corolla 5-lobed or 5-cleft at the apex, usually bell-shaped. Stamens 5, free; filaments broad at the base and membranous. Style covered by fascicles of hairs, except at the base; stigmas 3-5, filiform. Ovarium wholly inferior, 3-5-celled. Capsule 3-5-valved, dehiscing laterally. Seeds usually ovate, flattened, sometimes ovoid, and small.—Herbs usually perennial, rarely annual or biennial. Radical leaves usually different in form from the cauline ones, especially in size. Flowers for the most part pedunculate, usually racemose, rarely spicate or glomerate, blue or white.—All the species are inhabitants of the northern hemisphere.—The names Trachitrichia and Cerciáriæ are the oldest names used for this genus, which were given to it on account of its supposed efficacy in the cure of disorders of the neck and trachea; hence it has the name of Halskræut or Halawort in German, Halsurt in Danish, and Thröstur in English; and some European species have the name of Rapnículus, from the resemblance of the root to that of a turnip; hence they have the names Rápon, Rapúnit, Rapnucleus, &c., from whence spring the French name Raiponce, the German Rapunzel, the Spanish one of Rapúnchigo, and the English one of Rapunzel.

§ 1. Capsule 3-5-celled. Stigmas 5.—Stems many-flowered. Radical leaves on long petioles.—Inhabitants of Greece and the adjacent regions.

* Lower leaves irregularly lyrate or jagged; petioles marginated and lobed.

1 C. críspa (Lam. dict. 1. p. 581.) glabrous; stems simple; leaves smooth, coarsely and crenately toothed; radical ones bilate, jagged; cauline leaves sessile, ovate, acute; flowers pyramidal, racemose; calyx scabros, with the appendages of the sinuses small and tooth-formed; corolla broad, campanulate, roughish on the outside. §. H. Native of Armenia, about the city of Kas and Erzeroum. Alph. D. C. mon. p. 216.—Tourn. cor. 3. voy. 2. p. 370. Flowers disposed as in C. pyralidalis, rising from the lower or middle part of the stem to the apex from the axils of the leaves. Corolla very open, white or blue.

Curled Bell-flower. Fl. 1 to 1 ½ foot.

2 C. Crís'tis (Alph. D. C. mon. p. 217.) plant velutin; stem ascending; lower leaves irregularly lobed; terminal lobe crenated, ovate, acute; superior leaves sessile, obovate crenated; flowers disposed in long panicles; appendages of the sinuses of
the calyx small, tooth-formed; corolla tubular, velvety, 4 times longer than the calyceous lobes.  {5.} H. Native of Greece.

Celt's Bell-flower. Fl. 2 feet.

3. C. rupestris (Sibth. et Smith. prod. 1. p. 143. fl. grac. t. 213.) stems ascending, pilose; leaves hoary; radical ones irregularly pinnate, crenately toothed; terminal lobe roundish; cauline leaves sessile, ovate, a little toothed; flowers disposed in loose racemes; lobes and appendages of calyx triangular; corolla velvety, tubular, twice longer than the calyces.  6. H. Native of Spain and the Morea, among rocks. C. lauginoæa, Willd. in hort. berol. 1. p. 218. but not of Lam. Stems branched. Corolla pale blue, with a white throat.

Rock Bell-flower. Pl. ascending.

4. C. tomentosa (Lam. dict. 1. p. 584. ill. no. 2537.) plant clothed with hoaryomentum; radical leaves petiolate, irregularly lyrate, crenate-toothed; cauline leaves sessile, ovobate; upper ones lanceolate; flowers in loose racemes; appendages of the sinuses of the calyx ovate-lanceolate, one-half shorter than the lobes, which are long-acuminated; corolla tubular, silky, hardly twice the length of the calyceous lobes.  7. H. Native of the Levant. C. lauginoæa, Willd. in hort. berol. {1. t. 213} but not of Lam. Stem branched. Peduncles 1-3-flowered. Corollas white.

Var. ß; petals of radical leaves less lobed.  8. H. Native of Candia. C. tubulosa, Desf. pl. cor. in ann. mus. 11. p. 142. t. 17.—Tourn. cor. p. 3.

Tubular-flowered Bell-flower. Fl. 1 to 2 feet.

** Lower leaves regularly ovate or lanceolate; petals not margined.

10. C. betonicifolia (Sibth. et Smith. prod. 1. p. 141. fl. grac. t. 210. but not of Bieb.) stem erect; leaves elliptic-oblong or ovate, acute, crenate-toothed; radical leaves on short petioles; calyceous lobes ovate-acute, having the sinuses reflexed and length of the lobes; corollas tubular.  9. H. Native of Mount Olympus, in Bithynia. Plant pilose. Stem branched. Flowers terminal and axillary; the branches usually bearing 3 flowers. Corollas purplish-blue, with a pale yellow base.

11. C. corymbræs (Desf. pl. cor. in ann. mus. 11. p. 139. t. 15. choix. p. 49. t. 30.) stem erect; leaves ovate-acute, crenately toothed; radical ones petiolate; cauline ones sessile; lobes of calyx long-acuminated; appendages of the calyx ovate-acute, one-half shorter than the lobes; corolla campanulately tubular.  9. H. Native of Candia.—Tourn. cor. 3. Plant pilose. Stem branched. Flowers disposed in loose corymbs, 1-3 at the top of each branch. Corolla bluish violet.

Corymbos-flowered Bell-flower. Fl. May, July. 1820. Fl. 2 feet.

12. C. felvetorum (Lam. dict. 1. p. 586. Desf. choix. in ann. mus. 11. p. 141. t. 16.) stems ascending; radical leaves petiolate, ovate, crenate-toothed; cauline ones nearly sessile, ovate-acute; calyceous lobes ovate-acuminated; appendages of the recesses of the calyx length of the lobes, ovate-roundish; corolla large, campanulate.  9. H. Native of Candia.—Tourn. cor. inst. p. 3. Plant hairy. Flowers 1+ at the extremity of each branch. Corollas large, of a greyish-blue colour.

Borneo-flowered Bell-flower. Fl. May, July. Fl. 1 foot, ascending.

13. C. mædium (Lin. spec. 1. p. 236.) stem erect; leaves sessile, ovate-lanceolate, crenate-toothed; calyceous lobes ovate-acuminiated, with the appendages of the sinuses reflexed and large, but one-half shorter than the lobes; corolla campanulate, inflated.  9. H. Native of the south and east of Europe, as about Naples, Carniola, about Constantinople, north of Italy, Provence, Dauphiny at a place called Grande-Chartreuse, Bavaria, Thuringia, Austria, Transylvania, &c., on the mountains; and of Caucasus and Tauria, Hill. syst. 8. t. 7. St. Hil. pl. de. fr. t. 72. C. grandiflora, Lam. fl. fr. 3. p. 334. Mædio, Dioscor. Debray, floril. nov. t. 75. Tabern. icon. 315.—Swert, floril. t. 16. f. 6. —Park. parad. 355. f. 3.—Lob. icon. 324.—Besl. hort. syst. 1. t. 3. f. 2-3.—Mor. oxon. 2. p. 459. sect. 5. t. 3. f. 50.—Gard.
CAMPANULACEÆ. XV. Campanula.  

Aix. 1. p. 75. t. 13.—Weinm. phyt. t. 289. Plant hairy. Stem branched. Flowers numerous, large, disposed in racemes. Corollas blue, purple, and white, single and double. It is a very handsome and common border biennial.

Lactif., a monstrous polypetalous plant. Alph. D. C. mon. t. 3 f. A.

§ 2. Capsule 3-celled. Stigmas 3.—Flowers solitary, rarely capitulate, few or many.

* Stems 1-flowered. Radical leaves crowded.

14 C. Ada'mi (Bieb. fl. taur. 1. p. 153.) leaves ciliated a little: radical ones on long petiolae, ciliate-spatulate, coarsely toothed at the apex; cauline leaves sessile, obovate or linear, serrate-toothed; calyx rather pilose, with acuminate lobes, which are 3 times shorter than the corolla; appendages of the sinuses of the calyx 3 times shorter than the lobes, obtuse, acuminate. 2. H. Native of the Alps of Caucasus. Bieb. cent. pl. ross. 1. t. 16. Alph. D. C. mon. t. 9 f. 1. Plant to 1 ft. high. Roots woody. Stems simple. Flowers nearly erect, one on the top of each stem. Corolla funnel-shaped, bluish. Radical leaves tufted.

16 C. Filosâ (Pall. miss. Willd. ex Reem. et Schultes, syst. 5. p. 148.) leaves ciliated at the base; radical ones oblong-obovate, petiolate, crenulat: cauline ones linear, acuminate, sessile, entire; lobes of calyx ovate, acuminate, ciliat, 3 times shorter than the corolla; corolla funnel-shaped, with a bearded throat. 2. H. Native of Siberia. Ledeb. fl. ross. alt. ill. t. 209. Stems simple, hairy, 1-flowered. Corolla blue, form of those of C. saxifraga, bearded, drooping.

Phila Bell-flower. Pl. 1/2 to 2/3 foot.

17 C. saxifraga (Bieb. fl. taur. 1. p. 155.) stems smooth; leaves a little ciliated, pilose: radical ones on long petiolae, lanceolate-spatulate, crenulat: cauline leaves sessile, entire, ligulate; lobes of calyx broad, acuminate, glabrous, twice shorter than the corolla; appendages of the sinuses of the calyx ciliat, acuminate, doubly shorter than the lobes. 2. H. Native of Caucasus, on the upper part of Mount Beshtan, where it forms broad tufts. Alph. D. C. mon. p. 228. t. 10 f. 2. Leaves ciliat, with soft, hardly perspicuous hairs. Stem simple, 1-flowered. Flowers erect, blue.

Saxifrage Bell-flower. Fl. June, July. Pl. 1/2 to 2/3 foot.

18 C. ciliata (Stev. mem. soc. hortic. 3. p. 256.) stem rather pilose; leaves ciliated with stiff hairs; radical leaves almost sessile, obovate-lanceolate, crenulat, shining: cauline ones ligulate, ciliat, a little at the base: lobes of calyx ciliat, linear-acuminate, one-half shorter than the lobes of corolla; appendages of the sinuses of the calyx ovate-acute, 4 times shorter than the lobes. 2. H. Native of the higher alps of Caucasus, in stony places. Mèdium Saxifragum. Fisch. in litt. Stem solitary, 1-flowered. Lower leaves rosulate. Flower erect, blue.

Ciliated Bell-flower. Pl. 1/2 foot.

19 C. Altaica (Alph. D. C. mon. p. 229. t. 10 f. 3.) radical leaves petiolate, long-lanceolate, crenat, glabrous; calyces ligulate, a little toothed, smooth; tube of calyx downy, but with the lobes smooth and doubly shorter than the corolla, which is funnel-shaped; appendages of the sinuses of the calyx subulate, villous, 3 times shorter than the lobes. 2. H. Native of the Altai mountains, about Sayen; and of Persia. C. Sayenensis, Fisch. cat. hort. gorenk. 1808. p. 52, but not of Pall. Médium Sayanense, Fisch. in litt. C. frigida, Pall. in herb. Lam. Stems slender, 1-flowered, glabrous. Corolla blue, nutant.

Allais Bell flower. Pl. 1/2 foot.

20 C. dayynthia (Bieb. fl. taur. suppl. p. 117.) radical leaves ovate, acute, petiolate, crenat, smooth; cauline leaves sessile, lanceolate, entire, downy; calyces lobes ovate-lanceolate, 3 times shorter than the corolla, which is funnel-shaped; appendages of the sinuses small and subulate. 2. H. Native of the Aletun Islands; very frequent in the Unalaska, Behring's Island, and Behring's Straits. Rchb. icon. bot. 1. p. 70. t. 85. f. 178.—Gmel. sib. 3. p. 160. no. 28. Stem 1-flowered, pilose or glabrous, nearly naked. Flowers nearly erect, almost naked. Radical leaves rosulate. Corolla large, blue (f. 131).

White Bell-flower. Pl. ¼ to ½ foot. 27 C. calamensifolia (Linn. dict. 1. p. 588.) plant clothed with greyish down; stems decumbent, branched; leaves toothed: radical ones rosulate, somewhat spatulate: cauline leaves obovate; lobes of calyx lanceolate, one-half shorter than the corolla; sinuses of calyx short, tooth-formed. Y. H. Native of the island of Naxia. Desf. cor. in ann. mus. 11. t. 12. Stems numerous. Radical leaves rosulate. Flowers disposed in a loose leafy raceme, erect, pale rose-coloured.

Calaminit-leaved Bell-flower. Pl. decumbent. 28 C. edulis (Forsk. fl. aegypt. arab. p. 106. and 44. Alph. D. C. mon. p. 223.) plant hispid; root thick; stems erect, simple; leaves 1-flowered; leaves ovate-lanceolate, a little crenulated; calyceous lobes linear-lanceolate, equal in length to the corolla, which is hispid. Y. H. Native of Arabia Felix. Root thick, sapid, and is eaten by children like those of many other species under the names of chobs and okab. Corolla tubular, pale blue or white, with violeaceous veins.

Edible-rooted Bell-flower. Pl. ¼ foot. 29 C. strigosa (Russ. aegyp. ex Rœm. et Schultes, syst. 5. p. 142. Vahl. symb. 3. p. 34. 1831.) plant beset with stripy hairy roots; stem erect, with dichotomous branches; leaves lanceolate, entire; calyceous lobes subulate, equal in length to the corolla; appendages of the sinuses of the calyx obtuse. Y. H. Native of the Levant, especially in Syria, about Aleppo. C. Russeliana, Rœm. et Schultes, syst. 5. p. 142. Stem simple at the base, and branched at the apex. Flowers solitary, drooping, rising from the angles of the forks and tops of the branches. Calyx very hispid.

Strigose Bell-flower. Pl. ¼ to ½ foot. 30 C. decorticata (Linn. aegyp. acad. 4. p. 306.) plant clothed with stiff hairs; stem erect, with dichotomous branches; calyceous leaves ovate, acute, a little crenated; flowers sessile in the forks of the branches; calyceous lobes long, subulate, one-half shorter than the corolla; appendages of the sinuses of the calyx subulate, one-half shorter than the lobes. Y. H. Native in the region of the Mediterranean; near Athens; in the south of Italy, even to lat. 42°; frequent in Sicily; Spain; about Mogador; Tangiers, &c. Jacq. coll. 5. p. 26. t. 12. Sibth. et Smith. fl. grecce. t. 211. Sweet. brit. fl. gard. t. 280. C. mollis. Var. β, Willd. spec. 1. p. 910. C. Alva. Cav. ann. de cienc. 3. p. 21. Rœm. et Schultes, syst. 5. p. 147. C. decipiens, Rœm. et Schultes, syst. 5. p. 142.—Cupan. pamph. sic. 2. t. 259. Bocc. sic. p. 83. t. 45. f. 1. Moris. oxon. 2. p. 459, sect. 5. t. 3. f. 26. Flowers drooping, terminal, solitary in the forks of the branches and stem, bluish-purple, with a paler tube.

Dichotomous Bell-flower. Fl. July, Aug. Clt. 1820. Pl. ½ foot. 31 C. mollis (Linn. spec. 1. p. 237.) plant velvety from greyish down; stems ascending; leaves nearly entire: radical ones rosulate, spatulate; cauline ones ovate; flowers in loose panicles. Calyx velvety, with acuminated lobes, which are two-thirds shorter than the corolla, and with the appendages of the sinuses short and subulate. Y. H. Native of the region of the Mediterranean; about Tangiers; Candia; near Naples, at a place called St. Roch, and elsewhere in the kingdom of Naples; Spaiu, &c. Curt. bot. mag. t. 404. C. velutina, Desf. fl. atl. 1. p. 180. t. 51. Plant tufted. Stem downy, also often villous. Leaves more or less hoary on both surfaces, villous. Flowers 1 to 5 at the top of each stem, axillary and terminal. Corolla campanulate, pale blue.

Var. β, microphylla (Alph. D. C. mon. p. 238.) cauline leaves small, ovate, acute, a little toothed. Y. H. Native of Spain; in Murcia, about Elin.

Soft Bell-flower. Fl. May, Aug. Clt. 1788. Pl. ascending. 32 C. stricta (Linn. spec. p. 238.) stem branched, pilose; leaves ovate-lanceolate, acute, serrated, pilose; flowers almost sessile, few, solitary; lobes of calyx glabrous, lanculate, 4 times shorter than the corolla, which is tubular; appendages of the sinuses of the calyx ovate, length of lobes, but broader. Y. H. or 3. H. Native of Armenia; Syria, about Damascus, at the mountain called Djebl-cher; and of the island of Cos, on the mountains, and elsewhere in Greece. Desf. cor. in ann. mus. 11. t. 13. Flowers spicate. Corollas blue.

Var. β; leaves narrower, and nearly entire. Y. H. Native of Syria. C. stricta. Labill. pl. syr. dec. 5. t. 4. C. stricta, var. β. Rœm. et Schultes, syst. 5. p. 149.

Var. β, glabra (Alph. D. C. mon. p. 240.) stem leaves gla-
brous, as also the calyx. 2. H. C. Sarmática, Sims, bot. mag. t. 2019. Lodg. bot. cab. t. 581.

34. C. alliariifolia (Willd. spec. 1. p. 910. Salish. par. lond. t. 26.) stems simple, terete, downy; leaves crenulat, hairy beneath; lower ones petiolate, somewhat reniform; upper ones sessile, ovate, acute; flowers spicate racemose; lobes of calyx velvety, hoary inside, lanceolate, acuminate, 4 times shorter than the corolla; which is downy outside; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes. 2. H. Native of Siberia, Georgia, and Caucasus. Röhm. et Schultes, sst. 5. p. 143. C. lamiovii, Bieb. fl. cauc. 1. p. 154. Röhm. et Schultes, sst. 1. p. 754.—Buxb. cent. 5. p. 10. t. 18. Flowers sessile, second, disposed in a long, racemose, loose spike, with a few shorter floriferous branches at its base, the lower flowers often 3 from each bractea. Leaves hispid, and green above, but clothed with hoaryomentum beneath. Corollas white or cream-coloured.

Pl. 2 to 3 feet.

35. C. violacea (Lam. dict. 1. p. 587.) plant hulm, few-flowered, pilose; radical leaves petiolate, ovate-roundish, coriace, crenate: cauline leaves ovate-oblong, toothed; lobes of calyx lanceolate, ciliated, long-acuminated; appendages of sinuses of the calyx ovate, acute, one-half shorter than the corolla; corolla much longer than the calyce lobe. 2. H. Native of Siberia. C. violee, Pers.ench. 1. p. 192. Leaves rather pilose. Flowers 2-3, large, drooping, white, about the size of those of C. Medium.

Violet-leaved Bell-flower. Pl. $\frac{1}{2}$ to 3 foot.

36. C. punctata (Lam. dict. 1. p. 566.) plant pilose; stems simple, few-flowered, terete; leaves ovate, acute: radical ones on long petioles, cordate-ovate, acute, crenate; cauline ones almost sessile, toothed; lobes of calyx ciliated, long-lanceolate, 3 times shorter than the corolla; appendages of the sinuses of the calyx ovate, acute, one-half shorter than the lobes. 2. H. Native of Siberia, in the provinces called Okotok and Jakutsk; and of Dahuria, even to the Eastern Ocean; also of Japan. Sims, bot. mag. t. 1723. Schrank, pl. rar. fasc. 9. t. 87. C. Trachelium, Thunb. fl. jap. p. 88.—Gmel. sib. 3. p. 155. t. 30. no. 25. Stem usually downy, panicked at top. Flowers large, purplish. Corolla dirty-white, spotted with purple inside.

Pl. $\frac{1}{2}$ to 1 foot.

Diverging Bell-flower. Fl. June, July. Clt. 1814. Pl. 1$\frac{1}{2}$ foot.

Var. a. paniculata (Alph. D. C. mon. p. 244.) panicle divaricate. A broad-leaved garden variety, very like C. divergens.

Var. s. abortiva (Alph. D. C. mon. p. 241.) plant 2 inches high, 3-flowered; leaves linear-spatulate; flowers small. 2. H. Native of Vienna, in very dry places.

Siberian Bell-flower. Fl. July, Sept. Clt. 1783. Pl. 1 to 1$\frac{1}{2}$ foot.

Small-flowered Bell-flower. Fl. 1 to 2 feet.

40. C. caucasia (Bieb. capp. p. 140. append. no. 14. fl. taur. 1. p. 155. Stev. mem. soc. mosc. 3. p. 256.) plant hulmble; stems erect, branched, terete, scabrous, pilose; leaves crenulat, lower ones obovate, obtuse, petiolate; superior ones lanceolate, sessile; peduncles few-flowered, diverging; lobes of calyx acuminated, ciliated by hairs, 4 times shorter than the corolla; appendages of the sinuses of the calyx ovate-acuminated, one-half shorter than the lobes. 2. H. Native of Caucasus, in sub-alpine stony places. Root creeping. Leaves scabrous. Flowers few, terminal and axillary, drooping. Corollas glabrous outside, but bearded inside, of a violaceous blue-colour.

41. C. affinis (Röhm. et Schultes, sst. 5. p. 140.) stems hispid with deflexed bristles; cauline leaves linear-lanceolate, ciliate, very long. 2. H. Native of Spain, on Mount Lujo. Root horizontal. Stems numerous, simple. Leaves glabrous, but ciliated with reflexed bristles. Flowers at first erect, but at length drooping. Corolla above an inch long, blue.

42. C. barbata (Lin. spec. 236.) stems nearly simple, terete, pilose; leaves villous, nearly entire; radical leaves crowded, lanceolate: cauline leaves few, ligulate; racemes loose, few-flowered; calyx pilose, with triangular acuminated lobes; appendages of the sinuses of the calyx ovate, one-half shorter than the lobes; corollas bearded in the mouth. 2. H. Native of the alps of Dauphiny, Piedmont, Savoy, and even to the alps of Salisburgh and Austria; in the south towards Mount Baldo; as well as of Siberia, Saxony, Transylvania, &c. Jacq. obs. pt. 2. p. 14. t. 37. Krock. sil. t. 38. Sims. bot. mag. t. 1298. ex.
CAMPANULACE.A.E. XV. CAMPA\n
ulous of the synonyms. Lodd. bot. cab. t. 788.—C. Banh. prod. p. 36. with a figure.—Moris. oxon. p. 460. sect. 5. t. 3. f. 33. and f. 55. Root thick, white. Flowers nutant, disposed in a loose, often second raceme; pedicels 1-flowered, rising from the axis of the superior leaves. Corolla pale blue or white, glabrous outside, but woolly in the mouth. Pl. ¥/2 foot high. 

43 C. ALPINA (Jacq. enum. vind. 210.) humble; stem nearly simple, furrowed; leaves linear-lanceolate, repandly-crenate, woolly: radical ones crowded, narrowed at the base; flowers pyramidal racemose; calyce long-acuminated, woolly; appendages of sinuses oval-acuminate, ovobo, much shorter than the lobes. 2. H. Native of Europe, on the Alps, especially of Austria, Salzburg, Germany, Silesia, Transylvania, and the Carpathian mountains. Jacq. fl. austral. t. 118. Sims. bot. mag. t. 957.—Clus. hist. 5. p. 171. Root spongy, fusiform. Stem glabrous or woolly. Flowers few or numerous, scattered in a pyramidal manner along the whole of the stem. Corollas deep blue.

*** Flowers capitatus.

45 C. CICHORACE.A (Sibth. et Smith, fl. græc. t. 209.) plant pilose; stem angular, brached; leaves undulate crenated: radical ones obovate, irregularly jagged, petiolate; cauline leaves sessile, linear-oblong, obtuse; bracteas ovate, cordate; calyx pilose, with ovo acute lobes; appendages of sinuses of the calyx obtuse, very like the lobes; corolla tubular, 3 times longer than the calyx. 2. H. Native of Thessaly. C. capitata, Sims. bot. mag. t. 811.? Root fusiform. Leaves undulate. Flowers capitatus, terminal, and from the axils of the leaves. Corollas purplish blue.

46 C. LINGUIRATA (Waldst. et Kit. pl. h ung. 1. p. 65. t. 64.) plant hispid; stem nearly simple; leaves sessile, undulate crenated: lower ones lingually spatulate; superior ones linear-lanceolate; bracteas ovate, acute; calyce oblong, obtuse, setaceous ciliated: appendages of sinuses similar to the lobes; corolla tubular, twice longer than the calyx. 2. H. Native of Hungary, Croatia, and Dalmatia, in woods. Alph. D. C. mon. p. 250. Root branched. Stems many from the same root. Flowers in dense terminal heads, surrounded by setaceous ciliated bracteas.

SECT. I. EUÇONON (from eu, eu, well; and κυκος, kudos, a bell; this section is considered to contain the true species of *Campa\n

§ 1. Capsula erect, dehiscing at the base. Flowers sessile, capitata, or spicate.—*All the species are inhabitants of Europe.

47 C. Jacobinii (Alph. D. C. mon. p. 251.) glabrous; stem firm, glabrous; leaves remotely serrate: lower ones on short petioles, obovate: the rest ovate, bluish and larger; heads of flowers loose, bracteas; calyx velvety, with acuminated lobes much shorter than the corolla. 2. H. Native of the island of Candia, on walls on the Sphaceotic mountains. Phytéuma, Jacquinii, Sieb. herb. cret. Flowers disposed in a loose, terminal, spherical head, on short pedicles. Corollas blue? 

*Jacquinii’s Bell-flower. Pl. ¥/2 to ¥/2 foot.*

48 C. Foliosa (Tenor. fl. neap. 1. p. 71. t. 18.) rather pilose; stem terete; leaves doubly serrated: radical ones ovate, acute, subcordate: cauline ones acuminated; bracteas ovate, acuminated; calyce long-acuminated, ciliated, denticulate, one-third shorter than the corolla, which is tubular; lobes of corolla velvety inside. 2. H. Native of the kingdom of Naples, on the Apennines and Abruzzo. Heads of flowers globose, terminal. Corollas blue.

Leafy Bell-flower. Pl. 1 foot.

49 C. PETREA (Linn. spec. 236.) stem rather woody, hoary; leaves crenulated, hoary beneath: radical leaves petiolate, ovate-lanceolate: cauline ones sessile, linear-lanceolate; heads of flowers dense, surrounded by obtuse bracteas; calyx hoary, with linear obtuse lobes, doubly shorter than the corolla, which is campanulate. 2. H. Native of Mount Baldo, on rocks, in the wooded region; and of the south of France, at a place called Les Escaliers d’Egone. Doll. elem. bot. 2. p. 150. t. 5. f. 1.—Moris. oxon. p. 2. 163. sect. 5. t. 4. f. 44.—J. Bauh. hist. 2. p. 802, with a good figure.—Barrel. pl. gall. p. 10. t. 890.—Pluk. phyt. t. 132. f. 5. Pond. de- 

Rock Bell-flower. Fl. May. Pl. 1 foot, ascending.

50 C. GLOMERATA (Linn. spec. 235.) downy; stems terete; leaves serrulate: radical ones ovate, acute; bracteas ovate, acuminated; calyce oblong-acuminated, twice shorter than the corolla, which is funnel-shaped. 2. H. Native nearly throughout the whole of Europe; especially from Arragon, Pyrenees, south of France, Piedmont, northern part of the kingdom of Naples, Greece, even to Scotland, Sweden, &c.; collected also in Caucasus, Persia, Amtian mountains, and almost throughout Siberia, even to Kantschatka, &c. &c.; in shady rocky places, by river sides, and in dry, open, chalky pastures; plentiful in Britain, in like situations. Smith. engl. bot. t. 90. Gilib. demonstr. bot. t. 30. Oed. fl. dan. t. 1328. Gentianá collina, With. 282. t. 11. f. 3. C. barbata, Spreng. ex Steud. 

5 D 2
C. ciliata, minor, Dodon. pempt. 146. &c.  

**Var.** γ, Niceæensis (Alph. D. C. mon. p. 254.) leaves appressed, ovate, acute, sessile; flowers disposed in short dense spikes.  

**Var.** δ, elliptica (Alph. D. C. mon. p. 255.) leaves on long petioles, elliptic, less ciliate; flowers large, capitate; bracteae large, often longer than the flowers.  

**Var.** η, farniosa (Alph. D. C. mon. p. 268.) leaves sessile, hoary beneath; flowers disposed in terminal heads, and smaller axillary ones, all sessile.  

**Var.** θ, pellusa (Alph. D. C. mon. p. 255.) plant 1-3 inches high; leaves round, ciliate; flowers few, capitate.  

**Var.** υ, flore pleno; flowers double, blue or white.  

**Glomerate-flowered Bell-flower.** Fl. May, Sept. Britain. Pl. 1 to 2 feet.  

51 **C. Cericaria** (Lin. spec. 1. p. 235.) plant beset with stiff pili; stems tufted; leaves crenately serrated; radical ones linear-lanceolate, bluntish, on short petioles; cauline leaves linear, acuminate; bracteae ovate, acute; calyce lobes oblong, obtuse, shorter than the corolla, which is campanulate funnel-shaped.  

52 **C. Multiflora** (Waldst. et Kii. pl. hung. 3. p. 295. t. 283.) plant pilose; stems striated; leaves undulate crenated; lower ones ovate-lanceolate; cauline ones acuminate; spikes interrupted from the flowers being in fascicles; calyce lobes obtuse, 3 times shorter than the corolla, which is tubularly funnel-shaped; capsule bluntly triangular.  

53 **C. Scipicata** (Lin. spec. 1. p. 234.) hairy; stems striated; leaves nearly entire; radical leaves crowded, linear-lanceolate; cauline ones linear-acuminate; spike long, interrupted at the base; calyce lobes ovate, acuminate, 3 times shorter than the corolla, which is funnel-shaped; capsule spheric.  

54 **C. thyrsoides** (Lin. spec. 1. p. 233.) plant pilose; stem tufted; leaves entire, pilose; lower ones lanceolate, obtuse; cauline ones linear-lanceolate, acute; flowers disposed in a dense pyramidal spike; calyx with a glabrous tube, and linear-lanceolate ciliated lobes; corolla oblong, doubly longer than the calycine lobes; style erect; capsule spherical.  

**Species** of the genus **Campanula**. 

* Flowers on more or less elongated pedicels. Radical leaves usually ciliate, petiolate.—Species almost all perennial.  

A. Stems many-flowered. Corolla always glabrous. Capsule ovoid. Species all natives of Europe.  

55 **C. latifolia** (Lin. spec. 233.) stems simple, smooth; leaves large, doubly serrated; radical ones petiolate, corolla, ovate-oblong; cauline ones sessile, ovate-acuminate; flowers disposed in spicate racemes; pedicels erect, 1-flowered; calyce lobes long-acuminate, broad at the base, 3 times shorter than the corolla, which is campanulate funnel-shaped and large.  

56 **C. H.** Native of Europe, from the Pyrenées and north of Italy, even to Scotland; of Caucasus, Lopland, Nordland, Carpathian Mountains, Altai Mountains, and Nipal, always in moist woods and thickets. Frequent in the alps of France and Switzerland. Not unfrequent in Scotland and the north of England, but
more rare in the south: in moist woods and thickets, by the
sides of rivulets. Oed. fl. dan. t. 85. and t. 782. Smith, engl.
bot. 302. C. urticifolia, All. pedem. 1 p. 110. C. Brunonis,
Wall. cat. - Weim. phyt. t. 287. - Park. par. 355. f. 2. - Lob.
ic. 2. t. 278. Stem glabrous, rather a little hairy. Leaves
glabrous, rarely rather scabrous. Flowers solitary, rising from
the axils of the superior leaves. Corollas large, blue, but some-
times white, or bluish-white, glabrous outside, but sometimes
bearded inside. Lobes of calyx often dentilicate.

**Var. β. macráltha** (Alph. D. C. mon. p. 265.) stem and leaves rather plicate; teeth of leaves more distinct; calyx gla-
brose; corollas larger. 2. H. C. macráltha, Fisch. inded.
V. latifólia, var. macráltha, Sims. bot. mag. 2553.

**Var. β. ericócrápa** (Alph. D. C. mon. p. 265.) stem and leaves plicate and pale; leaves less acuminated; tube of calyx very
hispid. 2. H. Native of Caucasus. C. ericócrápa, Bieb. fl.
taur. 1. p. 149. C. latifólia, var. macráltha et ericócrápa,
Fisch, in litt.

**Broad-leaved Bell-flower.** Fl. July. Britain. Pl. 2 to 3 ft.
56 C. trachéllium (Linn. spec. 235.) stems angular, plicate;
leaves scabrous, acuminate, coarsely and crenately toothed:
radical ones petiolate, cordate; flowers disposed in loose rac-
emes; peduncles 1-3-flowered; calyx rather plicate, with trian-
gularly acuminate erect lobes. 1-3 times shorter than the corolla,
which is campanulate. 2. H. Native of Europe, from Spain,
Portugal, Piedmont, Naples, and Greece, even to Scotland,
Sweden, Russia, and the Carpathian Mountains; of Caucasus,
Tauria, Siberia, and even to Japan, in shady places. In Britain,
in groves, thickets, and hedges frequent. Smith, engl. bot. t. 12.
Oed. fl. dan. t. 1926. Hook. fl. lond. t. 109. C. gantéllce,
Jaun. St. HIl. fl. fr. t. 47. C. urticifolia or urticócrápa,
Schmidt, fl. bohem. no. 173. p. 75. Bieb. fl. canec. 1. no. 574.
Tenor. fl. neap. 1. p. 68.—J. Bauh. hist. 2. p. 805. with a figure.
C. Cervéricia, Fuchs, hist. p. 431. with a figure.—Moris. oxon.
2. p. 459. sect. 5. t. 3. f. 28. Stem simply or branched, red-
dish. Leaves often doubly toothed, roughish. Flowers droop-
ing a little, 1-4 together, terminating the branchlets. Corolla bluish
violet and white, and all the shades between these two colours,
bearded inside. The name Trachéllium is from τραχύς, the
neck; alluding to the reputed virtues of this plant in disorders of
the throat, to which the other appellations of old authors allude.
A decoction of the herb, which is bitter and somewhat ac-
cid, was used as a gargle.

**Var. β; flower solitary, terminal. Bieb. fl. taur. 1. p. 149.

**Var. γ, flòre pleno;** flowers double, blue and white, and all
the shades between these two colours. Theatr. flor. t. 69.

**Var. ε, monstròsà** (Alph. D. C. mon. p. 267.) flowers abortive,
degenerating into leaves. Hall. enum. p. 192.

**Great Throat-wort or Nettle-leaved Bell-flower.** Fl. July, Aug.
Britain. Pl. 2 to 3 feet.
57 C. rapiénciólòides (Linn. spec. 234.) stems rather scab-
rous; leaves scabrous, ovate, acuminate: radical ones petio-
late, cordate, crenululate: cauline ones serrulate; flowers dis-
posed in long spicate racemes, solitary; calyx rather scabrous,
with linear-lanceolate lobes, which are afterwards reflexed;
corolla funnel-shaped, 4 times longer than the calyceine lobes.
2. H. Native of Europe, from the Pyrenees, Dauphiny, Pied-
mont, Transylvania, even to Scotland, Sweden, and Lapland;
in the plains about the Carpathian Mountains; Caucasus, even
to the banks of the river Oby in Siberia. Frequent in Middle
Europe. In Britain, in woods and fields, but rare, in some woods
in Oxfordshire, among yew trees. It grows in Scotland, in
cornfields, 2 miles north-west from Kirkaldy. Smith, engl.
bot. t. 1369. fl. dan. 1327. Plenck, icon. t. 152. C. miátans,
Lam. fl. fr. 3. p. 336. but not of Waldst. et Kît. C. urti-
cifolia, Turr. prod. fl. ital. 64. no. 9. Vittm. summ. pl. 1. p. 454.

**Var. γ, macrófolia** (Alph. D. C. mon. p. 268.) stem and leaves
rather plicate; teeth of leaves more distinct; calyx gla-
brose; corollas larger. 2. H. C. macrófolia, Fisch. inded.

**Var. ε.** (Éuipoutánà) (Alph. D. C. mon. p. 268.) flowers few,
disposed in loose racemes; peduncles long, erect, usually 1-
flowered; calyceine lobes broader. 2. H. C. Éuipoutánà,
Morett. inded.

**Var. η, trachélidées** (Alph. D. C. mon. p. 269.) stem and leaves
beaten with stiff white hairs, but particularly the calyx.
2. H. Native of Caucasus. C. trachélidées, Bieb. fl. taur.
1. p. 150. no. 576. Stev. mem. nat. cur. mosc. 3. p. 255. C. Ucrá-
C. macrostécháya, Fanz. herb. C. setósà, Fisch. mss.

**Var. ζ, nánà** (Alph. D. C. mon. p. 269.) stems abortive, 1-3-
flowered. 2. H. 

to 4 feet.
58 C. Bononiësìm (Linn. spec. 1. p. 234.) scabrous; stems
simple; leaves serrated, ovate, acuminated, dark green above,
pale beneath: radical leaves cordate, petiolate: superior leaves
stem-clasping: flowers numerous, small, disposed in long ra-
cemes; calyceine lobes acuminated, 4 times shorter than the
 corolla, which is funnel-shaped. 2. H. Native of the east of
Europe and west of Asia, from 40° to 55° and, long. 15°
westerly, even to 60°; particularly in the northern elevated val-
ye downs in the kingdom of Naples; Upper Italy, Piedmont, Saxony,
Prussia, Bohemia, Silesia, Caucasus, the Ukraine, and near the
t. 2. t. 112.—Bauh. hist. 2. p. 806.—Moris. oxon. 2. p. 461. sect.
5. t. 4. f. 58. Tube of calyx blackish. Flowers smaller than in
any other nearly allied species, numerous, disposed in a simple
raceone, or the raceone is branched at the base. Corollas bluish-
violet, glabrous. Plant dark green. Leaves pale beneath.

**Var. β;** radical leaves very long. 2. H. Native of the
kingdom of Naples. C. obliquofólia, Tenore, fl. neap. prod. p. 15.

**Var. γ;** plant much branched, many-flowered. 2. H. Na-
ative of Caucasus. C. Bononíçias, var. ε, Bieb. fl. taur. 1. p.
151. C. multifóra, Hortl. C. lychnítis, Hort. hort. hafn.

**Var. ε;** leaves broader, tomentose beneath. 2. H. Native
of Tauria, Caucasus, and many parts of Russia, and the Levant.
Flowers bluish-violet.

**Var. θ;** stems very simple. 2. H. C. Bononíçias, All. fl.
Rhim. et Schultes, syst. 5. p. 129. C. Bononíçias, var. β, Bieb.

v. Stems few-flowered or 1-flowered. Corollas nearly always glabrous. Capsule ovoid, rarely spheroid.

59. C. collina (Bieb. fl. taur. 1. p. 152.) stems simple; lower leaves on long petioles, ovate-oblong, crenulated; middle ones lanceolate; superior ones linear-acuminate; flowers few, second, disposed in a long raceme; calyces lobes erect, lanceolate, acuminate, doubly shorter than the corolla, which is funnel-shaped. 2. H. Native of Caucasus and Tauria, on grassy hills. Bieb. Fl. rar. Ross. 1. t. 42. Stem rather pilose. Leaves smoothish. Calyx pilose. Corolla deep blue, twice the length of the calyceine segments.

Var. a; plant larger; petioles very long; germen hispid. 2. H. Native of Iberia, on the mountains, and of Tauria. Var. a, Bieb. l. c.

Var. c, piulna; plant dwarf.—Tourn. cor. p. 4. C. Ibérica, augustifolia, &c. var. b, Bieb. l. c.

Var. c; flowers white. 2. H.—Tourn. cor. p. 4.

60. C. Falciflora (Desf. choix. du. cor. p. 36. t. 26. ann. mus. 11. p. 57. t. 7.) stems branched; leaves dentately serrated; radical ones ovate-roundish, petiolate; cauline ones ovate, on short petioles; flowers few, terminal; calyceine segments subulate, erect; corolla funnel-shaped, twice the length of the calyceine segments. 2. H. Native of Candida, on the mountains, among bushes. Stem slender. Plant glabrous. Flowers hanging one way, solitary, terminating the branches and stem. Corolla campanulate, bluish-violet. The capsule is said to be 5-angled.

Few-flowered Bell-flower. Pl. 1 to 3/4 foot.

61. C. nemorosa (Alph. D. C. mon. p. 274.) stems simple; radical leaves on long petioles, cordate, ovate-oblong, crenated; cauline leaves sessile, long-acuminate, serrated; flowers disposed in loose racemes; calyceine segments subulate; corolla funnel-shaped, twice longer than the calyceal lobes. 2. H. Native of Austria and Moravia, in woods. C. elongata, Portenschl., but not of Wildf. nor others. Plant glabrous. Racemes often furnished with few-flowered peduncles at the base. Corollas blue.

Grote Bell-flower. Pl. 1 foot.

62. C. Rhamboidea (Lin. spec. p. 233.) stems almost simple; leaves sessile, ovate, acute, serrated; flowers few, disposed in loose racemes, pedunculate; segments of calyceal subulate, erect; corolla campanulate, twice longer than the calyceal capsules; capsule ovoid. 2. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, mountains of Auvergne, Alps of Provence, Dauphiny, Savoy, Switzerland, Germany, Carniola, &c.; and of Russia and Tauria. C. rhomboidea, Lin. spec. 333. Gillb. demonstr. bot. t. 27. Lodg. bot. cab. t. 603. C. azurea, Sims, Bot. mag. t. 551. Ait. Hort. Kew. ed. 2d. vol. 1. p. 348. C. venosa, Willd. comm. suppl. t. 10. —Barrel. icon. 78, t. 567.—Boeke. mus. p. 75. t. 61.—J. Bauh. hist. 2. p. 798. with a figure. Stem glabrous, or a little pilose, furnished with flower-bearing branches at top. Flowers usually drooping, but sometimes looking upwards, very like those of C. rotundifolia. Corollas hardly one-half longer than the calyceal lobes, blue, glabrous.

Var. γ, reflexa (Alph. D. C. l. c.) leaves broader; calyceal lobes reflexed. 2. H. Flowers blue.

Var. ε, polyphylla (Alph. D. C. l. c.) leaves long-lanceolate, nearly entire; corollas 5-parted. 2. H. Flowers blue.

63. C. trichocalycina (Ten. fl. neap. prod. p. 16. fl. neap. 67. t. 16.) stems simple; leaves on short petioles, ovate, acute, coarsely serrated; flowers few, racemose; calyceine segments reflexed, long-capillary, nearly equal to the corolla, which is profoundly 5-cleft, and funnel-shaped; capsule ovoid. 2. H. Native of the kingdom of Naples, on the mountains; of Sicily, on the Nebrodes; and of Candida. C. Althurmiana, Brigit. stirp. rar. in. ginn. encyl. sept. 1817. Root simple, fusiform. Stems glabrous, but hairy at the base. Flowers disposed in an almost simple terminal raceme, approximate at the top, 1-3 rising from each axil, at the time of flowering erect, but afterwards drooping. Corolla pale violet.

64. C. Carnica (Schiede. miss. ex Alph. D. C. mon. p. 277.) stems ascending, weak, few-flowered; leaves glabrous; lower ones obovate or lanceolate; upper ones linear; calyceine segments very long, reflexed; corolla tubular, elongated. 2. H. Native of Carniola and Carinthia, on the mountains. Root slender. Plant glabrous. Flowers few, on long peduncles, solitary, inclined. Corolla blue, glabrous.

Carniola Bell-flower. Pl. ½ to 3/4 foot.

65. C. Höstii (Baung. comm. 3. p. 842.) stems few-flowered; leaves with scarcely eiliated margins; radical ones few, roundish, cordate, broad, toothed; cauline leaves lanceolate and linear; flower-buds drooping; calyceine segments subulate, spreading or reflexed; corolla funnel-shaped. 2. H. Native of Transylvania, Austria, and Carinthia, in pastures, woods, and on the mountains; and on the Alps of Jura. Stems glabrous or scabrous, simple or branched at top. Flowers more or less numerous, pedunculate and pedicellate, as in C. rotundifolia, drooping. Corollas blue. Very like C. rotundifolia.

Var. b, uniflora (Alph. D. C. mon. p. 277.) stem 1-flowered, ascending, weak; cauline leaves few, linear-lanceolate, petiolate. 2. H.

Host's Bell-flower. Pl. 1 foot.

66. C. petiolata (Alph. D. C. mon. p. 278.) quite glabrous; stems simple, few-flowered; radical leaves on long petioles, cordate, ovate, reflexed; stem, hairy; cauline leaves, crenated; lower cauline leaves lanceolate, remotely toothed, petiolate; upper cauline leaves linear, entire; calyceal lobes erect, subulate; corolla campanulate, twice longer than the calyceal lobes. 2. H. Native of North America, near Slave Lake. Plant with the habit of C. rotundifolia. Root slender. Flowers 3-4, at the top of the stem, erect, but at length becoming recurved. Corollas blue.

Petiolate-leaved Bell-flower. Pl. 1 foot.

67. C. linifolia (Lam. dict. 1. p. 579.) stems erect; radical leaves few, petiolate, ovate, sinuated; cauline leaves linear, entire; calyceal segments long, erect, 2 or 3 times shorter than the corolla, which is large and campanulate. 2. H. Native of Europe, on the mountains; as of the Pyrenees, Auvergne, Dauphiny, Valais, Alsatia, Alps of Italy, Austria, Transylvania, and the Carpathian Mountains; but wanting in the more northern regions of Europe. Scop. carn. 1. p. 144. C. angustifolia, Lam. ill. 2499. —C. Schleicheri, Rut. fl. helv. 1. p. 124. C. rotundifolia linifolia, β et γ, Lap. ayrb. p. 104. C. rotundifolia, β, Wahl. helv. p. 39. but not of his fl. lapp. C. virgata, Rafin. in Rom. et Schultes. syst. 5. p. 100. —J. Bauh. hist. 2. p. 797. with a figure. Root slender, creeping. Plant quite glabrous, rarely a little downy. Flowers few at top of
each stem, but usually only one, drooping. Corollas large, blue, of a form between those of *C. rotundifolia* and *C. persicifolia*.

*Var. ε, albiflora*; flowers white.

70 C. Arista (Wall in Roxb. fl. ind. 2. p. 98.) plant quite glabrous; stems erect, 1-flowered; radical leaves petiolate, lanceolate, acute, undulated; cauleine leaves sessile, narrow-linear, glandularly denticulated; calycine segments long-subulate, twice longer than the corolla; capsule very long, obconical. 2. H. Native of the north of India, about Laddack. Root thickish, rather fusiform, divided at top. Flowers small, solitary, terminal, drooping. Tube of calyx very much elongated. Corolla funnel-shaped, pale blue.

Awned-calyx Bell-flower. Pl. 1 foot.

71 C. Silvatica (Wall in Roxb. fl. ind. 2. p. 97.) plant scabrous from short stiff hairs; stems erect, straight, few-flowered; cauleine leaves linear, narrow, nearly entire; calycine segments erect, subulate; corolla campanulate, downy, twice longer than the calycine segments. 2. H. Native of Nipaul, in shady humid places. C. stricta, Wall. assis. res. 13. p. 374. C. integerrima, Don, prod. fl. nep. p. 155. Habit of *C. rotundifolia*, but probably without any roundish radical leaves. Stems simple or branched. Flowers terminal, on long peduncles, disposed like those of *C. rotundifolia*. Corollas blue.

Wood Bell-flower. Pl. 1/2 to 1 foot.

72 C. Vesula (All. pedem. 1. p. 108. no. 297. t. 7. f. 1.) stems 1-flowered; leaves glabrous, oval, toothed; stems nearly naked; calyx glabrous. 2. H. Native of Piedmont, on Mount Vesulus. Leaves many at the roots, petiolate, with a few scattered hairs beneath. Flowers campanulate, spreading.

*Vesulus Bell-flower*. Pl. 3/4 foot.

73 C. du Bia (Alph. D. C. mon. p. 286.) glabrous; stems 1-flowered; cauleine leaves erect, narrow: lower ones linear-lanceolate, petiolar: superior ones long-acuminate; calyce lobes subulate; corolla tubularly funnel-shaped, twice longer than the calycine lobes. 2. H. Native of Newfoundland. Flowers erect, terminal, very like those of *C. rotundifolia*.

Doubtful Bell-flower. Pl. 3 to 4 foot.

**CAMPANULACEÆ. XV. CAMANula.**

*Meadow Bell-flower.* Pl. ½ foot.  
75. *C. puLLa* (Lin. spec. p. 231.) stems humble, 1-flowered; leaves glabrous, cumately toothed; lower ones on short petioles, ovate-rounded; superior ones sessile, ovate, acute; calyce segments long-acuminate, erect, twice shorter than the corolla, which is campanulate.  

77. *C. pedunculata* (Michx. fl. amer. bot. 1. p. 109.) glabrous; stem panched at top, with branches diverging; leaves equally scattered over the stem, nearly sessile, ovate-lanceolate, acuminate at both ends, coarsely serrated, with rather scabrous edges; calyce lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted.  
78. *C. helv.*, native of Carolina, on high mountains. Stems erect, angular. Leaves very few at the base, but crowded at top. Flowers panicked, terminal and axillary. Corolla blue.  

80. *C. flexuosa* (Roem. et Schult. Syst. 5. p. 59.) plant glabrous, humble; stems slender, 1-flowered; lower leaves linear-acuminate; calyce lobes setaceous, spreading, at length reflexed, 3 times shorter than the corolla, which is funnel-shaped; sinuses of corolla cut; capsule obconical.  

82. *C. Waldsteinii* (Roem. et Schult. Syst. 5. p. 59.) glabrous; stems erect, flexuous, stiff, simple, few-flowered; leaves sessile, lanceolate, serrate; lower ones obtuse; superior ones long-acuminate; alabastra erect; calyce lobes subulate, subdenticulated, spreading, 4 times shorter than the corolla, which is campanulate.  
83. *C. Wall.* Native of Crotia, on the mountains, in the fissures of rocks. Rechb. icon. bot. cent. 1. t. 85. C. flexuosa, Waldst. et Klot. pl. rar. hung. 2. p. 145. t. 136. C. rupestris, Host, fl. austri. 1. p. 263. Stems numerous from the same root, stiff. Flowers 3-4 at the top of each stem, one of which is terminal, and the others from the axils of the superior leaves, always looking upwards. Corollas of a violaceous blue colour.  

85. *C. aparinoides* (Pursh. fl. amer. sept. 1. p. 159.) glabrous; stem weak, ascending, simple, few-flowered, having the angles beest with short retrograde bristles; lower leaves linear-ovate: the rest linear and acuminate: all remotely denticulated, and bent with retrograde short bristles; calyce lobes triangular, twice shorter than the corolla, which is campanulate; capsule spherical.  
86. *C. Moorcroftiana* (Alph. D. C. mon. p. 233.) stems erect; peduncles elongated, terminal and axillary; calyx with a very dilate, pilose-crenulated, tubular and triangular entire lobes, which are about equal in length to the corolla, which is tubular and velvety; capsule turbinate.  
87. *C. Hoary*. Native of Nipauel. Leaves variable in size, acuminate at both ends, sessile, downy. Peduncles nearly naked, or bearing a large bract each.  

89. *C. flexuosa* (Michx. fl. bor. amer. 1. p. 109.) glabrous; stem panicked at top, with erect branches; leaves most frequent in the middle and above, almost sessile, lanceolate, acuminate at both ends, coarsely serrated; calyce lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted.  
90. *C. helv.* Native of Carolina, on high mountains. Stems erect, angular. Leaves very few at the base, but crowded at top. Flowers panicked, terminal and axillary. Corolla blue.  

92. *C. flexuosa* (Michx. fl. bor. amer. 1. p. 109.) glabrous; stem panicked at top, with branches diverging; leaves equally scattered over the stem, nearly sessile, ovate-lanceolate, acuminate at both ends, coarsely serrated, with rather scabrous edges; calyce lobes capillary, twice shorter than the corolla, which is tubularly campanulate; style a little exserted.  
93. *C. Hoary*. Native of Carolina and Virginia, on the mountains; and of Kentucky, &c. Stems leafy to the middle, and almost naked in the upper part. Flowers small, drooping, terminating the branches and branchlets. Corolla azure blue.  

*Divaricate-paniced Bell-flower.* Pl. 2 to 4 inches.  
94. *C. Hoary*. Native of Nipauel, on the mountains near Gosiingsthan. Root fibrous. Stems many, ascending, densely covered with white hairs, as well as the upper surfaces of the leaves. Flowers on short peduncles, terminating the stem and branches. Corollas blue.  

95. *C. Case's* (Wall. cat. no. 1289.) plant hispid; stem erect; radical leaves crowded, lanceolate, cumately; cauline leaves remote, narrower, rarely denticulated; flowers racemose, often approximate, on short pedicels, small; tube of calyx spherical; lobes linear, entire; corolla tubular, pilose.  
96. *C. Hoary*. Native of Nipauel; and Hindostan, about Rampore. Alph. D. C. mon. p. 292. C. Benthamii, Wall. cat. no. 1290. Root slender. Stem branched from the base or simple. Flowers numerous, small, 4-6 at the top of each branchlet, the whole forming a many-flowered loose raceme.  

*Caneose Bell-flower.* Pl. 1 foot.  
97. *C. colorata* (Wall. in Roxb. fl. ind. 2. p. 101.) stem branched, downy; leaves scattered, lanceolate, acute, repandy denticulated; peduncles elongated, terminal and axillary; calyx with a very dilate, pilose-crenulated, tubular and triangular entire lobes, which are about equal in length to the corolla, which is tubular and velvety; capsule turbinate.  
98. *C. Hoary*. Native of Nipauel. Leaves variable in size, acuminate at both ends, sessile, downy. Peduncles nearly naked, or bearing a large bract each.  

*Coloured Bell-flower.* Pl. ½ foot.  
100. *C. palmata* (Wall. in asiat. res. 13. p. 375.) plant clothed with canescent pili; stem erect; bracted; leaves elliptic, sinuately crenated, petiolar: upper ones sessile; calyx bristly, with linear-lanceolate segments, which are about equal in length to the corolla.  

*Tall Bell-flower.* Pl. 1 to 2 feet.  
102. *C. ramulosa* (Wall. in Roxb. fl. ind. 2. p. 100.) stem erect, pilose, branched; leaves lanceolate, sessile, crenately...
toothed, with the nerves rather prominent beneath; flowers pedicellate, terminal and axillary; calyx pilose, with broad, acute, subulate lobes, twice or thrice shorter than the corolla, which is cylindrical and velvety. capsule turbinate. \( \text{V. H.} \) Native of Nipal. Root short, slender, simple or branched. Flowers inclinate, pedicellate. Leaves pilose. Corolla of a violaceous blue colour.

**Branched Bell-flower.** Pl. 1 to 2 feet.

8 G. C. Alphæus (Wall. cat. no. 1296. Alph. D. C. mon. p. 294.) stems humble, simple, 1-flowered, downy; cauline leaves sessile, lanceolate, acute, toothed a little, rather pilose above, and hoary beneath; calyx downy, with acute segments, twice shorter than the corolla, which is campanulate and downy. \( \text{V. H.} \) Native of the south of India, on the Nelligerry Mountains. Stems very leafy at top. Flowers drooping, terminal, large for the size of the plant.

Alphæus De Candolle’s Bell-flower. Pl. 2 to 3 inches.

**Flowers on very short pedicels, opposite the leaves. Capsule turbinate. Branches more or less dichotomous. Leaves small, sessile, oblong.—All annual humble herbs, inhabitants of the region of the Mediterranean.

87 G. erinus (Lin. spec. 240.) plant hisd; leaves obovate or ovate, toothed; flowers sessile; calycine lobes triangular, acuminate, erect, at length spreading, about equal in length to the corolla, which is small and tubular. \( \text{V. H.} \) Native about the Mediterranean Sea; very plentiful throughout the whole Spanish Peninsula, south of France, Provence, Sardinia, throughout the whole of Italy, Sicily, Dalmatia, Grecian Islands, Teneriffe, &c. on walls and rocky places. Sibth. et Smith. fl. græc. t. 214. Cav. valence. t. 2. Ranouël erinus, Dumont, comm. bot. p. 14. —J. B. Bauh. hist. 2. p. 799, with a good figure.—Mor. ex. sect. 5. t. 3. f. 25.—Colunn. phyt. t. 28, pl. nov. hist. p. 29. t. 31. Stem much branched. Flowers terminal and axillary, and situated in the angles of the forks of the branches. Corolla tubular, of a pale bluish rose-colour or white, pilose at the base.

Erinus-like Bell-flower. Fl. May, Aug. Clt. 1768. Pl. \( \frac{1}{2} \) to \( \frac{1}{2} \) foot.

88 G. drabétolia (Sibth. et Smith. pl. græc. t. 11. t. 215.) plant hisd; leaves elliptic-oblong, toothed; flowers pedicellate; segments of the calyx always erect; corolla inflated, much longer than the calyx. \( \text{O. H.} \) Native of the Island of Samos, and near Athens, in cotton plantations and vineyards. Habitat of G. erinus. Stem many times forked, erectish. Corolla with white tube, and a violaceous blue limb.

89 G. rodenis (Alph. D. C. mon. p. 297.) plant pilose; leaves entire, ovate; flowers terminal; calycine lobes triangular, erect, at length spreading; corollae large, campanulate. \( \text{O. H.} \) Native of the Island of Rhodes. Root simple. Stems from each root, reddish. Flowers numerous, erect, terminating the branches. Corollae elegant.

Rhodes’ Bell-flower. Pl. \( \frac{1}{2} \) to 3 inches.

§ 3. Capsule erect; valves dehiscing at the base.—Flowers pedicellate. Radical leaves petiole, usually cordate, having the base of the petiole usually expanded and permanent.

**Corolla downy or velvety, tubular, 5-lobed at the apex. Radical leaves crowded. Stems few-flowered.—Species all natives of the Levant.

90 G. damascen (Labill. pl. syr. dec. 5. p. 7. t. 5.) downy; radical leaves ovate-obovate, acute, nearly entire, hoary; cauline ones few, ovate, acute; calyx velvety, with subulate lobes, twice shorter than the corolla; capsule ovoid. \( \text{V. F.} \) Native of the Levant, near Damascus, on the mountain called Dgebel-cher. Root woody. Stems slender, 1 or few-flowered. Flowers erect, pedicellate. Corollae cylindrical.

Damascen Bell-flower. Pl. ascending.

91 G. argentea (Lam. dict. 1. p. 584.) humble; radical leaves linear-obovate, clothed with silvery tomentum, nearly entire: upper leaves few, oblong; calyx silvery, with triangular lobes, 3 times shorter than the corolla; capsule turbinate. \( \text{V. F.} \) Native of Armenia.—Tourn. cor. 3. Root hard, blackish. Stems erect, velvety, with short branches. Flowers 1 or few on the top of each branch erect. Corollae velvety.

Silvery Bell-flower. Pl. \( \frac{1}{2} \) foot.

92 G. syriaca (Roum. et Schultes, syst. 5. p. 133.) radical leaves oblong-spatulate; cauline leaves oval, sessile, somewhat sinuated; stem simple, few-flowered at top. \( \varnothing ? \) H. Native of Syria. There is nothing said of the flower and capsule by the authors.

Syrian Bell-flower. Pl. \( \frac{1}{2} \) foot.

**Corollae rotate, deeply 5-lobed, usually downy outside. Style exerted.—All natives of Italy.

93 G. gariganiaca (Ten. fl. neap. prod. 1827.) radical leaves reniform, on long petioles; cauline ones cordate, all crenately toothed, downy; flowers axillary, in fasicles; corollæ 5-parted. \( \text{V. H.} \) Native of Apulia, on Mount St. Angelo. Sweet, fl. gard. n. s. t. 252. C. elatines, Pentag. inst. bot. 2. p. 367. Plant pale green. Corollæ bluish. Habitat of C. Carpaticum.

Garigani Bell-flower. Fl. May, Sept. Clt. 1832. Pl. \( \frac{1}{2} \) to 3 foot.

94 G. elatinoïdes (Morett. pl. ital. dec. 3. p. 5.) plant tomentose; leaves acutely toothed, petiolate; lower ones oblong; superior ones ovate-acute; flowers disposed in dense racemes; tube of calyx ovoid: lobes subulate, spreading, about equal in length to the corolla. \( \text{V. H.} \) Native of Italy, on the mountains about Pisa, among stones and on rocks. C. elatines, Poll. fl. veron. 1. p. 278. no. 404. C. petra‘æ, Zantedesch. fl. brix. ined. but not of Lin. nor others.—Gerard. emac. p. 435. f. 2.—

Elatino-like Bell-flower. Pl. \( \frac{1}{2} \) to 3 foot.

95 G. elatines (Lin. spec. 1. p. 240.) stem ascending; leaves cordate, coarsely and acutely toothed, ovate-acute; lower ones roundish; flowers in loose racemes; tube of calyx spherical; lobes of calyx spreading, linear-lanceolate, twice shorter than the corolla. \( \text{V. H.} \) Native of the alps of Piedmont, Liguria, Naples, &c. in shady, rocky places. All pedem. no. 422. t. 7. f. 2. Plant downy. Stem branched. Flowers scattered over the upper part of the plant, sometimes racemose, and sometimes panicked. Corollæ bluish-purple, hardly one-half longer than the calycine lobes.

Elatine Bell-flower. Fl. June, Aug. Clt. 1823. Pl. \( \frac{1}{2} \) to \( \frac{1}{2} \) foot.

**Corolla campanulate, funnel-shaped, or tubular, 5-lobed at the apex, glabrous.—Roots for the most part thick. All natives of Italy.

96 G. macrorhiza (Gay, ined. ex Alph. D. C. mon. p. 392.) root thick; stems ascending; radical leaves petiolate, small, roundish-cordate, toothed; lower cauline leaves on short petioles, ovate, acute, toothed: superior ones sessile, linear-acuminated; flowers terminal and axillary; alabaster erect; calycine lobes acuminate, spreading or reflexed, twice shorter than the corolla, which is campanulate. \( \text{V. H.} \) Native of Nice, on dry rocks; Provence, on the mountain called Cousseau; and near

5 E
San Marco, in Calabria. C. Nicéonis and C. rupéstris, Risso, in herb. D. C. Root thick, marked by the vestiges of the fallen leaves, creeping among rocks. Stem simple or branched, glabrous. Leaves glabrous. Flowers more or less numerous, solitary, pedunculate and pedicellate, as in *C. rotundifolia*, looking upwards. Corolla broader than those of *C. rotundifolia*.

**Long-rooted Bell-flower.** Pl. 3½ to 1 foot.

**Portenschlag’s Bell-flower.** Pl. 3½ foot.

98 C. **BILLARDÉRE** (Alph. D. C. mon. p. 303.) glabrous; stems ascending; radical leaves on long petioles, small, cordate, 3-5-cleft; lobes toothed; flowers few, in loose racemes; calyce segments filiform, rather unequal, two shorter than the corolla, which is tubular. **γ. H.** Native of Syria. Flowers few, second, drooping. Corollas small, blue. Radical leaves numerous; calyce ones few. Habit of *Wahlenbergia hederacea*.

**La Billardère’s Bell-flower.** Pl. 3½ foot.

99 C. **MORETTIANUM** (Reehb. Icon. rar. cent. iv. p. 18. t. 320.) plant pilose, humble; stems 1-flowered; leaves crenately toothed, small; radical leaves petiolate, cordate, roundish; calyce leaves smaller, ovate, acute; calyce lobes lanceolate, 4 times shorter than the corolla, which is funnel-shaped. **γ. H.** Native of Dalmatia, on Mount Biocco; and of Tyrol, on Mount Vodoi, above Vigo, in the valley of Fosca. C. pulita, Parol. hort. sic. incd. but not of Lin. nor Jacq. C. filiformis, Morett. pl. ital. dec. p. 8. giorn. d. fisic. &c. di. Pavia 1826. vol. 9. p. 155. bot. ital. no. 11. p. 21. no. 4. Flowers erect, blue.

**Moretti’s Bell-flower.** Pl. 1 to 3 inches.

100 C. **RAINÉRI** (Peperti, in bibl. ital. 1817. 5. p. 134. with a figure) stems erect, firm, branched: branches 1-flowered; leaves almost sessile, ovate, remotely serrated; lower ones the smallest, obovate; calyce lobes long-acuminate, erect, twice shorter than the corolla, which is funnel-shaped; capsule obovate. **γ. H.** Native of Italy, on the Alps in the province of Brixo, and on the mountains surrounding Lake Como; on the alps of Biandino and Tremare, above Mandello and Resegone, from the termination of the Beech Woods, even to the elevation of 6000 feet and upwards. C. Perpétue, Morett. in herb. D. C. Plant tufted. Caulaflex creeping. Stems leafy, rather pilose. Leaves glabrous or downy. Flowers erect, blue.

**Rainier’s Bell-flower.** Fl. June, July. Cit. 1826. Pl. ½ ft.

*** Corollas large, campanulately rotate, somewhat 5-cleft, glabrous. Roots usually thick.

101 C. **ISOPHYLLA** (Moretti, append. to Schouv. prospett. fl. italic. p. 22. Rchb. icon. pl. cent. 3. t. 202. f. 344.) stems erectish, firm; leaves all about the same size, petiolate, crenately toothed; flowers corymbose; calyce lobes acuminate, broad, twice shorter than the corolla; style exerted; capsule ovoid. **γ. H.** Native of Liguria, at Cape Nauli and Caprazzoppa. C. floribunda, Viv. fl. lyb. append. fl. italic. p. 67.

Caudex woody. Plant glabrous or velvety. Flowers numerous, erect, disposed in a corymb. Corollas blue, rotate.

**Equal-leaved Bell-flower.** Pl. ½ to ¾ foot.

102 C. **FRAGILIS** (Cyril. pl. fasc. 1. p. 32. t. 11. f. 2.) stems ascending, diffuse, branched; radical leaves on long petioles, roundish-cordate, bluntly crenate-lobe: calyce leaves smaller, ovate and lanceolate; flowers panicled; calyce lobes linear-lanceolate, erect, about equal to the corolla; style exerted; capsule ovoid. **γ. H.** Native of the south of Italy, in the valley of Ananìa; near Naples, in Goat’s Island, about Cava; on Mount Polino and elsewhere in Calabria; and probably of Sicily. C. diffusa, Vahl. symb. p. 18. C. cochlearifolia, Vahl. symb. p. 18. C. crassifolia, Nee, synl. rath. 1. p. 6. and amen. bot. fasc. 2. p. 9. t. 4. —Barrel. icon. rar. p. 54. t. 27. Root thick. Plant glabrous. Flowers numerous, racemously panicled, terminating the branchlets, erect, pedicellate. Corollas large, pale blue.

103 C. **BARRELLE** (Presb, symb. bot. p. 30. t. 19. ex Linn. 7. p. 7.) villous; stems diffuse, procumbent, very simple, 1-flowered; leaves roundish-cordate, crenated; flowers terminal; segments of the calyx lanceolate, acute, longer than the tube, which is glabrous. **γ. H.** Native of Naples, on rocks by the sea side. C. diffusa, var. Röen. et Schultes, syst. 5. p. 92. Corollas blue.

**Barrelle’s Bell-flower.** Pl. procumbent.

104 C. **VERSICOLOR** (Sibth. et Smith, prod. fl. grece. 1. p. 138. grece. t. 207.) glabrous; stem ascending; leaves serrated; radical leaves petiolate, ovate, acute, rather cordate; calyce leaves on short petioles, ovate-lanceolate, acuminate; flowers disposed in long spicate racemes; calyce segments acuminated, spreading, at length reflexed, twice shorter than the corolla, which is variegated; style exerted; capsule spheroid. **γ. H.** Native of Greece. C. planiflora, Wild. enum. 1. p. 210. but not of Lam. C. Wilderowitha, Röen. et Schultes, syst. 5. p. 107. Root tuberous, thick, white, subdivided at top. Stems erect. Corollas campanulately rotate, of a deep violaceous color, blotched, pale in the middle, and the lobes pale violet. Flowers disposed in long racemes, like those of *C. pyramidalis*, of which this species has the habit.

**Tenore’s Bell-flower.** Pl. ½ to 1 foot.

**Campanula.**
763

CAMPANULACEAE. XV. CAMpanula.

233.) glabrous; leaves glandular-toothed: lower ones petiolate, ovate-oblong, somewhat cordate; cauline leaves sessile, ovate-lanceolate; flowers numerous, pyramidal-racemose; calyces lobes acuminate, spreading; capsule spheroid, deeply furrowed. 2. H. Native on rocks and on walls in Carinthia, Carniola; of Dalmatia, in the island of Vigo; on the walls of Venice and Verona. The plant has been cultivated a long time in gardens, and consequently has become, as it were, indigenous in many parts of the south of Europe. J. Aust. St. Hil. pl. fr. t. 416.—Weinm. phyt. t. 289. f. b.—Moris, oxon. 2. p. 152. sect. 5. t. 1. f. 1.—Besl. hort. syst. t. 7. f. 1.—Tab. icon. 317.—Swett, floril. t. 16. f. 2.—Leb. hist. p. 177. icon. 387.—Dod. penat. 166. 100. Root large, turnip-formed, oblong, usually divided into fusiform branches. Flowers very numerous, pedicellate, usually 3 together from the same bracteae, the whole disposed in a large pyramidal raceme, which is loose at the base. Corolla pale blue, with a dark base. There is also a white-flowered variety of this.

§ 4. Capsule dehiscing laterally by the valves towards the apex, erect. Lobes of calyx usually dentilicated.—Radical leaves usually obovate, on short petioles, but never cordate. Flowers pedicellate.

* Valves situated between the middle and upper part of the capsule.—Branches not dichotomous.

108 C. Scouleri (Alph. D. C. mon. p. 312.) stem simple, few-flowered; leaves ciliatly, sharply serrated; lower leaves ovate, acute, petiolate; middle ones ovate-lanceolate, sessile; superior ones linear-lanceolate; flowers racemose; calyx glabrous, with capillary erect lobes, which are 3 times shorter than the 5-cleft, funnel-shaped corolla; style exerted; capsule ovoid. 2. H. Native of North-west America, about Fort Van Couver, on the banks of the Columbia river. Stems ascending at the base, glabrous or a little hairy, simple at bottom, and furnished with floriferous peduncules at top. Flowers 4 to 10 on each stem, terminal and axillary, loosely racemose. Habitat of a species of Adenophora. Scouler's Bell-flower. Pl. ½ foot.

* * Valves situated near the top of the capsule. Flowers usually on long peduncules, terminal or axillary. Branches not dichotomous.

109 C. planiflora (Lam. dict. 1. p. 580. ill. 2509.) quite glabrous; stems simple; leaves sessile, coriaceous, shining; radical ones crowded, ovate or obovate, obtuse, crenulated: cauline ones linear-lanceolate, acute, nearly entire; flowers disposed in spicate racemes; calyces lobes ovate, acute, broad, erect, 3 times shorter than the corolla, which is campanulate rotate. 2. H. Native of North America, probably towards Hudson's Bay. C. nifida, Ait. hort. kew. ed. 1. vol. 1. p. 346. Nutt. gen. amer. 1. p. 136. C. Americana, Mill. dict. no. 13. but not of Lin.—Tourn. inst. 1. p. 111. Munting, phyt. t. 123.—Do-dart, mem. ed. de mal. p. 621. t. 35. ed. fol. p. 119. t. v. flor. Floridae terminal and axillary, on short pedicels, approximate, disposed in a kind of spicate raceme. Corolla pale blue; there is also a variety with white flowers.

111 C. fulgens (Wall. in Roxb. fl. ind. 2. p. 99.) stem simple, erect, pilose; leaves lanceolate, acuminate at both ends, on short petioles, serrated; flowers almost sessile, disposed in a raceme, crowded at top; calyces segments linear-subulate, erect, entire, rather longer than the corolla, which is funnel-shaped; capsule ovoid, 10-nerved. 2. F. Native of Upper Nipaul, on the more elevated mountains. Root simple, glabrous. Stems usually undivided, but sometimes furnished with a few simple branches, angular, Leaves hispid. Petioles pilose. Flowers small, blue, in fascicles, from the axils of the upper leaves, the whole forming an oblong terminal raceme.

Falgent Bell-flower. Pl. 1 foot.

112 C. veresinna (Lin. syst. p. 301.) plant hispid; stem simple, many-flowered, angular; leaves crenated; lower ones obovate: superior ones ovate, acute; flowers disposed in a spicate raceme; calyces lobes acuminate, nearly entire, rather shorter than the corolla, which is spreading; capsule ovoid. 2. H. Native of Mount Lebanon, and near Aleppo. Jacq. hort. schoenbr. 3. p. 337. Sims, bot. mag. t. 1257. Hoffm. et Link. fl. port. 2. p. 15. t. 83. C. lanuginosa, Lam. dict. l. p. 584. but not of Willd. C. hispidissima, Guss. ined. Flowers sessile, solitary, disposed in a long dense spike. Corollas funnel-shaped, hardly one-half longer than the calycine lobes, of a dark violet colour at the base, of a less deep colour in the middle, and paler towards the margins.

113 C. primulifolia (Brot. fl. lus. 1. p. 288. phyt. lus. 1. t. 20.) stem hispid, many-flowered, simple; leaves unequally and doubly crenated: radical ones lanceolate, bluish: cauline 5 f. 2.
leaves ovate-oblong, acute; flowers disposed in a spicate raceme; calyces lobes acuminate, broad at the base, dentilculated; corolla connately rotate, twice longer than the calyce segments; capsule long, obovate. 2. H. Native of Portugal, in shady, humid places of the Algarves and Beira, and near Coimbra; above Fumete, and about Monchica. C. Trachelium, Broth. fl. his. 1. p. 287. Root oblique, branched, thickened into tubers at top. Leaves hispid on the ribs and veins. Flowers erect. Corollas nearly glabrous, blue, rarely purple, with a whitish downy bottom.

Primrose-leaved Bell-flower. Pl. 1 to 2 feet.

114 C. Alata (Desf. fl. atl. 1. p. 178. t. 50.) stem few-flowered, simple, glabrous; leaves irregularly toothed, glabrous: lower ones ovate, acute; calyces leaves lanceolate; flowers few, disposed in racemose heads; calyx with a hispid tube, and linear-lanceolate, acute, rather ciliated segments; corolla broadly campanulate, twice longer than the calyce segments; capsule spherical. 2. H. Native of the north of Africa, near Mai- ralu. Stem angular. Flowers sessile on the top of the stem. Corolla blue, size of that of C. pyramidalis.

Winged Bell-flower. Pl. 2 to 3 feet.

115 C. P. Various (Lin. spec. ed. 1. p. 579.) stems simple, many-flowered; racemes crowded, linear-lanceolate, serr- rulate; flowers sessile, disposed in a loose spike; calyx with a spherical tube and triangular lobes, which are thrice shorter than the tubularly-campanulate corolla. 2. H. Native of Armenia. Desf. choix. cor. p. 35. t. 25. or in ann. mus. 11. p. 56. t. 6. Radical leaves rosulate. Plant glabrous. Flowers erect, violaceous.

Sneezewort-leaved Bell-flower. Pl. 3 to 4 foot.

116 C. Capitata (Jacq. hort. vind. 1. p. 22. t. 57.) plant gla- bros, branched; lower leaves on long petioles, ovate-round- cordate, toothed; superior ones on short petioles, ovate, acute; flowers disposed in loose panicles, on long peduncles; calyces lobes erectish, triangular, acuminated, thrice shorter than the corolla, which is broadly campanulate; capsule ovoid-cylindri- cal. 2. H. Native of Transylvania, and at the sides and bottoms of the mountains of Liptov, to the south of the Carpathian mountains; among calcareous alpine rocks. Curt. bot. mag. t. 117. Root fibrous. Leaves branchy. Branches or peduncles elongated, naked, each terminated by an erect flower. Corollas blue, about the size of those of C. persicifolia.

117 C. Silicifolia (Fisch. ms. ex Alph. D. C. mon. p. 329.) stem simple, few-flowered; leaves ciliated; radical ones lanceolate, on long petioles, few; calyces leaves narrow, acuminated; calyces lobes erect, acuminated, ciliated, thrice shorter than the corolla, which is funnel-shaped; capsule long, obovate. 2. H. Native of Darabia; and at the river Lena, in Siberia. C. Bicalcalis, Pall. ms. in herb. Lamb. C. ciliata, Patrin, herb. Gmel. sib. 3. p. 159. t. 32. exclusive of the syn. of Tourn. Root slender, creeping transversely below the earth, and emitting slender fascicles of fibres. Stem glabrous. Flowers 1-3 on each stem, terminal and axillary, pedicellate. Corollas large, blue, with glabrous or ciliated lobes.

Catchfly-leaved Bell-flower. Pl. 4 foot.

Var. a. Silvestri (Alph. D. C. mon. p. 321.) stem few-flowered; corolla 5-leaf even to the middle, with ample lobes.

119 C. Persicifolia (Lin. spec. ed. 1. p. 164.) stems nearly simple; leaves glabrous, stiff, crenated: radical leaves lanceolate-ovate; calyces leaves linear-lanceolate; flowers racemose; calyces lobes acuminate, broad at the base, entire, twice shorter than the corolla, which is broadly campanulate; capsule ovoid, trisulcate, dehiscing by broad pores. 2. H. Native of the south and temperate parts of Europe; from Spain, Italy, Greece, even to Scotland; south of Sweden; about Petersburg and Moscow, and throughout Siberia, especially towards the east, and the Altaiian mountains; about Constantinople; delighting in subalpine shady places, and woods; in Scotland, in woods near Cullen. Bull. herb. t. 367. Oed. fl. dan. t. 1087. Sibth. et Smith, fl. greece. t. 205. C. decur- rens, Lin. spec. ed. 2. p. 232. C. speciosa, Gilib. pl. litt. p. 10. but not of Horn. C. amygdalifolia, Salisbury prod. p. 126.—Weinn. phyt. icon. t. 291. f. and b. and t. 290. f. c. and d.—Swett, floril. pt. 2. t. 16.—Besl. hort. syst. 1. t. 8. f. 2. and 3.—Tab. icon. t. 317.—Lob. icon. t. 327.—Moris. oxon. 2. p. 452. sect. 5. t. 1. f. 2. Plant glabrous. Flowers terminal and axillary, pedunculate, solitary, inclined, the whole forming a raceme. Corollas large, broad, campanulate, blue, and all the intermediate shades to white.

Var. φ. calycina (Alph. D. C. mon. p. 323.) plant monstrous; stems 1-flowered; calyces large, ovate-lanceolate; corolla narrowed at the base. 2. H. C. persicifolia calycina, Rehb. icon. cent. 1. t. 57.

120 C. Pyreneaica (Alph. D. C. mon. p. 324.) stems simple, 1-flowered, beset with soft hairs; leaves rather pilose: radi-
cal leaves roundish, a little crenated, on short pedioles: cauline leaves sessile, lanceolate, nearly entire at both ends; calyx glabrous: with subulate, spreading, entire lobes, which are rather shorter than the corolla. 2. H. Native of the Pyrenees, and of the Balkarian Islands. Flowers terminal, erect. Corolla blue?

Pyreanec Bell-flower. Pl. 1 to 1 ½ foot.

121 C. Raréculæ (Lin. spec. p. 232.) stem almost simple; lower leaves all, or short, petioled; cauline leaves sessile, linear-lanceolate, entire; flowers spicately racemose, solitary: calyce lobes erect, long-subulate, very slender, rather shorter than the corolla, which is funnel-shaped; capsule obconical, triloculate. 3. H. Native of Morocco and Barbary; as also of the south of Europe, and extending as far north as the county of Norfolk, in England; as well as of Transylvania and Caucasus. In Britain, on banks and about the borders of fields; not common. About old Buckingham Castle, Norfolk. In many parts of Kent and Surrey, as well as in other places on a gravelly soil; having formerly perhaps escaped from gardens. Smith, engl. bot. t. 233. Schrank, eno. no. 406. t. 39. Oed. fl. dan. t. 1326. Svensk, bot. t. 69. 164. 2. C. Britigiana, Gmel. reis. l. p. 153. t. 33. but not of Dufour, C. conyza, Giph. pl. l. p. 8. C. esculenta, Salisb. prod. p. 126. C. clatior, Link, et Hoffm. fl. port. 2. p. 11. t. 89. C. glandulosa, Banks, herb. Tourn. inst. 111. Morand. hist. p. 69. t. 39. f. 3.—Moris, oxon. sect. 5. t. 2.f. 20. and f. 1. Column. phyt. 102. with a figure. Lob. icon. t. 328. Root fusiform, thick, white. Stem simple, but sometimes furnished with a few branches towards the top, furrowed, glabrous, but pilose at the base. Leaves usually glabrous, but sometimes hairy. Flowers nearly sessile, or pedicellate, erect, forming a long raceme, which is branched at the base. Corollae blue or white. This plant varies in the stem being glabrous or pilose, in the length of the pedicels, in the tube of the calyx being glabrous or strigose, in the calyce teeth being entire or a little dentilicate at the base. The root is milky, thick, and edible, and, with the leaves, is mixed in salads; and, therefore, it was formerly cultivated for that purpose. In France and Italy the roots are boiled and eaten hot with sauce, or cold with vinegar and pepper. The seed is sown in the spring on deep light soils, in drills, and the plants are ready for use in the autumn of the same year. It is called Rapenorozza in Italy; Rapineco, in Portugal; Rapience, petite Rapiance, in France; Rampon, and Small Rampon, in England; Raspuzel, Rubeu, or Blau Bluhende Warzel, Raspuzel, Przutleizin, in Germany; Rzepka, in Bohemia; and Akla Raspuzel, in Sweden.

132 C. Lambertiana (Alph. D. C. mon. p. 327.) stem simple, many-flowered, pilose; cauline leaves sessile, oblanceolate, irregularly dentilicate, rather pilose; flowers disposed in a long spike, raceme; calyx glabrous: with nectariferous, spreading, coarsely, and acutely-toothed lobes, rather shorter than the corolla, which is obconical. 3. H. Native of Persia, in the province of Ghilan. Flowers disposed in a spike-formed raceme, furnished with a few branches at its base, as in C. Rapinclus. Corollae white?

Laubert's Bell-flower. Pl. 1 ½ to 2 feet.

123 C. Virgata (Labbil. pl. syr. dec. 2. p. 11. t. 6.) stem simple, many-flowered; radical leaves lanceolate, crenuliate, petiolo: caulis leaves sessile, linear-lanceolate; flowers spicate, usually twin or tern; calyx with a sebaceous tube, and erect subulate lobes, which are twice or thrice shorter than the funnel-shaped corolla; capsules obovate-fusiform. 3. H. Native of Mount Lebanon. Root thick. Stems hardly leafy, rather sebaceous below, but smooth at top. Leaves sebaceous. Flowers sessile, erect, 1-3 from each axil, forming a long interrupted spike, Corollas blue?

Twiggzy Bell-flower. Pl. 1 ½ to 2 feet.

124 C. Hermii (Hoffm. et Link, fl. port. 2. p. 9. t. 79. Rem. et Schultes, syst. 5. p. 328.) glabrous; stem ascending, simple; leaves nearly entire: radical ones lanceolate: caulis leaves linear-lanceolate, sessile, nearly entire; calyce lobes long-acuminated, spreading, serrated at the base, twice shorter than the corolla, which is funnel-shaped; capsule ovo-cylindrical. 3. H. Native of the south and temperate parts of Europe; as of the Pyrenees, Spain, throughout Italy, the Morea, and also in the region of Tunis; Levant, to the Carpathian Mountains, but not below them; Transylvania; about Petersburgh and Moscow, but is never to be found in Europe beyond lat. 61. In England, in pastures, borders of fields and hedges; rare in several parts in Kent; in many places about Alcester; in Worcestershire, and Staffordshire, &c. Oed. fl. dan. t. 373. Smith's engl. bot. t. 42. Hook. fl. lond. t. 51. C. bellidiifolia, Lap. ayr. arv. p. 36. C. decurrens, Lin. spec. ed. 1. p. 164. Diffuse Bell-flower, Hill. veg. syst. 8. t. 1. —Weinm. phyt. icon. t. 290. f. a. Dill. hort. elth. t. 58. f. 68. Besl. eyst. ordinat. 1. t. 5. f. 9. Root small, slender, branched. Stems glabrous, or sebaceous from pili on the angles. Branches divaricate, nearly naked. Leaves glabrous. Flowers pilose, terminal, and axillary, on long pedicels, large, erect. Corollas blue or white. This is a very polymorphous plant.

Var. γ, latifolia (Alph. D. C. l. c.) stem branched, glabrous, sebaceous on the angles; caulis leaves lanceolate, broad, serrulat.; calyce segments very long, rather longer than the corolla.

Var. ω, paniculata (Alph. D. C. l. c.) stem humble, branched a little, almost naked; flowers terminal, and axillary, few, large; corolla campanulate, one half longer than the calyce segments. Column. ephr. p. 24. with a figure. Tourn. inst. 111.

Var. s, neglecta (Alph. D. C. l. c.) calyceine lobes reflexed, serrulat, toothed at the base, acuminated, a half or a third the length of the corolla. C. neglecta, Rem. et Schultes, syst. 5. p. 104.

126 C. Erinoides (Lin. mant. p. 64.) Cav. anz. ciene. p. 29.) stem humble, few-flowered, with sebaceous angles; leaves small, linear-lanceolate, glabrous, crenulat.; lower ones obtuse: superior ones acuminat.: calyce lobes long, subulate,
CAMPANULACEÆ. XV. Campanula.

entire, rather shorter than the corolla, which is funnel-shaped; capsule long-obconical, nearly terete. 2 H. Native of Spain, about Madrid and elsewhere; and of Gibraltar and Tangiers. Root slender, filiform. Stem simple, but furnished at top with 1-flowered peduncles, which diverge more or less. Flowers erect, blue.

127 C. Matthiæ-nis (Alph. D. C. mon. p. 532.) stem humble, few-flowered; leaves linear-lanceolate, nearly entire; lower ones obtuse; superior ones acute; calyce lobes long-subulate, erect, entire, rather shorter than the corolla, which is narrow-funnel-shaped; capsule obconical, elongated, having the nerves rather prominent. 0 H. Native of Spain, about Madrid. Root filiform. Stem simple, but furnished with 1-flowered peduncles at the top, glabrous or pilose, hardly scabrous on the angles. Leaves glabrous or pilose. Corollas violaceous.

Madrid Bell-flower. Pl. 1/2 to 1/4 foot.

138 C. Ramosissima (Sibth. et Smith, fl. græc. t. 204.) stem branched, many-flowered, pilose; leaves ovate-lanceolate, crenated; lower leaves obtuse; upper ones acute; calyx with a pilose tube, and acuminate entire lobes, which are pilose outside, and rather shorter than the spreading corolla; capsule obconical, pilose, having the nerves rather prominent. 0 H. Native of Mount Olympus, in Bithynia, and in the island of Zante, &c. Root slender, fibrous. Stem angular. Leaves equally scattered over the stem, smoothish. Branches nearly naked, divaricate, each terminating in a single flower. Corolla bluish-pink, having the nerves more intensely coloured.

129 C. Loricì (Alph. D. C. mon. p. 333.) stem branched, few-flowered; leaves ovate-oblong, glabrous; lower ones ovate, crenated; middle ones ovate-lanceolate; superior ones linear, entire; calyx with a hispid tube, and long-acuminated glabrous spreading lobes, which are decumbent at the base, length of corolla, which is somewhat rotate; capsule spheroid, deeply furrowed, and beset with striose pili. 0 H. Native of the province of Verona, near Valleggio, where it was first collected by Lory; and on Mount Baldo, by Rainer. C. Loricà, Lorèii, or Lorìi, Poll. chem. bot. t. 2. p. 148. ultimate table, f. 1. Poll. fl. verr. 1. p. 271. t. 2. f. 4. Sims, bot. maj. t. 2581. C. Balendis, Balh. cat. hort. taur. 1813. p. 20. C. Ramosissima, Host, fl. austr. 1. p. 204, but not of Sibth. et Smith. Root slender, fibrous. Stem glabrous or hispid. Peduncles long, naked, glabrous, bearing each an erect flower at the apex; but the alabastrum is drooping before expansion. Corolla with a white base, middle part or base of the lobes pale blue, and the lobes bluish-violet.

150 C. decumæns (Alph. D. C. mon. p. 334. t. 12. f. A.) stem decumbent, nearly simple, few-flowered; radical leaves roundish-spatulate, sinuate; cauline leaves ovate, crenately-toothed; superior ones linear-lanceolate; calyx with a pilose tube; corolla funnel-shaped, twice longer than the calyce lobes; capsule spheroid. 0 H. Native of Spain, near Aranjuez. Root slender, fibrous. Stem glabrous or slightly pilose. Radical leaves with rather scabrous white subrevolute edges; middle ones quite glabrous. Flowers terminal, and axillary, on long peduncles, solitary, drooping before expansion, but afterwards erect. Corollas blue?

Decumbent Bell-flower. Pl. decumbent.

131 C. Loefelì (Brot. phyt. fasc. 1. no. 10. fl. lus. 1. p. 237.) stem much branched, many-flowered, rather scabrous on the angles; leaves crenulated; lower ones ovate-reniform, or roundish-cordate; superior ones ovate, stem-clasping; calyx glabrous, with an obconical tube, and long-acuminated spreading lobes, which are rather shorter than the corolla; capsule obconical, with prominent nerves. 0 H. Native throughout Portugal, in sandy places; of Spain, about Madrid; and of the territory of Mogador. Brot. phyt. hisp. sel. p. 11. t. 18. Hoffm. et Link, fl. port. 2. p. 14. t. 82. C. Broussettiannus, Roem. et Schultes, syst. 5. p. 104. Root slender, fibrous. Leaves glabrous. Flowers solitary, terminating the naked branchlets, loosely panicked, drooping. Corolla funnel-shaped, blue, or violaceous, with a deeper coloured zone beneath the middle, white at the base, both inside and outside. In one variety, the calyx is downy.

132 C. retrorsa (Labill. pl. syr. dec. 5. t. 3.) stem few-flowered, angular, scabrous from retrograde prickles or bristles on the angles; lower leaves roundish-obovate, petiolate, somewhat sinuated, glabrous; superior leaves ovate-lanceolate, entire, with scabrous edges; calycine lobes long-acuminated, spreading, scabrous from serrulations, longer than the corolla, which is funnel-shaped; capsule obconically elongated. 0 H. Native on Mount Lebanon. Root slender, fibrous. Branches elongated, naked, each terminated by an erect flower. Flowers drooping before expansion. Corolla mixed with white and violet.

Retrograde-bristled Bell-flower. Pl. 1/2 to 1/4 foot.

133 C. Zoysì (Wulf. in Jacq. coll. 2. p. 152.) plant tufted; stems erect, few-flowered; leaves entire; radical ones crowded, petiolate, ovately-obovate, obtuse; cauline leaves ovato-lanceolate, and linear; calyce lobes subulate; corolla long, cylindrically ventricose; capsule ovoid-spherical. 2 H. Native of the Upper Alps of Styria, Carniola, Carnibia, &c. Jacq. icon. rar. 2. t. 334. Plant small, glabrous, tufted. Root creeping, throwing out many small stems, which bear from 1 to 3 flowers each. Leaves crowded at the base. Flowers pedicellate, drooping. Corolla cylindrically, elongated, pale blue, with 5 deeper coloured lines; rarely white.

134 C. Cenìsìa (Lin. spec. suppl. p. 1669.) plant tufted; stems ascending, 1-flowered; leaves entire; radical ones rostrate, obvate, obtuse; cauline leaves ovato-oblong; calyx hairy, with linear-lanceolate lobes; corolla 5-lobed, hardly twice the length of the calyce lobes; capsule ovoid. 2 H. Native of the Higher Alps of Provence. Piedmont, Dauphiny, Savoy, Vallais; on Mount Cenis; and of Switzerland, on the mountains called Diablerets, &c. All, pedem. no. 395. t. 6. f. 2. Rchb. icon. bot. cent. 1. p. 85. All. rar. stipr. spec. 35. t. 5. f. 1. Root creeping, blackish. Stems numerous, glabrous, or slightly pilose. Flowers solitary, terminal, erect. Corolla deep blue, hardly one half longer than the calyce lobes.

Var. β, angustifolia (Schrad. prim. salsis. p. 70.) leaves narrow.

135 C. spatúlata (Sibth. et Smith, pro拾. fl. græc. 1. p. 137. fl. græc. t. 203.) stem ascending, 1-flowered, pilose; lower leaves petiolate, ovate, crenated; superior ones lanceolate; calyx with an obconical tube, and linear-acuminated toothed lobes; corolla subcampanulate, hardly longer than the calyce lobes; capsule spheroid. 2 H. Native on Mounts Olympus and Parnassus. Root slender, twisted. Stem solitary, angular. Leaves rather pilose, but becoming more smooth and entire as they ascend the stem. Flower terminal, erect, blue.

CAMPANULACEÆ. XV. CAMPANULA.

136 C. ALEDOA (Fisch. mss. ex Alph. D. C. mon. p. 338.) plant humble; stems nearly naked, 1-flowered; radical leaves crowded, obovate-lanceolate, setately denticulated; petioles ciliated; calyx with a villous tube, and denticulated acuminate lobes; corolla campanulately funnel-shaped, ovate or longer than the calyence lobes; capsule somewhat cylindrical. 2. H. Native of Kamtschatka, Unalaschka, Kotzebue's Sound, Cadiak, and Sledge Island, as well as of the Rocky Mountains in America. C. lasiocephala, Cham. in Linnaea. 4. p. 39, exclusive of the syn. Camp. Sayenensis, Fisch. Root slender, white. Stem glabrous, or slightly pilose. Foot terminal, erect. Corolla large for the size of the plant, blue.

Algid Bell-flower. Pl. ½ to ⅓ foot.

157 C. V. D. FLOREA (Lin. spec. p. 231, but not of Vill.) stems 1-flowered; leaves nearly entire: lower ones obovate, petiolate; middle ones obovate-lanceolate: upper ones few, linear-lanceolate; calyx rather villous, with linear acuminate lobes, about equal in length to the corolla, which is funnel-shaped; capsule cylindrical. 2. H. Native of the polar region of America, as in the Island Unalaschka; north side of the Rocky Mountains; between Point Lake and the Arctic Sea; Kotzebue's Sound, Melville Island, Greenland; and of the north of Europe, as in Lapland, Sweden, Norway, &c. Svensk, bot. t. 526. Rottb. pl. greenl. in act. hafn. x. p. 52. t. 6. f. 19. Oedl. fl. dan. t. 1512.—Lin. fl. lap. no. 855. t. 9. f. 5-6. Root simple, blackish. Stems simple, glabrous. Leaves glabrous. Foot dropping; deep azure blue.

*** 1 Valves situated near the apex of the capsule. Flowers on short pedicels. Leaves opposite. Branches usually more or less dichotomous.

138 C. FASTIGIATA (Dufr. in herb. D. C. ex Alph. D. C. mon. p. 540. t. 12. f. B.) plant scabrous, humble; lower leaves obovate, nearly entire: middle ones obovate-lanceolate, coarsely 3-5-toothed: superior ones linear-lanceolate; corolla one half shorter than the calyence segments, which are linear-lanceolate; capsule obconical. 2. H. Native of Spain, in Arragon and about Aranjuez. Plant of a greyish colour. Stem branched, erect; branches diverging. Leaves rather dowlq or glabrous. Flowers sessile, erect, terminal, rising from the axil or above the axil of the branches, always opposite the leaves, particularly terminating the stem and branches. The flowers situated in the lower axils expand before the rest. Corollas small, blue.

Fastigiate Bell-flower. Pl. ⅛ foot.

† Species not sufficiently known.

139 C. LIGULARES (Lam. dict. 1. p. 582. ill. no. 2547.) leaves numerous, alternate, oblong, narrow, obtuse, entire, and ciliated; flower erect, terminal, middle-sized; calyx hispid, with nearly linear segments and covered sinuses; corolla tubularly campanulate, bearded a little; stem leafy, nearly glabrous, 1-flowered.

—Native of the Alps of Europe.

Ligulare-leaved Bell-flower. Pl. ⅛ foot.

Very rough Bell-flower. Pl. ¼ foot.

141 C. decurrens (Zuccagni in Roem. misc. p. 128.) stem winged; leaves decurrent, toothed, hispid; corolla tomentose and hispid on the outside.—Native country unknown. Stem flexuous, winged from the leaves being decurrent. Leaves spathulate, reticulated and tomentose, especially beneath. Flowers axillary, crowded, seated on a common peduncle. Bracteas cordate. Calyx hispid.

Decurrent-leaved Bell-flower. Pl. 2 feet.

142 C. A. SPEERA (Moench. supp. p. 188.) stem terete, straight, quite simple; leaves oblong, sessile, crenated; peduncles 3-flowered. 2. H. Native country unknown. Plant hispid from pili. Leaves obtuse, stiff; radical ones petiolate; cauline ones sessile, remote. Racemes loose, terminal. Flowers axillary; intermediate one pedunculate, lateral 2 adnate to the common peduncle. Corolla blue. Stigma trilid. Capsule 3-celled.

Rough Bell-flower. Pl. 3 feet.

143 C. CYMBALARIA (Sibth. et Smith, prod. fl. gracc. 1. p. 130.) leaves reniform, cut, quite glabrous, shining; stems diffuse. 2. H. Native of Mount Olympus, in Bithynia. Camp. folius cymbalariae crisipus montis Olympi Bithyni, Tour. cor. Perhaps this is either C. fragilis, or C. Billardieri.

Cymbalaria-leaved Bell-flower. Fl. diffuse.

144 C. Wanneri (Roch. pl. banat. var. t. 5. f. 12.) C. hetrophylla, Baumg. fl. trans. suppl. ex Fersiss. bull. se. frb. 1829. Nothing is known of this species.

Wanner's Bell-flower. Pl.

145 C. LANCEOLATA (Presl. ex Wanderoth, beitr. zu. fl. Von Hessen. p. 37. but not of Lapeyrès). Nothing more is known of this plant.

Lanceolate-leaved Bell-flower. Pl.

146 C. MONTANA (Delarb. fl. auvergn. p. 40.). Native of Auvergne. Nothing is known of this plant but the name.

Mountain Bell-flower. Pl.

147 C. RIGESCENS (Pal. ex Roem. et Schultes, syst. 5. p. 102.) leaves lanceolate: radical ones attenuated into the petioles, crenated: cauline ones sessile; stem straight, simple, downy; flowers terminal, racemose; calyces ciliated. Native of Siberia, about Lake Baical, in frigid places. Corolla 1½ inches long, twice the length of the calyx, with the segments ciliated a little. Style a little longer than the calyx. Stem a span high, few-flowered.

148 C. ASCÉDENS (Vest, in Roem. et Schultes, syst. 5. p. 90.) leaves scattered: lower ones on short petioles, ovate, toothed: superior ones oblong, quite entire, glabrous as well as the stem, which is asseriate; flowers solitary, drooping: calyx ciliated, subulate, a little shorter than the corolla. Native of Siberia. C. rotundifolia, Pall. ex herb. Lamb. Very nearly allied to C. uniflora.

Ascending Bell-flower. Pl. ascending, ⅛ foot.

149 C. HETERODÔXÁ (Vest, in Roem. et Schultes, syst. 5. p. 98.) leaves oblong, glabrous; flowers axillary, pedunculate, spreading; calyx short, with lanceolate-subulate segments, which are a little shorter than the corolla. 2. H. Native of Siberia. C. rotundifolia, Pall. herb. Peduncles axillary, capillary, 1-flowered, roughish, furnished with bracteoles.

Heterodox Bell-flower. Pl. ⅛ to 1 foot.

150 C. LUNÄRELLA (Wildl. rel. ex Roem. et Schultes, syst. 5. p. 92.) leaves ovate, deeply cordate, petiolate, double serrate; flowers small. 2. H. Native of Caucasus.

Lunatrix-leaved Bell-flower. Pl. 1 foot.

151 C. KITAIÈLLA (Roem. et Schultes, syst. 5. p. 90.) lower leaves obvate-cuneiform, crenated: superior one linear, quite entire; stem quite simple, 1-flowered. 2. H. Native of Austria. C. microphylla, Kit. in Schultes, fl. austr. 2. ed. no. 400.

2 C. Campanula (Rom. et Schultes, syst. 5. p. 105.) leaves linear-lanceolate, quite entire; lower ones the broadest, smooth, and tapering into the petioles; stem downy; flowers axillary, at length spicate; calyces segments setaceous, divaricate, rather pungent, length of corolla. 2. H. Native of Siberia. C. speciosa, Willd. rel. ex Roem. et Schultes, i. c. Stem simple, terete, weak. Flowers terminal, and rising from the axilile of the superior leaves, forming an interrupted spike, hardly pedunculate.

Kautscheta Bell-flower. Pl. ½ foot.

 Cult. All the species are elegant and handsome when in blossom, and are well adapted for decorating flower borders. They in general thrive well in common garden earth. The seeds of the biennial and annual kinds should be sown in the open border in spring. The perennial species may either be propagated by division or by seed. Some of the perennial and biennial species, natives of the warmer latitudes, require a little protection in winter, when the weather is severe. Some of the smaller perennial kinds answer well for decorating rockwork, or to be grown in pots, among other alpine plants.

Lin. syst. _Pentadâria_, _Monœgynia_. Calyx 5-lobed, with an elongated, prismatic, or long-oblacanal tube. Corolla rotate, 5-lobed. Stamens 5, free, one-half shorter than the corolla; anthers longer than the filaments, which are short, or membranous, and pilose. Style inclosed, pilose; hairs secund, disposed in 10 rows; stigma 3, filiform. Corolla long, prismatic, 0-celled, dehiscing by 3 valves at the apex, or a little above the middle part. Seeds ovoid or lenticular, rather compressed, shining. Dwarf annual herbs, natives of the region of the Mediterranean, and the temperate parts of Europe; one species alone a native of America. Leaves alternate, equally scattered over the stem, small; lower ones unlike the rest. Flowers terminal and axillary, erect, always sessile. Corollas blue, rose-coloured, white, grey, or variegated, shining in the sun; hence the generic name.

- Tube of calyx very long, prismatic, and angular. Capsule dehiscing towards the top, near the lobes of the calyx. Seeds ovoid. Leaves ovate-oblong or lanceolate, nearly entire, not stern-clasping.

1 S. pentagonaria (Alph. D. C. mon. p. 344.) stem branching, larger; flowers terminal, solitary; calyx becat with a few stiff hairs, having a long prismatic tube, and long linear-lanceolate, spreading lobes; corolla the length of the calyces lobes. 2. H. Native of the Levant, about Aleppo; in Carmania, Candia, Thrace, &c. Campanula pentagonia, Lin. spec. 1. p. 239. Desf. choix. cor. p. 44. t. 33, or ann. mus. 11. p. 134. t. 18. Ker. bot. reg. t. 56. Prismatoâcarpus pentagonia, Lher. sert. angl. p. 2. Stem glabrous or pilose on the angles. Leaves glabrous, nearly entire or crenulated, with revolute edges; lower leaves obovate; middle caliex ones lanceolate-ovate; upper calyce ones linear-lanceolate. The corolla before expansion is blunt and pentagonal, but when expanded large, white at the base, blue to the middle part, and violaceous at the extremity of the lobes.

2 S. falcataria (Alph. D. C. mon. p. 345.) stem nearly simple; flowers disposed in long spikes, or approximate at the tops of the branches; calyx glabrous or scabrous on the margins, with a prismatic tube, and very long lanceolate acuminate lobes, which are reflexed at the apex, and are twice the length of the corolla. 2. H. Native of the region of the Mediterranean; as of the Island of Chalcos or Eubæa; of Dalmatia; about Rome and Naples; and of Sicily, Corsica, and Sardinia; among corn, and on dry hills. Campanula falçata, Rom. et Schultes, syst. 5. p. 143. Guss. pl. rar. p. 96. Prismatoâcarpus falcatius, Tenore, prod. 16. fl. neap. 1. p. 77. t. 29. S-bas et Maur. fl. rom. prod. 1. p. 105.—Boxb. cent. 4. p. 24. t. 38.—Cupan. paup. 2. t. 29. Stem glabrous or a little scabrous on the angles. Leaves glabrous, rarely pilose, with rather revolute edges, crenulate. Flowers sessile, solitary, axillary, the whole forming a leafy spike. Corolla rose-coloured. Lobes of calyx falcate.

3 S. speculum (Alph. D. C. mon. p. 346.) stem branching; branches 3-flowered; calyx glabrous or downy, with a prismatic tube, which is narrow at the apex, and linear-lanceolate spreading lobes, which are at length reflexed; corolla length of the lobes of the calyx. 2. H. Native of the temperate parts of Europe, and throughout the region of the Mediterranean Sea, in corn-fields; in Germany, Transylvania, Pyrenées, Spain, Italy, Greece, Syria, Barbary, &c. Campanula speculum, Lin. spec. p. 238. Curt. bot. mag. t. 102. Smith, fl. græcë. t. 216. Lagozëa arvensis, Durand, fl. bourg. 1. p. 57. Prismatoâcarpus speculum, Lher. sert. angl. p. 2. Campanula palchella, Salisb. prod. p. 137. Legouzîa Durandii, Delarb. fl. suvergn. p. 45. Campanula miroir de Venus, Jaume, pl. fr. t. 73. Camp. corr., Visianii. stirp. dalm. spec. 5. p. 12.—Weinn. phyt. t. 286. Besl. syst. 7. t. 1. f. 1.—Gesn. tabl. phyt. 9. t. 76.—Lob. icon. t. 418.—Dodd. pempt. p. 168. t. 1.—Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 21. Branches glabrous or scabrous on the angles. Leaves crenulated, glabrous or scabrous; lower ones obovate; middle ones ovate-acute; superior ones lanceolate, nearly entire. Flowers terminal and axillary, showy. Corolla greenish-white at bottom, deep violet towards the middle part, and the lobes less violaceous, paler on the outside. There is also a variety with white flowers.

Var. ë, Libinica (Alph. D. C. mon. p. 347.) stem humble, simple, erect; leaves erect; flowers approximate at the apex.

Pl. ½ to 1 foot.

4 S. hybrida (Alph. D. C. mon. p. 348.) stem nearly simple; flowers approximate at the top of the stem; calyx scabrous, with a prismatic tube, which is narrower at the apex, and short erect ovate-lanceolate lobes; corolla one-half shorter than the calyceine lobes. O. H. Native of the region of the Mediterranean, and the temperate parts of Europe, and of Cauca-sius, in corn-fields; from Barbary, Spain, Sardeonia, Italy, Sicily, and Morea, even to England, Germany, and Siberia; in Tauria, Georgia, and Transylvania. Campânula híbrida, Lin. spec. 239. Smith, engl. bot. t. 375. Prísmaticòcoccus híbrídus, Lher. sert. angl. p. 2. Ten. fl. neap. l. p. 77. Prísmaticòcárpus confréntus, Mœnch, meth. p. 496. Legózíida híbrida, Delarb. fl. auvergn. p. 47. Camp. spúria, Wall. ined. Réem. et Schult, syst. 5. p. 154. Legózíida parvi-fóra, Gray, nat. arrang. brit. Pl. 2. p. 410. — Cyp. par. p. 1. t. 100. Raf. t. 100. f. 2.— Mor. oxon. 2. p. 457. sect. 5. t. 2. f. 22. Stem more or less scabrous from pili on the angles. Leaves crenated, more or less pilose; lower ones obovate; middle ones ovate, acute; superior ones smaller and ovate-lanceolate. Flowers 3–6, crowded towards the top of the stem, sessile, rising from the axils of the upper leaves and top of the stem. Corollas rose-coloured, or of a bluish rose-colour.

5 S. Côa (Alph. D. C. mon. p. 350.) stem humble, nearly simple; flowers few, approximate towards the top of the stem; calyx downy, with prismatic tube, and erect lanceolate-subulate lobes; corolla twice longer than the calyceine lobes. O. H. Native of the Island of Côa, in the coast by the sea side. Campánula spéculum, var. D'Urâv. enum. pl. arch. in mem. Lin. par. 1. p. 280. Prísmaticòcárpus hírtus? or a new species? D'Urâv. in herb. D. C. Stem pilose, downy at the base. Leaves pilose, greyish; lower ones obovate; middle ones sessile, ovate-acute; superior ones narrower and lanceolate. Flowers 5–6 towards the top of the stem, sessile, axillary, and terminal. Corolla blue or white.

Cois Venus’s Looking-glass. Pl. ½ to ¼ foot.

6 S. Ghlâneënís (Alph. D. C. mon. p. 350.) stem simple or a little branched; leaves lanceolate, acuminate, serrated, flowers subbracteose; segments of the calyx acuminate, serrated, longer than the corolla. O. H. Native of Persia, in the province of Ghlân. Campánula Ghlâneënîs, Pall. ined. ex Réem. et Schultes, syst. 5. p. 154. Very like S. spéculum, but differs in the stem being simple and much higher, in the calyceine segments being serrated, and ending each in a long setaceous twisted nucrane.

Ghílan Venus’s Looking-glass. Pl. 1 foot.

** Tube of calyx long, obconical, smooth. Capsule dehiscing towards the middle part. Seeds rather lenticular. Leaves ovate-roundish, clasping the stem.

Cult. All the species are showy border annuals, and are therefore worth cultivating in every garden. The seeds only require to be sown in the open ground, where the plants are intended to remain. By sowing the seeds in the autumn, the plants will blossom early in summer, and by successive sowings in spring, at intervals of a fortnight or three weeks, a succession of blossoming plants may be kept up.

XVII. TRACHELUM. XVIII. ADENOPOHRA.

769

Narrow-leaved Throat-wort. Pl. 1 foot.

Cult. The species are very showy when in blossom. They grow best in a light soil, against a south wall, or in front of a hot-house; and they may either be increased by seed or by cuttings, planted under a hand-glass in spring.

5 F.
**CAMPANULACEÆ.**

Lin. syst. Pentándria, Monogýnia. Calyx 5-cleft, Corolla campanulate or funnel-shaped, 5-lobed at the apex. Stamens 5, free; filaments erect, membranous, long, very much ciliated, conning so closely as to appear coherent. Nectary cylindrical, girding the base of the style. Style usually exerted, plorate while in the bud, the hairs disposed in 10 rows, but afterwards it becomes glabrous; stigmas 3. Capsule 3-celled, dehiscing laterally at the base by 3 valves. Seeds ovate, more or less flat. —Perennial, rarely biennial herbs, with usually edible roots (ex Fisch.). Stems erect. Leaves alternate, very rarely subverticillate; radical ones roundish, petiolate; cauline ones usually sessile, becoming narrower and shorter to the top of the stem. Flowers racemose or panicked, terminal and axillary, pedicellate, drooping; clavate while in bud. —Natives of Siberia, China, and Japan, and one of the east of Europe.

* Leaves broader, ovate-lanceolate, more or less ciliately serrated.

1 A. Síno'sis (Alph. D. C. mon. p. 354.) leaves alternate, ovate-lanceolate, glabrous, acutely serrated; flowers disposed in separate racemes; calyce lobes linear-lanceolate, entire, glabrous; corolla funnel-shaped; style a little exerted. 2. H. Native of China. Stem branched, glabrous or velvety. Leaves glabrous, deep green above. Flowers disposed in a loose few-flowered raceme, which is furnished with branches at the base. Corolla blue, glabrous.

**Whorled Adenophora.** Fl. June, July. Chl. 1783. Pl. 2 to 3 feet.

**Lily-leaved Adenophora.** Fl. Aug. Sept. Chl. 1784. Pl. 1 to 1 1/2 feet.

**Loug-styled Adenophora.** Fl. May, July. Chl. 1820. Pl. 1 to 1 1/2 foot.

**Leaves narrower, linear, entire or nearly so.**

† A species hardly known.

*Cult.* All the species are elegant border-flowers, and are therefore worth cultivating in every garden. They grow in common garden soil, and are to be increased by seeds, as dividing at the root is almost sure to kill the plants.

**Linx. sytr. Monádélphiá, Pestándía,* Calýx* 3-fl., Corolla 5-lobed at the apex, usually velvety, and cream-coloured. Stamens 5; filaments free, membranous, ciliated; anthers combined into a long tube, which is 5-lobed at top. Style cylin-drical, pilose; stigmas 3, filiform. Capsule 3-celled, debiscing by 3 valves at the base. Seeds ovate, more or less flattened, shining.—Herbaceous perennial or woody plants. Leaves alternate, petiolate, cordate; lower ones larger and on longer petioles. Flowers terminal and axillary, pedicellate, usually racemose, rather large.—Three of the species inhabit the region of Caucasian, and one the Island of Candia.

**Sect. I. Sinuses of *calýx* not covered by the appendages.

**Sect. II. Sinuses of *calýx* covered by the appendages.

Camp. Vandéssii, G. Don, in Loud. hort. brit. p. 77. Roots rather creeping, throwing out many stems. Flowers drooping, showy, cream-coloured, disposed in a loose panicle, intermixed with the leaves; peduncles 1-3-flowered.

5. S. ? Oscetica (Alph. D. C. mon. p. 368.) stem humbly, simple; leaves petiolate, coriaceous, doubly serrated; calyxes glabrous, with the segments long and dentilculated, much shorter than the sinuses, which are reflexed; corolla somewhat 5-cleft, having the segments pilose inside. 2. H. Native of Iberia, in Ossetia, on Mount Kaischar. Campánula Oscetica. Bieb. fl. taur. suppl. p. 145. Habit of S. pendula, but is destitute of branches, and is wholly glabrous. Flowers solitary, axillary, erect, disposed in a crowded simple raceme from the middle of the stem to its top. Corollas blue.

Oscetica Symphyandra. Pl. ½ to 1 foot.

Cult. These plants have much the habit of the large bellflowered species of *Campanula*, as *C. punctata* and *C. medium*. They are of easy culture, and are increased by dividing at the root, or by seed; and being showy, are worth cultivating as border-flowers.

**XX. MUSSCHIA** (so named by Alphonse de Candolle, in honour of J. J. Mussche, director of the botanic garden at Gaudz.). Alph. D. C. mon. p. 368. t. 6. f. 4.—*Campanula* species of Lin. and others.

**Linn. syst. Pentándria, Monogynia**. Calyx 5-cleft. Corolla deeply 5-cleft, of a golden yellow colour. Stamens 5, cuspitate at the apex, free; filaments broadest at the base, glabrous. Stigmas 5. Capsule 5-celled, 10-nerved, debouching by numerous transverse lateral fissures between the nerves; cells alternating with the calyceal lobes and stamens. Seeds numerous, small, ovoid, shining.—A small glabrous shrub, native of Madeira and Teneriffe, altogether different in habit to any other campánulaceous plant. Stem thick. Leaves alternate, large, serrated. Flowers numerous, pyramidal racemose, yellow.

1 G. Native along the coast of Madeira, on rocks. Campánula atresca. Jacq. hort. schoenbr. 4. t. 472.

**Cult.** This remarkable shrub thrives very well in a mixture of loam and peat; but is only to be increased by seed, of which abundance is produced in the gardens.

† A genus not sufficiently known, and it is not quite certain whether it belongs to *Campanulaceae*.

**Linn. syst. Pentándria, Monogynia**. Calyx 5-cleft, with an ovoid tube. Corolla 5-loned, caducous, with a very narrow tube. Stamens 5, free; filaments very slender at the base, much longer than the anthers. Style filiform, usually exserted, glabrous; stigmas 2, very short. Ovarium inferior, 1-celled, probably always. Ovula usually 4, placed in the bottom of the ovary. Capsule indehiscent.?—Small Cape shrubs, with the habit of *Roëlla*. Stems erect, branched; branches very woolly, rather woody, redish. Leaves sessile, alternate, crowded, linear-subulate, more or less ciliated, stiff, and very similar to those of *Roëlla*. Flowers sessile, solitary, simple, always axillary. Inflorescence centripetal. Calyx with a very hispid tube, and lanceolate acute smoothish segments. Corolla like that of *Trachelium*, long, tubular, and narrow. The character of the capsule still remains unknown; this is, however, without doubt inferior, and probably 1-celled, and contains 4 ovula in the bottom. The capsule is without any indication of dehiscence in the specimen examined by Alph. D. C.

**Fine-leaved Merciera.** Shrub 1 foot.

2 M. brevifolia (Alph. D. C. mon. p. 371.) leaves ciliated a little; corolla white, length of leaves, 5-lobbled at the apex: lobes lanceolate, spreading, pilose; style doubly longer than the corolla. H. G. Native of the Cape of Good Hope. Roëlla lateriflora, Banks, herb. Very like the preceding. Flowers numerous, lateral, solitary, in the axis of the leaves.

**Short-leaved Merciera.** Shrub 1 foot.

**Slender-lobe-flowered Merciera.** Shrub 1 foot.

**Cult.** A mixture of peat and sand is a good soil for the species of *Merciera*; and they may be increased either by cuttings under a hand-glass, or by seed.

† Plants referred to the genus *Campánula*, but it is doubtful to what genera they belong.

1 Campánula stelláta (Thunb. phytt. bl. p. 20. mem. acad. petersb. 4. p. 377.) a short, linear, entire; flowers axillary, pedunculate; stem frutescent, white, glabrous, branched, erectish, a hand high; branches alternate, simple, a little curved; leaves sessile, acute, imbricated, angular; flowers solitary, at the tops of the branches; peduncles
capillary, flexuous, an inch long. §. G. Native of the Cape of Good Hope. This is certainly not a species of *Campánula*, but it may be a species of *Ligustória*, *Roëlla*, or *Prismato-carpus*.

**Stellate Bell-flower.** Shrubs \( \frac{1}{2} \) to 1 foot.

2. *Campánula lanceolata* (Roschb. fl. ind. 2, p. 96) branches, glabrous; leaves alternate or nearly opposite, on short peti-oles, lanceolate, serrated, acuminate; flowers terminal; calyce- segments lanceolate and jagged; capsule obovate, 5-celled. ○ H. Native of Chittagong, in humid valleys. Plant delicate, 1½ foot high, simple or branched at the top, sending out 2 or 3 1-flowered peduncles. Flowers inclined, size and form of *Corolla*. Radical leaves not seen. Perhaps this plant is allied to *Platycoðon*.

**Lanceolate-leaved Bell-flower.** PI. 1 to 1½ foot.

3. *Campánula phyteumoides* (Zuccagni, cent. 1. obs. bot. in Rœm. et Schultes, syst. 1. p. 84.) plant small; radical leaves numerous, lanceolate, obtuse, running down the petioles, undu- lated; cauline leaves few, remote, sessile, stem-clasping, mucro- nate; flowers sessile, crowded into a short spike or in a head; calyx with a tetragonal base, and erect, lanceolate, smooth seg- ments; corolla campuluate,-violaceous, larger than the calyx; style elevated, exserted; capsule tetragonal.—Native of Mount Olympus, in Bithynia. Perhaps a species of *Phyteum*. Deharengia-like Bell-flower. PI. small.

4. *Campánula glauca* (Thumb. fl. japo. p. 88.) leaves sessile, ovate, serrated, glaucous beneath; stem angular, panicled; ped-uncles 1-flowered.—Native of Japan, near Nagasaki; also culti- vated. Kekko Kempf, amoen. v. p. 822. Stem suffruticos, angular, glabrous, paniculately branched at top. Leaves green above, with rather reflexed edges. Flowers axillary, and on the tops of the branches solitary. Peduncles bracteate. Corollas large, blue. The roots are excent, like those of *Rampion*. It is, perhaps, a species of *Campánula*, but more probably of *Platycoðon* or *Adénophora*.

**Glaucous Bell-flower.** PI. 2 feet.

5. *Campánula montevideana* (Spreng. syst. 1. p. 788.) stem erect, downy, branched at the base; leaves obsolescently cre- nated; lower ones spatulate; superior ones cordate; pedi-uncles 3-flowered.—Native of Monte Video, where it was collected by Sello.

**Monte-Video Bell-flower.** PI. erect.

6. *Campánula carnosa* (Wall. in Roschb. fl. ind. 2, p. 102.) plant smooth, fleshy, procumbent; leaves ovate, cespitously ser- rated, petiolate; flowers axillary, on capillary peduncles, which are about equal in length to the leaves; filaments linear, not dilated at the base. ○ H. Native of靳paul on Mount Shepo- pore, towards the middle, on rocks near rivulets. Stems creeping, obscurely 3-cornered. Flowers very small, of a pale blue. Calyceine segments entire, erect. Corolla funnell-shaped, more than twice the length of the calyx, with a quinqued lib-biate limb; segments oblong, acute, equal, the two uppermost ones more parallel and erect; the rest spreading. Stamens distinct, distant, a little shorter than the corolla; filaments flat, not valvate at the base, inserted together with the corolla on the disc of the ovarium; anthers erect, linear. Ovarium oblong, obscurely triangular, 3-celled, many-seeded; its vertex not elongated, as is usual in the genus, but covered by a fleshy yellowish disc. Style filiform; stigmas 3, linear. Capsule club- shaped, prismatic, bursting towards the base by 3 round valves. This is certainly not a species of *Campánula*, but from the characters given, it appears to be a new genus, connecting *Campánulaceae* with *Adénophoraceae*.

**Fleshy Bell-flower.** PI. creeping.

**Order CXXXVIII. EPERIDEÆ.** (this order contains plants agreeing with *Eperis* in important characters). R. Br. Prod. p. 535.

Calyx 5-parted, (rarely 4-parted), usually coloured, perma- nent. Corolla hypogynous, monopetalous, with the tube sometimes divisible into 5 parts; limb 5-cleft, rarely 4-cleft, equal, and sometimes bursting transversely from the segments, co- hering, valvate or imbricate in aestivation, deciduous or mar- crescent. Stamens equal in number to the segments of the corolla, and alternating with them, rarely fewer; filaments epipetalous or hypogynous; anthers simple, with a single polliniferous receptacle, constituting a complete, rarely a marginate sepiment, undivided, dehiscing longitudinally. Pollen subglobose, rather angular, or composed of 3 com- bined globules. Ovarium sessile, usually girded by 5 dis- tinct or combined scales, many-celled, rarely 1-celled. Seeds solitary or indefinite. Style 1; stigma 1, sometimes toothed. Fruit drupaceous, baccate, or capsular. Seeds albuminous. Embryo straight, slender, longer than the half of the albumen.—*Shrub* or small trees. Leaves alternate, very rarely opposite, entire, rarely serrated, usually petiolate, or with a simple base; having the bases broader, imbricated, ciliate, and sheathing a little. Flower spicate or racemose, terminal: or solitary and axillary. Calyces or pedicels furnished with 2 or more bracte- ates, which are of the same texture as the calyx. Flowers white or purple, rarely blue. This order is chiefly distinguished from *Eriéæ* in the anthers being awnless and 1-celled. The shrubs are all elegant, of a dry prickly habit, with tubular or campulate flowers.

**Synopsis of the genera.**

**Trabe.**

**Styphylleæ.** Cells of ovarium 1-seeded. Pericarps closed, rarely capsular.

1. *Styphylle*la. Calyx with 4 or more bracteas. Corolla long, tubular; tube furnished on the inside near the base with 5 fasci- cles of villi: segments of the limb revolute, bearded. Filaments exerted.

2. *Astroloma*. Calyx imbricated by 4 or more bractes. Corolla with a ventricose tube (f. 132. b.), furnished with 5 fasci- cles of villi near the base, inside; limb short, spreading, bearded (f. 132. c.). Filaments inclosed.

4. *Melichrus*. Calyx many-bracteate. Corolla rotate or urceolate, furnished with 5 fascicles of glands near the base inside; segments half bearded.

12 Pentachondra. Calyx with 4 or more bracteas. Corolla funnel-shaped; limb spreading, longitudinally and densely bearded.

Tribe II.

EPACRIÉÆ. Cells of ovarium many-seeded. Pericarp capsular.

15 Epacris. Calyx coloured, many-bracteate (f. 133. a.); bracteas texture of calyx. Corolla tubular (f. 133. c.), with a beardless limb. Stamens epipetalous (f. 133. b.). Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

16 Lysine'ma. Calyx coloured, many-bracteate; bracteas texture of the calyx. Corolla salver-shaped: with the tube sometimes divided into 5 parts to the base; segments of the limb beardless, bent to the right. Stamens hypogynous. Anthers peltate above the middle. Hypogynous scales 5. Placentas adnate to the central column.

17 Physo'tes. Calyx bractless. Corolla tubular, with an open throat, and a beardless limb. Stamens hypogynous; filaments half adhering to the tube. Anthers with a complete dissepiment. Hypogynous scales 5.

19 Anderso'nia. Calyx coloured, imbricated by 2 or more foliaceous bracteas. Corolla length of calyx; segments of the limb bearded at the base. Stamens hypogynous. Anthers fixed beneath their middle. Hypogynous scales 5. Placentas adnate to the central column.

1 Stryphelia: Cells of ovarium 1-seeded. Pericarp closed, rarely capsular.

1. Stryphelia (from στρυφήλος, strophelos, rough or harsh; from the stiff, compact, harsh habit of the shrubs). B. Br. prod. p. 537. Stryphelia species, Smith.

Linn. syst. Por-ti-cae, Monogynia. Calyx girded by 4 or more bracteas. Corolla elongated, tubular; tube furnished with 5 fascicles of villi near the base inside: segments of the limb revolute, bearded. Filaments exerted. Ovarium 5-celled. Drupe nearly dry, containing a solid bony putamen.—Erect or ascending, branched, smoothish, shrubs. Leaves scattered, on short petioles, mucronate. Flowers axillary, drooping, or divaricate, showy. Peduncles 1-flowered, rarely 2-3-flowered. Hypogynous scales 5, distinct, rarely combined.

2 S. la'ta (B. Br. prod. p. 537.) leaves elliptic, or oblong-lanceolate, flat, glaucous, imbricated, with sebaceous denticulated edges; branchlets downy; stem erect. G. Native of New South Wales, about Port Jackson. Flowers red.

3 S. adsc'ëndens (B. Br. prod. p. 537.) leaves lanceolate, flat, with sebaceous dentilicate margins, glaucous beneath and manifestly striated; stems diffuse, with ascending branches. G. Native of Van Diemen's Land. Flowers scarlet.

4 S. latifolia (B. Br. prod. p. 537.) leaves broadly ovate, acute, imbricated, rather concave above, with sebaceous edges; flowers erectish. G. Native of New South Wales, about Port Jackson. Flowers pink.

5 S. viridiflora (B. Br. prod. p. 537.) leaves obovate-
oblong, obtuse, mucronulate, flat, smooth above, with the margins rather scabrous, and are, as well as the flowers, divaricate. G. Native of New South Wales, about Port Jackson. Andr. bot. rep. 312. Flowers green, with brown anthers.

6 S. tubiflora (Andr. bot. rep. 72.) leaves elliptic or oblong-lanceolate, flat, glaucous, smooth every where, as well as on the margins; branchlets glabrous; flowers coriaceously approximate; peduncles 1-3-flowered. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Sims, bot. mag. 1297. Flowers pink, with a cream-coloured limb.

7 S. tubiflora (Smith, new holl. 45. t. 14.) leaves linear, ovate, mucronate, rather scabrous above, with revolute edges; flowers drooping. G. Native of New South Wales, about Port Jackson. R. Br. prod. p. 537. Lodd. bot. cab. 1938. Flowers scarlet.

8 S. glaucescens (Siebl. pl. nov. holl. ex Spreng. syst. add. p. 67.) leaves lanceolate, mucronate, quite entire, smooth, finely striated, glaucous; peduncles short, 1-flowered. G. Native of New Holland.

Glaucescent Styphelia. Shrub. Cult. This is a very handsome genus of shrubs. A mixture of one-third sandy loam, and two-thirds sandy peat, answers the species best; and young cuttings, planted in sand under a bell-glass, will strike root.

II. ASTROLOMA (ἀστρολα, astron, a star, and λάμα, lama, a fringe; in reference to the bearded limb of the corolla. R. Br. prod. 538.). Ventenátia species, Cav. Styphélia, Spreng. syst. 1. pp. 657, 658.

Lin. syst. Pentádria, Monogynía. Calyx inbricated by 4 or more bracteas (f. 132. a.). Corolla with a ventricose tube (f. 132. b.), which is doubly longer than the calyx, and furnished with 5 fascicles of hairs near the base inside; limb short, spreading, half bearded. Filaments inclosed, fleshy, broader than the anthers. Ovarium 5-celled. Drupe nearly dry; containing a solid bony putamen.—An erect shrub. Leaves much crowded, acerose. Flowers axillary, erect, with a scarlet tube, and a greenish-yellow limb. Hypogynous disk cup-shaped, entire.

Pine-leaved Stenanthéra. Fl. May, July. Clt. 1811. Shrub 4 to 6 feet. Cult. This is a beautiful shrub when in blossom. A soil composed of one-third very sandy loam, and two-thirds sandy peat, suits it best. The pot in which it is grown should be well drained with shreds, or the mould is apt to get soddened from too much wet. It should not be too much exposed to the sun in summer. Cuttings from the young shoots root readily in sand, under a bell-glass.

III. STENANTHERA (στενός, stenos, narrow; and ἀνθερα, anthera, an anther; the filaments are broader than the anthers, which makes them appear narrow). R. Br. prod. p. 538.

Pine-leaved Stenanthéra. Fl. May, July. Clt. 1811. Shrub 4 to 6 feet. Cult. This is a beautiful shrub when in blossom. A soil composed of one-third very sandy loam, and two-thirds sandy peat, suits it best. The pot in which it is grown should be well drained with shreds, or the mould is apt to get soddened from too much wet. It should not be too much exposed to the sun in summer. Cuttings from the young shoots root readily in sand, under a bell-glass.

IV. MELICHRUS (from μέλιχρος, melichros, honey-coloured; in reference to the colour of the glands of the flowers). R. Br. prod. p. 539.

1 M. rotatus (R. Br. prod. p. 539.) corollas rotate; calyx villous; leaves lanceolate-linear, pilose on both sides and on the margins. G. Native of New South Wales, and of tropical New Holland. Ventenatía procumbéns. Cav. icon. 4. p. 28. t. 349. f. 1. Flowers scarlet.

V. CYATHODES (from κυάθος, kyathos, a cup; and ὀδος, odos, a tooth; in reference to the disk, which is cup-shaped and 5-toothed). R. Br. prod. p. 539.—Cyathodes species, Labill.—Styphelia species, Labill. Solander, and Spreng. Linn. syst. Pentandria Monogyna. Calyx with many bracteas. Corolla funnel-shaped; tube hardly exceeding the calyx, without any fascicles of villi or glans; limb spreading, with or without any beard. Filaments inclosed. Ovarium 5-10-celled. Drupe baccate.—Erect branched shrubs, with the habit of small trees. Leaves striated on the underside. Flowers axillary, erect, or drooping a little, small. Hypogynous disk cup-shaped, 5-toothed.

§ 1. Segments of the corolla bearded; axis simple inside.
1 C. glauca (Labill. nov. holl. l. p. 57. t. 81.) drupe 8-10-celled; leaves crowded at intervals, somewhat verticillate, spreading or divaricate, linear-lanceolate. $\psi$. G. Native of Van Diemen's Land. R. Br. prod. p. 539. Trochocarpus glauca, Spreng. syst. 1. p. 660.

2 C. staminea (R. Br. prod. p. 539.) drupe 5-celled; leaves crowded at intervals, somewhat verticillate, oval, obtuse, awnless, spreading, many-nerved beneath; stem erect. $\psi$. G. Native of Van Diemen's Land.

Stram Cyathodes. Shrub.
3 C. dealbata (R. Br. prod. p. 539.) drupe 2-5-celled; leaves linear, erectly spreading, margined with very short cilia, 5-nerved beneath: nerves all simple. $\psi$. G. Native of Van Diemen's Land.

Whitened Cyathodes. Shrub procumbent.
4 C. Tamei'male (Cham. et Schlecht. in Linnae, l. p. 539.) drupe 5-8-celled; leaves narrow, cuneate-obovate, petiolate, mucronate, many-nerved beneath. $\psi$. G. Native of the Sandwich Islands. Habitat of Leucopogon obovatus, Labill. Cy. Banksii, Gaud. in Freyc. voy. pt. bot. p. 265. is perhaps the same as this. Dr. R. Brown speaks of 2 other species from the Sandwich Islands, having the segments of the corolla naked, while this is bearded.

Tanei'mae's Cyathodes. Shrub or small tree.

§ 2 Segments of corolla beardless; axis usually elevated inside. Lissânté, Spreng. syst. 1. p. 660.

1 C. parvifolia (R. Br. prod. p. 540.) leaves linear-lanceolate, not half an inch long, spreading, margined with very short cilia, 5-nerved beneath: nerves all simple. $\psi$. G. Native of Van Diemen's land.

Small-leaved Cyathodes. Shrub or small tree.

6 C. oxycedrus (R. Br. l. c.) leaves linear, more than half an inch long, spreading, with naked margins, 3-5-nerved beneath: nerves all simple. $\psi$. G. Native of Van Diemen's land. Styphelia Oxycedrus, Labill. nov. holl. l. p. 49. t. 69. Flowers white. Red Cedar-like Cyathodes. Fl. April, June. Ct. 1822. Shrub 6 ft.

8 C. acriosa (R. Br. prod. p. 539. and 540.) leaves linear-spreading, with naked margins, 3-5-nerved beneath: outer nerves pectinately branched. $\psi$. G. Native of Van Diemen's Land.? Styphelia acerësa, Banks and Solander. ms. Ardisia acerësa, Gurrin.

VI. LISSANTHE (from λισσός, lissos, smooth, and ὀδος, odos, a flower). R. Br. prod. p. 540.

§ 1. Calyx bibracteate. Racemes axillary, few-flowered; pedicels bibracteate at the base. Tube of corolla villous inside.
1 L. sâpida (R. Br. prod. p. 540.) racemes 2-5-flowered, recurved; leaves oblong-linear, mucronate, with revolute margins, whitened and striated beneath. $\psi$. G. Native of New South Wales. Lindl. bot. reg. 1275. Hook. bot. mag. t. 3147. Flowers white, tipped with green. The berries are red and acid, and are made into tarts in New South Wales, under the name of cranberries.

2 L. subula'ta (R. Br. l. c.) racemes 4-5-flowered, erect; leaves linear-subulate, half an inch long; branchlets glabrous; drupe 10-striped. $\psi$. G. Native of New South Wales. Subulate-leaved Lissanthe, Fl. April, July. Ct. 1823. Shrub.

§ 2. Calyx bibracteate. Corolla urceolate, having the tube and throat naked. Spikes axillary, few-flowered.
4 L. montâna (R. Br. l. c.) leaves oblong-linear, obtuse, mutic, glaucous beneath. $\psi$. G. Native of Van Diemen's Land.

Mountain Lissanthe. Shrub.

§ 3. Calyx bibracteate. Corolla funnel-shaped, having the throat closed by deflexed villi. Flowers axillary, solitary.
Daphne-like Lissanth. Fl. June, July. Clt. 1818. Shrub. 6 L. cillata (R. Br. l. c.) leaves elliptic-lanceolate, flat, with serrrately ciliated margins, ending each in a pellucid mucrone; limb of corolla roughish. \( \hat{r} \). G. Native of Van Diemen's Land.

Cult. For culture and propagation see Stypheilla, p. 775.

VII. LEUCOPOGON (from λευκός, leucos, white; and πογός, pogon, a beard; the limb of the corolla is bearded with white hairs). R. Br. prod. p. 541. Stypheilla, Spreng. syst. 1. p. 656, 657, 658, and 659.

1. L. lanceolatus (R. Br. prod. p. 541.) spikes nodding, aggregate; ovaries 2-celled; drupes oval; leaves lanceolate, flat, 3-nerved; branchlets glabrous. \( \hat{r} \). G. Native of New South Wales, on mountains. Sweet. Fl. austral. t. 47. Stypheilla lanceolata, Smith, new holl. p. 49. exclusive of the synonyms. Stypheilla parviflora, Andr. bot. rep. 287. Flowers white.

2. L. Malaya nus (Jack, mal. misc. vol. 1. Wall. in Roxb. fl. ind. 2. p. 301.) spikes axillary, many-flowered, erect, short; drupes globose, 5-celled; leaves lanceolate, mucronate, nearly veinless, glaucous beneath. \( \hat{s} \). S. Native of the plains of Singapore, abundant; where it is called by the Malays Mentata. A small, branching, dry shrub, exhibiting the peculiar habit of the family. Corollas funnel-shaped, downy, having the segments bearded above beyond the base. The discovery of this species is remarkable as forming an exception to the general geographical distribution of the order Epacridae, a family almost exclusively confined to Australia, or at least to the southern hemisphere. Singapore, situated at the extremity of the Malay peninsula, and forming as it were the connecting link between continental or Western India and the plains of the great Eastern Archipelago, partakes of this character in its Flora, which exhibits many remarkable points of coincidence with the Flora of both regions. A resemblance has been observed between its productions and those of the northern frontier of Bengal, on the one hand, and of the Moluccas on the other, while the present plant connects it with the still more distant range of New Holland.

Malay Leucopogon. Shrub 3 feet.

3. L. Australianus (R. Br. l. c.) spikes erect; drupes depressed, globose, 5-celled; leaves linear-lanceolate, more than an inch long, 3-5-nerved, with recurved smooth margins. \( \hat{r} \). G. Native of the south coast of New Holland and Van Diemen's Land. Flowers white.

Southern Leucopogon. Shrub.

4. L. Richei (R. Br. l. c.) spikes erect, many-flowered, a little shorter than the leaves; drupes ovate, 5-celled; leaves glabrous, oblong-lanceolate, hardly an inch long, broadest beyond the middle, 3-5-nerved, convex above, with subrecurved margins. \( \hat{r} \). G. Native of New South Wales, the south coast of New Holland, and Van Diemen's Land. L. polystasychus, Lodd. fl. cab. t. 1436. L. apiculatus, Smith in Rees. cyc. L. parviflorus, Lindl. bot. reg. 1560. Stypheilla Richei, Labill. nov. holl. 1. p. 44. t. 60. Stypheilla parviflora, Andr. bot. rep. 287. Stypheilla Gnidium Vent. malm. t. 23. Flowers white.

5. L. affinis (R. Br. l. c.) spikes erect; drupes oval, 2-3-celled; leaves long-lanceolate, more than an inch long, flat. \( \hat{r} \). G. Native of Van Diemen's Land. Flowers white.

Allied Leucopogon. Shrub.

6. L. interruptus (R. Br. l. c.) spikes nearly terminal; leaves elliptic, spreading, many-nerved, \( \frac{1}{2} \) inch long, crowded in whorles. \( \hat{r} \). G. Native of the south coast of New Holland. Lodd. bot. cab. 1451. Flowers white.

7. L. cyphus (Labill. sert. caled. p. 36 t. 39.) spikes axillary, erect; segments of the corolla bearded with rufous hairs; leaves an inch long, oblong-lanceolate, rufous, concave. \( \hat{r} \). G. Native of New Caledonia. Flowers furnished each with an orbicular, lacernately ciliate scale, beside 2 opposite boat-shaped ones above it.

Boat-leaved Leucopogon. Shrub 1 to 2 feet.

8. L. verticillatus (R. Br. l. c.) spikes nearly terminal, aggregate, nodding while bearing the fruit; drupes 5-celled; putamen pentagonal; leaves oblong-lanceolate, attenuated at the apex, disposed in interrupted whorles, 2 to 4 inches long. \( \hat{r} \). G. Native of the south coast of New Holland. Flowers white.

Whorled-leaved Leucopogon. Shrub.

§ 2. Spikes axillary, but sometimes terminal. Flowers three or more together. Calyx and bracteas coloured. Drupe nearly dry. Leaves never cordate.

9. L. apiculatus (R. Br. prod. p. 542.) spikes terminal, rather aggregate, 5-7-flowered; bracteas lanceolate; leaves lanceolate-oblong, erect, rather concave, with smooth margins, ending each in a callous point; drupe crustaceous, depressedly turbinate, shorter than the calyx. \( \hat{r} \). G. Native of the south coast of New Holland. Flowers white.

Var. \( \alpha \), branchlets and leaves glabrous.

Var. \( \beta \), branchlets and leaves pubescent. Perhaps a distinct species.

Apiculatus-leaved Leucopogon. Shrub.

10. L. polystachys (R. Br. l. c.) spikes axillary or terminal, aggregate, 7-10-flowered; leaves linear-lanceolate, mutic, convexasly concave; branchlets glabrous, twigg; drupes dry, oval, depressed at the apex. \( \hat{r} \). G. Native of the south coast of New Holland. Flowers white.

11. L. multiflorus (R. Br. l. c.) spikes axillary, shorter than the leaves; leaves lanceolate, a little acuminate, mucronate, imbricated, rather convex beneath, with smooth edges; calyx and bracteas smooth; leaves linear-oblong, obtuse, mutic, smooth, rather convex above, with somewhat recurved denticulated edges; branchlets glabrous; drupes oblong. \( \hat{r} \). G. Native of the south coast of New Holland. Flowers white.

Many-flowered Leucopogon. Shrub.

12. L. Rudercauldis (R. Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyxes and bracteas smoothish; leaves linear-oblong, obtuse, mutic, smooth, rather convex above, with somewhat recurved denticulated edges; branchlets glabrous; drupes oblong. \( \hat{r} \). G. Native of the south coast of New Holland. Flowers white.

5 G
13. **L. villus**us (Br. l. c.) spikes nearly terminal, aggregate; leaves linear-oblong, bluish, mucilaginous, erectly spreading, villos on both surfaces as well as on the branches, with denticated subrecurved margins. \( \varphi \). G. Native of the south coast of New Holland. Flowers white. Very nearly allied to *L. ruifikacaitis."

**Villos Leucopogon.** Shrub.

14. **L. obovatus** (Br. l. c.) spikes terminal, nearly simple; leaves obovate-oblong, obtuse, mucronulate, with sub-recurved margins; drupes nearly globose, 5-celled. \( \varphi \). G. Native of New Holland, on the south coast. Stypheia obovata, Labill. nov. holl. 1. p. 48. t. 67. Flowers white.

15. **L. revolutus** (Br. l. c.) spikes nearly terminal, aggregate, 4-5-flowered; calyxes and bracteas clothed with fine down; leaves moderately spreading, linear-oblong, obtuse, mucilaginous, tipped by a callous obtuse point, convex and scabrous above, linear and glabrous beneath, with recurved naked margins; bracteas clothed with minute down; drupes dry, 5-celled, obovate. \( \varphi \). G. Native of the south coast of New Holland. Flowers white.

**Revolute-leaved Leucopogon.** Shrub.

16. **L. margaridens** (Br. l. c.) spikes axillary, usually 3-flowered; leaves moderately spreading, linear-oblong, obtuse, mucilaginous, with recurved smooth margins; drupes 2-celled, dry and compressed above. \( \varphi \). G. Native of New Holland, within the tropic. Flowers white.

**Pearl-toothed Leucopogon.** Shrub.

17. **L. muticus** (Br. l. c. prod. p. 543.) spikes axillary, erect, 3-6-flowered; leaves linear-oblong, obtuse, rather mucilaginous, erectly spreading, with smooth rather recurved margins; drupes 5-celled, angular, glabrous. \( \varphi \). G. Native of New South Wales, in rocky situations. Flowers white. Very nearly allied to the following.

**Awnless-leaved Leucopogon.** Shrub.

18. **L. trichocarpus** (Br. l. c.) spikes axillary, nodding a little, 3-flowered; leaves linear-oblong, obtuse, mucronulate; drupes 5-celled, angular, pilose. \( \varphi \). G. Native of Van Diemen's Land. Stypheia trichocarpa, Labill. nov. holl. 1. p. 47. t. 66. Flowers white.

**Hair-fruited Leucopogon.** Shrub 3 feet.

19. **L. ericoides** (Br. l. c.) spikes axillary, approximate, 3-4-flowered; leaves oblong-linear, moderately spreading, mucronate, with recurved margins, rather scabrous above; bracteas mucilaginous; drupes dry, angular. \( \varphi \). G. Native of New South Wales and Van Diemen's Land. Stypheia ericoides, Smith, nov. holl. p. 48. E'pacris spuria, Cav. icon. 4. p. 27. t. 347. f. 1. Flowers reddish.

**Heath-like Leucopogon.** Fl. ? Clt. 1815. Shrub 4 to 6 feet.

20. **L. tropips**us (Br. l. c.) spikes axillary, usually 3-flowered, pedunculate; leaves lanceolate-linear, setaceous mucronate, smooth above, with revolute margins, which are dentilated from without; bracteas cupulately. \( \varphi \). G. Native of the south coast of New Holland

**Allied Leucopogon.** Shrub.

21. **L. atenuatus** (Cunningh. in Field's New South Wales, p. 341.) peduncles very short, erect, usually 1-flowered; leaves ovate-lanceolate, moderately spreading, rather convex, striated, setaceous mucronate, when young imbricated and ciliately dentilated. \( \varphi \). G. Native of New South Wales, on hills at Cox's River.

**Attenuated-leaved Leucopogon.** Shrub.

22. **L. virga**us (Br. l. c.) spikes terminal and axillary, almost aggregate, few-flowered; calyxes and bracteas rather membranous; leaves linear-lanceolate, attenuated at the apex, very acute, convexly concave, imbricated and spreading, with ciliated margins; bracteas glabrous. \( \varphi \). G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. Stypheia virgata, Labill. nov. holl. 1. p. 46. t. 64. Flowers white.

**Twiggy Leucopogon.** Fl. May, July. Clt. 1824. Shrub 2 feet.

23. **L. collins**us (Br. l. c.) spikes terminating the short lateral branches; lower bracteas sheathed a little, foliaceous, equalling the calyx in length; leaves oblong-linear, acutish, mucilaginous, smooth and rather convex above, with recurved dentilicate edges. \( \varphi \). G. Native of Van Diemen's Land. Stypheia collins, Labill. nov. holl. 1. p. 47. t. 65. Flowers white.

**Hill Leucopogon.** Fl. May, June. Clt. 1824. Shrub 1 foot.

**§ 3. Spikes axillary and terminal. Leaves cordate. Calyxes and bracteas membranous and foliaceous.**

25. **L. amplexicaulis** (Br. l. c.) spikes axillary and terminal, spreading, pedunculate, exceeding the leaves; leaves cordate, stem-clasping, mucilaginous, clothed with minute down beneath; with recurved margins, which are as well as the branches villos; drupes lenticular, 2-celled. \( \varphi \). G. Native of New South Wales. Stypheia amplexicaulis, Rudge, in Lam. trans. 8. p. 292. t. 8. good. Flowers white.

**Stem-clasping-leaved Leucopogon.** Clt. 1815. Shrub.

26. **L. alternifolius** (Br. l. c.) spikes axillary and terminal, few-flowered; leaves alternate, reiform, stem-clasping, acute, mucilaginous, a line and a half long, and as well as the branches glabrous; drupes crustaceous, lenticular, 2-celled. \( \varphi \). G. Native of the south coast of New Holland. Flowers white.

**Alternate-leaved Leucopogon.** Shrub.

27. **L. distans** (Br. l. c. prod. p. 544.) spikes terminal, aggregate, flexuous; flowers distant; leaves ovate, subcordate, divericate, mucilaginous, one line long, convex above and downy beneath; drupes crustaceous, 5-celled, obovate, depressed. \( \varphi \). G. Native of the south coast of New Holland. Flowers white.

**Distant-flowered Leucopogon.** Shrub.

28. **L. reflexus** (Br. l. c. prod. p. 544.) spikes terminal, crowded, few-flowered; flowers imbricated; leaves ovate, almost cordate, divericate, mucilaginous, a line long, convex above, and concave beneath, pilose, lined; drupes crustaceous, 5-celled. \( \varphi \). G. Native of the south coast of New Holland. Flowers white.

**Reflexed-leaved Leucopogon.** Shrub.

29. **L. glabellus** (Br. l. c. prod. p. 544.) spikes terminal, almost solitary; bracteas foliaceous, and are as well as the calyxes glabrous; leaves alternate, broadly cordate, acute, mucilaginous, flatish, and are, as well as the branches, glabrous. \( \varphi \). G. Native of the south coast of New Holland. Flowers white.

**Smooth Leucopogon.** Shrub.

30. **L. microphyllus** (Br. l. c.) spikes crowded, few-flowered; leaflets of calyx acuminated, semi-foliaceous; bracteas foliaceous, nerved; leaves oval, obtuse, mucilaginous, flat, of the same colour on both surfaces; drupes crustaceous, 1-2-celled.
Flowers. bracteas leaves leaves leaves leaves.  1. G. Native of the south coast of New Holland. Flowers white.

**Leucopogon.**

Flowers white.

**Striated-leaved Leucopogon.** Fl. May, Aug. Clt. 1820. Shrub 2 to 3 feet.

35 L. Nervosus (Br. l. c.) spikes crowded, few-flowered; bracteas and calyces foliaceous and quite glabrous; leaves elliptic, imbricate, on short petioles, mucic, flat above, and rather convex beneath, with elevated nerves; branchets downy.  1. G. Native of the south coast of New Holland. Flowers white.

Nerved-leaved Leucopogon. Shrub.

36 L. Carinatus (Br. prod. p. 545.) spikes solitary or aggregate; bracteas and calyces foliaceous, quite glabrous; leaves lanceolate, mucic, imbricate, flat above, and keeled beneath, with the lateral nerves obsolete, and the margins dentilicate; branchets downy.  1. G. Native of the south coast of New Holland. Flowers white.

Keeled-leaved Leucopogon. Shrub.

37 L. Assimilis (Br. prod. p. 545.) spikes aggregate; leaves lanceolate-linear, imbricated, adpressed, mucic, and striated beneath, of the same colour on both surfaces, with dentilicate margins; ovary 5-celled.  1. G. Native of New Holland, on the south coast. Flowers white.

Similar Leucopogon. Shrub.

38 L. Cucullatus (Br. l. c.) spikes aggregate, 4-6-flowered; bracteas foliaceous; leaves ovate, obtuse, mucic, cucullate, imbricata, sessile, lined, with naked margins; drupes 5-celled.  1. G. Native of the south coast of New Holland. Flowers white.

Cuculate-leaved Leucopogon. Shrub.

§ 5. Peduncles axillary, 2-flowered, or 1-flowered every where from abortion: when this is the case, the calyx is many-bracteate. Drupes dry.

39 L. Pendulus (Br. prod. p. 545.) peduncles usually 2-flowered, recurved; tube of corolla equal in length to the calyx; leaves spreading, linear-lanceolate, flat, 3 lines long, each ending in a pungent point, with smooth margins.  1. G. Native of New South Wales. Flowers white.

Pendulous-flowered Leucopogon. Shrub.

40 L. Biflorus (Br. l. c.) peduncles 2-flowered, recurved; tube of corolla equal in length to the calyx; leaves spreading, linear-lanceolate, flat, 3 lines long, each ending in a pungent point, with smooth margins.  1. G. Native of New South Wales. Flowers white.

Two-flowered Leucopogon. Shrub.

41 L. Setiger (Br. l. c.) peduncles 2-flowered, recurved, longer than the calyx; leaves spreading, lanceolate-linear, acuminate, half an inch long, ending in a setaceous pungent mucrone, with recurved oblong dentilicate margins.  1. G. Native of New South Wales. Flowers white.

Bristle-bearing Leucopogon. Fl.? Clt. 1824. Shrub 2 to 3 feet.

42 L. Acuminatus (Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectis, linear-lanceolate, very acute, flat, ending in a setaceous mucrone, with scabrous dentilicate margins.  1. G. Native of New Holland, within the tropic. Flowers white.

Acuminated-leaved Leucopogon. Shrub.

43 L. cuspidatus (Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves moderately spreading, obovate-oblong, acute, cuspidate, flat, with scabrous dentilicate edges.  1. G. Native of New Holland, within the tropic. Cuspidate-leaved Leucopogon. Shrub.

44 L. Imbricatus (Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves imbricate, oval, obtuse, cuspidate, rather concave, with smooth toothless edges.  1. G. Native of New Holland, within the tropic. Flowers white.

Imbricated-leaved Leucopogon. Shrub.

45 L. Ruscifolius (Br. l. c.) peduncles very short, erect, usually 2-flowered; leaves erectis, spreading, obovate-elliptic, acute, rather concave, mucronate, with smooth obliquely dentilicate edges.  1. G. Native of New Holland, within the tropic. Flowers white.

Ruscous-leaved Leucopogon. Shrub.

46 L. Faecifolius (Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves linear-lanceolate, moderately spreading, flat, ending each in a very short cally mucrone, with smooth margins; stem arborescent.  1. G. Native of New Holland, within the tropic. Flowers white. Fen-flowered Leucopogon. Shrub.

47 L. Leptospermoides (Br. prod. p. 546.) peduncles very short, erect, usually 2-flowered; leaves linear-lanceolate, moderately spreading, flat, ending each in a very short cally mucrone, with smooth denticulated margins; flower white.  1. G. Native of New Holland, within the tropic. Flowers white.

Leptospermum-like Leucopogon. Shrub.

48 L. Roundipulius (Br. l. c.) peduncles very short, erect, 1-2-flowered; leaves roundish or obovate, petiolate, spreading moderately, flat, mucronate, with pellucid finely ciliated edges.  1. G. Native of New South Wales. Flowers white.

Round-leaved Leucopogon. Shrub.

50 L. Fastigiatus (Sieb. l. c.) leaves lanceolate, cuspidate, serrulate at the apex, striate; calyx glabrous; flowers axillary, almost solitary.  1. G. Native of New Holland. Staphylinia fastigiata, Spreng. l. c. Fastigiata-Leucopogon. Shrub.
VIII. MONOTOC'A (from πύρος, monos, alone, and τόκος, tokos, a birth; in reference to the fruit being one-seeded). R. Br. prod. p. 546.

3 M. linea' a (R. Br. l. c.) spikes axillary, few-flowered, nodding, pedunculate; leaves oblong, and often obovate, acute, flatish, mucronate. ü. G. Native of Van Diemen's Land. Styphelia glauca, Labill. nov. holl. l. p. 45. t. 61. Where the plant is represented as having erect spikes, and a 5-celled ovary.

VIII. MONOTOC'A. IX. ACROTRICHE.

§ 2. Bracteas extending, permanent. Shrubs with hermaphrodite flowers.

4 M. scop'era (R. Br. l. c.) spikes axillary, few-flowered, nearly sessile, nodding; leaves oblong-linear, with revolute edges; stem erect. ü. G. Native of New South Wales. Styphelia scoparia, Smith, new holl. p. 48.

5 M. empet'rifolia (R. Br. l. c.) spikes axillary, nodding; 2-3-flowered; leaves oblong-oval, mucronate, divaricate, convex above, white and striated beneath; stem prostrate. ü. G. Native of Van Diemen's Land. Emptetrum-leaved Monotoca. Shrub.

Cult. For culture and propagation see Leucopogon, above. The pots in which the species are grown require to be well drained with shers.

IX. ACROTRICHE (from ἀκρος, akros, the uttermost, and ἁπλος, thrinc, hirsch, a hair; the tips of the corolline segments are bearded). R. Br. prod. p. 547. Styphelia species. Spreng.

2 A. aggrega'ta (R. Br. l. c.) leaves oblong-lanceolate, rather concave, glaucous beneath, with smooth margins. ü. G. Native of New Holland, within the tropic. Aggregated Acrotriche. Shrub 1 foot.

3 A. ra'miflora (R. Br. l. c.) leaves linear-lanceolate, mucronate, divaricate, of a different colour beneath, nerved, with recurved margins; spikes on the branches. ü. G. Native of New Holland, on the south coast. Ramiflorous Acrotriche. Shrub 1 foot.

4 A. serrulata (R. Br. l. c.) leaves linear-lanceolate, cuspitate, spreading, pilose or smoothish, with serrately ciliated edges; spikes axillary. ü. G. Native of the south coast of New Holland, and Van Diemen's Land. Serrulato-leaved Acrotriche. Shrub 1 foot.

5 A. pula'(a (R. Br. l. c.) leaves ovate lanceolate, acuminate, mucronate, flatish, and are as well as the branches divaricate; spikes axillary. ü. G. Native of New Holland, on the south coast. Spreading Acrotriche. Shrub.

7 A. corda'ta (R. Br. l. c.) leaves cordate, flat, striated below; flowers axillary, twin or solitary. ü. G. Native of New Holland, on the south coast. Styphelia cordata, Labill. nov. holl. l. p. 46. t. 63. Perhaps belonging to a different genus.
Epacridiæ. X. Trochocarpæ. XI. Decaspæra. XII. Pentachondra. XIII. Needhamia. XIV. Oligarrhena, &c. 781

Cordate-leaved Acrotiche. Fl. April, July. Cht. 1833. Shrub 1 foot.]

8. A. depresse'sa (R. Br. l. c.) leaves ovate, rather cordate, mucronate, divericate, convex above, and veiny beneath; stem decussate; spikes on the branches. 9. G. Native of New Holland, on the south coast.

Depressed Acrotiche. Shrub depressed. Cult. For culture and propagation see Leucopogon, p. 780.

X. TROCHOCARPÆ (from τροχός, trochos, a wheel, and κάρπος, karpos, a fruit; in reference to the putamen of the fruit, which is wheel-shaped and 10-lobed). R. Br. prod. p. 518.

Linn. syst. Pentandria, Monogynia. Calyx bracteate. Corolla funnel-shaped; limb spreading, bearded. Ovarium 10-celled. Drupe baccate, containing a wheel-shaped, 10-lobed putamen, which is at length divisible into as many parts.—A small glabrous tree, with very hard wood. Leaves scattered, petiolate, nervet very like those of a species of Lauræus. Spikes slender, terminal, and axillary, solitary or aggregate. Flowers small, white. Hypogynous disk cup-shaped, 5-celled. Drupe depressedly globose, smaller than a pea. The genus approaches Decæspæra in character and habit.

XI. DECA'SPÆRA (from είκος, deca, ten, and σπόρα, spora, a seed; the fruit contains 10 pyrenes or seeds). R. Br. prod. p. 548.

1 D. DISTICA (R. Br. prod. p. 548.) leaves lanceolate, very acute, flat, nervet beneath, 8 times longer than the petals; branches glabrous. 9. G. Native of Van Diemen's Land. Cyathodes Disticha, Labill. nov. holl. 1. p. 58. t. 82.

Distich-leaved Decaspæra. Shrub 4 to 6 feet.

2 D. THYMIFOILÀ (R. Br. prod. p. 548.) leaves ovate, acutish, mutic, hardly 4 times longer than the petals, obliquely 3-nerved beneath; branches downy. 9. G. Native of Van Diemen's Land.

Thymæ-leaved Decaspæra. Shrub. Cult. For culture and propagation see Leucopogon, p. 780.

XII. PENTACHO'NDRA (from πέντε, pente, five, and χόρτος, chórtos, a grain; in reference to the berry containing 5 pyrenes or seeds). R. Br. prod. p. 549.

1 P. INVOLUCRATA (R. Br. prod. p. 549.) filaments exerted; calyxes ciliated, furnished with 8 bractes; leaves elliptic-lanceolate, flatish, many-nerved; branches downy; stem erect.

Involucrated-flowered Pentachondra. Shrub.

2 P. ru/milsa (R. Br. l. c.) stamens inclosed; calyx furnished with 4 bractes; leaves nearly elliptic, 5-nerved, with naked margins; branches glabrous; stem prostrate, much branched. Ovarium 5-celled. Drupe dry. Leaves opposite.—A small erect shrub. Leaves minute, adpressed. Spikes terminal, erect, solitary; bractes extending, foliaceous. Flowers white. Hypogynous disk saucer-shaped.

Dwarf Needhamia. Shrub. Cult. For culture and propagation see Astroloma, p. 775.

Dwarf Needhamia. Shrub. Cult. For culture and propagation see Astroloma, p. 775.

XIV. OLIGARRHENÆ (from ὀλίγος, oligos, few, and ἀίγος, a'igos, a G. Native of New Holland, on the south coast. Small-flowered Oligarrhena. Shrub. Cult. See Astroloma, p. 775, for culture and propagation.

Tribe II.

Epacridiæ. (The genera contained in this tribe agree with Epacris in many particulars). Cells of ovary many-seeded. Fruit capsular.

Linn. syst. Pentandria, Monogynia. Calyx coloured, many-bracteate; bractes of the same texture as the calyx. Corolla tubular; limb beardless. Stamens epipetalous. Anthers peltate above the middle. Hypogynous scales 5. Capsule having the placenæ adnate to the central column.—Small branched, usually glabrous shrubs. Leaves scattered, petiolate or simple at the base. Flowers axillary, white or purplish, usually disposed in leafy spikes.
**Leaves cordate.**

1. *E. purpurea* (R. Br. prod. p. 550.) segments of calyx acuminate, about equal in length to the tube of the corolla; leaves cucullate, nearly sessile, ending each in a recurved mucrone, which exceeds the base of the leaf; floral leaves equaling the corollas in length. \( \tau \). G. Native of New South Wales. E. \( \pi \) unguens, Sims, bot. mag. t. 814. Epacris attenuatum, Lindl. Lodd. bot. cab. t. 38. Corollas purplish.

*Var. \( \beta \) radiata* (Loddl. bot. cab. 876.) flowers red.

**Small-leaved Epacris.** Fl. April, June. Ch. 1822. Shrub 1 to 2 feet.

3. *E. siparia* (R. Br. l. c.) segments of calyx setaceous acuminate, about equal in length to the tube of the corolla; leaves flat, acuminate, spreading. \( \tau \). C. Native of New South Wales.

**River-side Epacris.** Shrub.

5. *E. grandiflora* (Smith, exot. bot. 75. t. 59. Sims, bot. mag. t. 982.) corollas cylindrical, 4 times longer than the calyx; flowers pendulous; leaves flat, acuminate. \( \tau \). G. Native of New South Wales. Lodd. bot. cab. 21. Epacris longiflora, Cav. icon. 4. p. 25. t. 344. Flowers scarlet and white.

6. *E. campanulata* (Lodd. bot. cab. 1925.) leaves ovoate, reflexed; flowers axillary, the whole forming a spike; corolla twice or thrice longer than the calyx, campanulate. \( \tau \). G. Native of Van Diemen's Land. Corollas red.

*Var. \( \alpha \) alba* (Lodd. bot. cab. 1931.) Flowers white. **Campanulata-flowered Epacris.** Fl. March. Ch. 1830. Shrub 1 to 2 feet.

7. *E. apiculata* (Cunningh. in Field's New South Wales, p. 340.) calycine segments lanceolate, acuminate, about equal in length to the tube of the corolla; leaves cucullate, hairy, sessile, arched at the base; superior leaves imbricated, ending each in a callous obtuse point; branches downy. \( \tau \). G. Native of New South Wales; on boggy moist declivities, in the ravines of King's Table Land.

**Apiculata-flowered Epacris.** Fl. April, July. Ch. 1823. Shrub.

* * Leaves simple at the base, not cordate.**

8. *E. recurvifolia* (R. Br. prod. p. 550.) flowers scattered, pendulous; leaves elliptic-lanceolate, petiolar, acuminate; corollas cylindrical, having the tube twice longer than the calyx. \( \tau \). G. Native of Van Diemen's Land.

**Ruscus-leaved Epacris.** Fl. April, June. Ch. 1824. Shrub.

9. *E. rivulina* (Sieb. pl. nov. holl. ex Spreng. syst. add. p. 64.) leaves almost sessile, ovate, acuminate, reflexedly spreading; calyxes acute, about equal in length to the corolla. \( \tau \). G. Native of New Holland.

---

**Rienlet Epacris.** Shrub.

10. *E. impressa* (Labil. nov. holl. l. p. 43. t. 55.) flowers pendulous, spicate; having all one way; leaves lanceolate, nearly sessile, attenuated at the apex, mucronate, with scabrous edges; peduncles 3 times shorter than the calyx; corollas cylindrical; tube of corolla prismatic, twice longer than the acute ciliate calyx. \( \tau \). G. Native of the south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Sweet, fl. austr. t. 4. Lodd. bot. cab. 1931. Flowers beautiful crimson.

**Impressed Epacris.** Fl. April, July. Ch. 1824. Shrub 1 to 3 feet.

11. *E. variabilis* (Lodd. bot. cab. 1818.) leaves ovate, sessile, tapering to the apex; corolla tubular, 3 or 4 times longer than the calyx. \( \tau \). G. Native of Van Diemen's Land. Flowers drooping, pale red or blush, spicate. Like *E. impressa.*

12. *E. nivalis* (Lodd. bot. cab. 1821. Lindl. bot. reg. 1531. Graham, in bot. mag. 3253.) leaves ovate-lanceolate, spreading much, nakedish, nerved beneath, attenuated at the apex, mucronate, with scabrous margins; flowers axillary, solitary, secund; disposed in a leafy raceme or spike; tube of corolla campanulate, much longer than the segments of the calyx, which are ciliated, as well as the bracteas. \( \tau \). G. Native of New Holland. Flowers white.

**Snowy Epacris.** Fl. April, May. Ch. 1829. Shrub 2 to 3 feet.

13. *E. cerifolia* (Graham, in bot. mag. t. 3243.) leaves lanceolate, spreading much, nakedish, attenuately mucronate at the apex, with scabrous edges; flowers spreading, axillary, solitary, secund; tube of corolla ovate, exceeding the acute ciliated segments of the calyx. \( \tau \). G. Native of Van Diemen's Land. Flowers white, collected near the extremities of the branches, much shorter than those of *E. nivalis.*

**Wax-leaved Epacris.** Fl. April, May. Ch. 1831. Shrub 1 to 3 feet.

14. *E. sparsa* (R. Br. prod. p. 551.) flowers unknown; peduncles scattered, about equal in length to the acute calyx; leaves oblong-lanceolate, petiolar, mucronate, veinless. \( \tau \). G. Native of New South Wales. Flowers white.

**Scattered-flowered Epacris.** Shrub.

15. *E. kiinda* (Sieb. l. c.) leaves ovate-oblong, bluish, nearly sessile, cartilaginous, spreading, keeled; calyxes obtuse, about equal in length to the tube of the corolla. \( \tau \). G. Native of New Holland.

**Stiff Epacris.** Shrub.

16. *E. obtusifolia* (Smith, exot. bot. p. 77. t. 40.) flowers nodding; leaves lanceolate, erect, a little imbricated, ending in a bluntness callous point; segments of the calyx obtuse, length of the tube of the corolla; stamens inclosed. \( \tau \). G. Native of New South Wales, south coast of New Holland, and Van Diemen's Land. R. Br. prod. p. 551. Lodd. bot. cab. 293. Flowers white.

**Bulbin-leaved Epacris.** Fl. April, June. Ch. 1804. Shrub 2 to 3 feet.

17. *E. heteromea* (Labil. nov. holl. l. p. 42. t. 56.) leaves elliptic-lanceolate, acuminate, rather concave, striated beneath; segments of calyx very acute, naked, length of tube of the...
corolla; stamens inclosed; style glabrous; branches hairy.

G. Native of Van Diemen's Land, and of New Holland.

Variable-stamened Epacris. Fl. May, June. Clt. 1825. 3 feet.

22 E. lucidoi (Br. prod. p. 551.) leaves lanceolate, acuminate, to 2.5 cm. long; corolla white; flowers white. Clt. 1825. 2 to 3 feet.

19 E. lanuginosa (Labill. nov. holl. 1. p. 42. t. 57.) leaves ovate, acute, acuminate, flat, obtuse; flowers white. Clt. 1825. 2 feet.

Woolly Epacris. Shrub 2 feet.

21 E. oonteseflora (Cunningh. in Field's New South Wales, p. 340.) leaves elliptic-lanceolate, acuminated, cuneately concave, 2-nerved, mucronate, petiolate, with ciliated margins; base subulate, hairy; corolla cylindrically ventricose, with the tube exserted; calyx, which is very acute. G. Native of New South Wales, in boggy moist declivities on the King's Table Land. Nearly allied to E. lanuginosa, Labill.

21 E. myrthiflora (Labill. nov. holl. 1. p. 41. t. 55.) leaves ovate, acute, mucronulate, flat, thick; flowers to 3 cm. long, in length to the corolla; calyx segments acutish, naked, length of tube of the corolla; bracteas bluish; stamens inclosed. G. Native of Van Diemen's Land. R. Br. prod. 551.

Myrtle-leaved Epacris. Shrub.

22 E. semivillifolia (R. Br. prod. 551.) leaves ovate, acute; flowers to 1.5 cm. long, in length to the corolla; calyx segments acutish, naked, length of tube of the corolla; bracteas bluish; stamens inclosed. G. Native of Van Diemen's Land.

Wild-Thyme-leaved Epacris. Shrub.

23 E. exsata (R. Br. prod. 551.) leaves lanceolate, acute, erect, flat above, and rather convex beneath; calyx segments bluish, equaling the tube in length; stamens clearly exerted. G. Native of Van Diemen's Land. Flowers white.

Exsated-stamened Epacris. Fl. April, July. Clt. 1812. Shrub 1 to 3 feet.

24 E. cressiflora (R. Br. l. c.) leaves ovate or obovate, obtuse, mutic, flat, cartilaginous, acute at the base; calyxes pedunculate, with woolly margins; stem procumbent, with ascending branches. G. Native of New South Wales.

Thick-stemmed Epacris. Shrub procumbent.

25 E. mucronulata (R. Br. prod. p. 552.) leaves lanceolate, very acute, erectly spreading, ending each in a pungent, plumuloid mucron; calyx segments acute, with naked margins. G. Native of Van Diemen's Land. Flowers red.

Cult. All the species of this genus are delicate and handsome small shrubs; and many of them, on that account, are cultivated by nurserymen and florists. A sandy peat soil suits them best, and the rougher and more turfy it is, the better the plants will thrive. They should be always shifted into fresh pots and mould just before they are placed out of doors for the summer from the green-house, as the roots become matted, and being so very fine, the hot sun against the pots is apt to destroy the points, and thus often kills the plants altogether. Cuttings taken from the tips of young shoots, and planted in pots filled with sand, with a bell-glass placed over them, either in autumn, winter, or spring, will readily strike root; but they will not strike so freely in summer. When the cuttings are rooted, they should be potted singly in small pots, and set in a close frame for some time, and hardened off to the air only by degrees.

XVI. LYSINEMA (from λυσις, lysis, a freeing, and ρητη, riηη, a filament; in reference to the stamens being hypogynous, and therefore free from the corolla, not as in Epacris epipetalous). R. Br. prod. p. 552.

XVII. PRIONOTES (from πριόν, prior, a saw, and ος ονος, ou stos, an ear; in reference to the serrated leaves). R. Br. prod. p. 552.

EPACRIDEA. XVIII. Cosmelia. XIX. Andersonia. XX. Ponceletia. XXI. Sprengelia.

1 P. cerinthoides (R. Br. prod. p. 553.). G. Native of Van Diemen’s Land. Epacris cerinthoides, Labill. nov. holl. 1. p. 43. t. 59.

Cerinthe-like Prionotes. Shrub 4 to 5 feet.

Cult. This is an elegant and delicate shrub, bearing showy pendulous flowers. For culture and propagation, see Epacris, p. 783.

XVIII. COSMELIA (from xosmelos, Kosmeo, to adorn; beauty of flowers.) R. Br. prod. p. 553.

Red-flowered Cosmelia. Fl.? Clt. 1826. Shrub 1 to 2 feet.

Cult. See Epacris, p. 783. for culture and propagation.

XIX. ANDERSONIA (named in memory of William Anderson, a surgeon of the Royal Navy, who accompanied Captain Cook; he paid great attention to botany. Descriptions of the genera of Van Diemen’s Land plants, written by him, are still in the Banksian Library. The genus is also intended to commemorate the late Alexander Anderson, formerly Director of the Botanic Garden at St. Vincent; and William Anderson, the present Curator of the Apothecaries’ Botanic Garden at Chelsea.) R. Br. prod. p. 553.

Lin. syst. Pentandria, Monogyenia. Calyx coloured, imbricated by 2 or more foliaceous bracteas. Corolla length if feally; segments of the limb bearded at the base. Stamens hypogynous: anthers fixed beneath the middle. Hypogynous scales 5, sometimes connate. Capsule with the placentas adnate to the central column.—Small squarrose shrubs, having the branches not annulated while naked. Bases of leaves succulente, half sheathing. Flowers terminal, spicate, or solitary, erect. Placentas short, rising from the bottom of the capsule. Seeds few when mature, erect.

* Flowers biflbracteate, spicate.

2 A. farfollia (R. Br. l. c.) leaves adpressed, ending in a triquetrous point each. G. Native of the south coast of New Holland.

Small-leaved Andersonia. Shrub.

** Flowers many-bracteate; terminating the short branches.

3 A. cerulea (R. Br. l. c.) leaves moderately spreading; young leaves and outside of calyxes downy. G. Native of New Holland, on the south coast. Flowers blue.

Blue-flowered Andersonia. Shrub.

4 A. squarrosea (R. Br. prod. p. 554.) leaves squarrose, divaricate or recurved, glabrous, with naked margins; calyces and styles glabrous; stem erect. G. Native of New Holland, on the south coast.

Square-rose-leaved Andersonia. Shrub.

5 A. depressa (R. Br. l. c.) leaves squarrose, divaricate or recurved, downy, with ciliated margins; calyces glabrous; style pilose in the middle; stem depressed. G. Native of New Holland, on the south coast.

Depressed Andersonia. Shrub depressed.

6 A. microanthia (R. Br. l. c.) leaves adpressed; style downy beneath the middle. G. Native of New Holland, on the south coast.

Small-flowered Andersonia. Shrub.

Cult. The species of this genus are very elegant and delicate plants. They grow freely in a sandy peat soil, having the pots well drained with sherds. Care should be taken not to give them too much water, as when the mould gets sodden, the plants are almost sure to die. They are increased by cuttings in the same way as Epacris, which see, p. 783.

XX. PONCELETTIA (to the memory of Mr. Poncelet, author of treatise on Triticum or Wheat.) R. Br. prod. p. 554.

1 P. sprengeliiodes (R. Br. prod. p. 554.). G. Native of New South Wales. A suffruticose dense habit plant, adhering to rocks perpetually damp.

Cult. For culture and propagation, see Epacris, p. 783.

Lin. syst. Pentandria, Monogyenia. Calyx coloured a little. Corolla 3-parted, rotate, beardless. Stamens hypogynous. Anthers connate or free, with an immarginate dissepiment. Hypogynous scales wanting. Capsule having the placentas adnate to the central column.—Small, erect, branched shrubs; branches hardly annulated while naked. Bases of leaves succulente, half sheathing. Flowers terminating the short lateral branches. Corolla purplish, length of calyx: with the tube very short, and at length cleft into 5 to the base.

2 S. montana (R. Br. l. c.) anthers free, beardless; calyx half coloured; leaves short-acuminated. G. Native of Van Diemen’s Land. Flowers purplish.
Mountain Sprengelia. Shrub 1 foot.

Cult. These are elegant and delicate shrubs, with much the habit of *Andersonia*, which see, p. 784, for culture and propagation.

XXII. CYSTAN'THE (from κυστάς, kysta, a box or coffier, and κυστος, kystos, a flower; in reference to the closed hooded flowers.) R. Br. prod. p. 555.

Lin. syst. Pentândria, Monogyniâ. Calyx foliaceous. Corolla closed, calyptraeform, dehiscing transversely; with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales wanting. Capsule having the placenta loose, and hanging from the top of the central column.—A shrub with the habit of *Sprengelia, Cosmidia*, and *Poncetâlia*; unless that the branches are annulated while naked.

1 C. Sprengeloides (R. Br. prod. p. 555.), Ε. G. Native of Van Diemen's Land. Flowers pale red. 

Var. a, leaves much shorter. Growing on the shady sides of mountains.

Var. β, leaves much shorter. Growing on the tops of mountains.

Spraycelia-like Cystanthe. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *Andersonia*, p. 784. It is an elegant and delicate shrub.

XXIII. RICHEA (named in memory of M. Riche, one of the naturalists who accompanied the expedition in search of La Perouse). R. Br. prod. p. 553 but not of Labill.

Lin. syst. Pentândria, Monogyniâ. Calyx membranous, bracteate. Corolla closed, calyptraeform, dehiscing transversely; with a truncate permanent base. Stamens hypogynous, permanent. Hypogynous scales 5. Capsule having the placentas loose and hanging from the top of the central column.—A shrub with the habit almost of *Dracophyllum montanum*, Labill, but differing in the singular economy of the flower. It comes nearest to *Cystanthe*, in the corolla being calyptraeform; but that genus differs in the inflorescence, foliaceous calyx, and want of hypogynous scales. Richea of Labill. v. 1. p. 187. t. 16. in Craspèdia, Forst. prod. no. 306. and Willd. spec. 3. p. 2393.

1 R. Dracophylla (R. Br. prod. p. 555.), Ε. G. Native of Van Diemen's Land. This shrub differs much in stature according to stations of its natural growth; for on the tops of mountains it is a humble shrub, 1/2 foot high; but on the sides of the mountains it grows to 10 feet high.

Dracophylled Richea. Shrub 1 to 10 feet.

Cult. For culture and propagation, see *Andersonia*, p. 784.

XXIV. DRACOPHYLLUM (from ἐγκρεα, drakon, a dragon; and φυλλον, phyllon, a leaf; so named because the leaves have some resemblance to those of *Draceâna Dracos*, or Dragon's Blood Tree.) Labill. fil. 2. t. 40. R. Br. prod. p. 555. Rchb. hort. 2. t. 108.

Lin. syst. Pentândria, Monogyniâ. Calyx bracteate. Corolla tubularly funnel-shaped; with a 5-parted aecus spreading beardless limb, a somewhat ventricose tube, and a hardly contracted throat. Stamens 5, hypogynous. Hypogynous scales 5. Capsule having the placenta loosened and hanging from the top of the central column.—Shrubs or small trees having the branches annulated while naked. Leaves imbricate, ciliate at the base, and half sheathing. Spikes or racemes terminal, simple, or compound. Bracteas subtending the pedicels, beardless.

Long-leaved Dracophyllum. Shrub.

Rosmary-leaved Dracophyllum. Shrub.

Cult. See *Andersonia*, p. 784. for culture and propagation.

XXV. SPHENOTOMA (from σφένος, sphenos, to cleave, and τομη, tome, a section; in reference to the deep divided limb of the corolla). Sweet, fl. austr. t. 44. Dracophyllum, sect. Sphenotoma, R. Br. prod. p. 555.

Lin. syst. Pentândria, Monogyniâ. Corolla salver-shaped, with a slender tube, a coarctate throat, and an obtuse beardless limb (f. 134. c.) Stamens epipetalous. Hypogynous scales 5. Capsule having the placenta loose, and hanging from the top of the central column.—Shrubs having the branches annulated when naked. Leaves imbricate, ciliate and half sheathing at the base. Spikes simple, terminal. Bracteas stretched out, permanent.

1 S. squarrosa; floriferous branches hardly the length of the spikes; leaves squarrose, ensiform, lanceolate. Ε. G. Native of New Holland, on the south coast. Dracophyllum squarrosum, R. Br. prod. p. 556.

Squarrose Sphenotoma. Shrub.

2 S. capitata; floriferous branches much longer than the spikes, which are ovate; cauline leaves lanceolate-ensiform, erectish; of the branches adpressed. Ε. G. Native of New Holland, on the south coast. Dracophyllum capitatum, R. Br. prod. p. 556.

Capitate-flowered Sphenotoma. Shrub.

3 S. gracilis (Sweet, fl. austr. t. 44.) floriferous branches much longer than the spikes, which are ovate; cauline leaves lanceolate-subulate, spreading, or recurved; of the branches adpressed. Ε. G. Native of New Holland, on the south coast. Dracophyllum gracilis, R. Br. prod. p. 556. Flowers white. Leaves withering when long hairs. (f. 134.).

Slender Sphenotoma. Fl. April, May. Clt. 1823. Shrub 1 to 2 feet.

Cult. For culture and propagation, see *E' pacris*, p. 783. or *Andersonia*, p. 784.

Flowers hermaphrodite, subsymmetrical, regular. Calyx 1-5-cleft. Corolla 4-parted, rarely 5-parted. Stamens 4-5-8-10, 5 ll
ERICACEÆ.

Synopsis of the genera.

 Tribe I.

1 Erica. Calyx 4-parted, naked at the base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; with capillary filaments and bifid anthers; cells of anthers short, opening by an oblong hole, awned or crested at the base, rarely mutic. Stigma peltate.—Leaves acerosæ. Pedicels scaly.

2 Gymso'callis. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated 4-lobed mouth. Stamens exserted, with flattened filaments and bipartite anthers; cells of anthers mutic at the base, distinct, subdeterminate, opening by an oblique hole. Stigma simple.—Leaves acerosæ.

3 Ble'r'ia. Calyx 4-parted. Corolla short, tubular, with a 4-cleft limb. Stamens 4-6, with linear flattened glabrous filaments, and bipartite anthers; cells of anthers attenuated at the base, mutic, dehiscing by an oblong foramen at the apex. Stigma obtuse.—Leaves whorled. Flowers terminal, glomeratus.

5 Pachy'ya. Calyx deeply 4-parted, coriaceous. Corolla nearly globose, coriaceous, with a contracted 4-lobed mouth. Stamens inclosed, with dilated filaments, and bifid anthers; cells of anthers short, crested at the base, opening by an oblong foramen. Stigma obtuse.—Leaves loosely imbricated, compressed. Pedicels bracteolatus.

6 Ce'ramia. Calyx 4-parted, glumaceous. Corolla urceolate, with a 4-lobed limb. Stamens inclosed, with dilated flat filaments and bifid anthers; cells of anthers short, horned at the base. Stigma capitata.—Leaves scattered, bluntish, flat.

7 De's'mia. Calyx 4-lobed. Corolla globose, with a contracted 4-toothed mouth. Stamens exserted, with flat filaments; cells of anthers short, opening by an oblong hole, simple at the base, and confluent in the filament. Stigma capitata.—Leaves scattered, subulate.

8 Euryflep'sis. Calyx 4-parted, coriaceous, bibracteolate at the base. Corolla tubular, coriaceous, ventricose at the base, with an erect 4-parted limb. Stamens inclosed, with dilated channelled filaments, and bipartite anthers; cells of anthers coriaceous, opening by an oblong hole, auricled at the base. Stigma chavate.—Leaves scattered. Flowers terminal, solitary.

9 Euryste'gia. Calyx 4-parted, large, glumaceous. Corolla...
urceolate, with a contracted 4-toothed mouth. Stamens inclosed, with dilated flat filaments and bipartite anthers; cells of anthers opening by an oblong foramen, biappendiculate at the base; appendages flat, crested, crenated. Stigma capitate.—Leaves subulate. Flowers subsolitary, pendulous.

10 **Lophandra.** Calyx 4-parted, furnished with 4 bracteas at the base: segments scarious, rounded, ventricose outside. Corolla campanulate, 4-lobed. Stamens inclosed, with dilated flat filaments and bifid anthers; cells of anthers beaked at the apex, winged, crested, and crenulated at the sides, dehiscing by an oblong hole in the middle. Stigma truncate.—Leaves short, obtuse, glaucous. Flowers terminal.

11 **Lamprosia.** Calyx 4-parted, large, glumaceous, coloured, bibracteate at the base. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic, or crested at the base. Stigma capitate.—Leaves adpressed, opposite, or 3 in a whorl. Flowers terminal.

12 **Calyx.** Calyx 4-parted, foliaceous. Corolla salver-shaped, with a cylindrical or ventricose tube, and a dilated, spreading, 4-cleft limb. Stamens inclosed, with capillary filaments; cells of anthers short, dehiscing lengthwise, mutic at the base. Stigma capitate.—Leaves acerose. Flowers terminal.

13 **Eurytoma.** Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a revolute 4-lobed limb. Stamens exerted, with capillary filaments, and truncate anthers; cells of anthers elongated, parallel, awned at the base. Stigma simple, obtuse.—Leaves 3 in a whorl, linear, awned. Flowers terminal.

14 **Cheona.** Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a revolute 4-lobed limb. Stamens exerted, with capillary filaments, and truncate anthers; cells of anthers elongated, parallel, awned at the base. Stigma simple, obtuse.—Leaves 3 in a whorl, linear, awned. Flowers terminal.

15 **Stenogoea.** Calyx 4-leaved, glumaceous. Corolla long-tubular, with a short 4-lobed limb. Stamens usually inclosed, with capillary filaments, and bipartite anthers; cells of anthers short, obtuse, mucic or awned at the base, dehiscing by an oblong foramen. Stigma simple or capitate, in some annulated by an elevated disk.—Leaves loose, acerose. Flowers crowded at the tops of the branches.

16 **Dasynthus.** Calyx 4-parted, bibracteate at the base. Corolla tubular, hispid, with a 4-lobed erect limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells of anthers mutic at the base, dehiscing lengthwise. Stigma large, peltate.—Leaves loosely imbricated, hispid. Flowers in terminal fascicles.

17 **Ecta.** Calyx 4-leaved, glumaceous. Corolla tubular, a little ventricose at the base, with a 4-toothed limb. Stamens much exerted, with dilated filaments and bipartite anthers; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, having the base continuous in the filament, and mutic. Stigma clavate, truncate.—Leaves loosely imbricated. Flowers terminal or lateral.

18 **Eriodea.** Calyx large, 4-parted, bibracteate at the base. Corolla campanulate, with a 4-lobed revolute limb. Stamens exerted, with dilated filaments, and bifid obtuse scabrous anthers; cells of anthers dehiscing by an oblong pore, continuous in the filament at the base.—Leaves 3 in a whorl, obtuse, hairy. Flowers terminal.

19 **Octoera.** Calyx 4-parted, reflexed, naked at the base. Corolla globose, with a contracted bluntly 4-lobed mouth. Stamens inclosed, with flattened filaments; cells of anthers very short, dehiscing by an ample hole, and furnished at the base by a solitary lanceolate acuminated appendage.—A downy procumbent shrub. Leaves verticillate. Flowers terminal, subumbellate. Pedicels scaly.

20 **Ecalama.** Calyx 4-parted, with imbricated bracteas at the base; segments orbicular, coriaceous, ciliated. Corolla urceolate, with a small 4-lobed limb. Stamens inclosed, with capillary filaments, and bipartite anthers; cells short, mutic at the base, dehiscing by an oblong hole. Stigma capitate. Cells of capsule 1-seeded.—Leaves spreading, bristly. Flowers glomerate.

21 **Salax.** Calyx 4-leaved, irregular. Corolla campululate, 4-cleft. Stigma peltate. Capsule drupaceous, 3-celled, 3-seeded.—Leaves 3-6 in a whorl. Flowers subumbellate at the tops of the branches.

22 **Callena.** Calyx 4-parted, membranous, coloured, furnished with 4 bracteas at the base. Corolla shorter than the calyx, campululate, 4-lobed. Stamens inclosed, with dilated filaments, and bipartite anthers, which are biappendiculate at the base; cells mucronulate, dehiscing lengthwise. Stigma capitate.—Leaves short, imbricated, in 4 rows. Flowers terminal, spicately racemose.

**Subtribe II. Andromedeæ.** *Corolla deciduous.*

23 **Andromeda.** Calyx 5-cleft; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed, with bearded filaments; cells of anthers short, one-awned. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

24 **Cassiope.** Calyx 5-leaved; segments imbricate at the base. Corolla campululate, 5-cleft. Stamens 10, inclosed, with glabrous filaments; cells of anthers short, tumid, one-awned. Style dilated at the base; stigma obtuse. Capsule with a loculicidal dehiscence; valves bifid at the apex; placenta 5-lobed.

25 **Cassandra.** Calyx 5-leaved, bibracteate at the base; segments imbricate at the base. Corolla oblong, with a contracted 5-toothed mouth. Stamens 10, inclosed, with glabrous filaments; cells of anthers elongated at the apex, tubular, mutic. Stigma annulated. Capsule with a loculicidal dehiscence; placenta 5-lobed.
ERICACEÆ.

26 Zenobia. Calyx 5-toothed. Corolla campanulate, with a revolute 5-lobed limb. Stamens 10, with very short glabrous filaments; cells of anthers elongated, tubular, biauriate at the apex. Stigma truncate. Capsule with a loculicidal dehiscence; placenta 5-lobed.

27 Lyonia. Calyx 5-parted. Corolla ovate or tubular, with a contracted 5-toothed mouth. Stamens inclosed, with short, flattened, downy filaments; cells of anthers membranous, dehiscing lengthwise, mucit. Style pentagonal; stigma obtuse. Capsule pentagonal, with a loculicidal dehiscence.

29 Pieris. Calyx 5-parted. Corolla tubular or ovate, with a contracted, 5-toothed, revolute mouth. Stamens 10, inclosed, with dilated filaments, which are biserose at the apex; cells of anthers short, incumbent, dehiscing lengthwise. Style pentagonal; stigma truncate. Capsule with a loculicidal dehiscence.

31 Bryandus. Calyx 5-leaved, imbricated. Corolla deeply 5-parted, spreading. Stamens 10, shorter than the corolla, with flattened glabrous filaments; cells of anthers short, mucit, or awned behind, dehiscing by a terminal foramè. Stigma obtuse. Capsule with a septicidal dehiscence.

32 Daboecia. Calyx 4-parted. Corolla oval, ventricose, with a 4-toothed mouth. Stamens 8, inclosed, with dilated glabrous filaments, and linear anthers, which are sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma truncate. Capsule 4-celled, with a septicidal dehiscence.

33 Erica. Calyx small, 5-parted. Corolla campanulate, with a 5-parted limb, and 5 nectarial pits at the base. Stamens inclosed; anthers 2-horned. Berry 5-celled, many-seeded.

34 Arrétes. Calyx small, 5-parted. Corolla globose or ovate, with a small, contracted, 5-cleft, reflexed border. Stamens 10, inclosed, with flattened filaments; anthers compressed at the sides, dehiscing at the apex by 2 pores, fixed by the back beneath the apex, and there furnished with 2 reflexed awns. Stigma obtuse. Berry globose, granular.

35 Actostaphylos. All as in Arbutus, except that the fruit is 5-celled, and the cells 1-seeded, and not granular on the outside.

36 Perénétya. Calyx 5-parted. Corolla globose, with a contracted 5-parted revolute limb. Stamens 10, inclosed, having the filaments thickened at the base; anthers 2-celled, 2-lobed at the apex; lobes bifid. Hypogynous scales 10, 3-lobed, sur-rounding the ovary. Stigma convex. Berries globose, 5-celled, many-seeded.

37 Agerista. Calyx 5-lobed. Corolla ovate, with a contracted 5-toothed mouth. Stamens 10, inclosed, with flattened villous filaments, and bipartite anthers; cells of anthers short, mucit at the base, diverging at the apex, and dehiscing by a terminal pore. Capsule globose, 5-celled, with a loculicidal dehiscence; placenta thick, oblong.

38 Drymocé. Calyx girded by a calyculus, which is composed of 2 combined bracteas, 5-cleft. Corolla campanulate, with a 5-cleft reflexed limb. Stamens 10, inclosed, inserted in the disk of the calyx. Anthers bifid at the apex. Stigma truncate. Capsule nearly globose, depressed, inclosed in the baccate calyx, 5-celled, many-seeded.

39 Gaultheria. Calyx 5-cleft or 5-toothed, bifractate at the base. Corolla ovate, ventricose, with a 5-cleft revolute border, diaphanous at the base. Stamens 10, inclosed, with flat filaments; anthers bifid at the apex; lobes biauriate. Hypogynous scales 10, usually united at the base. Ovarium half inferior. Capsule 5-celled, with a loculicidal dehiscence.

40 Epigéa. Calyx large, 5-parted, furnished with 3 bracteas at the base. Corolla salver-shaped, with a 5-parted spreading border, and with the tube villous inside. Stamens 10. Capsule 5-celled; placenta 5-parted.

42 Clethra. Calyx 5-parted. Corolla so deeply 5-parted as to appear 5-petalied. Stamens 10, with membranous filaments; anthers at length inflexedly pendulous, obverse, and corolate at the base, and mucronate at the apex, but mucit. Stigma trispid. Capsule 3-celled, many-seeded, with a loculicidal dehiscence.

TYPHE II.

44 Vireya. Calyx obsolescently 5-toothed. Corolla subcampanulate, or funnel-shaped, regularly 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calycine disk; anthers dehiscing by terminal pores, mucit. Stigma capitulate, 5-furrowed. Capsule siliqua-formed, 5-angled, 5-celled, 5-valved. Placenta 5-lobed. Seeds numerous, expanded at both ends into a bristle-formed awn.

46 Hymenanthus. Calyx small, obsolescently denticulated.
Ericaceae.

Corolla subcampanulate, with a short compressed tube, and a 7-parted limb. Stamens 14, hypogynous; anthers mutic, opening by two terminal pores. Stigma obtuse, with 7 crenatures. Capsule oblong, 7-valved, 7-celled, many-seeded.

47 Kalima. Calyx 5-parted. Corolla salver-shaped; border producing 10 protuberances on the under side, and a corresponding number of cavities on the upper side, in which the anthers are concealed. Capsule 5-celled; dissepiments marginal.

48 Menzie'sia. Calyx 4-cleft. Corolla globose, 4-cleft. Stamens 8, hypogynous. Capsule 4-celled, 4-valved, having the dissepiments formed from the inflexed margins of the valves.

51 Le'rum. Calyx minute, 4-toothed. Corolla 5-petalled, spreading. Stamens 5-10, exerted; anthers opening by 2 pores at the apex. Capsule subovate, 5-celled, 5-valved, pedicellate, dehiscing at the base. Seeds ending in a wing at both ends.

Tribe III.

52 Vaccinium. Limb of calyx 4-5-toothed. Corolla urceolate or campanulate, 4-5-cleft. Stamens 8-10, hypogynous. Berry globose, 4-celled, many-seeded.

53 Oxycoccus. Calyx 4-cleft. Corolla 4-parted, with the segments somewhat linear and revolute. Stamens 8; filaments connivent; anthers tubular, bipartite. Berry 4-celled, many-seeded.

54 Gaylussacia. Limb of calyx 5-cleft. Corolla tubular, with a ventricose base and a 5-cleft limb. Stamens 10, inserted in the limb of the calyx; anthers mutic, drawn out into 2 little tubes from the top. Stigma capitate. Berry nearly globose, 10-celled; cells 1-seeded.

55 Thribedia. Calyx urceolar, 5-lobed. Corolla tubular, with a contracted 5-toothed mouth. Stamens 10, inserted in the calyx, inclosed; anthers elongated, mutic, drawn out into 2 little tubes at the apex. Berry 5-celled, many-seeded.

56 Agapetes. Limb of calyx 5-cleft. Corolla tubular, with a 5-cleft limb. Stamens 10, with very short flattened filaments; anthers mutic, very long, auricled at the base, exerted, narrow, emarginate at the apex, with the cells confluent. Stigma clavate. Berry 5-celled, many-seeded.

57 Ceratostema. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, contracted and 5-lobed at the apex. Stamens 12, with very short, flattened, hairy filaments; anthers bluntly spurred at the base, having the cells elongated at the apex and filiform, dehiscing by a terminal pore. Stigma simple. Berry 5-celled, many-seeded.

Tribe IV.

58 Pyrola. Calyx 5-cleft or 5-parted. Petals 5. Stamens 10, slightly united at the base. Style exerted. Stigma 5-lobed. Capsule 5-celled, dehiscing at the angles near the base, having the margins of the valves connected by intricateomentum.

Tribe V.

62 Hyppóptes. Calyx 3-5-parted. Corolla 4-5-petalled; petals or segments each with a cucullate nectariferous base. Anthers small, horizontal, at length opening flat. Stigma orbicular, with a bearded margin. Capsule 5-celled, 5-valved, many-seeded.

63 Monótopa. Calyx none. Corolla 5-petalled; petals or segments each with a cucullate nectariferous base; anthers reflexed, horizontal. Stigma orbicular, naked. Capsule 5-celled, 5-valved, many-seeded.

64 Petérosópha. Calyx 5-parted. Corolla ovate, with a reflexed 5-toothed border. Anthers peltate, adnate to the filaments by the margin, bisepalous. Capsule 5-celled; placenta 5-lobed. Seeds terminated each by a wing.

ERICACEÆ. 1. ERICA.

1. ERICA (Erica of Pliny is altered from ἔρικα of Theophrastus, which is derived from ἐπικώ, erico, or ἐπικώ, erico, to break; from the supposed quality of some species in breaking the stone in the bladder). D. Don. in edinb. phil. journ. 17. p. 152.—Erica species of Lin. and other authors.

LIN. Syst. Octandria, Monogynia. Calyx 4-parted, with a naked base. Corolla globose or urceolate, with a 4-lobed limb. Stamens inclosed; filaments capillary; anthers bifid; cells of anthers opening by an oblong hole, awned or crested at the base, or mutic. - Sigma petalate. Capsule 4-celled, many-seeded.—Shrubs, natives of Europe and Africa. Leaves scattered or verticillate, acerate. Flowers terminal, fascicled or racemose. Pedicels scaly.

§ 1. Anthers awned at the base. Normal species.

* Leaves 3 in a whorl. Corollas campanulate.

1 E. LEVÍS (Andr. heath. 3. t. 6.) leaves glabrous, 3-4 in a whorl, spreading; branches slender; flowers terminal by threes, drooping; corollas small, bell-shaped; awns of anthers falcate. 5 G. Native of the Cape of Good Hope. Lodd. bot. cab. 1593. E. cyaritiformis, Salis. in Lin. trans. 6. p. 376. Flowers white. Plant glabrous. Anthers black. Perhaps only a variety of E. perfoliata.

2 E. callosa (Wendl. eric. ex Spreng. syst. 2. p. 194.) leaves glabrous, 3 in a whorl, linear-oblong, with revolute edges, spreading, white beneath; flowers terminal, usually by threes, erectish; calyx coloured, viscid; corollas campanulate; awns of anthers short. 5 G. Native of the Cape of Good Hope. E. canaliculata minor, Andr. heath. 3. t. 39. Corollas red.

3 E. deflexsæa (Thumbl. diss. no. 50. with a figure); leaves glabrous, 3 in a whorl, linear, revolute; flowers terminal; corolla bell-shaped; spars of anthers long, subulate and hairy; bracteae remote from the calyx. 5 G. Native of the Cape of Good Hope. E. rapicrastris, Andr. heath. 3. t. 9. E. haimilis, Salish. in Lin. trans. 6. p. 329. Branches decumbent. Flowers small, white.

4 E. nofiflora (Bedf. eric. wob. p. 16. but not of Sal.) leaves 3 in a whorl, slightly hispid; flowers subaxillary; bracteae remote from the calyx; corolla campanulate, with deep segments; anthers awned. 5 G. Native of the Cape of Good Hope. Erica glomerata, Hort. Flowers white.

5 E. sicifolia (Sal. in Lin. trans. 6. p. 326.) leaves 3 in a whorl, mucronate; corolla 1½ lines long, hairy outside, with a cup-shaped tube; flowers terminal; spars of anthers linear; fruit glabrous. 5 G. Native of the Cape of Good Hope.

6 E. montana (Bedf. eric. wob. p. 15.) leaves 3 in a whorl; flowers axillary, by threes; bracteae broad, approximating the calyx, loose, angular; corolla bell-shaped; anthers awned; style inclosed. 5 G. Native of the Cape of Good Hope. E. confertifolia, Wendl.? Flowers purplish-red.

7 E. villosiúscula (Lodd. bot. cab. 1841.) hairy; leaves acicular, ciliate with long hairs; flowers disposed in racemose terminal fascicles; corollas campanulate. 5 G. Native of the Cape of Good Hope. Flowers small, pale red. Anthers unknown.

Rather-eillous Heath. Fl.? Clt.? Shrub.

8 E. scamnæa (Sal. in Lin. trans. 6. p. 329.) leaves lanceolate, 3 in a whorl; flowers terminal; corolla bell-shaped; bracteae remote from the calyx; anthers awned, glabrous. 5 G. Native of the Cape of Good Hope. E. scamnæa, Thumb. diss. 84. Flowers small, reddish-purple. Corolla 4-5 lines long.

9 E. assucægens (Hort. Bedf. hort. eric. wob. p. 2.) leaves 3-4 in a whorl, villous; flowers terminal; corolla bell-shaped; bracteae approximating the calyx; anthers awned. 5 G. Native of the Cape of Good Hope. Flowers white. Bractes villous. Style inclosed.

10 Deflexsæa (Bedf. hort. eric. wob. p. 8.) leaves 3 in a whorl, rough; flowers terminal, umbellate; corolla deflexed, openbell-shaped; bracteae minute, remote from the calyx; anthers awned. 5 G. Native of the Cape of Good Hope. Flowers white. Style exerted.

11 E. ortesæa (Lodd. bot. cab. 1027.) glabrous; leaves 3 in a whorl, obtuse; flowers terminal, by threes; corollas campanulate; genitils inclosed. 5 G. Native of the Cape of Good Hope. Flowers purplish-red. Anthers unknown.

12 E. glomerata (Lodd. ex Bedf. eric. wob. p. 11.) leaves 3 in a whorl; flowers terminal, capitate; corolla small, bell-shaped; bracteae approximating the calyx; anthers awned. 5 G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style exerted.

13 E. verna (Lodd. bot. cab. 1608.) glabrous; leaves 3 in a whorl; flowers terminal; corollas campanulate; style exerted. 5 G. Native of the Cape of Good Hope. Flowers purple-red. Anthers unknown.

14 E. parciflora (Bedf. hort. eric. wob. p. 17.) leaves 3 in a whorl; flowers terminal, almost sessile; corolla campanulate; bracteae remote from the calyx; anthers awned. 5 G. Native of the Cape of Good Hope. Flowers small, reddish-purple. Style inclosed.

15 E. tenuis (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, linear, glabrous; flowers terminal, subsolitary; bracteae remote from the calyx; corolla bell-shaped; anthers awned; style exerted. 5 G. Native of the Cape of Good Hope. Flowers white. Anths of anthers linear, attenuated; filaments very short.

16 E. Schollia (Bedf. bot. cab. 538.) leaves alternate, scattered; flowers subterminal and axillary; corolla campanulate; bracteae remote from the calyx, anthers awned. 5 G. Native of the Cape of Good Hope. Flowers purple, drooping, and are as well as the calyces coloured. Style inclosed.

17 E. acteæa (Bedf. hort. eric. wob. p. 1.) leaves 3 in a whorl, glabrous; flowers terminal; bracteae remote from the calyx; corolla oblong-bell-shaped; anthers awned. 5 G. Native of the Cape of Good Hope. Erica Láudéræa, Hort. but not of Andr. Corollas white. Style exerted.

ERICACEÆ.  I. ERICA.

791

18 E. purescens (Lin. spec. 506.) leaves linear, 3 in a whorl, downy; flowers terminal; pedicles hardly the length of the flowers; corolla 2 lines long, urceolate, downy both inside and outside; spurs of anthers short. ñ. G. Native of the Cape of Good Hope. E. pubescens, var. pilosa, Thumb. eric. no. 61. E. pâlida, Sal. in Lin. trans. 6. p. 326. Sides of calyx redundant. Flowers pale red. Style inclosed.

19 E. hirta (Thumb. eric. no. 56. t. 2.) leaves 3 in a whorl, linear, bristly; flowers terminal; pedicles more than twice the length of the flowers; corolla 3 lines long, downy outside, with an urceolar tube; spurs of anthers linear attenuated. ñ. G. Native of the Cape of Good Hope. E. düra, Hort. E. urceolaris, Sal. in Lin. trans. p. 326. Corolla pale green, with greenish yellow apex. Style inclosed.

Hairy Heath. Fl. April, July. Cult. 1795. Shrub 1 to 2 feet.

20 E. suaveolens (Lodd. bot. cab. t. 24.) leaves 3 in a whorl, oblone-lanceolate, ciliate; flowers terminal; bracteas remote from the calyx; corolla urceolate; anthers a little exserted, black; style much exserted. ñ. G. Native of the Cape of Good Hope. Flowers pale red.

21 E. grandiflora (Lodd. bot. cab. 627.) glabrous; leaves linear, 3 in a whorl; flowers terminal, drooping, by threes; corolla irregularly ovate, inflated, small, anthers awned; calyx reflexed. ñ. G. Native of the Cape of Good Hope. Bedd. hort. eric. wob. p. 11. Flowers small, white. Style inclosed.

Hailstone-flowered Heath. Fl. April, May. Cult. 1810. Shrub ½ to 1 foot.

22 Ñ. ñeucova (Andr. heath. 3. t. 1.) leaves linear, 3 in a whorl, rather falcate, with revolute ciliated edges; flowers terminal by threes; calyx ciliolate; corolla globose; anthers awned. ñ. G. Native of the Cape of Good Hope. E. camphyliphylla, Spreng. syst. 2. p. 190. Plant downy. Flowers small, red. Style exserted.

23 E. globosa (Andr. heath. 3. t. 24.) leaves linear-lanceolate, oblong, 3–4 in a whorl, ciliate, recurved; flowers terminal, aggregate, drooping; corolla globose; calyx coloured, beset with glandular hairs; awns of anthers small. ñ. G. Native of the Cape of Good Hope. Flowers small, pink.

24 E. tubuscula (Bedd. hort. eric. wob. p. 26.) downy; leaves 3 in a whorl; flowers terminal; corolla tubular, very small; anthers awned; bracteas remote from the flower. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1157. E. pubescens minima, Andr. heath. 2. t. 8. Flowers small, purplish red. E. pubescens, Wendl. eric. p. 8. no. 7. Style inclosed.

26 E. frymilla (Andr. heath. vol. 4. icon.) leaves 3 in a whorl, subulate, glabrous, square or branches decumbent; flowers terminal, generally by four, downy; calyces short, adpressed; corolla globose; anthers awned. ñ. G. Native of the Cape of Good Hope. E. sanguinolenta, Ker. in bot. mag. 2263. Lodd. bot. cab. 468. Flowers small, blood-red or purple. Bracteas remote from the calyx. Style inclosed.

Urectoral-flowered Heath. Fl.

28 E. tomentosa (Sal. in Lin. trans. 6. p. 327.) clothed with hoary tomentum; leaves 3 in a whorl, narrow-linear, ciliate, imbricated; flowers terminal by threes; calyx flattish, fringed; corolla ½ line long, tomentose both inside and outside; spurs of anthers long, recurved. ñ. G. Native of the Cape of Good Hope. Bracteas situated at the base of the pedicels, and are, as well as the calyces and corollas, purple.

29 E. alopecuroides (Wendl. eric. no. 20. p. 119.) leaves linear, 3 in a whorl; flowers terminal; corolla ovate; bracteas remote from the calyx; anthers awned. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 874. Flowers small, purplish red. Plant downy. Calyx coloured, inclosed. Style inclosed.

30 E. adenophora (Spreng. syst. 2. p. 188.) leaves 3 in a whorl, glandularly hispid, spreading, remotish; flowers terminal, aggregate, glabrous; calyces viscid, coloured, adpressed. ñ. G. Native of the Cape of Good Hope. Anthers coiled.

31 E. laevis (Salisb. in Lin. trans. 6. p. 335. Ait. hort. kew. 2. p. 387.) leaves 3 in a whorl, ovate, obtuse, imbricated, downy; flowers terminal, sub-capitate; corolla ovate, 2 lines long, with a recurved limb; spurs of anthers long and narrow-cuneated, smooth. ñ. G. Native of the Cape of Good Hope. E. lâchen, Andr. heaths. 3. t. 2. Flowers middle-sized, white. Style exserted.

32 E. pulvifera (Lodd. bot. cab. t. 263.) glabrous; leaves 3 in a whorl; flowers terminal; corolla globosely campanulate; bracteas remote from the calyx; anthers awned. ñ. G. Native of the Cape of Good Hope. Bedd. eric. wob. p. 3. f. 1. E. nivalis, Andr. heath. vol. 4. Flowers small, white, downy. Genitalis included.

33 E. pulviflora (Bedd. eric. wob. 20.) clothed with powderly down; leaves 3 in a whorl; flowers terminal; corolla ovate; bracteas imbricate; anthers awned. ñ. G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

34 E. purpusii (Bedd. f. c.) leaves 3 in a whorl; flowers terminal; corolla globose; anthers awned, a little exserted. ñ. H.
Native of the Cape of Good Hope. Flowers reddish-purple, small. Style exserted.

36 E. *rubella* (Lodd. bot. cab. 658. Sims, bot. mag. 2165.) leaves 3 in a whorl; flowers terminal, capitate; corolla ovate, ventricose, length of calyx; bracteas approximating the calyx. 1. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

41 E. *lasophyllílla* (Spreng. syst. 2. p. 195.) leaves 4 in a whorl, linear, scabrous, glandularly ciliated, spreading, aristate at the apex; flowers racemose, drooping; calyx adpressed; corolla campanulate; anthers awned. 1. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

42 E. *floribúndá* (Lodd. bot. cab. 176.) glabrous; leaves 4 in a whorl; flowers terminal; corolla bell-shaped, open; anthers awned. 1. G. Native of the Cape of Good Hope. Flowers small, axillary and terminal, pale red. Style exserted.

47 E. *blándordjíana* (Ait. hort. kew. 2. p. 392.) leaves linear, 4 in a whorl, spreading; flowers terminal, almost solitary; corolla ovate-globose, or urceolar; anthers awned. 1. G. Native of the Cape of Good Hope. Curt. bot. mag. 1793. Lodd. bot. cab. 115. E. Blandordian, Andr. heath. 3. t. 8. Corollas yellow, small. In the hortus eric. wob. the anthers are said to be mutic; this must be wrong.

49 E. *tárden Nóra* (Sal. in Lin. trans. 6. p. 572.) leaves 4 in
ERICACEAE. I. \textit{Erica}.

a whorl, linear, revolute, downy; flowers terminal, umbellate; corolla urceolate, downy, with a short recurved limb; anthers awned; fruit hairy. \(\text{G} \). Native of the Cape of Good Hope. E. pubescens, Curt. bot. mag. 480. E. hirtiflora, \(\beta\). Ait. hort. kew. 2. p. 406. Calyxes adpressed, narrow, ovate, cuneated. Corollas red. Style inclosed.

\textit{Late-flowered Heath}. Fl. year. Ct. 1800. Shrub 1 to 2 feet.

50 E. canescens (Wendl. eric. ex Spreng. syst. 2. p. 195.) leaves 4 in a whorl, linear, canescent, erect; flowers terminal, sessile; corolla urceolate-campanulate; calyxes foliaceous, ovate, acuminate, adpressed; awns of anthers linear. \(\text{G} \). Native of the Cape of Good Hope. E. pubescens minor, Andr. heath. 2. t. 7. E. exigua, Sal. in Lin. trans. 6. p. 373. E. pubescens parviflora, Thumb. diss. no. 61. Corolla with an ovate tube, and a short limb. Flowers small, pale purple.

51 E. fusilla (Salisb. in Lin. trans. 6. p. 374.) downy; leaves 4 in a whorl; calyxes adpressed, broad, ovate-cuneated; corolla very small, downy, with a cup-shaped tube, and the limb the length of the tube; anthers awned; fruit glabrous. \(\text{G} \). Native of the Cape of Good Hope, in Baaey Fals. Flowers terminal.

\textit{Least Heath}. Shrub.

52 E. cónica (Lodd. bot. cab. 1179.) leaves 4 in a whorl, linear, glabrous; flowers axillary, racemose; genitals inclosed. \(\text{G} \). Native of the Cape of Good Hope. Flowers purplish-red.

53 E. pubigera (Sal. in Lin. trans. 6. p. 372.) downy; leaves 4 in a whorl; flowers terminal; calyxes spreading; ovate-acuminate; corolla \(\frac{1}{2}\) line long, downy, with a longish recurved obtuse limb; anthers awned; fruit hairy. \(\text{G} \). Native of the Cape of Good Hope, on Mount Tafelfberg.

\textit{Down-bearing Heath}. Shrub.

54 E. catervuliflora (Sal. l. c.) hairy; leaves 4 in a whorl; stem angular; flowers terminal; corolla 2 lines long, downy, with a narrow obovate tube; anthers awned, dehiscing by long holes. \(\text{G} \). Native of the Cape of Good Hope, on the summit of Mount Tafelfberg. E. pubescens villosa, Thumb. diss. no. 61.

\textit{Company-flowered Heath}. Shrub.

55 E. turbiniflora (Sal. in Lin. trans. 6. p. 377.) stem glabrous; leaves 4 in a whorl; flowers terminal; corolla \(\frac{1}{3}\) line long, smooth, with a turbinate 8-shaped tube, and an incurved limb; spurs of anthers glabrous. \(\text{G} \). Native of the Cape of Good Hope. Flowers pale purple.

56 E. trauquiliflora (Sal. in Lin. trans. 6. p. 374.) leaves 4 in a whorl; flowers terminal; calyx involute; corolla \(\frac{2}{3}\) lines long, with an urceolar tube, and a recurved limb; anthers hairy, broadly foraminose; spurs hairy. \(\text{G} \). Native of the Cape of Good Hope.

57 E. plumosa (Andr. heath. 2. t. 6.) leaves 4 in a whorl, linear, hairy, erect, imbricated; flowers disposed in axillary whors; corolla ovate-globose; calyxes hairy; anthers awned. \(\text{G} \). Native of the Cape of Good Hope. Erica amoenà, Wendl. eric. 17. p. 73. Corollas purplish-red. Branches erect. Style exserted.

58 E. tenùissima (Wendl. eric. fasc. 6. p. 9, with a figure) leaves 4 in a whorl, linear-liliform, glabrous, erect, somewhat imbricated; flowers terminal, aggregate; calyx short, naked; corolla urceolate, with an erect limb; anthers appendiculate. \(\text{G} \). Native of the Cape of Good Hope. Flowers red.

59 E. curvirostris (Sal. in Lin. trans. 6. p. 375.) leaves 4 in a whorl, linear; flowers terminal; calyxes adpressed; corolla \(\frac{1}{2}\) line long, with a spherical tube; spurs of anthers downy; style curved. \(\text{G} \). Native of the Cape of Good Hope.

\textit{Curved-beaked Heath}. Shrub.

60 E. piluliformis (Lin. spec. ed. 2. p. 582.) leaves 4 in a whorl, linear, glabrous, ciliated; flowers terminal; corolla globose, \(\frac{3}{4}\) lines long, having the tube length of the calyx; calyx-cines segments ovate, acuminated, deeper coloured at the apex; spurs of anthers linear-attenuated; fruit glabrous. \(\text{G} \). Native of the Cape of Good Hope. E. madrocíalis, Berg. pl. cap. p. 113. E. pilulíformis, Sal. in Lin. trans. 6. p. 370. Flowers red. Style exserted.

61 E. imbecilla (Hort. Loud. hort. brit. no. 9716. p. 150.) leaves 4 in a whorl; bracteas remote from the calyx; calyx minute; flowers terminal; corolla with an ovate tube and a recurved limb; spurs of anthers linear-attenuated, hairy. \(\text{G} \). Native of the Cape of Good Hope. E. grácilis, Salisb. in Lin. trans. 6. p. 375. Flowers small, red or purple.

62 E. intervallaris (Sal. in Lin. trans. 6. p. 375.) stem slender; leaves 4 in a whorl, remote; flowers terminal; corolla \(\frac{1}{2}\) to 2 lines long, with an ovate-cylindrical tube, and a broad mouth; anthers awned; pericarp hairy. \(\text{G} \). Native of the Cape of Good Hope. Erica elongata, Roxb. ms. Flowers small, red, drooping.—A very pretty species.

63 E. mucosa (Andr. heath. 1. t. 6.) leaves 4 in a whorl, glabrous; flowers terminal; corolla glabrous, viscid, having the interstices of the limb rather tumid; calyx-cines segments ovate, obtuse, coloured, tipped with green; anthers awned. \(\text{G} \). Native of the Cape of Good Hope. Lodd. bot. cab. 35. Icon. pl. kew. t. 15. Flowers pale purplish-red. Corolla with the tube more or less obovate. Style inclosed.

\textit{Mucous-flowered Heath}. Fl. March, July. Ct. 1787. Shrub 1\(\frac{1}{4}\) foot.

64 E. mucosoioides (Bedd. hort. eric. wob. p. 15.) leaves short, 4 in a whorl; flowers terminal; corolla glabrous; calyx-cines segments coloured, tipped with green; anthers awned. \(\text{G} \). Native of the Cape of Good Hope. Lodd. bot. cab. 1202. Flowers small, purplish red. Style inclosed.

65 E. lateralis (Wildl. spec. 2. p. 380. but not of Andr.) leaves 4 in a whorl, linear-attenuated, glabrous; flowers terminal; bracteas remote from the calyx; calyx-cines segments ciliated; corolla conical, having the segments anointed with drops of waxy matter at top; corolla of anthers downy. \(\text{G} \). Native of the Cape of Good Hope. E. gulliflora, Sal. in Lin. trans. 6. p. 374. Corollas small, red. Style exserted.

\textit{Fur. a} stem fastigite; corolla 1 or \(\frac{1}{4}\) line long, with a hemispherical tube; stigma much exerted. \(\text{G} \). E. late-

\textit{ralis, Wildl. l. c.}

\textit{Fur. b} stem low; corolla 2 lines long, with an ovate tube; stigma hardly exerted. \(\text{G} \). E. incarnàta, Andr. heath. 1. t. 19. Lodd. bot. cab. 1655.

\textit{Fur. c} stem dwarf; corolla 2 lines long, with an ovate tube; stigma a little exerted. \(\text{G} \). E. rubens himilus, Wendl. eric. fasc. 3. p. 13. with a figure.

\textit{Lateral Heath}. Fl. March, July. Ct. 1791. Shrub 1\(\frac{1}{4}\) to 2 feet.

66 E. řeústa (Sal. in Lin. trans. 6. p. 371.) leaves 4 in a 5 1
whorl; stem angular; flowers axillary at the tops of the branches; corolla viscid, 2½ lines long, with a narrow urceolate tube; filaments mutic; anthers appendiculate. G. Native of New Holland. Flowers fulvous.

67 E. *CANTHAREFORMIS* (Lodd. bot. cab. 1961.) leaves obsolete; flowers terminal; pedicels about 3 together; calyx reflexed; corolla ovate, ventricose. G. Native of the Cape of Good Hope. Flowers white. Anthers unknown. Nearly allied to *E. reflexa*.

68 E. *BONPLANDIANA* (Sims, bot. mag. t. 2926.) leaves 4 in a whorl, imbricate, aceroso; flowers terminating the small branches, solitary or by threes, sessile; bracteas close to the calyx; corolla large, with an urceolar tube, and an acute spreading limb; genitals inclosed. G. Native of the Cape of Good Hope. Flowers white. Perhaps a species of *Catasetum*.

*Var. f. flavus; flowers buff-coloured.

69 E. *CUFRESKINSA* (Hort. Beddf. eric. wob. p. 6. pl. 3. f. 10.) leaves 4 in a whorl, slightly ciliolate; flowers terminal; corolla ovate-globose; bracteas remote from the calyx; calyx recurved; anthers awned. G. Native of the Cape of Good Hope. *E. tarrigera*, Sal. in Lin. trans. 6. p. 577. É. procmumens, Hort. Flowers middle-sized, pale purplish-red. Corolla 2 lines long, with a hemispherical tube, and with the segments imbricate at the base.

70 E. *MORESTA* (Beddf. eric. wob. p. 15. but not of Salisb.) leaves 4 in a whorl; flowers terminal; corolla globose; bracteas approximating the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed.

71 E. *VOLIS* (Beddf. eric. wob. p. 15.) downy; leaves 4 in a whorl; flowers terminal; bracteas remote from the calyx; corolla globose; anthers awned. G. Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed.

72 E. *OLULIA* (And. heath. vol. 4.) leaves 4 in a whorl, sessile, crowded, linear, glabrous; flowers terminal, umbellate; corolla ovate-globose; awns of anthers recurved. G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

73 E. *SUBULATA* (Wendll. eric. ex Spreng. syst. 2. p. 190.) leaves 4 in a whorl, linear-subulate, a little incurved, elongated; branches rather hairy; flowers terminal, crowded; corolla urceolate; calyxes subulate, adpressed; anthers awned. G. Native of the Cape of Good Hope. Flowers purple. Style exerted.

74 E. *FLORIDA* (Thumb. diss. 64. t. 6.) leaves 4 in a whorl, linear; flowers terminal, umbellate, glabrous; calyxes villous, reflexed; corolla 2 lines long, urceolate; awns of anthers lancéolate. G. Native of the Cape of Good Hope. Corolla red, with a globose tube, and the segments imbricate at the base. Bracteas very minute. Style inclosed.

75 E. *SMITHIANA* (Loj. bot. cab. 1614. Beddf. eric. wob. p. 4. leaves 4 in a whorl; flowers subterminal, axillary, drooping; corolla globose, bell-shaped; bracteas remote from the calyx; anthers awned. G. Native of the Cape of Good Hope. Flowers purplish-red.

*Smith’s Heath*. Fl. April, May. Clt. 1791. Shrub 1 to 2 feet.

76 E. *CORTOLOIA* (Beddf. eric. wob. p. 29, but not of Ait.hort. kew.) leaves 4 in a whorl; flowers terminal; corolla ovate; bracteas remote from the calyx; anthers awned; style inclosed. G. Native of the Cape of Good Hope. Flowers white. Style inclosed.

77 E. *PECTINIFOLIA* (Sal. in Lin. trans. 6. p. 367.) leaves 4 in a whorl, narrow, ovate-cuneated, pectinated; flowers terminal; calyxes segments spatulate; corolla 5-7 lines long, woolly inside; anthers inclosed, appendiculate. G. Native of the Cape of Good Hope. Erica cerinoides, Thumb. diss. no. 35.

§ 2. Anthers crested.

* Leaves 3 in a whorl. Corollas campanulate.

78 E. *NIVEA* (Beddf. hort. eric. wob. p. 16.) leaves 4 in a whorl, glabrous; flowers terminal; corolla bell-shaped; bracteas remote from and approximating the calyx, large, loose; calyx large; anthers crested. G. Native of the Cape of Good Hope. Flowers pure white. Style subeverted.

79 E. *LEUCANTHAEA* (Lin. suppl. p. 223. Andhr. heath. 3. t. 15.) glabrous; leaves 3 in a whorl, erect; branches twitty; flowers terminal, drooping; peduncles glabrous; bracteas remote from and approximating the calyx; corolla oblong-bell-shaped, having the limb as long as the tube; anthers crested. G. Native of the Cape of Good Hope. E. spiracéfolia, Sal. in Lin. trans. 6. p. 350. Corollas 1½ line long, white as well as the anthers. There is a variety of this, which is rather downy, and larger in the flowers. Style inclosed.

*Var. f. styloosa; style very long.

*Var. g. squarrosa (Hort.) leaves squarrose.

*Var. c. minima (Hort.) plants small.*

81 E. *POLYTRICHUMFLORIA* (Sal. in Lin. trans. 6. p. 329.) leaves 3-5 in a whorl; stem tomentose; flowers terminal; bracteas remote from the calyx; calyxes gradually narrowed at the base; corolla 1-2 lines long; spurs of anthers cuneated. G. Native of Portugal, about Lisbon. Fruit pear-shaped. Perhaps only a variety of *E. arborea.*

*Polychromum-leaved* Heath. Shrub.

82 E. *LUCIDA* (Andhr. heath. 2. t. 16.) leaves 3 in a whorl, filiform; branches spreading; flowers terminal, by threes; co-
rollas short, bell-shaped, subglobose; calyx coloured, bracteate, scurilated; bracteas imbricate, sessile. ½ G. Native of the Cape of Good Hope. Flowers small, reddish purple. Anws of anthers a little crested. Style exerted. 

* * * Leaves 3 in a whorl. Corollas urceolate.

83 E. nitida (Andr. heath. 3. t. 18.) leaves 3 in a whorl, scabrous, spreading; flowers terminal, drooping; pedicels downy; bracteas sessile, close to the calyx; corolla urceolate globose; anthers crested. ½ G. Native of the Cape of Good Hope. Loddi. bot. bot. cab. 1181. E. reflexa rubra, Hort. Flowers white, tinged with red. Style exerted.

84 E. peduncularis (Sal. in Lin. trans. 6. p. 329.) leaves 3 in a whorl, linear, hispid; flowers terminal; corolla 3 lines long, with a globose tube; anthers woolly, dehiscing by long chinks, crested. ½ G. Native of the Cape of Good Hope. E. rufens, Thumb. diss. no. 83, but not of Andr. Pedicels an inch long. Flowers purplish red.

Peduncular-flowered Heath. Shrub.

85 E. fausta (Sal. in Lin. trans. 6. p. 326.) leaves 3 in a whorl, hispisty; flowers terminal; corolla 2½ lines long, downy outside, with an urceolate tube; spurs of anthers serrated, attenuated, crested. ½ G. Native of the Cape of Good Hope. Very like E. hirta, Thumb. Flowers pale purple.

Fortunate Heath. Fl. April, July. Clt. 1795. Shrub 1 to 2 feet.

86 E. incana (Wendel. eric. fasc. 18. p. 89, with a figure,) leaves 3 in a whorl, linear-oblong, obtuse, hairy, white beneath; bracteas remote from the calyx; flowers terminal, downy; corolla urceolate; anthers awned. ½ G. Native of the Cape of Good Hope. Flowers white. There is also a red-flowered variety of this species. Style exerted.

87 E. ovata (Lodd. bot. cab. 417.) downy; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corollas ovate; anws of anthers crested a little. ½ G. Native of the Cape of Good Hope. Flowers purplish red. Style inclosed.

88 E. reflexa (Link, enum. 1 p. 371. Lodd. bot. cab. 1787.) leaves 3 in a whorl, glabrous, lanceolate, obtuse; flowers terminal, usually 3 in a fascicle; calyx, bracteas, and pedicels coloured; corolla ovate, ventricose at the base, clamyd; crests of anthers plumose. ½ G. Native of the Cape of Good Hope. Calyx spreading. Corollas white, waxy, middle sized. Anthers black. Very nearly allied to E. nitida, and probably only a variety of it. The young leaves are said by Link to be glandularly ciliated. Style inclosed.

Var. β, atropúrpürase (Lodd. bot. cab. 1409.) plant dwarf; flowers deeper purple.

Var. γ, dálba (Bedd. l. c.) flowers white.

Var. ð, pálítica (Lodd. bot. cab. 1507.) flowers pale purple.

90 E. vernícilía (Sal. in Lin. trans. 6. p. 355.) leaves 3 in a whorl, viscid; corolla 2½ lines long, with a recurved limb; flowers terminal; spurs of anthers car-formed and cuculate, hairy; fruit smooth. ½ G. Native of the Cape of Good Hope. E. glûnibus, Roxb. mas. The leaves are bluntly acuminated, densely clothed with glands in the reduplicate part; hence they appear shining and clammy.

Furnished-flowering Heath. Shrub.

* * * Leaves 4 in a whorl. Corollas campánulate.

93 E. declinás (Bedd. hort. eric. wob. p. 7,) leaves 4 in a whorl; flowers axillary, subspicate; corolla bell-shaped; bracteas remote from the calyx; anthers crested. ½ G. Native of the Cape of Good Hope. Loddi. bot. cab. 1662. Flowers white, tinged with red. Style a little exerted.

* * * Leaves 4 in a whorl. Corollas urceolate.

94 E. margaritáceæ (Sal. in Ait. hort. kew. 2. p. 401.) glabrous; leaves 4 in a whorl; flowers terminal; bracteas remote from the calyx; anthers crested; corolla with a spherical tube. ½ G. Native of the Cape of Good Hope. Andr. heaths. 1. t. 17. Wendel. eric. 8. p. 11, with a figure. E. ovata, Sal. in Lin. trans. 6. p. 375. Calyx incurredly spreading. Corollas nearly 2 lines long, white. Crests of anthers glabrous. Style exerted.

95 E. lachneóides. This species is very distinct from Eria lachneæa, Andr.; but we have not means of giving any description of it. Anthers crested. ½ G. Native of the Cape of Good Hope. E. lachneæa purplææa, Andr. heaths. 3. t. 3. Flowers red.

96 E. racemífera (Andr. heath. 3. t. 12.) leaves 4 in a whorl, and are as well as the calyces glabrous; flowers axillary, verticillate; corollas ovate-globose; anthers crested. ½ G. Native of the Cape of Good Hope. Flowers small, red. Style inclosed.

97 E. solaðhc (Andr. heath. 2. t. 17. Ait. hort. kew. 2. p. 399,) leaves 4 in a whorl, hispid; branches decumbent; flowers terminal, capitate, or umbellate; bracteas sessile, linear, ciliated, near the calyx; corollas globose bell-shaped; anthers crested.
\( \text{Ericaceae} \).

**1. Erica.**

G. Native of the Cape of Good Hope. Flowers reddish-purple. Style inclosed.

98 E. acu'ta (Andr. heath. 2. t. 19. Ait. hort. kew. 2. p. 399.) leaves 4 in a whorl, stiff, glabrous, spreading; flowers terminal, usually by threes, drooping; bracteas approximating the calyx; corolla ovate-globose; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Flowers small, deep purplish-red. Calyx ciliated. Style inclosed.

*Acute-flowered Heath.* Fl. May, Aug. Clt. 1799. Shrub \( \frac{1}{2} \) to 1 foot.

99 E. re'uens (Andr. heath. 2. p. 21.) leaves 4 in a whorl, hirsut, spreading; flowers terminal; bracteas remote from and approximating the calyx; anthers crested or awned; corolla ovate-globose. \( \text{G.} \) Native of the Cape of Good Hope. Lodd. bot. cab. 557. Flowers small, purplish-red. Style exserted.

Shrub 1 foot.

101 E. barbăta (Andr. heath. 2. t. 23.) leaves 4 in a whorl, ciliate; flowers terminal, umbellate, drooping; corolla short, urceolate; bracteas remote from the calyx; calycine segments spathulate, ciliates; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Lodd. bot. cab. 124. Erica barbata major, Andr. heath. 2. t. 23. Flowers pale yellow, with brown anthers. Style exserted.

*Var. his microscopic* (Andr. heath. 2. t. 24.) flowers white, with black anthers; but according to the hort. eric. wob. they are red, flowering Feb. Aug.

103 E. ce'ñua (Lin. suppl. p. 222.) leaves 4 in a whorl, hoary, villous or ciliate, aristate: those of the branches ovate; flowers terminal, drooping, umbellate; bracteas deciduous; calyx much fringed; corolla ovate-globose; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Montin, in act. ups. 2. p. 291. t. 9. f. 3. Flowers purplish-red or pink. Corolla \( \frac{2}{3} \) lines long.

104 E. verec'undá (Sal. in Lin. trans. 6. p. 379.) leaves 4 in a whorl, linear, incurvedly spreading, glabrous; branches hairy; spikes coarctate; flowers drooping; bracteas and calyces fringed; corolla \( \frac{2}{3} \) lines long, with an amphiroid-formed tube, and crenulated limb; anthers hairy; spars cuneate, hairy. \( \text{G.} \) Native of the Cape of Good Hope. Erica cernua, Andr. heath. 1. t. 20. Lodd. bot. cab. 822. but not of Lin. Flowers flesh-coloured. Style inclosed.

*Reddish-flowered Heath.* Fl. April, Sept. Clt. 1793. Shrub. 105 E. pę'dulá (Wendl. eric. 10. p. 13, with a figure) leaves 4 in a whorl, glabrous; flowers terminal, drooping; bracteas remote from the calyx; calycine segments lanceolate, adpressed; corolla ovate, angular; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Ait. hort. kew. 2. p. 400. E. arbuscula, Lodd. bot. cab. 843. Flowers purple: in hort. kew. there are said to be 3 bracteas on each pedicel; 2 near the calyx, and the third remote from it. Style inclosed.

*Pendulous-flowered Heath.* Fl. July, Aug. Clt. 1791. Shrub \( \frac{1}{2} \) foot.

106 E. nutans; leaves 4 in a whorl; flowers terminal, drooping; bracteas remote from the flower; calyx ribbed, green; corolla ovate-globose; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. E. pendula, Hort. Bedd. eric. wob. p. 18. but not of Wendl. Flowers reddish-purple. Style a little exserted.

*Nodding-flowered Heath.* Fl. Spring and Summer. Clt. 1791.

107 E. ribúla (Link. enum. 1. p. 368.) leaves 4 in a whorl, finely ciliate, flowers terminal; bracteas remote from the calyx; corolla oblong-globose; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. Flowers purplish-red. Style exserted.

108 E. lactífołá (Lodd. bot. cab. t. 901.) leaves 4 in a whorl, and are as well as the branches scabrous; flowers terminal, erectish; corolla ovate; bracteas remote from the calyx; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. E. lacticola, Roll. cat. E. tricoló, Spreng. syst. 2. p. 193. Limb of corolla connivent and drawn out. Flowers white. Style inclosed.

109 E. t'únc (Spreng. syst. 2. p. 188.) leaves 4 in a whorl, crowded, ciliated, erect; flowers terminal, umbellate, drooping; bracteas remote from the calyx; calyx minute, colour, ciliated; corolla urceolate or globosely bell-shaped; anthers crested. \( \text{G.} \) Native of the Cape of Good Hope. E. pedunculata, Andr. heath. 4. icon. but not of Wendl. E. ciliátá, Hort. Flowers purplish-red. Style inclosed.

**• • • • Leaves 3-6 or more in a whorl.**

111 E. empetrifólia (Lin. mant. p. 375.) leaves 6-7 in a whorl, oblong-linear, ciliate, erect; flowers disposed in glomerate racemose whorls; bracteas and calyces lanceolate; corolla 2 lines long, hairy, with an urceolar tube, and a recurvedly spreading limb; anthers awned or crested; stigma exserted. \( \text{G.} \) Native of the Cape of Good Hope. Lin. diss. no. 15, with a figure. Thumb. diss. no. 76. Curt. bot. mag. 447. Lodd. bot. cab. 1875. Calyx 4-lobed. Style exserted. Flowers purplish-red.
ERICACEÆ. 1. ERIKA.

139 E.? Colletter (Spreng. syst. 2. p. 192.) branches straight, hairy; leaves linear-oblong, obtuse, revolute, rather hispid, spreading; flowers axillary, drooping, clamy; corolla urceolate; style excised; stigma peltate. ñ. G. Native of the Cape of Good Hope.

Collett Heath. Shrubs.

* * * Leaves 4 in a whorl. Corollas campanulate.

140 E. odorata (Andr. heath. 3. t. 64.) leaves 4 in a whorl, glandularly ciliated, spreading; flowers terminal, umbellately verticillate, drooping; pedicels coloured; bracteas remote from the calyx; corolla campanulate, viscid. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 633. Sims, bot. mag. 1899. Corolla white, very like those of some species of Anùraíac. Style inclosed.

141 E. propéndens (Andr. heath. 2. t. 45. Sims, bot. mag. 21408.) downy; leaves 4 in a whorl, short, ciliated; branches flexuous; bracteas approximating the calyx; flowers terminal, solitary or by threes; corolla bell-shaped. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 63. Calycine segments jagged or serrated. Corolla purple, or deep red. Style inclosed.

142 E. palestris (Andr. heath. 2. t. 46.) leaves 4 in a whorl, linear, obtuse, downy; flowers terminal, umbellate; bracteas

nulate, with a cup-shaped tube; bracteas remote from the calyx. ñ. G. Native of the Cape of Good Hope. E. fucata, Thunb. diss. no. 6. E. viridipupurea, Hort.—Clus. hist. 1. p. 42. Stem downy. Corollas very small, green. Style inclosed or exserted.

VVAR. ß. minima (Hort.) plant smaller than the species.

129 E. corniculata (Nois. et Spreng. syst. 2. p. 196.) branches flexuous; leaves 3 in a whorl, linear, stiff, glandularly ciliate; flowers terminal, sessile, by threes, erect; calycine segments foliaceous, downy. ñ. G. Native of the Cape of Good Hope. Flowers red, small, campanulate. Stigma peltate, much exserted.

130 E. antennata (Spreng. syst. 2. p. 196.) branches hispid; leaves linear, obtuse, 3 in a whorl, glabrous; flowers terminal, usually by threes, drooping; bracteas close to the calyx, inflated; corolla wide, campanulate; anthers mutic. ñ. G. Native of the Cape of Good Hope. E. florída, Lodd. bot. cab. 234. Flowers purplish-red. Style a little exserted.

131 E.? spasa (Bedd. eric. wob. p. 22.) leaves 3 in a whorl, glabrous; flowers terminal; bracteas approximate and remote from the calyx; corollas small, bell-shaped, with deep spreading segments; anthers a little exserted. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1467. Flowers purplish-red. Style excised.

132 E. passerina (Lin. suppl. p. 221. Thunb. diss. no. 16. prod. 70.) leaves 3 in a whorl, ovate, glabrous; flowers terminal, almost solitary; pedicels and calyces tomentose; corolla campanulate; style excised. ñ. G. Native of the Cape of Good Hope. Montin. in. nov. act. ups. 2. p. 289. t. 9. f. 1. E. passerinæfolia, Sal. in Lin. trans. 6. p. 332.—Petit. gen. t. 3. f. 7. Corolla 2½ lines long; pericarp tomentose.—Perhaps a species of Ceränãia.

* * Leaves 3 in a whorl. Corollas urceolate.

133 E. ericopeiíla (Andr. heath. 2. t. 37.) leaves 3 in a whorl, and are as well as the calyces and corollas woolly; bracteas remote and approximating the calyx; anthers a little exserted; flowers terminal, umbellate; corolla urceolate. ñ. G. Native of the Cape of Good Hope. Lodd. bot. cab. 1270. E. canadensæn, Ait. hort. kew. 2. p. 407. E. gnáphaloides, Hortul. Flowers with a purplish-red calyx, and a white corolla. Style excised.

134 E. tubérculaíris (Sal. in Lin. trans. 6. p. 330.) leaves 3 in a whorl; flowers terminal; corolla 1½ line long, rough from tubercles, with a glabrous tube; filamenta mutica; pericarp on a long stipe. ñ. G. Native of the Cape of Good Hope. Erica inclyta, Sól. mas. Anthers minute, smooth. Flowers purple.
remote from the calyx; corollas cylindrically bell-shaped; anthers a little exserted. GH. Native of the Cape of Good Hope. Lodd. bot. cab. t. 4. Branches divaricate. Corollas reddish-purple.

Marsh Heath. Fl. April, June. Clt. 1799. Shrub 1 ft. 143 E. visca'ria (Andr. heath. 1. t. 43.) leaves 4 in a whorl, linear, glabrous, spreading; flowers axillary, disposed in verticillate spires or racemes, drooping; corolla campanulate, clothed with clammy down; bracteae approximating the calyx, sessile; calyce segments ciliated; fruit silky. GH. Native of the Cape of Good Hope. Lodd. bot. cab. 726. Icon. pl. kew. t. 1. E. viscidia, Sal. in Lin. trans. 6. p. 372. Corolla pale purplish-red, 3 lines long, with a cup-shaped ribbed tube. Style inclosed.

Var. a, incana; leaves hoary, 13 to 3 lines long. GH. E. viscaria, Thunb. diss. no. 40. Lin. mant. 321. diss. no. 45. with a figure.

Var. β, glabra; leaves green, 3-5 lines long. GH. E. viscária, Andr. heath. 1. t. 43. Icon. pl. kew. t. 1.

Clammy Heath. Fl. April and Autumn. Clt. 1774. Shrub 2 feet. 144 E. pyramidi'formis (Wendl. ex Spreng. syst. 2. p. 198.) leaves linear, hispid, spreading, 4 in a whorl; flowers terminal, usually by threes, erect; calyces adpressed, hispid; stigma quadridrilid. GH. Native of the Cape of Good Hope. Flowers purplish-red, campanulate.

Beautiful Heath. Fl. Jan. Oct. Clt. 1800. Shrub 1 ft. 147 E. sty-la'ris (Spreng. syst. 2. p. 198.) leaves 4 in a whorl, linear, obtuse, much spreading, and as are also as the branches hispid; flowers terminal, glomerate, erectish; calyces coloured, spreading, ciliated; corolla campanulate; style much exserted: stigma capitulate. GH. Native of the Cape of Good Hope. Anthers mutic.

Bearded Heath. Fl. June, Oct. Clt. 1816, Shrub. 149 E. const'x'tia (Bedf. eric. wob. p. 6.) leaves 4 in a whorl; flowers terminating the branches; bracteae remote from the calyx; corolla bell-shaped. GH. Native of the Cape of Good Hope. Style exserted.

Constantia Heath. Clt. 1810. Shrub 2 feet. 150 E. con'stita (Wendl. eric. fasc. 17. p. 75.) leaves 4 in a whorl, linear, pilose, spreading; flowers axillary, capitate, drooping; calyx foliaceous, imbricate, toothed; corolla campanulate, open; bracteae sessile; anthers mutic. GH. Native of the Cape of Good Hope. Flowers white. Style exserted.

Crowded-flowered Heath. Fl. July. Clt. 1820. Shrub 1 foot. * * * * Leaves 4 in a whorl. Corollas urceolate.

151 E. flexicaulis (Dry, in hort. kew. 2. p. 395.) leaves linear, 4 in a whorl, spreading, oblong, glandularly ciliate; flowers terminal, umbrilute; calyces coloured, glandularly ciliate. GH. Native of the Cape of Good Hope. E. glandulosa, Andr. heath. 2. t. 58. but not of Thumb. Corollas purple, urceolate. Style inclosed.

Honey-bearing Heath. Shrub.

155 E. Sic'i ca (Schonberg, in Linnaea. 2. p. 614.) leaves 4 in a whorl, petiolate, linear, nearly terete, canescent; flowers terminal, on long pedicels, subumbellate, canescens, erect; calyces segments and bracteae membranous, coloured, about equal in length to the corolla; corollas ovate-oblong, downy. GH. Native of Sicily. Flowers red.

Sicilian Heath. Fl. April, June. Clt. 1819. Shrub 2 to 3 feet. 156 E. aggrega'ta (Wendl. eric. fasc. 13. p. 11.) leaves 4 in a whorl, linear, hairy, spreading; flowers terminating the small branches; bracteae remote from the calyx; corolla globose, downy, with an erectish limb. GH. Native of the Cape of Good Hope. Lodd. bot. cab. 1678. Flowers purplish-red the whole forming branched racemes. There is also a white-flowered variety of this. Style exserted.

Aggregato-flowered Heath. Fl. June, July. Clt. 1820. Shrub 1 foot. * * * * Leaves 5-6 or more in a whorl. Corollas campanulate.

157 E. de'côra (Andr. heath. 3. t. 66. Alit. hort. kew. t. 392.) leaves 6 in a whorl, elongated, recurved; flowers axillary, mutant, disposed in spikes or racemes; bracteae remote from the calyx; corolla campanulate; anthers a little exserted. GH. Native of the Cape of Good Hope. Lodd. bot. cab. 1383. E. spiralis, Hortul. Flowers pale red.

Beaumont's Heath. Fl. June. Clt. 1820. Shrub 1 foot. * * * * * Leaves 5-6 in a whorl. Corolla urceolate.

159 E. cerintheoides (Lin. spec. ed. 2. p. 505. diss. no. 43.}
with a figure) leaves 5–6 in a whorl, linear-lanceolate, pilose and ciliolate, bearded at the apex; flowers terminal, capitate, drooping; corolla oblong, with an inflated tube, clothed with viscid hairs outside; bracteas sessile, larger than the calyx; segments of calyx cuneated. \( G \). Native of the Cape of Good Hope. Andr. heath. 1. t. 50. Curt. bot. mag. t. 220. Lodd. bot. cab. 1679. Berg. pl. cap. p. 104.–Breyn. cent. p. 25. t. 13. Wendl. eric. 7. p. 9, with a figure. E. crinifolia, Sal. in Lin. trans. 6. p. 367. Corollas scarlet or crimson, 8–10 lines long. There are several trifling varieties of this species in the gardens.

§ 4. Anthers coriunculate. Leaves 3 or 4 in a whorl.

160 E. magnifica (Andr. heath. vol. 4. icon.) leaves 3 in a whorl; flowers terminal by threes or fours; corolla ovate; bracteas remote from the calyx; anthers coriunculate. \( G \). Native of the Cape of Good Hope. Flowers purplish-red. Style inclosed. 

162 E. tenella (Andr. heath. 2. t. 31.) leaves 4 in a whorl, glabrous; flowers terminal by fours; corolla urceolate; anthers incluculate. \( G \). Native of the Cape of Good Hope. Lodd. bot. cab. 375. Flowers small, pale purplish-red. Style inclosed. 

163 E. gracilis (Andr. heath. 1. t. 2.) stem and branches glabrous; leaves glabrous, 4 in a whorl, linear; flowers terminal; corolla ovate-globose, or urceolate; anthers coriunculate. \( G \). Native of the Cape of Good Hope. Lodd. bot. cab. 244. Flowers small, purplish-red. Style inclosed. 

164 E. precox (Bedl. hort. eric. p. 19. Lodd. bot. cab. 1413.) leaves 4 in a whorl, aciculately spreading; flowers small, glabrously bell-shaped, disposed in terminal racemose fascicles; bracteas remote from the flower; anthers coriunculate. \( G \). Native of the Cape of Good Hope. Lodd. bot. cab. 1047. Flowers red. 

166 E. setacea (Andr. heath. 1. t. 24.) leaves 3–4 in a whorl; flowers terminal; corolla globose, bell-shaped; bracteas remote from the calyx; anthers coriunculate. \( G \). Native of the Cape of Good Hope. Flowers small, purplish-red. Style inclosed. 

† Species, not known to which genera of the Normal Ericae they belong.

167 E. Lavandulifolia (Sal. in Lin. trans. 6. p. 335.) stem hoary; leaves 3 in a whorl, hoary?; flowers terminal; bracteas close to the calyx; corollas 2 lines long, with a 4-angled tube, and an incurved limb; filaments very broad at the base; anthers inclosed, mutic. \( G \). Native of the Cape of Good Hope. 

168 E. crestedflora (Sal. in Lin. trans. 6. p. 332.) leaves 3 in a whorl; flowers terminal; calyx 4-toothed; corolla 2 lines long, having the limb 3 times longer than the tube, entire at the base; anthers inclosed, pericarp smooth. \( G \). Native of the Cape of Good Hope. Erica melanthera, Thunb. diss. no. 12. but not of Lin. Perhaps a species of Lophandra. 

169 E. cumuliflora (Sal. in Lin. trans. 6. p. 336.) leaves 3 in a whorl; fascicles 7–12-flowered, terminal; calyx hoary; corolla 2½ lines long, having the limb ciliated at bottom; anthers mutic, inclosed; pericarp hairy; stigma narrow. \( G \). Native of the Cape of Good Hope. Erica aggregata, Roxb. 

—Perhaps a species of Lamprotus. Flowers purplish-red. 

170 E. genistifolia (Sal. in Lin. trans. 6. p. 337.) flowers terminal, by threes; calyx viscid; corolla 2 lines long, having the limb ciliated at bottom; anthers mutic, inclosed; pericarp smooth; stigma broad. \( G \). Native of the Cape of Good Hope. Erica tetraloba, Roxb. 

—Perhaps a species of Lamprotus. 

171 E. perfoliataflora (Sal. in Lin. trans. 6. p. 337.) leaves 3 in a whorl, lanceolate-cuneated; flowers terminal, on long pedicels; calyxes short, orbicular; corolla 1½ lines long; anthers appendiculate, inclosed; stigma narrow. \( G \). Native of the Cape of Good Hope. Flowers deep purple. Filaments with short cuneate spurs. —Perhaps a species of Lamprotus.

Periplaca-flowered Heath. Fl. May, Dec. Clt. 1812. Shb. Cult. Elegant shrubs when in blossom, like all the other genera of the order. Turfy peat, mixed with sand, is the best soil for the species; and young tops root readily, if planted in a pot of sand in spring, with a bell-glass over them, in a moderate heat. When the plants have grown a considerable size, the balls of earth should be raised a little above the surface, so as to prevent water from remaining at the top of the stem, and the pots in which they are grown should be well drained.

II. GYPSCOLLIS (from γυπος, gypsos, lime, and κυλλος, kallos, most beautiful; the plants are very elegant, and generally inhabit calcaneous districts). Sal. mss. D. Don, in edinb. phil. journ. 17. p. 153.—Erica species of authors.

L. syn. Octandria, Monogynia. Calyx 4-parted, glumaceous, naked at the base. Corolla campanulate, or short-tubular, with a dilated mouth. Stamens exserted; filaments flattened or filiform; anthers biparite; having the cells mutic at the base, distinct and subitestate, dehiscing by an oblique pore. Stigma simple. Capsule 4-celled, many-seeded. —Small shrubs, natives of Europe and Africa, with whorled acerose leaves, and lateral or terminal crowded flowers. This genus is easily distinguished from Erica in the exserted anthers, flattened filaments, and simple stigma.

§ 1. Anthers mutic at the base, that is, without any horns, awns, or spurs.

* Leaves 4 in a whorl. Corollas campanulate. 

1 G. vaegans (Salisb. mss. ex Don, in edinb. phil. journ. 17. p. 153.) leaves 4–5 in a whorl, glabrous; flowers axillary, racemose; bracteas remote from the calyx; pedicels usually thin; corolla short, campanulate. \( G \). Native of England, in Cornwall; and of the south of France and north of Africa.

Var. 1. alba; flowers axillary, white.
Var. 2. tubulosa; flowers pale red.

2 G. purpureascens (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 3-4 in a whorl, linear, glabrous; flowers axillary; corollas tubular or campanulate; andthers deeply bifid; calyce segments awl-shaped. 15. H. Native of the south of Europe. Erica purpurascens, Lin. spec. 509. Seg. veron. 250. Thunb. mon. no. 44. Flowers pale purplish-red.

Purplish-flowered Moor-Heath. Shrub 1 to 2 feet.

3 G. raste'lum; branches flexuous, hispid; leaves linear, in fascicles, reflexed; flowers terminal, tetragonal, drooping a little; calyces coloured, adpressed; corolla campanulate. 15. G. Native of the Cape of Good Hope. Erica rastellum, Spreng. syst. 2. p. 190.

Rastellum Moor-Heath. Shrub.

4 G. microstôma; leaves 4 in a whorl, clothed with woolly hairs, linear, hispidly ciliated, spreading; flowers axillary, pedicellate, aggregate; corolla campanulate. 15. G. Native of the Cape of Good Hope. Erica microstoma, Berg. pl. cap. p. 97. Flowers purplish-red.

5 G. pilosa; leaves 3-4 in a whorl, linear, spreading; pilose; flowers terminal, few, villous, pedicellate, erect; bracteas remote from the calyx, spreading, very villous; corollas campanulate. 15. G. Native of the Cape of Good Hope. Erica pilosa, Lodd. bot. cab. 606. Flowers greenish-yellow.

** Leaves 4-5 in a whorl. Corollas urceolate.

8 G. Medîterrânea (D. Don, l. c.) leaves 4-5 in a whorl, linear-cuneate, glabrous; flowers axillary, racemose, secund, nutant; bracteas above the middle of the pedicels; corolla urceolar; anthers foraminose from the middle. 15. H. Native of the south of Europe, in the region of the Mediterranean; and of Ireland, &c. Erica Mediterranea, Lin. mant. p. 229, diss. no. 55. with a figure of the flower. Wendl. eric. 7. p. 11. Curt. bot. mag. 471. Erica lugubris, Sal. in Lin. trans. 6. p. 344. Flowers red, with dark anthers. Corolla 1½ to 2 lines long.

9 G. horizontâlis; leaves 4 in a whorl, linear, spreading; flowers terminal, sessile, usually by threes, drooping; calyce segments spatulate, serrated; corolla conical. 15. G. Native of the Cape of Good Hope. Erica horizontalis, Andr. heath. 2. t. 52. Flowers white, with brown anthers.

10 G. procumbens; leaves 4 in a whorl, linear, spreading; glabrous; flowers terminal, subaggregate, villous; bracteas remote from the calyx, corolla globose ovate. 15. G. Native of the Cape of Good Hope. Erica prostrata, Lodd. bot. cab. 1992. Flowers reddish-purple.

11 G. hispida; leaves 4 in a whorl, hispidly ciliated, linear, spreading, obtuse; flowers terminal, racemose, pendulous; bracteas remote from the calyx; corolla urceolate, globose. 15. G. Native of the Cape of Good Hope. Erica hispida, Andr. heath. 2. t. 56. Lodd. bot. cab. 1982. Corollas red.

12 G. flexilis; branches villous; leaves 4 in a whorl, beset with glandular hairs; flowers axillary, racemose, drooping; pedicels viscid; corolla 1½ line long, with an ovate tube; fruit woolly. 15. G. Native of the Cape of Good Hope. Erica flexilis, Wendl. diss. no. 47, with a figure. Erica flexilis, Sal. in Lin. trans. 6. p. 342. Calyce segments ciliated with glands.

Best Moor-Heath. Shrub.

** ** ** Leaves 3 in a whorl. Corollas campanulate.

Handful-flowered Moor-Heath. Shrub.

15 G. leucanthêra; leaves 3 in a whorl, linear, glabrous, erect; branches twiggie; flowers terminal, drooping; pedicels glabrous; corolla 1½ line long, funnel-shaped, having the limb quite entire, and length of tube; anthers foraminose near 5 K.
ERICACEÆ.

G. ericaceae, Link. 

G. bracteas 

flowers terminal on short pedicels; bracteas approximating the calyx; calyx one half shorter than the corolla, with ovate segments, furnished with a green line; anthers exerted; stigmas very. 

G. G. Native of the Cape of Good Hope. 

Erica Actea, Link. 

16. G. Actea; leaves 3 in a whorl, glabrous; flowers terminal on short pedicels; bracteas approximating the calyx; calyx one half shorter than the corolla, with ovate segments, furnished with a green line; anthers exerted, mutic; stigmas very. 

G. G. Native of the Cape of Good Hope. 

Erica Actea, Link. 

17. G. xigricans; leaves 3 in a whorl, spreading, a little reflexed, linear, glabrous, awned at the apex; flowers terminal, usually by threes; pedicels bracteate, and are as well as the calyx coloured and viscid; corolla campanulate rotate, with a revolute limb. 

G. G. Native of the Cape of Good Hope. 

Erica nigritta, Lodd. bot. cab. t. 54. Flowers white; anthers black.

Blackish Moor-Heath. 

18. G. Parthen; leaves 3 in a whorl, oval-oblong, ciliated, spreading; branches hairy; flowers terminal, usually by threes; calyx coloured, ciliated; corolla campanulate rotate; anthers connivent, sebaceous. 

G. G. Native of the Cape of Good Hope. 

Erica pâtenis, Andr. heath. t. 35. Lodd. bot. cab. 1228. Flowers red.

Spreading-flowered Moor-Heath. 

19. G. Concava; leaves 3-4 in a whorl, linear, glabrous, spreading; flowers axillary; corolla campanulate; anthers a little exerted. 

G. G. Native of the Cape of Good Hope. 

Erica concava, Ker. in bot. mag. 2149. Flowers pale red.

Concave-flowered Moor-Heath. 

20. G. Acutangula; leaves 3 in a whorl, linear; flowers terminal, usually by two or three; corolla campanulate, with a short tube, and a reflected limb. 

G. G. Native of the Cape of Good Hope. 

Erica acutangula, Lodd. bot. cab. 1868. Flowers white; anthers black, exerted. Bracteas approximating the calyx, sessile.

Acute-angled Moor-Heath. 

21. G. Melanthera; leaves 3 in a whorl, obtuse, smooth, spreading; flowers terminal, subumbellate, nutant; bracteas remote from the flower; corolla bell-shaped; bracteas and calyces coloured; stigma obtuse; fruit silky. 

G. G. Native of the Cape of Good Hope. 

Erica melanthera, Lin. mant. 232. Lodd. bot. cab. 867. Erica lysimachiaeflora, Sal. in Lin. trans. 6. p. 332. Corolla 2 lines long, having the limb twice the length of the tube. Flowers red, with black anthers. Calyx large, and is, as well as the pedicels, coloured.

Black-angled Moor-Heath. 

22. G. Thalictriflora; branches hairy, straight; leaves 3 in a whorl, linear, glabrous, erect; flowers terminal, 2-3 together, erect, almost sessile; bracteas approximating the calyx; corolla short, campanulate, with deep open segments. 

G. G. Native of the Cape of Good Hope. 

Erica thalictriflora, Lodd. bot. cab. t. 1294. Flowers yellow.

Meadow-Rue-flowered Moor-Heath. 

23. G. Umbellata (D. Don, l. c.) branches downy; leaves 3 in a whorl, linear, short, slightly ciliated; flowers terminal, umbellate; bracteas unilateral, pressed to the calyx; corolla pea-shaped, with an 8-angled base; anthers foraminose near the apex. 

G. G. Native of the Cape of Good Hope. 

Umbellate Moor-Heath. 

24. G. Villosa; leaves 3 in a whorl, linear, spreading, villous; flowers axillary or terminal, on long pedicels, drooping, usually by threes; calyces segments ovate, villous; corollas urceolate, with the limb a little connivent. 

G. G. Native of the Cape of Good Hope. 

Erica villosa, Andr. heath. 3. t. 53. Corollas white, with black anthers.

Villous Moor Heath. 

25. G. Dumosa; leaves 4 in a whorl, oval, with revolute edges, spreading, hispid; flowers terminal, corymbose, drooping; calyces adpressed, foliaceous; bracteae close to the calyx; corollas urceolate. 

G. G. Native of the Cape of Good Hope. 

Erica dumosa, Andr. heath. 4. icon. Flowers pale red.

Bushy Moor Heath. 

26. G. Nudiflora (D. Don, in edinb. phil. journ. 17. p. 153.) leaves 3 in a whorl, linear-cuneated, ciliated, or slightly hairy, spreading; flowers axillary and terminal, aggregate, erect; corolla ovate-cone-shaped; bracteas minute, remote from the calyx; fruit smooth. 

G. G. Native of the Cape of Good Hope. 

Naked flowered Moor Heath. 

27. G. Staminea; leaves 3 in a whorl, linear, glabrous, erect; flowers axillary, scattered; bracteas approximating the calyx; corolla subrotate, about equal in length to the calyx; stamens divaricate, much exerted. 

G. G. Native of the Cape of Good Hope. 

Erica staminea, Andr. heath. 3. t. 48. Flowers sulphur-coloured.

Long-stamened Moor Heath. 

28. G. Tiareflora; leaves 3 in a whorl, stiff, spreading, obtuse; flowers terminal, glomerate, drooping; calyx bracteate; corolla covered by the calyx, having the tube dilated at the base; filaments gradually dilated. 

G. G. Native of the Cape of Good Hope. 

Tiar-flowered Moor Heath. 

29. G. Imbricata; leaves 3 in a whorl, linear, erect, imbricated; branches rather hairy; calyx imbricated by bracteas; corolla urceolate, 1 line long, length of calyx; flowers terminal, aggregate, erectish; pericarp gegartoid. 

G. G. Native of the Cape of Good Hope. 

Erica imbricata, Lin. mant. 372. diss.

30 G. squamiflora; leaves 3 in a whorl, linear; flowers terminal; bracts scattered above the middle of the pedicels; corolla ⅓ of a line long, shorter than the calyx; anthers acuminate; fruit broad, ovate. η. G. Native of the Cape of Good Hope. Erica squamiflora, Sal. in Lin. trans. 6. p. 349. Erica imbricata, Roxb. miss. but not of Lin.

31 G. cæsia; leaves 3 in a whorl, short, linear, glabrous; flowers terminal, twin, erect; calyx imbricate by bracteae; corolla campanulate, ⅛ of a line long, shorter than the calyx; anthers oblong, with a broad dissipation; fruit ovate; stigma broadish. η. G. Native of the Cape of Good Hope. Erica cæsia, Sal. in Lin. trans. 6. p. 349.

Grey Moor Heath. Shrub.

32 G. flexuosa; leaves 3 in a whorl, linear, glabrous, erect, short; flowers terminal, usually by three, erect; bracteae scattered above the middle of the pedicels, imbricate, small; corolla bell-shaped, 1 line long, longer than the calyx, which is coloured; anthers oblong, with a narrow dissipation; nectarium large; fruit imbricate. η. G. Native of the Cape of Good Hope. Erica flexuosa, And. health. 1. t. 23. Sal. in Lin. trans. 6. p. 349. Lodd. bot. cab. 1495. E. divaricata, Wendl. eric. 7. p. 5. Flowers white, with red anthers.

Flexuous Moor Heath. Fl. April, July. Cl. 1792. Shrub 1 to 2 feet.

33 G. lasciva; leaves 3 in a whorl, linear; flowers terminal; calyx imbricate by bracteae; corolla ⅓ of a line long, a little shorter than the calyx; anthers foraminose from the base; stigma peltate. η. G. Native of the Cape of Good Hope. Erica lasciva, Sal. in Lin. trans. 6. p. 349. Erica imbricata, Thumb. diss. no. 11.

34 G. dioteflora; leaves 3 in a whorl; flowers axillary at the top of the branches; calyce segments cuneate; corolla 1⅓ line long, with an urceolate tube; anthers a little exerted; pericarp downy. η. G. Native of the Cape of Good Hope. Erica dioteflora, Sal. in Lin. trans. 6. p. 342. Erica pistillaris, Sol. miss.

35 G. stylosa; leaves 3 in a whorl; flowers terminal; pedicels long, furnished with bracteae near the calyx; corolla line long, a little longer than the calyx; anthers pointed; fruit oval; style very long. η. G. Native of the Cape of Good Hope. Erica stylosa, Sal. in Lin. trans. 6. p. 350. Erica bracteata, Roxb. miss. but not of Lin.

36 G. Pohlmannii; leaves 3 in a whorl, 7 obuse, imbricate; flowers terminal; corolla with a globose tube, and a 4-parted limb; anthers a little exerted. η. G. Native of the Cape of Good Hope. Erica Pohlmannii, Lodd. bot. cab. 1852. Flowers pale red, with deep red anthers.

37 G. longipedunculata; leaves oval, mucronate, 3 in a whorl, hispid; flowers terminal, umbellate, on long pedicles, pendulous; bracteae remote from the calyx, deciduous; calyceae adpressed; corolla ovate; anthers mutic. η. G. Native of the Cape of Good Hope. Erica longipedunculata, Lodd. bot. cab. 103. Flowers large, purple, pedicellate, and are, as well as the calyxes, henset with glandular hairs.

38 G. rostellata; leaves 3 in a whorl; flowers terminal; bracteae imbricate; corolla ovate-globose. η. G. Native of the Cape of Good Hope. Erica rostellata, Bedf. eric. wob. p. 21. Flowers white.

39 G. felata; leaves 3 in a whorl; flowers terminal; bracteae remote from and approximating the calyx; corolla round, with deep, loose segments. η. G. Native of the Cape of Good Hope. Erica felata, Andr. health. 4. icon. Erica exserta, Bedf. eric. wob. p. 9. Flowers pale purplish-red.

Peltate Moor-Heath. Fl. Spring, Autumn. Cl. 1810. Shrub 1 to 2 feet.

* Leaves 3 in a whorl. Corollas campanulate.

40 G. articulata; leaves 3 in a whorl, glabrous; flowers terminal, umbellate; bracteae remote from the calyx; anthers corniculate; corollas slender, campanulate. η. G. Native of the Cape of Good Hope. Erica articulata, Bedf. hort. eric. wob. p. 2. but not of Thumb. nor Curt. Flowers reddish-purple.

Jointed Moor-Heath. Shrub.

41 G. Loddigesii; leaves 3 in a whorl, downy; flowers terminal; bracteae approximating the calyx, sessile; corolla campanulate, with deep segments; anthers awned. η. G. Native of the Cape of Good Hope. Erica concava, Lodd. bot. cab. 134 but not of Ker. Flowers pale purplish-red, spreading. Probably a species of Erica.

42 G. intertexta; leaves 3 in a whorl, ciliated with long hairs; flowers sessile; bracteae approximating the calyx, which is ciliated; corolla round, campanulate; anthers awned. η. G. Native of the Cape of Good Hope. Erica intertexta, Lodd. bot. cab. 1034. Flowers yellow. Anthers black.

43 G. paniculata; leaves 3 in a whorl, linear, triqueterous, glabrous; branches tomentose; flowers terminal, by threes; corolla ⅓ of a line long, campanulate, having the segments imbricate at the base; spars of anthers linear, smooth; style exserted. η. G. Native of the Cape of Good Hope. Erica paniculata, Lin. spec. ed. 2. p. 508. Lodd. bot. cab. 1194. Erica millefolia, Berg. pl. cap. p. 96. Sal. in Lin. trans. 6. p. 550. Flowers red. There is also a white-flowered variety of the species.

44 G. Bedfordiana; leaves 3 in a whorl; flowers terminal; bracteae remote from the calyx; corolla bell-shaped; anthers awned, exserted, as well as the style. η. G. Native of the Cape of Good Hope. Erica mellifera, Bedf. eric. wob. p. 15. Duke of Bedford's Gypsocalis. Fl. Spring. Cl. 1812. Shrub.

** Leaves 3 in a whorl. Corollas urceolate.

45 G. fra'grans; glabrous; leaves opposite, or 3 in a whorl, 5 k 2
subulate; flowers terminal or lateral, usually by twos; corolla campanulate, with a revolute limb; anthers exerted, black, mucic. \( \text{G} \). Native of the Cape of Good Hope. Erica fragrans, Ker, in bot. mag. 2181. Flowers pale red, with blackish anthers. Perhaps a species of Lampros.

**Fragrant Moor-Heath.** Fl. Spring. Clt. 1803. Shrub.

46 G. nigéita (D. Don, in edinb. phyll. journ. 17. p. 153.) leaves 3 in a whorl, linear, trisetious, glabrous, shining, spreading; flowers terminal, usually by three; pedicels pilose, with broad imbricate bracteae, which are coloured like the calyx; corolla globosely bell-shaped, or urceolar, with a revolute limb; fruit tomentose. \( \text{G} \). Native of the Cape of Good Hope. Erica nigrita, Lind. diss. mant. 65. Thunn. diss. no. 53. Andr. heath. 1. t. 32. Wendl. eric. fase. 12. p. 11. with a figure. Erica laricina, Berg. pl. cap. p. 94. E. volubilia, Sal. in Lin. trans. 6. p. 835.—Seb. thes. 2. p. 11. t. 9. f. 7. Sides of calyx recurved at top. Corolla white, with black corniculate anthers.

**Black-anthered Moor-Heath.** Fl. April, July. Clt. 1790. Shrub 1 foot.

47 G. lyríceera; leaves 3 in a whorl, shining, linear, trigonal; flowers terminal; corolla urceolate, with a revolute limb; spurs of anthers serrate; anthers lyre-form, hairy; fruit tomentose. \( \text{G} \). Native of the Cape of Good Hope. Erica lirigera, Sal. in Lin. trans. 6. p. 836. Erica nigrita, Roxb. but not of Sal. Flowers white, with black anthers.

***Leaves 4 in a whorl. Corollas campanulate.***

48 G. cistifòlia; leaves 4 in a whorl, beset with glundular hairs; flowers terminal; bracteae remote from the calyx; corolla bell-shaped, with reflexed segments; anthers corniculate. \( \text{G} \). Native of the Cape of Good Hope. Erica cistifolia, Link. enytum. 1. p. 369. Bedf. eric. wob. p. 5. Corollas white. Calyx hairy.

**Cistus-leaved Moor-Heath.** Fl. April, May. Clt. 1823. Shrub 1 to 2 feet.

49 G. exzîmpîta; leaves 4 in a whorl, linear, spreading, reflexed, hairy, bearded at the apex; branches woolly; flowers aggregate, terminal, drooping; corolla campanulate; anthers asned or corniculate. \( \text{G} \). Native of the Cape of Good Hope. Erica exzîmpîta, Spreng. syst. 2. p. 195.

**Draw-out-anthered Moor-Heath.** Fl. April, Sept. Clt. 1811. Shrub 1 to 2 feet.

Cult. See Erica, p. 800, for culture and propagation of the greenhouse species; and Calluna, p. 828, for those of the hardly kins.

**L. syst. Tetra-Pentândria Monogânia.** Calyx 4-parted. Corolla short-tubular, with a 4-cleft limb. Stamens 4-6, inserted in the receptacle; filaments linear, flattened, glabrous; anthers bipartite; cells of anthers attenuated at the base, mutic, dehisceing by an oblong hole. Stigma simple, obtuse. Capsule 4-celled, many-seeded.—Much branched shrubs, natives of the Cape of Good Hope. Leaves verticillate, with revolute margins. Flowers terminal, glomerate.

**Anthers mutic.***

**Var. ß. pâllida;** (Lodd. bot. cab. 85.) Flowers pale red.

2 B. depresâtâ (Licht. mss. ex Rœhm. et Schultes, syst. 3. p. 168.) leaves 3-4 in a whorl, linear, spreading, hairy; anthers exerted. \( \text{G} \). Native of the Cape of Good Hope. Corolla cylindrical, rufescent.

**Scarbrus Bleria.** Fl. May, June. Clt. 1824. Shrub 1 foot.

4 B. fâsciculâta (Willd. spec. 1. p. 629.) leaves 4 in a whorl, lanceolate, ciliate scarous; stamens 4, exerted. \( \text{G} \). Native of the Cape of Good Hope. Erica fâsciculâta, Thunn. prod. 72. fl. cap. 2.

**Fasciculated Bleria.** Fl. June, July. Shrub 1 foot.

5 B. antîcublata (Lin. mant. 198.) leaves 4 in a whorl, ovate or linear, glabrous, shining; bracteae solitary; calyx funnel-shaped, hairy; stamens 4-5, exerted. \( \text{G} \). Native of the Cape of Good Hope. Erica antîcublata, Thunn. prod. 71. Wendl. coll. 2. p. 19. t. 44. Erica palâeacea, Sal. in Lin. trans. 6. p. 341. Erica eriozêpha, Lam. enyc. no. 73. ill. 78. Flowers reddish. Heads drooping.

7 B. mucîôsa (Willd. spec. 1. p. 630. Att. hort. kew. 1. p. 150.) leaves 4 in a whorl; calyx pilose; corolla campanulate, pilose above; flowers axillar; stigma petalate. \( \text{G} \). Native of the Cape of Good Hope. Erica mucîôsa, Thunn. prod. 70. Branches downy. Leaves scarous.

**Least Bleria.** Shrub.

9 B. hersútxa (Licht. in Rœhm. et Schultes, syst. 3. p. 170.) leaves 3 in a whorl, fleshy, nearly terete, spreading; calyx pilose; corolla cylindrical; anthers 4, exerted. \( \text{G} \). Native of the Cape of Good Hope. Corolla flesh-coloured. Anthers black.

**Hairy Bleria.** Shrub.

10 B. paçîflôra (Wendl. coll. 2. p. 17. t. 43.) leaves 3 in a whorl, ovate, glabrous; corolla clavate, glabrous; calyx
ERICACEÆ. III. BLERIA.

20 B. ciliata (Lin. suppl. 123.) leaves 4 in a whorl, glabrous, minute; calyx very hairy; corolla 1½ line long, hairy; stamens 4-5, included; filaments spurred. *G*. Native of the Cape of Good Hope. Wendl. coll. 2. p. 35. t. 49.

ERICACEÆ. IV. SYMPIEZÄ. V. PACHYSA.

805

21 B. buxodesa (Wendl. coll. 2. p. 3. t. 38.) leaves 3-4 in a whorl, linear, obtuse cresent, 1 line long; corolla 1½ line long, glabrous; anthers crested, exerted. *G*. Native of the Cape of Good Hope. Flowers rose-coloured, drooping.

22 B. bruneifolia; leaves 6 in a whorl, long; bracts near the calyx, the outer one very long; corolla 1½ line long; stamens 6, exerted; filaments spurred. *G*. Native of the Cape of Good Hope. Filaments brunnifolia, Sal. in Lin. trans. 6. p. 341. Erica hemisphérica, Sal. mss.

Brunia-leaved Bleria. Shrub.

Cult. Pretty little shrubs, deserving a place in every collection of greenhouse plants. A mixture of turfy peat and sand is the best soil for them; and young tops root readily, planted in a pot of sand in spring, with a bell-glass over them.

IV. SYMPIEZÄ (from συμπειζω, sympizeo, to press; in reference to the stamens, which adhere to the tube of the corolla.) Licht. mss. ex Rœn. et Schultes, syst. 3. p. 8. no. 447. and p. 171.

LIN. SYST. Tetrandria Monogyneia. Calyx turbinate, compressed, bilabiata, fringed. Corolla tubular, sub-bilabiata, longer than the calyx. Stamens 1-5, inserted in the tube of the corolla, exerted; anthers erect; style length of stamens; stigma simple. Capsule 4-celled, many-seeded.—A small branched shrub, native of the Cape of Good Hope. Leaves adpressed, erect, imbricated, 3 in a whorl, linear, trilobed, glabrous, engraved by a line above. Flowers drooping, disposed in terminal heads, purplish.

Cult. See Bleria above for culture and propagation.

V. PACHYSA (from παχυς, pachys, thick; in reference to the thick substance of the corolla.) D. Don, in edinb. phil. journ. 17. p. 153.—Erica species of authors.

LIN. SYST. Octandria Monogyneia. Calyx deeply 4-parted, (f. 153 a.) coriaceous. Corolla nearly globose, (f. 153 c.) coriaceous, with a contracted 4-lobed mouth, (f. 153 d.) Stamens included; filaments much dilated; anthers bifid; cells of anthers short, crested at the base, opening by an oblique foramen. Style dilated at the base; stigma simple, obtuse. Disk hypogynous, elevated. Capsule 4-celled, many-seeded.—Small erect shrubs, natives of the Cape of Good Hope. Leaves loosely imbricated, compressed, 3 in a whorl. Flowers large, terminal, ststoborymbose, drooping; pedicels bracteolate.

Ardent Pachysea. Fl. April, June. Cl. 1800. Shrub 1 to 2 feet.
ERICACEE. V. PACHYSA. VI. CERAMIA.

3 P. aristata; leaves 3 in a whorl, linear, spreading, roughish; corolla ovate-globose, clammy; bracteas approximating the calyx; cells of anthers awned. f. G. Native of the Cape of Good Hope. Erica vernix, var. coccinea, Bedd. eric. wob. p. 27. t. 3. f. 22. Corolla reddish-orange, tipped with green. This species differs from the rest in the anthers being awned, not crested. 

Annealed-anthered Pachysa. Fl. May, June. Clt.? Shrub 1 to 2 feet.

4 P. lambertiana; leaves 3 in a whorl, linear, sebaceous, spreading; corolla glabrous, ovate-globose; bracteas 3 or 2 near the calyx, and 1 remote from it. f. G. Native of the Cape of Good Hope. Erica lamberti, Andr. heath. 2. t. 16. Eric Lambertiana, Sol. in Ait. hort. kew. 2. p. 391. Lodd. bot. cab. 3. Calyx red. Corolla white. 

6 P. formaosa; leaves 3 in a whorl, oblong, obtuse, spreading; calycine segments ovate; corolla ovate-globose, clammy. f. G. Native of the Cape of Good Hope. Erica formaosa, Thumb. disp. no. 80. t. 3. f. 3. Corolla white. 

Bery-flowered Pachysa. Fl. April, July. Clt. 1774. Shrub 1 to 2 feet.

8 P. vesiculatias; leaves 3 in a whorl, besprinkled with black vesicles; corolla 1 line long, clothed with viscid pubescence; anthers inclosed; spurs of anthers parallel, cuneated; fruit silky. f. G. Native of the Cape of Good Hope. Erica vesiculatias, Sol. in Lin. trans. 6. p. 335. Erica conaeca, Hortul.

9 P. glomeriflora; leaves 3 in a whorl, narrow-cuneated; flowers terminal; calyx imbricated by bracteas; corolla 2½ lines long, viscid, with a spherical tube; spurs of anthers very villous. f. G. Native of the Cape of Good Hope. Erica glomeriflora, Sal. in Lin. trans. 6. p. 330. Erica viscaria, Sol. mss. Tufted-flowered Pachysa. Shrub. 

Cult. See Erica, p. 800. for culture and propagation.

VI. CERAMIA (from κεραμίς, kerámis, a pitcher; shape of flowers). D. Don, in edinb. phil. journ. 17. p. 153. — Erica species of authors. 

2 C. auricularias; leaves 3 in a whorl, linear-lanceolate; corolla 3 lines long, downy outside, with an ovate tube; spurs of anthers minute, ear-formed. f. G. Native of the Cape of Good Hope. Erica auricularias, Sol. in Lin. trans. 6. p. 327. Like the preceding, but differs in the spurs of the anthers. 

4 C. helianthemifolia; leaves opposite, obovate; corolla urceolate, 3 lines long, downy both inside and outside; spurs of anthers long. f. G. Native of the Cape of Good Hope. Erica helianthemifolia, Sal, in Lin. trans. 6. p. 328. Corollas white. 

Var. β; authors exserted.  h. G. Erica planifolia, Wildl. spec. 2. p. 362.—Pluck. mant. p. 69. t. 847. f. 1.

6 C. thyrsiflora; leaves 3 in a whorl, ovate, spreading, reticulata, ciliate; flowers axillary, solitary; spurs of anthers short; corolla globose, urceolate, downy.  h. G. Native of the Cape of Good Hope. Erica thyrsiflora, Andr. heath. 2. t. 29. Ait. hort. kew. 2. p. 402. Bracteas remote from the calyx. Corollas white, but in Andrew's figure they are red or purple.

7 C. thymiflora; leaves 3 in a whorl, lanceolate, rather villous, spreading; flowers axillary, cymose.  h. G. Native of the Cape of Good Hope. Erica thymiflora, Spreng. syst. 2. p. 109.

8 C. cordata; leaves 3 in a whorl, ovate, sub-cordata, villous above and woolly beneath; branches divaricate, hairy; corollas globose; anthers mutic.  h. G. Native of the Cape of Good Hope. Erica cordata, Andr. heath. 3. t. 41. Corollas white, with black anthers.

9 C. calathiflora; leaves 3 in a whorl, ovate, imbricated; flowers terminal; calyx corymbosus; corolla campanulate, 1 line long, smooth; spurs of anthers cuneate, hairy; fruit tomentose; style exerted.  h. G. Native of the Cape of Good Hope. Erica calathiflora, Sal. in Lin. trans. 6. p. 338. Erica bicolor, Thunb. diss. no. 57. Willd. spec. 2. p. 363.

10 C. latiflora; leaves 3 in a whorl, oblong-lanceolate, villous above and white beneath, as in the rest of the species; flowers axillary, aggregate; corollas conical; genitals exserted; anthers mutic.  h. G. Native of the Cape of Good Hope. Erica latiflora, Andr. 2. t. 41. Flowers dark red or purple. Branches flexuose.

11 C. deliqua; leaves obliquely verticillate, linear, truncata, with glandular margins; spikes of flowers terminal, coarctate; corollas urceolate, viscid, having the interstices of the limb ending in a tumid hook each; anthers awned.  h. G. Native of the Cape of Good Hope. Erica deliqua, Thunb. diss. no. 73. with a good figure. Baur. pl. kew. t. 3. Andr. heath. 1. t. 23. Wendl. eric. 17. p. 77. with a figure. Bracteas remote from the calyx; calyce segments linear-oblong. Corollas pale purple.

12 C. oxycoeciflora; stems decumbent, filiform; leaves 3 in a whorl, ovate; corolla 1½ line long, campanulate, hairy; filaments mutic.  h. G. Native of the Cape of Good Hope. Erica oxycoeciflora, Sal. in Lin. trans. 6. p. 322.—A very pretty species, with the habit of Oxycoccus palustris. Flowers red.

13 C. bleenfa; leaves 4-5 in a whorl, ovate, cuneate; corolla urceolate, 4½ lines long, viscid, having the segments imbricated at the base; filaments very broad; anthers corniculate.

h. G. Native of the Cape of Good Hope.—A very fine species. Corollas yellow, with a green mouth. Perhaps a species of Pachyta.

Bleüna Cerámia. Shrub.

14 C. serpylliflora; leaves 3 in a whorl, ovate, ciliate, sessile; flowers terminal; branches hairy.  h. G. Native of the Cape of Good Hope. Erica serpylliflora, Loddel. bot. cab. 744. Corollas white.

15 C. humifusa; leaves opposite, or 3 in a whorl, ovate; corolla 1½ line long, with an ample limb; flowers terminal; anthers mutic, inclosed; style much exerted.  h. G. Native of the Cape of Good Hope. Erica humifusa, Sal. in Lin. trans. 6. p. 332.

Cult. See Erica, p. 800. for culture and propagation.

VII. Desinia. VIII. Eurylepis.

807

VII. DESMIA (from icsm, icsne, a fascicile; in reference to the glomerate flowers). D. Don, in edinb. phil. journ. July, 1834.—Erica species of authors.

2 D. eûalias (D. Don, l. c.) umbels pedunculate, aggregate; filaments dilated.  h. G. Native of the Cape of Good Hope.

Égal Desmia. Shrub.

3 D. polifôlia (D. Don, l. c.) leaves 3 in a whorl, aristate; flowers fasciculate; corolla oblong, with a dilated throat; filaments dilated; stigma nearly simple.  h. G. Native of the Cape of Good Hope.

Polium-leaved Desmia. Shrub.

Cult. See Erica, p. 800. for culture and propagation.

VIII. EURYLEPIS (from eûrops, eûry, broad, and Ŀèpis, a scale; in reference to the dilated scales of the calyces). D. Don, in edinb. phil. journ. 17. p. 154.—Erica species of authors.

Lin. syst. Octândria, Monogyânia. Calyx 4-parted, coriaceous, bifractate at the base. Corolla tubular, coriaceous, ventricose at the base, with a 4-cleft erect limb. Stamens inclosed; filaments dilated, canaliculate; anthers bipartite; cells of anthers coriaceous, desiccatio from an oblong foramen, auricled at the base. Stigma clavate, with a 4 tuberculatæ disk and a crenulatæ ring. Capsule 4-celled, many-seeded. Segments of placenta 2-lobed. Seeds oval, ventricose.—Difusely branched shrubs, natives of the Cape of Good Hope. Leaves scattered, with revolute margins. Flowers terminal, solitary, large, pendulous.
§ 1. Anthers mutic at the base. Normal species.

1. **E. malacábara** (D. Don, l. c.) leaves 3 in a whorl, linear, glabrous, spreading; flowers terminal, solitary, or by threes; corolla ovate-tubular, glabrous; bracteas ovate, near the calyx; fruit spherical; calyx adpressed. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica malacábara, Thumb, diss. no. 51. Lin. diss. no. 3. with a figure of the flower. spec. ed. 2. p. 507. amoen. acad. 5. p. 82. Andr. eric. 2. t. 36. Wendl. eric. 6. p. 7. with a figure. Erica rupestris, Sal. in Lin. trans. 6. p. 353. Corolla 7-8 lines long, sulphur-coloured, or yellowish-green.

2. **E. azaleífera**; leaves 3 in a whorl, lanceolate; flowers terminal; corolla 1½ line long, hairy; anthers mutic, exerted, foraminose the whole length. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica azaleífera, Sal. in Lin. trans. 6. p. 354.

4. **E. tetragóna**; leaves 3 in a whorl, linear, acuminate, adpressed, erectly spreading; flowers axillary, erect; corolla 4 lines long, with a pyramidul 4-angled tube; calyce segments cuipitate and adpressed. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica tetragóna, Thumb. diss. no. 5. with a figure. Lodd. bot. cab. 1239. Erica pugioniformis, Sal. in Lin. trans. 6. p. 387. Flowers yellow.

Shrub 1 foot.

6. **E. bractea-tá**; leaves 3 in a whorl, lanceolate, glabrous, adpressed; flowers terminal, umbellate; bracteas large, obovate, and are, as well as the calyces, coloured; corolla 2 lines long, having the segments crenulate. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica bracteata, Thumb. diss. no. 3. Erica ovbrallóalis, Sal. in Lin. trans. 6. p. 387. Filaments spurred.

7. **E. mucronáta**; leaves 3 in a whorl, linear-lanceolate, cuspidate, spreading, glabrous; flowers terminal, racemose; calyx bracteate, coloured, about equal in length to the corolla, which is campanulate. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica mucronata, Andr. heath. 3. t. 43. Flowers reddish-purple.

VIII. *Euryeleps.*

8. **E. petiolóata**; leaves 3 in a whorl, lanceolate-linear spreading, on cuneated fringed petioles; flowers terminal, by threes; bracteas broad, imbricated, ribbed, about equal in length to the corolla, which is bell-shaped, 2½ lines long, and yellow at apex. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica petiolóata, Sal. in Lin. trans. 6. p. 334. Erica petiolóata, Thumb. diss. no. 7. with a figure. Andr. heath. 3. t. 40. Lodd. bot. cab. 1150. Bracteas pale red. Corollas white, with black anthers.

9. **E. oecordóta**; leaves 3 in a whorl, lanceolate, keeled, broad, erect, with scabrous margins; floral leaves or bracteas dilated; flowers terminal; calyces spreading, about equal in length to the corolla, which is urceolate; bracteas loose, ribbed. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica oecordóta, Link. Bedf. eric. wob. p. 17. Calyx and corolla purplish-red.

10. **E. croosenta**; leaves opposite, or 3 in a whorl, linear, cuspidately awned, glabrous, spreading; flowers terminal, usually by threes; peduncles, bracteas, and calyces fringed; corolla conical. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica croosenta, Spreng. syst. 2. p. 201.

§ 2. Anthers annu or convolute at the base.

11. **E. frágrans**; leaves 3 in a whorl, subsulate, glaucous, erect; flowers drooping, terminal, usually by threes; bracteas large, calyx coloured, about equal in length to the corolla, which is campanulate and spreading; anthers bident at the base, convolute; stigma obtuse. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica frágrans, Andr. heath. 2. t. 27. Lodd. bot. cab. 288. Ait. hort. kew. 2. p. 407. Calyx and corolla purplish-red.

12. **E. gláabra**; leaves 4 in a whorl, spreading, glabrous; flowers terminal, on short pedicles; bracteas remote from the calyx; calyx foliaceous; corolla 7-8 lines long, white; anthers subinclosed. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica glabra, Link. enum. 1. p. 362. Corolla white.

13. **E. sexfária** (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, linear, glabrous, spreading, placed so as to appear in 6 ranks; flowers terminal, nearly sessile, drooping; bracteas imbricate, angular; corolla campanulate, a little shorter than the calyx, glabrous, searious; stigma obtuse; fruit smooth; spurs of anthers long. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica sexfária, Bauer, pl. kew. t. 11. Andr. heath. 2. t. 28. Ait. hort. kew. 2. p. 364. Erica spinussa, Thumb. diss. no. 14. Flowers white; anthers black, a little exerted.

14. **E. pyrolélfóra** (D. Don, l. c.) leaves 3 in a whorl, linear-cuneated, glabrous; flowers terminal, agglomerate; calyx bracteate, equal in length to the corolla, which is urceolate; segments of the calyx ovate, cuneated; spurs of anthers broad, cartiform. \( \varepsilon \). \( \text{G.} \) Native of the Cape of Good Hope. Erica trifóla, Wild, spec. 2. p. 356, exclusive of the synonymes. Erica pyrolélfóra, Sal. in Lin. trans. p. 2. Flowers white. Corolla 2 lines long, with a 4-angled spherical tube.

16. E. pallíflófða; stem angular; leaves lanceolate-cuneated, glabrous; flowers terminal; corolla 1 1/2 line long, a little longer than the calyx; spurs of anthers ear-formed, glabrous. G. Native of the Cape of Good Hope. Erica pallíflófða, Sal. in. Lin. trans. 6. p. 351. Erica çándida, Sol. mss. Flowers white.

18. E. rigídfólia; leaves 3 in a whorl, linear, stiff; shining, erectly spreading; flowers terminal, aggregate, drooping; calyces coloured, about equal in length to the corolla, which is campanulate; anthers appendiculate. G. Native of the Cape of Good Hope. Erica rigídfólia, Wendl.

19. E. pachyphy'fìllâ; leaves 3 in a whorl, petiolate, elliptic, thick, short, quite glabrous, shining, with scabrous edges; flowers aggregate, terminal, glabrous; calyx equal in length to the corolla, which is urceolate. G. Native of the Cape of Good Hope. Erica pachyphy'fìllâ, Ñpréng, syst. 2. p. 190.

Lady Monson's Broad-scaled Heath. Fl. April, Sept. Clt. 1787. Shrub 2 to 3 feet.

Cult. For culture and propagation see Erica, p. 800.

IX. EURYSTEGIA (from evreu, evry, broad, and stå, stego, a cover; in reference to the large calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erica species of authors.

LIN. SYST. Ocatadria Monogy'ñîa. Calyx 4-parted, large, glaucous. Corolla urceolate, with a contracted 4-toothed mouth. Stamens included; filaments dilated, flat; anthers bifurate, opening by an oblong foramen, biappendiculate at the base: appendages flattened, decurrent, crossly crenated. Stigma capitâte. Capsule 4-celled, many-seeded.—Densely branched shrubs, natives of the Cape of Good Hope. Leaves loose, subulate, with revolute margins. Flowers almost solitary, drooping, white or rose-coloured.

4. E. lasúgníosa; leaves 3 in a whorl, linear, ciliated; flowers solitary, axillary; bracteas ovate, near the calyx; corolla hardly twice longer than the calyx, tomentose; anthers awned. G. Native of the Cape of Good Hope. Erica lasúgníosa, Andr. heath. 3. t. 5. Ait. hort. kw. 2. p. 382. Corollas brownish-red, or reddish-green.

5. E. émaróginá'ta; leaves 3 in a whorl, oblong, channelled, recurved, ciliated; flowers terminal, by threes; bracteas near the calyx, and are, as well as the calyces, ciliated. G. Native of the Cape of Good Hope. Erica émaróginá'ta, Andr. heath. 3. t. 20. Flowers white, with black anthers. Very like E. nigíra, and E. lachñerfóflùa.

6. E. tráceps; leaves 3 in a whorl, somewhat trigonal, ciliated, erectly spreading; branches downy; flowers terminal, by threes; bracteas imbricate; calyceal segments oblong, scarious, a little shorter than the corolla; anthers ciliated, mucic, and are, as well as the style, which is capitate, exserted; corolla ovate. G. Native of the Cape of Good Hope. Erica tráceps, Link, enum. 1. p. 371. Bedf. eríc. wob. p. 25. Lodd. bot. cab. 962. Flowers white. Calyx white.

7. E. triübíphâns; leaves 3 in a whorl, ciliated; flowers axillary; bracteas remote from the calyx; calyx large, inflated, angular; corolla ovate, inflated; anthers crested; style inclosed. G. Native of the Cape of Good Hope. Erica triübíphâns, Lodd. bot. cab. 257. Bedf. eríc. wob. pl. 3. f. 19. Flowers large, white.

8. E. teggulefóflâ; leaves oval, downy; flowers terminal; 5 L
corolla 1½ line long, with a turbinate, rather 4-angled limb; spurs of anthers large, orbicular. \( \text{G}\). Native of the Cape of Good Hope. Leaves broad, imbricated in the straight order.

**Title-leafed Large-calyxed Heath.** Cl. 1800. Shrub.

0 E. corýdalís; leaves 3 in a whorl, lanceolate-euneate; flowers terminal; corolla 2 lines long, having the limb entire at the base, obtuse; anthers inclosed, urceolate. \( \text{G}\). Native of the Cape of Good Hope. Erica corýdalís, Sal. in Lin. trans. 6. p. 334.

10 E. ? pànnôsa; leaves 3-5 in a whorl, a little reduplicate; flowers terminal; corolla 2 lines long, woolly; filaments broad, with short spurs; style exserted. \( \text{G}\). Native of the Cape of Good Hope. Erica pànnôsa, Sal. in Lin. trans. 6. p. 336.

—This leaves is very like *Eriódesmia capitata*, but differs in the leaves being 3-5 in a whorl, and greatly in the anthers.

11 E. ? lâchinchéfoliа; leaves 3 in a whorl, ovate, imbricated, downy; flowers terminal, subcapitate; bracteas imbricated, approximating the calyx; anthers crested; corolla ovate, rather longer than the calyx. \( \text{G}\). Native of the Cape of Good Hope. Erica lâchinchéfoliа, Sal. in Lin. trans. 6. p. 335. Ait. Hort. kew. 2. p. 387. E. lâchinchéfoliа, Andr. heath. 3. t. 2. Flowers white.

**Cult.** For culture and propagation see *Erica*, p. 800.

**X. LOPHÁN'DRA** (from *lóphos*, *lophos*, a crest, and *ávros*, *aner andros*, a male; in reference to the cells of the anthers being crested). D. Don, in edinb. phil. journ. 17. p. 154.

—Erica species of authors.

**Lin. syst. Octándria Monogyniа.** Calyx 4-parted, furnished with 4 bracteas at the base; segments roundish, sericeous, ventricose on the outside. Corolla campanulate, 4-lobed. Stamens inclosed; filaments dilated, flat; anthers biseri; cells of anthers beaked at the apex, opening by an oblong foramen in the middle; with the sides winged, crested, and crenulated. Stigma truncate. Capsule 4-celled, many-seeded.—Erect, much branched shrubs, natives of the Cape of Good Hope. Leaves spreading, short, obtuse, glaucous. Flowers terminal, usually by threes, rose-coloured.

1 L. cu'êica (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 4 in a whorl, semicylindrical; bracteas remote from the calyx, which is coloured; calyceine segments serrulated. \( \text{G}\). Native of the Cape of Good Hope. Erica cuêica, Andr. heath. 1. t. 27. Ait. Hort. kew. 2. p. 397. Erica cuêica major, Hortul. Erica huttoniôfóra, Sal. in Lin. trans. 4. p. 531. Calyx and corolla purplish-red.—The flowers are at first disposed in a terminal fascicle, but when the terminal branches grow, they in consequence appear axillary and verticillate.

**Var. β, minor** (Andr. heath. 2. t. 49). This is probably a distinct species.

**Cube-flowered Lophandra.** Fl. April, Sept. Cl. 1790. Shrub 1 foot.

2 L. blán'da; leaves 3 in a whorl; flowers terminal, glomerate; corolla 1½ line long, having the limb one half longer than the tube, with semi-ornicular segments; stigma broad; cells of anthers drawn out into a crest beyond the foramen. \( \text{G}\). Native of the Cape of Good Hope. Erica blán'da, Sal. in Lin. trans. 6. p. 331. Erica cornuta, Roxb. mss. Flowers pale red.

**Blush-flowered Lophandra.** Shrub.

3 L. ? seriphírolió; leaves 5 in a whorl; calyceine segments minutely ciliated; corolla 1½ line long, having the limb entire at the base, obtuse; anthers inclosed, urceolate. \( \text{G}\). Native of the Cape of Good Hope. Erica seriphírolió, Sal. in Lin. trans. 6. p. 331. Erica scariôsa, Berg. pl. cap. 102. Corolla white, 1½ line long, with sub lanceolate segments.

**Treathy Lophantis.** Fl. May, July. Cl. 1786. Shrub.

**XI. LAMPROTIS** (from *lýmptos*, *lampros*, splendour in reference to the shining calyx). D. Don, in edinb. phil. journ. 17. p. 154.—Erica species of authors.

**Lin. syst. Octándria Monogyniа.** Calyx large, 4-parted, glaucous, coloured, adnicate at the base. Corolla urceolate, with a 4-lobed limb. Stamens inclosed; filaments capillary; cells of anthers short, dehiscing lengthwise, mucronate, or created at the base. Stigma capitate. Capsule 4-celled, many-seeded. Seeds round, scrobiculate.—Small, much branched shrubs, natives of the Cape of Good Hope. Leaves opposite, or 3 in a whorl, terminal, subulate, glabrous, always adpressed to the branches. Flowers numerous, terminal.

* Leaves 3 in a whorl.

**Var. β, minor** (Andr. heath. 3. t. 15.) smaller.

**Large-calyced Lamprotis.** Fl. June, Sept. Cl. 1799. Shrub 1 foot.

**Cori-es-leaved Lamprotis.** Fl. May, Dec. Cl. 1774. Shrub 1 foot.

3 L. pa'llíida; leaves 3 in a whorl, linear, imbricate, glabrous, acute, glaucous; flowers terminal, erect; bracteas large, loose, coloured; calyx exceeding the corolla, which is urceolate; anthers crested. \( \text{G}\). Native of the Cape of Good Hope. Erica pallida, Wendl. eric. with a figure. Flowers red.

**Pale Lamprotis.** Fl. April, July. Cl. 1812. Shrub.

4 L. tu'érêida; leaves 3 in a whorl, mucronate, with white margins, glabrous as well as the branches; flowers terminal; bracteases remote from the calyx; calyceine segments purplish, acute, longer than the corolla; style inclosed; anthers crested. \( \text{G}\). Native of the Cape of Good Hope. Erica türêida, Link, enum. 2. p. 365. Flowers purple.

**Turgid Lamprotis.** Fl. April, July. Cl. 1821. Shrub.

5 L. bu'mosá; leaves 3 in a whorl, erectly spreading, glabrous; flowers terminal, by threes, erect; calyx spreading, about equal in length to the corolla; bracteaces nearly orbicular, imbricate; stamens a little exserted; anthers crested; stigma narrow. \( \text{G}\). Native of the Cape of Good Hope. Erica bu'mosá, Lin. spec. ed. 2. p. 508. Berg. pl. cap. 103, but not of Loddl. Erica scarìosa, Berg. pl. cap. 102. Corolla white, 1½ line long, with sub lanceolate segments.
ERICACEE.

6 L. ? Loddigesii; leaves 3 in a whorl, erectly spreading; flowers terminal, by twos or threes; bracteas imbricate, angular; genitils exserted, with black corneiculate anthers. G. Native of the Cape of Good Hope. Erica spumosa, Lodd. bot. cab. 566. but not of Lin. Flowers purplish-red.

7 L. flagellaria; leaves 3 in a whorl, linear-lanceolate, glabrous, finely ciliated, adpressed; branches zigzag, downy; flowers terminal, usually by threes, erect; calyx bracteate, exceeding the corolla; anthers crested. G. Native of the Cape of Good Hope. Erica flagellaries, Link, enum. 1. p. 365. Flowers dirty-yellow. Calycine segments lanceolate, keeled, purple.

8 L. flagelliformis; leaves 3 in a whorl, imbricate, smooth; flowers terminal, umbrellate, erect; bracteas remote from the calyx; calyx coloured, larger than the corolla, which is urceolate; anthers crested. G. Native of the Cape of Good Hope. Erica flagelliformis, Andr. eric. 4. icon. Flowers reddish-purple.

9 L. caulicinoides; leaves 3 in a whorl, linear, subulate, imbricate, glabrous; flowers terminal, glomerate or capitulate; bracteas imbricate; calyx coloured, rather shorter than the corolla, which is urceolate; anthers almost mutic. G. Native of the Cape of Good Hope. Erica caulicinoides, Bedf. eric. wob. p. 4. Erica glomerata, Andr. heath. vol. 4. Erica calycina capitata, Hortul. Flowers purplish-red.

10 L. caulisaladum; leaves 3 in a whorl, ovate, glabrous, imbricate; flowers in terminal fascicles; calyxes spreading, with exquisitely ciliately glandular margins; corolla 1 line long, hardly longer than the calyx; fruit smooth; stigma large, 4-cleft; anthers crested. G. Native of the Cape of Good Hope. Erica caulisaladum, Lin. dist. no. 25. Berg. pl. cap. 119. Thumb. diss. 75. Erica caulisalado, Sal. in Lin. trans. 6. p. 337. Flowers white.

11 L. ? phyllioideae; leaves 3 in a whorl, imbricating in 6 rows, glabrous; flowers axillary, drooping; calyx large, elongated; anthers awned. G. Native of the Cape of Good Hope. Erica phyllioideae, Willd. spec. 2. p. 361. Corolla campanulate, purple, 1-2 lines long.—Perhaps a species of Eurypleps.

12 L. ? holosericea; leaves 3 in a whorl, sharply reduplicate; flowers terminal; corolla 3 lines long, silky, with an ovate tube; anthers crested, hairy. G. Native of the Cape of Good Hope. Erica holosericea, Sal. in Lin. trans. 6. p. 332. Flowers red.

Whole-silky Lamproitis. Shrub.

13 L. lucida; leaves 3 in a whorl; flowers terminal; calyx minutely ciliated, shining; corolla 1 line long; crests of anthers ear-formed, deeply serrated; stigma narrow. G. Native of the Cape of Good Hope. Erica lucida, Sal. in Lin. trans. 6. p. 337.

Shining-calyxed Lamproitis. Shrub.

14 L. munda; leaves 3 in a whorl, imbricate; bracteas and calyxes quite entire; corolla 1 line long; crests of anthers ear-formed, ciliated; fruit hairy. G. Native of the Cape of Good Hope. Erica munda, Sal. in Lin. trans. 6. p. 337.

15 L. fabellis; leaves 3 in a whorl, densely imbricating; flowers terminal; corolla 1 line long, hardly longer than the calyx; crests of anthers quite entire; anthers minute. G. Native of the Cape of Good Hope. Erica fabellis, Sal. in Lin. trans. 6. p. 338. Flowers reddish-purple.

16 L. chlamydiflora; leaves 3 in a whorl, linear, hairy, imbricate, flowers terminal; corolla 2 lines long, hardly longer than the calyx; crests of anthers ear-formed. G. Native of the Cape of Good Hope. Erica chlamydiflora, Sal. in Lin. trans. 6. p. 338. Flowers reddish-purple.

17 L. selaginifolia; stem tomentose; leaves linear, 3 in a whorl; flowers terminal; corolla 1 1/2 line long, with a globose tube; crests of anthers very broad, orbicular. G. Native of the Cape of Good Hope. Erica selaginifolia, Sal. in Lin. trans. 6. p. 338.

Selago-leaved Lamproitis. Shrub.

18 L. breviflora; leaves 3 in a whorl, ovate; flowers terminal; corolla 1 1/2 line long, hardly longer than the calyx; spurs of anthers linear, attenuated. G. Native of the Cape of Good Hope. Erica breviflora, Sol. mss. ex Sal. in Lin. trans. 6. p. 338.

19 L. hyssopifolia; leaves 3 in a whorl, densely ciliated; corolla 2 lines long, hairy towards the apex, with curled retuse segments; anthers crested. G. Native of the Cape of Good Hope. Erica hyssopifolia, Sol. in Lin. trans. 6. p. 337. Erica pigna, Sol. ex Salisb. Flowers red.

20 L. modesta; leaves 3 in a whorl, densely imbricating; corolla tomentose, 3 1/2 lines long, with a broad ovate tube and a recurved limb; flowers terminal; spurs of anthers linear, attenuated. G. Native of the Cape of Good Hope. Erica modesta, Sal. in Lin. trans. 6. p. 359. Flowers very pale red.

Modest Lamproitis. Shrub.

21 L. paniculata; leaves 3 in a whorl, adpressed; flowers terminal, drooping; bracteas close to the calyx; corolla ovate, ventricose, equal in length to the calyx; anthers cornute; style incurved. G. Native of the Cape of Good Hope. Erica paniculata, Lodd. bot. cab. 419. but not of Thumb. Bedf. eric. wob. p. 17. Flowers pale purplish-red.

22 L. Bedfordiana; leaves 3 in a whorl, linear, glabrous; flowers terminal; bracteas remote from the calyx; corolla ovate-campanulate; anthers awned. G. Native of the Cape of Good Hope. Erica Bedfordiana, Bedf. eric. wob. p. 14. Flowers pale yellow.

23 L. taxifolia (D. Don, in edinb. phil. journ. 17. p. 154.) leaves 3 in a whorl, trigonal, glabrous, spreading; flowers terminal, umbrellate; corolla with a cone-shaped tube and a spreading limb; bracteas remote from and approximating the calyx; calyx coloured, about equal in length to the corolla; anthers mutic. G. Native of the Cape of Good Hope. Erica taxifolia, Wendl. eric. fass. 2. p. 19. with a figure. Bauer, pl. kew. t. 19. Andr. heath. 1. t. 35. Erica turgida, Hortul. Flowers pale red. Leaves mucronate. Corolla 3 lines long, with ovate, cuneate, bifid segments.

24 L. ru'dida; leaves 3 in a whorl, linear, glabrous; flowers
terminal, capitate; bracteas approximate, 3 large and 2 small; calyx equal to the corolla in length, which is ovate-ventricose; anthers awned. *G. Native of the Cape of Good Hope. Erica rubella, Bedd. eric. wob. p. 22. Flowers red.

* * Leaves 4 in a whorl.

25 L. squamosa; leaves 4 in a whorl, inbricated, serrated; flowers terminal, drooping; bracteas imbricate; calyx large, coloured, about equal in length to the corolla, which is urceolate; anthers crested. G. Native of the Cape of Good Hope. Erica squamosa, Andr. heath. 3. t. 22. Flowers pale red.

* * * Leaves opposite.

27 L. lutea; leaves opposite, linear, inbricate, glabrous; flowers nearly terminal; bracteae imbricate; branches flexuous; calyce segments narrow, ovate-cuneated; corolla 2½ lines long, ovate, ventricose; fruit obovate; anthers mutic or awned? G. Native of the Cape of Good Hope. Erica luteca, Lin diss. no. 2. mant. p. 234. Berg. pl. cap. 115. Wendl. eric. 1. p. 13. with a figure. Andr. eric. 1. t. 31. Erica imbellis, Sal. in Lin. trans. 6. p. 385. Flowers yellow.—There appears to be two species confounded under this name; one with crested or awned anthers, and another with mutic anthers.

28 L. bifilora; leaves opposite, canaliculate, adpressed, glabrous; flowers terminal, twin, on short pedicles; bractees approximating the calyx; calyce segments ovate, acute, white; anthers crested. G. Native of the Cape of Good Hope. Erica bifilorus, Don. Lodd. bot. cab. 683. Calyx white.

29 L. borboniæfolia; leaves opposite; flowers axillary; calyce segments broad, ovate-acuminate, equal in length to the corolla, which is urceolate; fruit obovate; anthers crested or awned. G. Native of the Cape of Good Hope. Erica borboniæfolia, Sal. in Lin. trans. 6. p. 386. Flowers red, 3½ lines long.

30 L. oppositifolia; leaves opposite, filiform, inbricate; flowers terminal, crowded, erect; bractees sessile; corolla urceolate, about equal in length to the calyx, which is spreading; anthers mutic. G. Native of the Cape of Good Hope. Erica oppositifolia, Andr. heath. 3. p. 35. Lodd. bot. cab. 1343. Flowers white.

Var. L. ribra (Andr. heath. 3. t. 36. Lodd. bot. cab. 1060.) flowers red.

32 L. rubella; leaves opposite, or 3 in a whorl, linear, inbricate; flowers terminal, capitate; corolla with a ventricose tube and a spreading limb; calyx about equal in length to the corolla, bracteae; anthers mutic. G. Native of the Cape of Good Hope. Erica rubella, Ker. bot. mag. 2165. Lodg. bot. cab. 658. Flowers red.

33 L. taca; leaves opposite, linear, inbricate; flowers terminal; bractees remote from the calyx; broad; calyx coloured, large, cup-shaped; corollas urceolate, with a spreading limb; anthers mutic. G. Native of the Cape of Good Hope. Erica taca, Sims, bot. mag. 1626. Flowers fine red.

34 L. dianthifolia; leaves opposite, long; flowers terminal; calyce segments ovate-cuneated; corolla 3 lines long; spurs of anthers serrated; pericarp glabrous. G. Native of the Cape of Good Hope. Erica dianthifolia, Sal. in Lin. trans. 6. p. 338. Flowers pale purple.

Cult. See Erica, p. 800, for culture and propagation.—Pretty little shrubs, easily distinguished from the other genera broke off from Erica by the large coloured calyx and small adpressed leaves.

XII. CALLISTA (from καλλιστος, kallistos, very beautiful; flowers). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

LIN. SYST. Oëtandria, Monogyneia. Calyx 4-parted, foliaceous. Corolla salver-shaped, with a dilated spreading 4-cleft limb, and a ventricose or cylindrical tube. Stamens inclosed; filaments capillary; cells of anthers short, deliscing lengthwise, mutic at the base. Stigma capitulate. Capsule 4-celled, many-seeded.—Small, much branched shrubs, natives of the Cape of Good Hope. Leaves acerose, loosely imbricate. Flowers terminal, almost solitary, or in fascicules.

* Leaves 3 in a whorl.

Var. L. albula (Andr. heath. 3. t. 50.) flowers white, sub-axillary, or terminating the small branches, sweet-scented.

2 C. tetragonosa; leaves 3 in a whorl, linear, pointed, ciliated, erectly spreading; flowers terminating small branches; calyx bracteate, with ciliate cuspidate segments; corolla with
ERICACE.

XII. CALLISTA.

813

4 C. Bandônâ; leaves 3 in a whorl, linear-lanceolate, glabrous, spreading; flowers terminal, umbellate, on long pedicels, erect; bracteas remote from the calyx; calycine segments broad; tube of corolla ovate, ventricose; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica Bandônâ, Andr. heath. vol. 4. Corolla reddish-purple.  

5 C. MAGNIFICA; leaves 3 in a whorl, linear, obtuse, spreading; flowers terminal, usually by threes, drooping; bracteas remote from the calyx; calyx coloured; corolla with an ovate tube, and an erect limb; style inclosed. ɣ. G. Native of the Cape of Good Hope. Erica magnifica, Andr. heath. vol. 4. Corollas pale red. Antlers cornute.  

6 C. Broadleyana; leaves 3 in a whorl, linear, fasciculated, spreading; flowers axillary, on long pedicels, drooping; calycine segments foliaceous, narrow; corolla ventricose, contracted at the mouth, with hardly any limb; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica Broadleyana, Andr. heath. vol. 4. Flowers red.  

**Broadley’s Callista.** Fl. June, July. Clt. 1800. Shrub 1 to 2 feet.  

8 C. Celsiâna; glabrous; leaves 3 in a whorl; flowers terminal; bracteas remote from the calyx; corolla with a globose tube; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica Celsiâna, Lodd. bot. cab. 1777. Corolla with a pale red tube and a deep red border.  

9 C. Armaâta; leaves 3, sometimes 5, in a whorl, linear, erect, spinulose; flowers terminal, aggregate, clothed with yellow stigmas; calycine segments foliaceous, spinose; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica armaâta, Spreng. syst. 2. p. 184.  

10 C. Humeana; leaves 3 in a whorl, linear, glabrous; flowers terminal, by threes; bracteas sessile; corolla with a short ventricose tube, and a large limb; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica Humeana, Lodd. bot. cab. 389. E. Humea, Hortul. Corolla with a red tube, reddish-purple segments, and a dark eye.  

11 C. Carnuôla; leaves 3-4 in a whorl, linear, glabrous; flowers terminal, racemose; calyx bracteate; corolla with an inflated tube, and a short limb. ɣ. G. Native of the Cape of Good Hope. Erica carnuôla, Lodd. bot. cab. 926. Flowers pale red.  

12 C. Sainsburyana; leaves 3 in a whorl, filiform, elongated, glabrous, erectly spreading; flowers terminal, umbellate; bracteas remote from the calyx; corolla oblong-ovate, with a short limb; anthers awned. ɣ. G. Native of the Cape of Good Hope. Erica Sainsburyana, Andr. heath. vol. 4. Flowers pale red. Style a little exerted.  

13 C. Comptoniana; leaves 3 in a whorl, subulate, glabrous, spreading, recurved; flowers terminal, aggregate, pedicellate. ɣ. G. Native of the Cape of Good Hope. Erica Comptoniana, Andr. heath. vol. 4. Style inclosed.  

**Compton’s Callista.** Fl. May, July. Clt. 1802. Shrub.  

14 C. Infundibuliformis; leaves 4 in a whorl, filiform, obtuse, glabrous, erect; flowers terminal, aggregate; bracteas sessile; corolla with a slender tube, and large segments. ɣ. G. Native of the Cape of Good Hope. Erica infundibuliformis, Link. enum. 1. p. 364. Andr. heath. vol. 4. Lodd. bot. cab. 589. Flowers pale red, or pale purplish-red. Style inclosed.  

15 C. Vária; leaves 3 in a whorl; flowers terminal; bracteas approximating the calyx; corolla short, with revolute segments; style exerted. ɣ. G. Native of the Cape of Good Hope. Erica vária, Lodd. bot. cab. 1325. Erica Cassoni, Hortul. Flowers purplish-red.  

16 C. Umbulata; glabrous; leaves 3-4 in a whorl; flowers terminal, by fours, sessile; corolla with an elongated, ventricose, twisted tube, and a spreading limb. ɣ. G. Native of the Cape of Good Hope. Erica umbulata, Lodd. bot. cab. 1792. Flowers deep red.  

**Umbrella Callista.** Fl. Summer. Clt. 1827. Shrub.  

* * Leaves 4 in a whorl.  

17 C. Prefângna; leaves 4 in a whorl, linear, ciliate, spreadingly recurved; flowers terminal, crowded; bracteas remote from the calyx; calycine segments acute; corolla ventricose at the base. ɣ. G. Native of the Cape of Good Hope. Erica praëgnana, Andr. heath. 3. t. 32. Lodd. bot. cab. 945. Corolla pale red, almost white. Very like C. ventricosa, and probably only a variety of it. Style inclosed.  

**Swelled-flowered Callista.** Fl. April, Aug. Clt. 1796. Shrub 1 to 2 feet.  

18 C. Metuleflora; leaves 4-5 in a whorl, subulate, spinulose; flowers terminal, umbellate; bracteas remote from the calyx; corolla ventricose at the base. ɣ. G. Native of the Cape of Good Hope. Erica metuleflora, Sims, bot. mag. t. 614. Andr. heath. 3. t. 33. Lodd. bot. cab. 1753. Flowers red, with a paler border. Style a little exerted.  

19 C. Acuminaâta; leaves 4 in a whorl, trigonal, cuspidate, recurved; flowers terminal, nearly sessile, aggregate; calycine segments acuminate; corolla with an inflated acuminate tube, and a short revolute limb; bracteas close to the calyx. ɣ. G. Native of the Cape of Good Hope. Erica acuminaâta, Andr. heath. 3. t. 54. Lodd. bot. cab. t. 216. Flowers reddish-purple. Style inclosed.  

20 C. Ferruginea; leaves 4 in a whorl, linear, secund, ciliated with rusty hairs; flowers terminal, umbellately verticillate, horizontal; calyx bracteate, with the segments bearded at the
ERICACEE.

apex; filaments terminating in a flat glandular substance; corolla with an acuminated inflated tube.  h. G. Native of the Cape of Good Hope. Erica ferruginea, Andr. heath. 3. t. 57. Corolla with a red tube, and a greenish-yellow limb; but in the figure given by Andrews it is white, tipped with red. Style inclosed.

Rusty Callista. Fl. May, July. Ct. 1798. Shrub 1 ft. 21 C. hyacinthoides; leaves 4 in a whorl, shining, spreading; flowers aggregate; calyx bracteate, having the segments serrated or ciliated; corolla with a ventricose tube.  h. G. Native of the Cape of Good Hope. Erica hyacinthoides, Andr. heath. 3. t. 55. Alt. hort. kew. 2. p. 384. Flowers red. Style subexcised.

Hyacinth-like Callista. Fl. June, Aug. Ct. 1798. Shb. 1 ft. 22 C. fastigiiata; leaves 4 in a whorl, shining, erect, imbricated; flowers terminal, crowded, sessile; bracteas serrated; calyces segments serrated; corolla with a narrow tube.  h. G. Native of the Cape of Good Hope. Erica fastigiiata, Lin. diss. no. 44. mant. 66. Thunb. diss. no. 37. Andr. heath. 2. t. 57. Lodd. bot. cab. t. 207. Erica fariiforia, Sal. in Lin. trans. 6. p. 382. Corolla white, with the limb mealy inside, according to Sal. l. c. In bot. mag. t. 2084, the corollas are pointed pale red; it is therefore perhaps a distinct species.

Pellucid-flowered Callista. Shrub. 24 C. Walkeriana; stem glabrous; leaves 4 in a whorl, linear, shining; flowers terminal, almost sessile; bracteas approximating the calyx, ciliated; calyx segments lanceolate, serrated; corolla 4-5 lines long, with an ovate ventricose tube, and a wide-spread limb, which is doubly shorter than the tube.  h. G. Native of the Cape of Good Hope. C. pulchra, G. Andr. Native of the Cape of Good Hope, Erica pullicida, Sal. ex Sal. in Lin. trans. 6. p. 384. Flowers pink or pale red. Style inclosed. Var. β, rubra (Andr. heath. 2. t. 43,) flowers red.

Bedford's Callista. Fl. May, June, July. Ct.? Shrub. 27 C. Templeiana; leaves 4 in a whorl, linear, ciliated? flowers terminal, almost sessile; bracteas approximating the calyx, ciliated, as well as the calycine segments; anthers curved; corolla with an oblong ventricose tube, and a small limb.  h. G. Native of the Cape of Good Hope. Erica Templea, Hort. Bedf. eric. wob. p. 24. pl. 4. f. 17. Corolla about the size and shape of those of C. ventricosa, pale red, or reddish-purple. Style inclosed.

33 C. daphniefolia; leaves 4 in a whorl, short, glabrous, acerose, crenately spreading; bracteas sessile; calyces segments lacerated a little; flowers terminal, usually by fours; corollas with an ovate ventricose tube, and a spreading obtuse limb. L. G. Native of the Cape of Good Hope. Erica daphniefolia, Lodd. bot. cab. 345. Bedd. eric. wob. p. 7. Flowers small, white or deep red. Style exerted.

34 C. daphnoïdes; leaves 4 in a whorl, linear, glabrous; flowers terminal by fours; bracteas sessile; corolla with an ovate ventricose tube and a large limb. L. G. Native of the Cape of Good Hope. Erica daphnoïdes, Lodd. bot. cab. 154. Erica mirabilis, Hortul. Flowers pale red. Style a little exerted.

35 C. Coventryana; leaves 4 in a whorl, linear-trigonal, ciliated, as well as the calyxes and bracteas; flowers terminal, aggregate, sessile; bracteas sessile; calyces segments foliaceous, narrow; corolla with a slender tube, and large segments. L. G. Native of the Cape of Good Hope. Erica Coventryana, Andr. heath. 4. icon. Lodd. bot. cab. 453. Corolla with a greenish-yellow tube, and a red limb, with ovate segments. Style a little exerted.

36 C. verucunda; leaves 47 in a whorl, linear, obtuse; flowers lateral, verticillate; corolla with a ventricose tube, and a spreading limb. L. G. Native of the Cape of Good Hope. Erica verucunda, Lodd. bot. cab. 1827. but not of Sal. Flowers red.

37 C. stellifera; leaves 4 in a whorl, linear-lanceolate, subulate, pilose, spreading; flowers axillary and terminal, racemose, erect; bracteas remote from the calyx; limb of corolla 6-cleft. L. G. A hybrid. Erica stellifera, Andr. heath. vol. 4. Lodd. bot. cab. 1622. Flowers reddish-purple.

39 C. munda; leaves 4 in a whorl, subulate, spreading, shining, glabrous; flowers terminal, usually by fours, sessile; bracteas sessile; calyx naked; corolla with a short narrow tube, and a wide limb; style inclosed. L. G. Native of the Cape of Good Hope. Erica munda, Andr. heath. vol. 4. Lodd. bot. cab. 114. Flowers reddish-purple.

40 C. rigida; glabrous; leaves 4 in a whorl, linear, spreading; flowers terminal, pedicellate; corolla ventricosely tubular, with a blunt border; pedicels red; bracteas remote from the calyx. L. G. Native of the Cape of Good Hope. Erica rigida, Lodd. bot. cab. 286. Erica metuliflora bicolor, Bedd. eric. wob. p. 15. Corolla red. Limb short, white.

41 C. trussula; leaves 4 in a whorl, linear, glabrous; flowers terminal; bracteas approximating the calyx; corolla with an ovate ventricose tube. L. G. Native of the Cape of Good Hope. Erica trussula, Lodd. bot. cab. 1742. Flowers white. Var. b, rabra; flowers red.

42 C. struthiolefolia.—This species has not yet been described or figured. L. G. Native of the Cape of Good Hope. Erica struthiolefolia, Lodd. bot. cab. p. 25.

Struthiola-flowered Callista. Shrub.

43 C. clisifolia; leaves 4 in a whorl, glabrous; flowers terminal; bracteas rather remote from the calyx; corolla with a slender ventricose tube; style inclosed. L. G. Native of the Cape of Good Hope. Erica clisifolia, Lodd. bot. cab. 34. Flowers white.

44 C. fayettelefolia; leaves 4 in a whorl, linear; flowers terminal; pedicels very short; corolla 9-10 lines long, having the limb mealy inside; filaments spurred near the top of the anthers. L. G. Native of the Cape of Good Hope. Erica fayettelefolia, Sal. in Lin. trans. 6. p. 382. Erica infundibuliformis, Roxb. mss.

45 C. nidiflora; stem pubescent; leaves 4 in a whorl, linear; flowers terminal; calyces segments obovate, serrated; corolla 3 lines long, with the limb one-half shorter than the tube; spurs of anthers very minute, ear-formed. L. G. Native of the Cape of Good Hope. Erica nidiflora, Sal. in Lin. trans. 6. p. 383. Erica denticalata, Roxb. mss.

46 C. parmentierii; leaves 4 in a whorl; flowers terminal; bracteas sessile; corolla with a cylindrically ventricose tube, and broad-spreading segments. L. G. Native of the Cape of Good Hope. Erica parmentierii, Lodd. bot. cab. 197. Flowers reddish-purple. Style a little exerted.

47 C. moschata; glabrous; leaves 4 in a whorl; ? flowers terminal; corolla short, with a ventricose tube, and a small spreading limb. L. G. Native of the Cape of Good Hope. Erica moschata, Andr. heath. 4. icon. Lodd. bot. cab. 014. Corollas yellow.

48 C. calostoma; glabrous; leaves linear, 4 in a whorl; flowers terminal, crowded; corolla with a ventricose elongated tube, a dark neck, and a white limb. L. G. Hybrid. Erica calostoma, Lodd. bot. cab. 1759.

49 C. russelianna; leaves 4 in a whorl, linear, glabrous; flowers terminal; bracteas remote from the calyx; corolla ovate-globose, with large open segments. L. G. Native of the Cape of Good Hope. Erica russelianna, Lodd. bot. cab. 1013. Bedd. eric. wob. p. 22. Flowers reddish-purple.

50 C. vexusta; leaves 4 in a whorl, ciliated; flowers terminal, sessile; bracteas sessile, prenorse, membranous, ciliated, as well as the calyxes; corolla ovate, ventricose, with broad segments. L. G. Native of the Cape of Good Hope. Erica venusta, Hortul.

*** Leaves 5-6 in a whorl.

51 C. blaenda; leaves 6 in a whorl, spreadingly reflexed, imbricate; flowers terminal, umbellate, horizontal; calyx bracteate; genitals a little exerted; corolla with an oblong tube, and small border. L. G. Native of the Cape of Good Hope. Erica blanda, Andr. heath. 3. t. 34. Flowers reddish-purple or bluish.—Perhaps a species of Syringioidea. Style exerted.

Charming Callista. Fl. April, Sept. Clt. 1800. Shrub $\frac{2}{3}$ foot.

Primrose-like-flowered Callista. Fl. May, July. Cl. 1802. Shrub 1 to 2 feet.

53. C. swainsoni; leaves 5-6 in a whorl, linear, obtuse, crowded, erect; flowers terminal, umblellate; bracteas sessile; calyceine segments lanceolate; corolla with a cylindrical furrowed tube, and a spreading border; anthers somewhat exserted. L. G. Native of the Cape of Good Hope. Erica Swainsoni, Andr. heath. t. 3. t. 65. Flowers reddish-purple or buff-red.

Cult. For culture and propagation see Erica, p. 800. — Elegant shrubs when in blossom. The wood being harder than that of the species of Erica, cuttings are more difficult to root.

XIII. EURYLOYMA (from eurye, eurye, wide, and loma, loma, a margin; in reference to the wide limb of the corolla). D. Don, in edinb. phil. journ. 17. p. 155. — Erica species of authors.

Lin. syst. Octandria Monogyonia. Calyx 4-parted, foliaceous. Corolla salver-shaped, with an elongated filiform or ventricose tube, and a 4-parted dilated limb. Stamens included; filaments dilated, membranous, channeled; anthers bipartite; cells of anthers membranous, dehiscing lengthwise, and drawn out at the base into a short minutid spur. Stigma with an elevated 4-lobed disk. Capsule 4-celled, many-seeded. — Diffusely branched shrubs, natives of the Cape of Good Hope. Leaves adpressed, semi-cylindrical, minutely dentilicate. Flowers terminal, solitary or by threes, large, showy, on short pedicles, clanny.

* Leaves 3 in a whorl.
1. E. Aitoni (D. Don, l. c.) leaves 3 in a whorl, linear, serrulat, erect; flowers terminal, usually by threes; bracteas remote from the calyx; corolla viscid, with a cylindrical tube, which is ventricose at top, and large ovate segments; style exserted. L. G. Native of the Cape of Good Hope. Erica Aitoni, Andr. 1. t. 25. Curt. bot. mag. 429. Erica Aitoniāna, Alt. hort. kew. 2. p. 372. Lodg. bot. cab. 144. Erica Aitoni, Willd. spec. 2. p. 398. Erica jasminiflora, Sal. in Lin. trans. 6. p. 382. Corolla pale red, or nearly white, 16 to 19 lines long.

2. E. jasminiflora (D. Don, l. c.) leaves 3 in a whorl, linear-oblong, serrulat, recurved, imbricated in 6 rows; flowers terminal, aggregate; bracteas ciliolate, remote from the calyx; corolla viscid, with an ovate tube, which is ventricose at the apex, and ovate segments; style exserted. L. G. Native of the Cape of Good Hope. Erica jasminiflora, Andr. heath. t. 26. Erica loganfliora, Sal. in Lin. trans. 6. p. 382. Corolla 12-14 lines long, with a reddish tube, and a yellow-green border. 

Var. "alba;" flowers pure white.

Jasmine-flowered Euryloma. Fl. June, Nov. Cl. 1794. Shrub 1 to 2 feet.

3. E. tricolor; leaves 3 in a whorl, linear, recurved, ciliolate, as well as the bracteas and calyces: the terminating hairs the longest; pedicels bibracteate near the base; flowers terminal, usually about 6 together; corolla viscid, with a large ventricose tube, and ovate-cordate slightly crenulated segments; style exserted. L. G. Native of the Cape of Good Hope. Erica tricolor, Nois. Bedd. hort. eric. wob. p. 25. Corolla red at the base, white at top, but greenish-yellow below the contraction of the limb.

Var. major (Bedd. eric. wob. p. 26.) leaves adpressed, slightly ciliolate; corolla oblong, inflat-ed, with a red tube and segments, and yellowish-green below the contraction.

Var. minor (Bedd. eric. wob. p. 26.) leaves 4 in a whorl; style inclosed; corolla inflated, viscid. L. G. Corolla with a red tube, greenish-yellow top, and red segments.

4. E. xiridnalis; leaves 3 in a whorl, obtuse; flowers terminal, disposed in umbrallate fascicles; corolla viscid, with a ventricose base, a contracted neck, and a wide-spreading border. L. G. Native of the Cape of Good Hope. Erica mirabilis, Lodg. bot. cab. 1804. Corollas white, tinged with red.

5. E. ampullacea; leaves 3-4 in a whorl, lanceolate, ciliolate, reflexed; flowers terminal, usually by fours; bracteas approximating the calyx, ciliolate, as well as the calyceine segments; corolla viscid, with a ventricose tube, ribbed neck, and ovate-cordate slightly crenulated obtuse segments; style exserted. L. G. Native of the Cape of Good Hope. Erica ampullacea, Curt. bot. mag. 303. Andr. heath. l. t. 29. Lodg. bot. cab. 508. Erica ampullifōrum, Sal. in Lin. trans. 6. p. 381. Leaves imbricate at the base, moderately spreading at top. Corolla 8-10 lines long, red. Anthers incurved at top.

5. E. T. Hope's, leaves 3 in a whorl, ciliate, with seaborous margins, erect; bracteas remote from and approximating the calyx; flowers terminal, umbrallate; corolla viscid, with a cylindrical ventricose tube, and large segments; style exserted; anthers mucilaginous. L. G. Native of the Cape of Good Hope. Erica irbyana, Andr. heath. t. 3. t. 25. Lodg. bot. cab. 816. Flowers white.

Var. "rubra;" flowers reddish-purple.

7. E. novā NASIS; leaves linear-oblong, 3 in a whorl, serrulately ciliolate, short, adpressed; branches slender, flexuous; flowers small, terminal, aggregate, viscid; corolla tubular, with a contracted neck, and small limb. L. G. Native of the Cape of Good Hope. Erica notabilis, Wendl. Licht. ex Spreng. syst. 2. p. 184. Style inclosed.

8. E. curtifolia; leaves 3 in a whorl, recurved, ciliolate?; spikes coarctate; corolla 4 lines long, viscid, with an ovate pyramidal tube; spurs of anthers linear-attenuated; petiole hairy. L. G. Native of the Cape of Good Hope. Erica curtifōlia, Sal. in Lin. trans. 6. p. 380. Flowers lateral.

Crested-leafed Euryloma. Shrub.

9. E. shannoniāna; leaves 3-4 in a whorl, stiff, spreading,
ERICACEÆ. XIII. Euryloma. XIV. Chona. 817

ending each in a hair; flowers terminal, umbellate, drooping; calyx coloured; bracteas remote from the calyx; corolla with a ventricose ribbed tube; style exerted. G. Native of the Cape of Good Hope. Erica Shannónita, Andr. heath. vol. 4. Erica Shannóniana, Lodg. bot. cab. 168. Spreng. syst. 2. p. 185. Flowers red.

* * Leaves 4 in a whorl.

10 E. Hartnelli; leaves 4 in a whorl, lanceolate, imbricated, finely ciliated: the terminating hairs the longest; corolla viscid nearly tubular, rather ventricose at the base, with ovate-triangular lobes. G. Native of the Cape of Good Hope. Erica Hartnelli, Roll. cat.

11. E. Ampullaceoides; leaves 4 in a whorl, ciliate; flowers terminal; bracteas remote from the calyx; corolla with a ventricose curved tube. G. Native of the Cape of Good Hope. Erica ampullaceoides, Beddf. eric. wob. p. 2. Erica ampullaceae, Hort. Corolla with a red tube, and a greenish-yellow neck.

12. E. raíscens; leaves 4 in a whorl, linear, ciliate, recurved; flowers terminal, umbellate; bracteas approximating the calyx, ciliated, as well as the calycine segments; corolla viscid, with a ventricose tube, and a hairy top; style inclosed. G. Native of the Cape of Good Hope. Erica princeps, Andr. heath. 2. t. 44. Lodg. bot. cab. 647. Corollas reddish-purple.

Var. G. cràncæ; flowers pale red.

Var. G. alba; corolla white, Sal. l. c.

16. E. aristállæ; leaves 4 in a whorl, hispid, awned, imbricated, subsecund; flowers terminal; bracteas approximating the calyx; corolla with an oblong acuminate tube; anthers mu tic. G. Native of the Cape of Good Hope. Erica

Small-awned Euryloma. Fl. June, July. Clt. 1806. Shrub. E. oblonga; leaves 4 in a whorl, linear, ciliate, recurved; flowers terminal, umbellate; bracteas approximating the calyx; ciliated, as well as the calyxes; corolla viscid, with a globose-ventricose ribbed tube, and spreading obtuse segments. G. Native of the Cape of Good Hope. Erica oblonga, Andr. heath. 2. t. 33. Corolla with a reddish-purple tube, a greenish-yellow neck, and a pale limb.

Tar. ß, umbellata (Andr. heath. 3. t. 20.) flowers terminal, umbellate, white. G. Native of the Cape of Good Hope.

18. E. oblonga (Beddf. eric. wob. p. 17.) leaves 4 in a whorl, linear, ciliate, recurved; flowers terminal, umbellate; bracteas approximating the calyx; ciliated; calyx inflated, ciliated; corolla oblong; ruffled; anthers mucous. G. Native of the Cape of Good Hope. Erica oblonga, Beddf. eric. wob. p. 17. Erica obhátæ rossæ, Hortul. Flowers reddish-purple.

* * Leaves 6 in a whorl.

19. E. squarrosà; leaves 6 in a whorl, squarrose; flowers terminal; corolla viscid, 5–6 lines long, with an ovate pyramidal tube, and an obtuse limb; anthers smooth; spurs marginal. G. Native of the Cape of Good Hope. Erica squarrosà, Sal. in Lin. trans. p. 380. Leaves very dense.

20. E. imperialis; leaves 6 in a whorl, filiform, erect, imbricated; flowers terminal, corymbose, drooping; corolla viscid, with a discoloured limb. G. Native of the Cape of Good Hope. Erica imperialis, Andr. heath. 4. icon.

21. E. recurvata; leaves 6 in a whorl, linear, flexuous, recurved; flowers terminal, nearly sessile, drooping, capitulate; bracteas sessile; corolla curved, ovate-oblong; style exerted; anthers mucous. G. Native of the Cape of Good Hope. Erica recurvata, Andr. heath. vol. 4. Flowers pale red.

Recurved-flowered Euryloma. Fl. April, June. Shrub.

22. E. crinita; leaves crowded, lanceolate, terminated each by a hair; flowers nearly terminal, drooping; pedicels red; corolla cylindrical, contracted at the neck. G. Native of the Cape of Good Hope. Erica crinita, Lodg. bot. cab. 1432. Corolla purplish-red, with a pale border.

Cult. For culture and propagation see Erica, p. 800. Most elegant shrubs when in blossom. The wood of the species being more hard than that of Erica, the cuttings do not strike root so freely.

XIV. CHO'NA (from woryn, chone; a funnel; from the figure of the corolla). D. Don, in edinb. phil. journ. 17. p. 155.—Erica species of authors.

Lin. syst. Octándria Monogyinia. Calyx 4-parted, foliaceous. Corolla funnel-shaped, with a 4-lobed revolute limb. Stamens exserted; filaments capillary; anthers truncate, combined; cells of anthers elongated, parallel, anwéd at the base. Stigma simple, obtuse. Capsule 4-celled, many-seeded.—A small diffuse shrub, native of the Cape of Good Hope. Leaves 3 in a whorl, linear, anwéd, with revolute cestously-ciliated margins. Flowers terminal, corymbose, blood-red. Anthers black. Perhaps Syringóidea mathiissii belongs to this genus.

I. C. Sanguineæ (D. Don, l. c.) G. Native of the Cape of Good Hope. Erica Sanguinæ. Philipp. bot. 2. t. 26. 5 M
§ 1. Anthers mutic at the base. Normal species.

* Leaves 3 in a whorl.

1 S. costata; leaves bluntish, downy, spreading; flowers terminal, by threes; bracteas close to the calyx, calyce segments serrate, corolla glabrous, curved, ribbed; style a little exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica costata, Andr. heath. 1 t. 40. Corolla pale red, with a greenish border. 

Var. \( \beta \), supræba (Andr. heath. vol. 4.) corolla larger, reddish-purple, with a greenish-yellow mouth.

2 S. diaephra; leaves spreading, glabrous; flowers terminal, by threes, pendulous, glabrous; bracteas foliaceous, close to the calyx, calyces obverse, foliaceous, corolla with a clavate inflated tube; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica transparens, Andr. heath. vol. 4. with a figure. Lodd. bot. cab. 177. Erica diaphra, Spreng. syst. 2. p. 178. Corollas deep reddish-purple.

3 S. clamata; leaves erect; flowers terminal, by threes; drooping; bracteas close to the calyx, adpressed; genitils exerted a little. \( \beta \). G. Native of the Cape of Good Hope. Erica clamata, Andr. heath. 3 t. 40. Corolla green, cylindrically clavate. Anthers black.

4 S. fallens; leaves linear, hoary, spreading; flowers disposed in terminal racemes, horizontal; bracteas close to the calyx. \( \beta \). G. Native of the Cape of Good Hope. Erica tellins, Andr. heath. 3 t. 45. Corolla sulphur-coloured.

5 S. decibus; leaves 3-4 in a whorl, villous; flowers terminal, by threes; bracteas close to the calyx, calyces coloured, ciliated; corolla cylindrical; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica dichrus, Spreng. syst. 2. p. 179. Erica bicolor, Andr. heath. 2 t. 39. Lodd. bot. cab. 1001, but not of Thunb. nor Wildl. Erica dichromata, Lodd. bot. cab. 1813. Corolla purplish-red, with a greenish-yellow mouth.

6 S. linnea (D. Don, l. c.) leaves ciliated, spreading; flowers axillary, numerous, nearly sessile, horizontal; corollas clavate, downy or villous; bracteas close to the calyx, and are as well as the calyce segments serrate; style subexserted. \( \beta \). G. Native of the Cape of Good Hope. Erica Linneaëa, Lodd. bot. cab. 102. Erica Linnea, Andr. heath. 2 t. 34. Erica perspicua \( \beta \), Ait. hort. kew. 2. p. 371. Corolla white, with a red base. Anthers bearded on the back at top. In this and S. abietina the ovarium is 6-8-celled.

Var. \( \beta \), supræba (Lodd. bot. cab. 1778.) flowers large, white tinged with red, erect. \( \beta \). G. Native of the Cape of Good Hope. Erica versicolor, Andr. heath. 1 t. 39. Lodd. bot. cab. 208. Corolla purplish-red, with a greenish-yellow mouth.

Var. \( \beta \), major (Lodd. bot. cab. 1316.) flowers larger.

7 S. versicolor; leaves glabrous, spreading; flowers terminal, by threes; calyces coloured; bracteas close to the calyx, denticulated, as well as the calyce segments; corolla nearly cylindrical; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica versicolor, Andr. heath. 1 t. 39. Lodd. bot. cab. 208. Corolla purplish-red, with a greenish-yellow mouth.

9 S. broadleyana; leaves linear, spreading; flowers axillary, on long pedicels, drooping; calyce segments narrow, foliaceous; bracteas remote from the calyx; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica Broadleyana, Andr. heath. 3 t. 44. Corolla deep red, with a yellow mouth. Anthers mutic.

10 S. insulsæ; leaves 5 in a whorl; flowers terminal; bracteas close to the calyx, foliaceous; corolla with a cylindrical incurved tube, and ciliated segments; style a little exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica insula, Hortul. Bedf. eric. wob. p. 12. Lodd. cat. p. 25. Flowers yellowish-green.

* * Leaves 4 in a whorl.

11 S. refugiens; leaves glabrous, spreading; flowers terminal, drooping, by fours; calyces coloured, subulate, adpressed; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica refugens, Andr. heath. vol. 4. with a figure. Corollas scarlet or deep purplish-red.

12 S. transparens; leaves ovate-cuneate, shortly pectinated; calyce segments cuneate; corolla 6-7 lines long, chiefly towards the apex outside; filaments spurred. \( \beta \). G. Native of the Cape of Good Hope. Erica transparens, Thum. prod. p. 71. Erica cerinuthoides \( \gamma \), Thum. diss. no. 53. Erica strigilifolia, Sal. in Lin. trans. 6. p. 367. Corollas white. ?

13 S. pellucida; leaves linear, horizontal, ciliated; flowers terminal, pedicellate, drooping; bracteas close to the calyx; corolla with an oblong inflated tube, subpellucid; style exerted. \( \beta \). G. Native of the Cape of Good Hope. Erica pellucida, Andr. heath. 3 t. 60. Lodd. bot. cab. 276. Corolla white. Calyce segments linear-subulate.

Var. \( \beta \), rubra (Bedf. eric. wob. p. 18. but not of Andr.) co-
**ERICACEÆ.**

14 **S. Bedfordiâna;** leaves linear, ciliated; flowers terminal, pedicellate, drooping; bracteas remote from and approximating the calyx; corolla cylindrical, curved; style subexserted. ½, G. Native of the Cape of Good Hope. Erica pellucida Bedf. eric. wob. p. 18. Corollas reddish-purple.

15 **S. extãdans;** leaves linear, obtuse, spreading, clamy from glands; flowers terminal, subaggregate, drooping; bracteas subulate, close to the calyx; corolla oblong, curved, ribbed; style exserted. ½, G. Native of the Cape of Good Hope. Erica exsudans Lodd. bot. cab. 287. Erica rosa sólis, Hortul. Corollas reddish-purple. Bracteas awned.

16 **S. sulfureâ;** leaves linear, obtuse, villous; flowers fasciculate, axillary and terminal, nearly sessile, horizontal; bracteas close to the calyx; corolla cylindrical, trumpet-shaped, villous; style exserted. ½, G. Native of the Cape of Good Hope. Erica sulphureâ, Andr. heath. vol. 4. with a figure. Sims, bot. mag. 1884. Lodd. bot. cab. 1762. Corollas pale yellow or sulphur-coloured.

17 **S. ? flavâ;** leaves 3 in a whorl, filiform, glabrous, short, erect; flowers horizontal, axillary, crowded; calyx bracteate; corolla urceolate tubular, short; style exserted. ½, G. Native of the Cape of Good Hope. Erica flavâ, Lodd. bot. cab. 882. Andr. heath. vol. 2. t. 38. Flowers yellow.

**Yellow-flowered Syringodea.** Fl. April, Sept. Clt. 1795. Shrub.

18 **S. erubescens;** leaves linear-lanceolate, with revolute ciliated margins; floriferous branches pendulous; bracteas awned, close to the calyx, and as are also as the calycine segments dentately fringed; corolla cylindrical, inflated, beset with glandular hairs both inside and outside, with a revolute limb; style exserted. ½, G. Native of the Cape of Good Hope. Erica erubescens, Andr. heath. 3. t. 56. Lodd. bot. cab. 1826. Erica elongâta, Hortul. Corolla from pale purplish-red to white. Calycine segments ovate, roundish.

19 **S. elaâta;** leaves filiform, bluntish; branches spreading; flowers axillary or terminating small branches, crowded in the manner of a spike; bracteas remote from and approximating the calyx; corolla curved, trumpet-shaped, villous, with a rather revolute limb; gentils exserted. ½, G. Native of the Cape of Good Hope. Erica elâta, Andr. heath. 2. t. 18. Lodd. bot. cab. 1785. Erica longiflora, Sal. in Lin. trans. 6. p. 359. Corolla orange-red, 15-20 lines long, downy, with an obtuse limb. Herb powdery. Pedicels glabrous. Calyx recurved spreading, convex on the outside at the base.

20 **S. ? linkii;** leaves spreading, beset with a few hairs; flowers terminal, umbellate; bracteas remote from the calyx; calycine segments ovate, white; anthers mutic, subexserted. ½, S. ? Native of the Cape of Good Hope. Erica protrudens, Link. enum. 1. p. 373. Corolla 2-3 lines long, white.—Probably a species of *Gypsophâlia.*

**Link’s Syringodea.** Fl. April, May. Clt. 1805. Shrub.

21 **S. stægnalis;** leaves linear, hairy; flowers terminal; pedicels glabrous; corolla 10-11 lines long, hairy; anthers straight, papillose, mutic. ½, G. Native of the Cape of Good Hope. Erica stagnâlis, Sal. in Lin. trans. 6. p. 359. Erica tubiflora, Roxb. mss.

22 **S. flâmâea;** leaves filiform, erectish, glabrous; flowers sub solitary, terminating the small branches, spike-like, horizontal; bracteas close to the calyx; calycine segments subulate, imbricated, unequal; corolla 8 lines long, downy, with a clavate tube, and the segments of the limb imbricated at the base; gentils a little exserted. ½, G. Native of the Cape of Good Hope. Erica flâmâea, Andr. heath. 2. t. 53. Erica bilaxa, Sal. in Lin. trans. 6. p. 358. Erica curviflora, Thumb. diss. no. 30. Corollas pale yellow.

23 **S. linençeae;** leaves linear-lanceolate, pilose, spreading; flowers almost sessile, terminating small branches; bracteas close to the calyx; calycine segments lanceolate; corolla villous, cylindrical, swollen at top; style subexserted. ½, G. Native of the Cape of Good Hope. Erica linençeae, Andr. heath. 2. t. 42. Erica Limneæa, Hort. kew. 2. p. 577. Lodd. bot. cab. 102. Corollas with a purplish-red base, and a white top.

24 **S. radiaâta;** leaves filiform, spreading; flowers terminal, umbellately verticillate; bracteas remote from the calyx; calyx adpressed; corolla 9-10 lines long, glabrous, with a cylindrical tube, and recurved limb; style exserted; fruit glabrous. ½, G. Native of the Cape of Good Hope. Erica radiâta, Andr. heath. 1. t. 46. Erica calaminÆum, Sal. in Lin. trans. 6. p. 350. Flowers reddish-purple.

25 **S. spîrâ;** leaves linear, subciliated, erectly spreading; flowers aggregate, terminating the small branches; bracteas remote from the calyx; calycine segments ovate, acuminate; corolla 7-8 lines long, downy, with a cylindrical tube, and a spreading border; gentils inclosed; pericarp obpyramidal. ½, G. Native of the Cape of Good Hope. Erica spirâia, Andr. heath. 1. t. 54. Erica ealectiflora, Sal. in Lin. trans. 6. p. 357. Corolla red.

**Var. ? transâlina;** corolla purplish-red, rather ventricose at the base.—Erica transâlina, Andr. heath. vol. 4. with a figure.

26 **S. exsægêns;** leaves filiform, spreading recurved; flowers axillary, verticillate, horizontal, crowded; bracteas remote from and approximate to the calyx; corolla cylindrically clavate, 13-15 lines long, viscid, with ovate cuneated segments; filaments exserted; pericarp 4-furrowed. ½, G. Native of the Cape of Good Hope. Erica exsægêns, Andr. heath. 1. t. 57. Lodd. bot. cab. 835. Erica grandiflora breviflora, Wendl. eric. 7. p. 7, with a figure. Erica pharetraformis, Sal. in Lin. trans. 6. p. 361. Corollas orange-red. This species differs from all others in the corolline segments being attenuated at the apex, and bifid. There are several varieties of the species in the gardens, besides those mentioned before, differing in the colour of the flowers.

27 **S. curviflóra;** leaves linear, spreading, glabrous; flowers usually solitary, terminating small branches; bracteas close to the base.
ERICACEÆ.

the calyx; corolla glabrous, 10-11 lines long, with a curved cylindrical tube, and an erect or spreadingly reflexed limb; style exserted. 老师的 Native of the Cape of Good Hope. Erica curtiviflora. Lin. diss. no. 41. a. Andr. heath, t. 52. Lodd. bot. cab. 1668. Wendl. eric. fasc. 3. no. 3. p. 3, with a figure. Erica fastiavosa, Sal. in Lin. trans. 6. p. 359. Flowers orange-yellow. Fruit broadly turbinate.

**Var. β, räbra** (Andr. heath. 3. t. 61.) corolla orange-red, cylindrically trumpet-shaped. 老师的 Native of the Cape of Good Hope. Erica ericiflora, Houtt.

29 S. tubiflora; leaves linear, obtuse, downy, erect; flowers usually solitary, terminating the small branches; bracteas almost close to the calyx; corolla downy, cylindrical, 9-10 lines long, a little curved, with a revolute limb; calycine segments oblong; style exerted. 老师的 Native of the Cape of Good Hope. Erica tubiflora, Lin. diss. no. 40. spec. ed. 2. p. 505. Andr. heath. t. 53. Wendl. eric. 4. p. 7, with a figure. Icon. hort. Kew. 28. Sal. in Lin. trans. 6. p. 337. Flowers purplish-red. Pedicels glabrous.

**Var. α, cocinea** (Sal. in Lin. trans. 6. p. 357.) flowers deeper red. 老师的 Native of the Cape of Good Hope. Erica cocinea, Lin. diss. no. 42, with a figure of the flower.

30 S. hone'scens; leaves linear, glabrous, spreading; flowers solitary, terminating the small branches, drooping; calycine segments ovate, acuminate, a little ciliolate; bracteas ovate, ribbed, close to the calyx, or rather remote; corolla cylindrical, rather plicate at top, with a revolute limb; style exerted. 老师的 Native of the Cape of Good Hope. Erica ignescens, Andr. heath, t. 57. Corollas reddish-orange. Calycine segments ovate, acuminate.

31 S. sordida; branches scattered, hairy; leaves linear, oblique, woolly, spreading; flowers usually solitary, terminating the small branches, drooping; bracteas remote from the calyx; calyxes adpressed, convex outside at the base; corolla 12 lines long, cylindrical, curved, villous, with a revolute limb; petals inclosed. 老师的 Native of the Cape of Good Hope. Erica sordida, Andr. heath. t. 55. Lodd. bot. cab. 1793. Erica lamiflora, Wendl. eric. fasc. 19, no. 4, with a figure. Erica floccosa, Sal. in Lin. trans. 6. p. 350. Flowers dirty orange-red. Style exerted.

32 S. brachialis; leaves linear, hairy; flowers terminal; corolla 6-8 lines long, hairy both inside and outside, with a curved pyramidal tube; anthers mutic, very long. 老师的 Native of the Cape of Good Hope. Erica brachialis, Sal. in Lin. trans. 6. p. 367.

33 S. serratifolia; leaves linear, acute, spreading, with plumose margins; flowers aggregate, terminal; bracteas close to the calyx; calyxes foliaceous, glabrously ciliolate, a little recurved; corolla 9 lines long, glabrous, cylindrical, with a spreading limb; anthers a little exerted; style exerted. 老师的 Native of the Cape of Good Hope. Erica serratifolia, Andr. heath. t. 48. Lodd. bot. cab. 1703. Erica cylindrificifora, Sal. in Lin. trans. 6. p. 356. Erica plumosa, Wendl. eric. no. 12. p. 5. Corolla greenish-yellow at top, and orange-red at base. Leaves 4-6 in a whorl.

**Var. α, minora** (Bedd. eric. wob. p. 14.) corolla smaller, with an inflated clavate tube. 老师的 Native of the Cape of Good Hope. Erica procera, Wendl. eric. with a figure. Corollas white?

35 S. ruscica; leaves linear, erect, downy; flowers solitary, terminating the small branches, erectish; corolla constricted in the middle, with a spreading limb; style exerted. 老师的 Native of the Cape of Good Hope. Erica ruscica, Sal. in hort. kew. 2. p. 375. Willd. spec. 2. p. 404. Pl. kew. t. 12. Andr. heath. t. 1. 10. Wendl. eric. 4. p. 9, with a figure. Corollas orange-yellow.

37 S. glandulosal; leaves linear, acute, beset with glandular hairs, spreading; flowers nearly terminal, crowded, disposed in a verticillate crown; bracteas close to the calyx, and are as well as it ciliate with glandular hairs; corolla glabrous, with a clavate tube; style exerted. 老师的 Native of the Cape of Good Hope. Erica glandulosa, Thumb. prod. p. 71. diss. no. 32. Corollas orange-red?

38 S. gémíFERA; leaves oblong, adpressed, ciliolate, aristate, 4-5 in a whorl; branches thickened at top; bracteas remote from and approximating the calyx; flowers drooping, crowded, disposed in a verticillate crown; corolla villous, cylindrical, inflated; petals inclosed. 老师的 Native of the Cape of Good Hope. Erica geminifera, Sims, bot. mag. t. 2366. Lodd. bot. cab. 457. Erica Massonii minor, Houtt. Corollas reddish-purple or scarlet, with a green apex.

39 S. lituiflorá; leaves linear, nearly smooth; flowers solitary or by threes terminating the branches; bracteas close to the calyx; corolla 6-8 lines long, downy or villous, with the tube ciliate; filaments bearded on the back at the apex. 老师的 Native of the Cape of Good Hope. Erica lituiflora, Sal. in Lin. trans. 6. p. 356. Erica perspicua, Wendl. eric. fasc. 1. p. 7, with a figure. Corolla white, tinged with red.

40 S. Persicicu; leaves linear, nearly smooth; flowers terminating in the small branches, spike-formed; bracteae remote from the calyx; pedicels hairy; corolla cylindrical, erect; genitals inclosed. $. G. Native of the Cape of Good Hope. Erica perspicuca. Hort. Bedf. eric. wob. p. 18. Corolla reddish-purple.

**Var. $, nigro (Bedf. l. c.) leaves hairy; pedicels slightly hairy; tube of corolla cylindrical, straight. $. G. Corollas purplish-red.**

41 S. Bedforiana; leaves linear, ciliated, hairy; flowers terminal, subcapitate; pedicels slightly hairy; bracteae remote from the calyx; corolla downy, with a cylindrical subventricose tube; genitals inclosed. $. G. Native of the Cape of Good Hope. Erica perspicucoides, Bedf. eric. wob. 18. Flowers reddish-purple.

42 S. cirelliflorea; stem slender; leaves linear, glabrous? corolla 2-3 lines long, downy, with a narrow campanulate tube, and a short limb. $. G. Native of the Cape of Good Hope. Erica cirellifloera, Sal. in Lin. trans. 6. p. 357. Flowers pale scarlet.

43 S. obpyramidalis; leaves pubescent, spreading; flowers terminal, usually by threes; bracteae remote from the calyx, broad at the base; corolla funnel-shaped, with a spreading border, having the interstices of the limb tumid on the outside; fruit spherical. $. G. Native of the Cape of Good Hope. E. pyramidalis, Andr. heath. t. 45. Sims, bot. mag. 366. kew. Lodd. bot. cab. 319. Ait. hort. kew. 3. p. 401. Icon. pl. t. 27. Wendl. eric. 5. p. 3. with a figure. Erica obpyramidalis, Sal. in Lin. trans. 6. p. 356. Corollas purplish-red, 1/3 to 4 lines long. Style exserted.

44 S. verticillata; leaves linear, glabrous; flowers crowded, nearly terminal, verticillate, drooping; bracteae linear, remote from the calyx; corolla with a cylindrical inflated tube, glabrous, constricted at top; genitals inclosed. $. G. Native of the Cape of Good Hope. Erica verticillata, Andr. heath. t. 7. Lodd. bot. cab. 145. Erica mammiosa, $, verticillata, Ait. hort. kew. 2. p. 369. Flowers scarlet.

45 S. colo-rans; leaves linear, spreading, ciliated; flowers crowded, terminating the small branches; bracteae close to the calyx; corolla cylindrical, claveate, glabrous; style almost inclosed; calyces coloured, subulate. $. G. Native of the Cape of Good Hope. Erica colo-rans, Andr. heath. vol. 4. with a figure. Lodd. bot. cab. 224. Ker. bot. reg. 601. Bedf. eric. wob. pl. 4. f. 11. Corollas varying from white to red.

**Colouring Syringodea. Fl. April, June. Clt. 1827. Shrub.**

**x x x Leaves 6 or more in a whorl.**

46 S. splendens; leaves linear, obtuse, spreading; flowers densely crowded, drooping; calyx segments ovate; corolla, with a subrevolute limb; genititals exserted. $. G. Native of the Cape of Good Hope. Erica splendens, Wendl. eric. f. se. 8. p. 5. with a figure, but not of Andr. Corolla deep red.

47 S. longitudinalis; leaves long, linear, incurvingly spreading, with sebaceous edges; flowers crowded in whorls, drooping; bracteae close to the calyx; corolla pubescent, clamy, calyxine segments linear; genitals inclosed. $. G. Native of the Cape of Good Hope. Erica longifolia, Fl. hort. kew. t. 4. Willd. spec. 2. p. 398. Erica longifolia, Sal. in Lin. trans. 6. p. 363. Erica pinéa, Wendl. eric. 1. p. 11. with a figure. Corolla more or less incravate, deep red.

48 S. vestita; leaves linear, erect, with sebaceous edges; flowers crowded, verticillate, nearly sessile, spreading; bracteae close to the calyx; corolla cylindrical, more or less incravate, 9-11 lines long, downy, with a revolute limb; style exserted; pericarp silky at top. $. G. Native of the Cape of Good Hope. Erica vestita, Thunb. diss. no. 25. Erica longifolia, var. a, Sal. in Lin. trans. 6. p. 363. Erica serissa, Alba, Andr. heath. t. 1. p. 62. Wendl. eric. no. 12. p. 3. with a figure. Calyculine segments ciliated with glandular hairs. Corolla white, cylindrical, curved.

**Var. $, lattea (Andr. heath. 3. t. 72.) leaves 6-8 in a whorl; corolla cylindrical, pale yellow.**

**Var. $, incana (Andr. heath. 2. t. 66.) Lodd. bot. cab. 1693. leaves 7 in a whorl; genitals a little exserted; corolla cylindrical, almost straight, pale reddish-purple. Erica longifolia, Curt. bot. mag. 706.**

**Var. $, rosea (Andr. heath. 2. t. 67.) leaves 7-8 in a whorl; anthers a little exserted; corolla cylindrical, subcalvate, reddish-purple.**

**Var. $, falcigera (Andr. heath. 2. t. 68.) anthers a little exserted; flowers nearly terminal; corolla with a cylindrical tube, and straight segments, reddish-purple, or deep red. Erica fulgida, Bedf. eric. wob. p. 11. Lodd. bot. cab. 1633.**

**Var. $, purpurea (Andr. heath. 1. t. 65.) anthers a little exserted; corolla cylindrical, subcalvate, purplish-red. Lodd. bot. cab. 217. Wendl. eric. 10. p. 7. with a figure.**

**Var. $, cocinea (Andr. heath. 1. t. 6.) bot. mag. 402. Wendl. eric. 11. p. 5. with a figure.) anthers a little exserted; corolla erectly cylindrical, curved, deep red, not exactly scarlet.**

49 S. pinéa; leaves linear, obtuse, spreading; flowers crowded, verticillate, almost sessile, spreading; bracteae close to the calyx; calyxine segments dilated at the base, and linear-subulate at the apex, imbricate; corolla 6-7 lines long, glabrous, with a cylindrical clavate tube, and a serrulate spreading limb; pericarp glabrous; style exserted. $. G. Native of the Cape of Good Hope. Erica pinéa, Thunb. diss. no. 26. Andr. heath. 1. t. 61. Erica pinifolia, Sal. in Lin. trans. 6. p. 362. but not of Andr. Flowers deep red and blue.

**Var. $, purpurea (Lodd. bot. cab. 1259.) corollas purple.**

There are several other varieties in the gardens.

50 S. pinifolia; leaves filiform, elongated, glabrous, spreading, 6-8 in a whorl; flowers nearly terminal, crowded, horizontal, verticillate; bracteae close to the calyx; calyx villous, with linear segments; corolla tomentose, cylindrically club-shaped, inflated, ribbed; style exserted. $. G. Native of the Cape of Good Hope. Erica pinifolia, Andr. heath. 3. t. 69. Erica pityophylla, Spreng. syst. 2. p. 181. Corolla white, with dark anthers.

**Var. $, discolor (Andr. heath. 3. t. 70.) corolla with a cylindric ribbed tube, reddish-purple or pale red.**

**Var. $, spirítuá (Hort. Bedf. eric. wob. 19.) corolla with a clavate inflated tube, white and purplish-red.**

**Var. $, cocinea (Andr. heath. 2. t. 65.) flowers scarlet.**

51. **S. au-réea**; leaves linear, recurvedly spreading; flowers horizontal, crowded, verticillate, nearly terminal; bracteas close to the calyx, aristate; corolla cylindrical, with reflexed segments; style exerted; calycine segments ovate, acuminate. **†**, **G**. Native of the Cape of Good Hope. Erica atorea, Andr. heath. 2. t. 61. Corollas orange-yellow.

*Var. ψ*, *floré pallidó* (Andr. heath. 3. t. 71.) flowers pale red, with dark anthers; corolla downy, viscid, with a cylindrical inflated tube; calycine segments serrulate, as well as the bracteas; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica aréti-a, Andr. heath. 2. t. 61. Corollas orange-yellow.

52. **S. virídis**; leaves linear, spreading, subrecurved; flowers crowded, verticillate, horizontal; bracteas one-half shorter than the calyx; corolla cylindrical, ribbed, dilated in the middle, with a revolute limb; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica viridi-s, Andr. heath. 2. t. 59. Ait. hort. kew. 2. p. 370. Flowers green-yellowish.

53. **S. Híbbertiá'na**; leaves 4-6 in a whorl, linear, glabrous, spreading; flowers horizontal, crowded, disposed in a whorled crown; bracteas 3, two of which are close to the calyx, and the third remote; corolla glabrous, cammy, cylindrical, curved, clavate, with an erect limb; anthers a little exerted. **†**, **G**. Native of the Cape of Good Hope. Erica Híbbertiá-na, Andr. heath. 3. t. 68. Erica Hibbertiana, Ait. hort. kew. 2. p. 378. Sins. bot. mag. 1728. Corollas dark red or purplish-red, with a yellow mouth.

54. **S. onosmóflórà**; leaves linear, spreading, glabrous; flowers crowded, axillary, subverticillate; corolla viscid, with a cylindrical tube and spreading limb; bracteas one-half shorter than the calyx. **†**, **G**. Native of the Cape of Good Hope. Erica glutinnósà, Andr. heath. 1. t. 60. Erica viscósa, Wendl. eric. with a figure. Erica onosmáflóra, Sal. in Lin. trans. 6. p. 363. Corolla sulphur-coloured; tube clavate, 9-10 lines long. Calycine segments ovate-oblong.

55. **S. echíflórà**; leaves 5-7 in a whorl, linear, downy, with rough margins, spreading; flowers axillary, horizontal, spicate; bracteas close to the calyx; corolla with a short inflated ribbed tube, cammy; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica echíflóra, Andr. heath. 3. t. 62. Lodd. bot. cab. 356. Erica echíflóra, var. superba, Bedf. eric. wob. p. 8. Corollas deep red or reddish-purple.

*Var. ψ*, *purípara* (Bedf. eric. wob. p. 8.) corolla purple, with a short equal tube, that is not inflated.

*Var. γ*, *cocinée* (Lodd. cat. p. 25.) corollas deep red or scarlet.

56. **S. argéntiflórà**; leaves linear, glabrous, spreadingly incurved; flowers axillary, horizontal, spicate, rather pellucid; bracteas close to the calyx; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica argéntiflóra, Andr. heath. vol. 4. with a figure. Corolla tubular, short, white.

57. **S. Archèriá'na**; leaves 6-7 in a whorl, serrately ciliated, spreading; flowers axillary and terminal, crowded, verticillate; pedicels triradiate, 2 of the bracteas near the calyx, and the third remote; corolla downy, viscid, with a cylindrical inflated tube; calycine segments serrulate hispid, as well as the bracteas; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica Archéria, Andr. heath. 2. t. 66. Erica Archériá-na, Ait. hort. kew. 2. p. 378. Lodd. bot. cab. 1466. Corolla deep reddish-purple or scarlet. Ovarium cylindrical.

**Lady Archer’s Syringodæa.** Fl. April, Sept. Clt. 1796. Shrub.

58. **S. rósea**; leaves filiform, erect, 5-6 in a whorl; flowers sessile, terminating small branches; bracteas close to the calyx; corolla glabrous, with a cylindrical cylindrical segments; calycine segments subulate; anthers inclosed. **†**, **G**. Native of the Cape of Good Hope. Erica rósea, Andr. heath. 2. t. 13. Lodd. bot. cab. 782. Flowers red.

59. **S. Salsibúriá'na**; leaves linear, erect, with revolute margins, white beneath; flowers axillary, racemose spicate, tufted, crowded, drooping; corollas cylindrically clavate; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica Salsibúria, Andr. heath. vol. 4. with a figure. Erica rósea, Hort. Bedf. eric. wob. p. 132. Flowers purplish red.

60. **S. grandíflórà**; leaves linear, bluntish, glabrous, reclinate; flowers axillary near the tops of the branches and stem, verticillate; bracteas small, close to the calyx; calycine segments ovate-lanceolate; corolla long, curved, trumpet-shaped, viscid, with a revolute limb; anthers exerted. **†**, **G**. Native of the Cape of Good Hope. Erica grandíflóra, Bl W. jun. suppl. 223. Curt. bot. mag. 189. Pl. hort. kew. t. 8. Andr. heath. 1. t. 50. Erica grandiflora longiflora, Wendl. eric. 6. p. 5. with a figure. Lodd. bot. cab. 498. Corolla orange-yellow outside, yellow inside. Leaves from 4 to 6 in a whorl, but usually the latter number.

*Var. ψ*, *formósà*; leaves 8 in a whorl; pedicels bracteate, 2 of the bracteas close to the calyx, and the third remote from it; corollas reddish-orange. Erica formósà, Bedf. eric. wob. p. 10.

*Var. γ*, *hámítis*; leaves 4 in a whorl. Shrub dwarf.

59. **S. Andréusí**; flowers scarlet. **†**, **G**. Erica formósà, Andr. heath. 2. t. 64.

61. **S. Lééà’na**; leaves linear, filiform, stiff, obtuse, spreading; flowers axillary, verticillate; bracteas close to the calyx, and length of it; corolla 5-6 lines long, viscid, with a calyptra 4-ribbed tube, and a spreading limb; calyx adpressed; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica Lééà, Andr. heath. 1. t. 59. Erica Lééà, Ait. hort. kew. 2. t. 376. Pl. kew. 24. Lodd. bot. cab. 298. Erica costéflóra, Sal. in Lin. trans. 6. p. 363. Corollas orange-red.

**Lee’s Syringodæa.** Fl. May, Jan. Clt. 1788. Shrub.

62. **S. cethálótes**; leaves linear; flowers disposed in capitate whorls; calyx downy; corolla tubularly clavate; anthers inclosed; style exerted. **†**, **G**. Native of the Cape of Good Hope. Erica cethálótes, Thunb. diss. no. 23. prod. 70. Willd. spec. 2. p. 398. Corolla purple.

*Var. ψ*, *Bedfordiana*; bracteas coloured; calyx woolly; genitils exerted; flowers nearly terminal, verticillate; corolla with
ERICACEÆ. XV. SYRINGODAE. 823

§ 2. Anthers awned or crested. Aberrant species.

* Leaves 3 in a whorl.

71 S. discolor; leaves linear, spreading, ciliated; flowers terminal, by threes; bracteas close to the calyx; calycine segments serrulatated; corolla 9-10 lines long, anointed with gluten, cylindrical, having the tube finely striated; awns of anthers short, glabrous. ♂ G. Native of the Cape of Good Hope. Erica discolor, Andr. heath. t. 1. t. 3. Wendl. eric. p. 5. p. 9. with a figure. Loddd. bot. cab. 1452. Erica cupressiformis, Sal. in Lin. trans. 6. p. 354. Corollas pale red.

72 S. mucosa; leaves crowded, linear, spreading reflexed, 3-5 in a whorl; flowers axillary, verticillate, near the tops of the branches; bracteas broad at the base, remote from the calyx; calyx foliaceous; corolla with a wrinkled tube; awns of anthers long, downy. ♂ G. Native of the Cape of Good Hope. Erica mucosa, Andr. heath. vol. 4. with a figure. Flowers reddish-purple.

73 S. densifolia; leaves linear-oblong, imbricated, glabrous; flowers axillary, ciliated; corolla cylindrically-clavate, downy; style exerted. ♂ G. Native of the Cape of Good Hope. Erica densifolia, Wildl. spec. 2. p. 359. Flowers purplish-red.

74 S. Ewerana; leaves linear, scabrous, spreading; flowers subspicate; bracteas remote from the calyx; calyx flat, with thick margins; corolla cylindrical, 8-10 lines long, clothed with viscid down, curved and clavate; style exerted; awns of anthers long, downy. ♂ G. Native of the Cape of Good Hope. Erica Ewerana, Dry. in Ait. hort. kew. 2. p. 368. Loddd. bot. cab. 303. Erica Ewerana, Hort. Erica Uhlria, Andr. heath. 2. t. 3. Wendl. eric. 18. p. 91. Erica decora, Sal. in Lin. trans. 6. p. 354, with a figure. Corolla dark red, or reddish-purple, with a greenish-yellow mouth.

Var. β, pilosa (Andr. heath. 2. t. 4.) leaves pilose; bracteas close to the calyx; flowers terminating small branches; corolla slightly curved and clavate, purplish-red, with a greenish-yellow mouth.

75 S. hirta; leaves linear, ciliated; flowers terminal; bracteas sessile, close to the calyx, ciliated; corolla cylindrical; style exerted; anthers awned. ♂ G. Native of the Cape of Good Hope. Erica hirta, Andr. heath. 3. t. 5. Loddd. bot. cab. 1116, but not of Thumb, nor Wildl. Corolla reddish-purple, with a greenish-yellow mouth.

76 S. crevulens; leaves linear, subulate, glabrous, spreading; flowers terminal, by threes; bracteas remote from the calyx; calyx serrated; corolla 9-12 lines long, shining, smooth, with a clavate, more or less compressed, curved tube; style exerted; pericarp ovate. ♂ G. Native of the Cape of Good Hope. Erica cruenta, Pl. kew. t. 13. Loddd. bot. cab. 1656. Erica mellifiens, Sal. in Lin. trans. 6. p. 354. Corolla reddish-purple or blood-coloured.

Var. β; calyx slightly serrated; corolla deep red or scarlet. ♂ G. Erica cruenta, Andr. heath. 1. t. 9. Sol. in Ait. hort. kew. ed. 1. vol. 2. p. 16. Wendl. eric. 4. p. 11. with a figure.
ERICACEÆ.

77 S. viridiflora; leaves 3 in a whorl, or alternate, ciliated; flowers terminal, drooping; bracteas imbricate; corolla with a cylindrical clavate tube; style exserted; anthers a little exserted, suberistate. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica hispa var. C. G. Lodd. heath. 3. t. 7. Lodd. bot. cab. 917. Flowers deep green.

78 S. scoposa; leaves linear, downy, spreading; flowers terminal, by threes; bracteas close to the calyx; calyceine segments broad, short, imbricate, with woolly edges; corolla with a cylindrical, infulated, curved tube, and an erect limb; style exserted, incurved at the top; anthers awned, about the length of the corolla. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica speciosa, Andr. heath. 3. t. 2. Lodd. bot. cab. 575. Ait. hort. kew. 2. p. 569. Corollas dark red or reddish-purple, with a greenish-yellow mouth.

79 S. Dickensii; leaves glabrous; flowers terminating the small branches; bracteas imbricate, angular; corolla with a bell-shaped tube, and large spreading segments; anthers a little exserted, crestted; style exserted. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica Dickensëa, Bedf. eric. wob. p. 8. Lodd. bot. cab. t. 1816. Flowers yellow.

Var. \( \beta \), albâ; flowers white.
Var. \( \gamma \), râbra; flowers red.

80 S. mutabilis; leaves linear, ciliated, spreading, 3-4 in a whorl, the terminal hairs the longest; flowers terminal, umbellate; pedicels downy; bracteas 3, 2 near the calyx, and the third remote from it; calyceine segments ciliated, with glandular hairs; corolla cylindrical, inflated; filaments awned; anthers a little exserted; style exserted. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica mutabilis, Andr. heath. 3. t. 31. Sims, bot. mag. 2518. Lodd. bot. cab. 46. Corolla purplish-red, deeper towards the top. The hairs or down on the plant are tipped with black glands in the young state.

Changeable-flowered Syringodea. Fl. Year. Ct. 1798. Shrub 1 to 2 feet.
81 S. cuspidaëra; leaves linear, pedicels glabrous; calyceine segments ovate, cuspidate; flowers terminal; corolla 11-12 lines long, downy, having the interstices of the limb lanceolate at the base; anthers hairy, awned; filaments rather villous. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica cuspidaëra, Sal. in Lin. trans. 6. p. 358.

82 S. densâ; leaves 4-5 in a whorl, linear, somewhat imbricated, spreading; flowers axillary, crowded, nearly sessile; bracteas close to the calyx; calyx adpressed; corolla with an oblong-cylindrical tube, and a short spreading limb; anthers awned; style a little exserted. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica densa, Andr. heath. 3. t. 30. Corolla pale red, with a deep spreading border, like a Callista, of which it may probably be a species.

83 S. naëna; stem trailing; leaves linear, spreading, obtuse; flowers terminal; bracteas close to the calyx, imbricated, ciliated; corolla 9-11 lines long, downy outside, with a clavate compressed tube; style exserted; awns of anthers long. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica naëna, Sal. in Lin. trans. 355. Erica depressa, Andr. heath. 2. t. 12. but not of Thub. nor Wild. Corollas yellow-green.

84 S. ostrina; leaves 4-5 in a whorl, glabrous; flowers terminal; corolla cylindrical, curved, widened to the throat. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica ostrina, Lodd. bot. cab. 1218. Corolla purplish-red.

85 S. hybrida; leaves linear, glabrous, flowers terminal; bracteas close to the calyx; corolla glabrous, with a cylindrical, slightly curved tube; style exserted; anthers aristate. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica hybrida, Hort. Flowers purplish-red. Nearly allied to S. cylindrica.

86 S. nitens; leaves hairy, flowers terminal; pedicels triciliate; bracteas 2 of the bracteas near the calyx, and the third remote; calyx coloured, hairy; corolla with a curved subclavate tube; glands aristate, a little exerted. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica nitens, Hort. Bedf. eric. wob. p. 16. Corolla purplish-red, with a green top.

87 S. sanguinea; leaves linear, glabrous; flowers nearly terminal, crowded, verticillate; calyxes broad; bracteas remote from the calyx; corolla cylindrical; anthers a little exerted, suberistate; style exerted. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica sanguinea, Lodd. bot. cab. 86. Flowers deep red.

88 S. virens; leaves linear, incurved erect, hairy; flowers terminal, sessile; bracteas close to the calyx; corolla clammy; style exerted, incurved. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica virens, Lodd. bot. cab. 225. Corolla greenish-yellow. Anthers awned.

89 S. ambigua; leaves linear, rather hairy, spreading; flowers terminal, usually solitary; bracteas close to the calyx; calyceine segments subulate, adpressed; corolla striated, glabrous, with a cylindrical tube and short reflexed limb; style a little exerted; anthers awned. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica ambigua, Wendl. eric. fasc. 16. p. 61. with a figure. Erica cylindrica, Andr. heath. 3. t. 30. Lodd. bot. cab. 1734. Corolla reddish-purple.

90 S. cuciciformis; leaves linear, downy; flowers terminal; pedicels downy; corolla 2-10 lines long, downy, with a recurved spreading limb; filaments downy; anthers awned. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica cuciciformis, Sal. in Lin. trans. 6. p. 359. Erica tubiflora, Thunb. diss. no. 31. Flowers reddish-purple.

91 S. claviflora; leaves linear, glabrous, spreading; flowers axillary, nearly sessile, spicate; bracteas imbricate; calyx fleshy, with orbicularly spatulate entire segments; corolla downy, 10-12 lines long, clavate; style exerted; anthers awned. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica claviflora, Sal. in Lin. trans. 6. p. 205. Erica sessiliflora, Andr. heath. 2. t. 10. Corollas greenish-yellow.

92 S. epistomia; leaves glabrous; flowers terminal; bracteas remote and close to the calyx; calyx green, large, inflated; corolla with an oblong inflated tube; genitils inclosed, aristate. \( \frac{7}{4} \). G. Native of the Cape of Good Hope. Erica epistomia,

93 S. sacculiflora; leaves linear, flowers terminal; calycine segments broad, ovate, acuminate; corolla 6-8 lines long, glabrous, with a cylindrical tube; awns of anthers long; anthers linear, papillose. \( \beta \). G. Native of the Cape of Good Hope. Erica sacculiflora, Sal. in Lin. trans. 6. p. 355.

94 S. Patersonii; leaves dense, linear, straight, spreading, glabrous; flowers crowded, axillary; bracteas close to the calyx; calycine segments ciliated at the base, and cuspidate at the apex; corolla 6-8 lines long, glabrous, with a cylindrical tube and a short reflexed limb; style exserted; awns of anthers long. \( \gamma \). G. Native of the Cape of Good Hope. Erica Patersonii, Andr. heath. 1. t. 10. Wendl. eric. fasc. 1. p. 16. with a figure. Erica Patersonii, Ait. Hort. kew. 2. p. 379. Lodd. bot. cab. 1729. Erica abietina, Lin. spec. ed. 2. p. 506. diss. no. 20. Erica spissaflora, Sal. in Lin. trans. 6. p. 355. Flowers yellow.

Var. \( \beta \), moustrousa (Bedf. eric. wob. p. 17.) corolla larger.

Var. \( \gamma \), Major (Andr. heath. 3. t. 10.) calyx slightly toothed.

95 S. velitatis; leaves linear; flowers terminal; corolla 2 to 3 lines long, downy, with an obovate tube and a recurvedly spreading limb; crests of anthers long, cucurited, and a little serrated. \( \gamma \). G. Native of the Cape of Good Hope. Erica velitatis, Sal. in Lin. trans. 6. p. 357.

96 S. glava; leaves linear, triquetrous, stiff, glabrous; spreading; flowers axillary, verticillate, pendulous, crowded; pedicels glabrous; bracteas lanceolate, close to the calyx, ribbed; calycine segments lanceolate; corolla downy, 7-9 lines long, with a cylindrical inflated tube, 4-angled at the base; genitils incised; anthers awned. \( \beta \). G. Native of the Cape of Good Hope. Erica glava, Wendl. eric. with a figure. Erica gelida, Andr. heath. 2. t. 11. Att. Hort. kew. 2. p. 370. Lodd. bot. cab. 699. Erica alveiflora, Sal. in Lin. trans. 6. p. 366. Flowers green. Leaves 4-6 in a whorl.

Var. \( \beta \), abinesis (Bedf. eric. wob. p. 11.) corolla with a white base and a green top.

Var. \( \gamma \), giliea (Wendl. eric. fasc. 12. p. 13. with a figure); bracteas remote from the calyx; flowers disposed in a verticillate crown, greenish-yellow. Leaves 4-5 in a whorl.

97 S. mammosa; leaves linear, subulate, glabrous, erect, spreading; flowers drooping, axillary, crowded, verticillate, near the tops of the branches; bracteas linear, remote from the calyx; calyx coloured; pedicels downy; corolla downy, 8-10 lines long; with a cylindrical inflated tube, having 4 pits near the base; genitils incised; anthers awned. \( \gamma \). G. Native of the Cape of Good Hope. Erica mammosa, Lin. mant. 294. diss. 21. Andr. heath. 1. t. 8. Lodd. bot. cab. 125. Erica mammosa, \( \beta \). Sal. in Lin. trans. 6. p. 366. Var. \( \beta \), minor (Andr. heath. 3. t. 9.) corolla more slender, purplish-red.

Var. \( \gamma \), pallida (Lodd. bot. cab. 931.) flowers paler.

98 S. tumida; leaves linear, obtuse, hairy, reflexed; flowers terminal, usually by fours; pedicels trichoblate, 2 of the bracteas close to the calyx, and the third remote; corolla downy, with an oblong-cylindrical tube; calyx spreading; style somewhat exserted; anthers anawnd. \( \beta \). G. Native of the Cape of Good Hope. Erica tumida, Ker. bot. reg. t. 65. Erica spiculata, Andr. heath. vol. 4. with a figure. Erica spiculata, Hort. Loud. hort. brit. p. 116. Flowers red.

99 S. Bowieana; leaves linear, glaucous, glabrous; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, pendulous; corolla cylindrical, with an inflated tube, and contracted mouth; genitils inclosed; anthers awned. \( \beta \). G. Native of the Cape of Good Hope. Erica Bowieana, Lodd. bot. cab. 842. Erica Bowiana, Bedf. eric. wob. p. 4. Erica Baiiana, Andr. heath. vol. 4. with a figure. Flowers white.—Habit of S. mammosa, and S. verticillata, &c.

*** Leaves 5-6 to 8 in a whorl.

100 S. cerviciflora; leaves 5-6 in a whorl, linear; flowers axillary, crowded; corolla 5-6 lines long, downy, with a very narrow urceolate tube and a spreading limb; filaments minutely spurred. \( \beta \). G. Native of the Cape of Good Hope. Erica cerviciflora, Sal. in Lin. trans. 6. p. 362. Erica impetaria, Hort. Pedicels trichoblate.

101 S. Patersonioides; leaves linear, glabrous, 5-6 in a whorl; flowers crowded, verticillate; bracteas close to the calyx, toothed; corolla with a cylindrical, clavate, curved tube; style exserted; anthers aristate. \( \gamma \). G. Native of the Cape of Good Hope. Erica patersonioides, Bedf. eric. wob. p. 18. Erica Patersonia coccinea, Andr. heath. 3. t. 11. Corolla deep redish-orange or scarlet.

102 S. cahinata; leaves 5 in a whorl, reflexed, woolly; flowers terminal; bracteas remote from the calyx; corolla with a cylindrical, inflated, ribbed tube; crests of anthers plumose; style a little exserted. \( \gamma \). G. Native of the Cape of Good Hope. Erica carninata, Lodd. bot. cab. 1071. Corollas reddish-purple.

103 S. rotundus. We know nothing further about this species. \( \gamma \). G. Native of the Cape of Good Hope. Erica foliaca, or foliacea, Andr. heath. vol. 4. with a figure. Flowers of an orange-yellow colour.

104 S. spicata; leaves linear, subulate, hispid, spreadingly reflexed, 6 in a whorl; pedicels very short; bracteas sessile; flowers axillary, crowded, verticillate, spicate, drooping; calycine segments ciliolate, spatulate, entire; corolla downy, 7-9 lines long, cylindrical; genitils incised; anthers awned. \( \gamma \). G. Native of the Cape of Good Hope. Erica spicata, Thumb. diss. no. 71. with a figure. Wendl. eric. fasc. 2. p. 27. with a figure. Erica sessiliflora, Lin. suppl. 222. Erica favosa, Sal. in Lin. trans. 6. p. 365. Corollas yellowish-green.

Var. \( \beta \); corolla 5-7 lines long, having the segments contiguous at the base. \( \gamma \). G. Erica spicata, Andr. heath. 1. t. 11. Lodd. bot. cab. 1203. Flowers greenish-yellow.

105 S. fascicularis; leaves 8 in a whorl, narrow-linear, obtuse, glundularly ciliated, spreading, a little recurved; bracteas remote from the calyx; flowers crowded, axillary, verticillate, near the tops of the branches, horizontal; corolla 13 lines 5 N
long, viscid, with a cylindrical clavate tube and an erect limb; pedicels and bracteas glandular; style a little exserted; anthers subulate. \( \text{G} \) Native of the Cape of Good Hope. Erica fasciculāris, Lin. suppl. 219. Phl. kew. t. 6. Erica corenāta, Andr. t. 1. Bedd. eric. wob. pl. 11. f. 17. Erica oc-}

106 S. spectriformis; leaves 8 in a whorl; stem straight; pedicels very short, axillary, crowded; calyx callous, with broad, spathulate, deeply serrated segments; corolla 7-10 lines long, downy. \( \text{G} \) Native of the Cape of Good Hope. Erica spectriformis, Sal. in Lin. trans. 6. p. 365. Erica enneaphylλa, Roxb. mas.

107 S. ? Doliiformis; leaves hairy, linear, 6 in a whorl; bracteas close to the calyx; flowers terminal; corolla 4-5 lines long, viscid, with an urceolate tube; anthers of anthers short, exserted. \( \text{G} \) Native of the Cape of Good Hope. Erica doliiformis, Sal. in Lin. trans. 6. p. 368. Erica nannmosa, Thumb. diss. no. 69, with a figure.

† Species hardly known.

109 S. ruvida; leaves linear, 4 in a whorl, glabrous; flowers terminal and axillary; bracteas distant from the calyx; corolla tubular, drooping; anthers. \( \text{G} \) Native of the Cape of Good Hope. Erica ruvida, Lodd. bot. cab. 1166. Pedicels and calyces red. Corollas white. Reddish-calycexed Syringodea. Fl. May, June. Cl. 1826. Shrub.

110 S. exoπīta; leaves 4 in a whorl, hairy, calyx, bracteas, and pedicels, clothed with glandular hairs; flowers terminal, by threes or fours; corolla cylindrical. \( \text{G} \) Native of the Cape of Good Hope. Erica exoπīta, Lodd. bot. cab. 1521. Flowers red.

XVI. DASYANTHES (from čaπe, dasys, hairy, and anthus, a flower; in reference to the corolla, which is hairy). D. Don, in edinib. phil. journ. 17. p. 136.—Erica species of Lin. Līn. sīst. Octandria, Monogynia. Calyx 4-parted, bibrac-}
teate at the base; Corolla tubular, hispid, with an erect 4-lobed limb. Stamens included; filaments capitellate; anthers bipartite; cells of anthers mutic at the base, debasing longitudinally. Stigma large, flat. Capsule 4-celled, many-seeded. —An erect shrub, native of the Cape of Good Hope. Leaves loosely

imbricate, hispid from bristles, with revolute margins. Flowers terminal, fascicled, yellow.

1 D. sparmannii (D. Don, l. c.). \( \text{G} \) Native of the Cape of Good Hope. Erica sparmannii, Lin. suppl. 219. in act-}

XVII. ECTASIS (from ἐκτασία, ectasis, extension; from the stamens being much exserted). D. Don, in edinib. phil. journ. 17. p. 156. Erica species of authors. Lin. sīst. Octandria, Monogynia. Calyx 4-leaved, glama-}
ceous. Corolla tubular, rather ventricose at the base, with a 4-toothed limb. Stamens much exserted; filaments dilated; anthers bipartite; cells of anthers elongated, tubular, dehiscing by a longitudinal fissure, continuous, with the base of the filaments mutic. Stigma clavate, truncate. Capsule 4-celled, many-seeded. Seeds ovate, compressed, smooth, shining—Much-branched shrubs, natives of the Cape of Good Hope. Leaves loosely imbricate, with revolute edges, flat above, or 3 or 4 in a whorl, but mostly the latter number. Flowers terminal, solitary or numerous.

Var. β; corollas of a dirty rufous colour. \( \text{G} \) Erica petiveri, Thumb. diss. 21.

Var. γ; hirsuta (Andr. heath. t. 72.) leaves hairy; corollas deep red.

young; flowers solitary, terminal; corolla with a cylindrical 
tube, 7-9 lines long. ²·G. Erica vestiflora, Sal. in Lin. trans. 

7 Erico Saba (D. Don, l. c.) leaves recurvedly spreading; 
tube of corolla cylindrical, incurved, ventricose at the base; 
pericarp oval; calyx and bracteas glabrous. ²·G. Native of 
the Cape of Good Hope. Erica Seba, Pl. kew. t. 10. Erica 
coccinea, Lin. spec. ed. 2. p. 505. Erica cothornaillii, Sal. in 
by threes. Corolla pale brown.
Var. ²·G. Alba; bracteas and calyx downy. ²·G. Erica Pluk-
Var. ²·G. Rubra; flowers reddish-orange at top and redish-
purple at the base; anthers orange-yellow.
Var. ²·G. Atrorubens; flowers reddish-purple. ²·G. 
Seba's Ectasis. Fl. April, Nov. C1774. Shrub
8 E. eccipientflora; leaves recurvedly spreading; corolla coni-
cal; flowers by threes; fruit ovate. ²·G. Native of the 
Cape of Good Hope. Erica socciiflora, Sal. in Lin. trans. 
heath. 1. icon. Corolla greenish-yellow; anthers orange-yellow.

Pomp-flowered Ectasis. Fl. April, May. C1799. Shrub
9 Erica subflorosa; leaves recurvedly spreading, downy; flowers 
by threes; corolla viscid, cylindrical; filaments very broad; 
nectarium cotyliform. ²·G. Native of the Cape of Good Hope. 
Erica subflorosa, Sal. in Lin. trans. 6. p. 348. Erica mona-
delphla, Andr. heath. t. 1. 65. Sims. bot. mag. 1370. Corolla 
white, with a red border, and orange-yellow anthers.

10 Erica monadelphla; corolla with a cylindrical tube, and re-
flexed segments; filaments very broad. ²·G. Native of the 
Cape of Good Hope. Erica monadelphla, Bedfl. eric. wob. 
p. 15. pl. 2 f. 12. Erica Banksia purpurea, Andr. heath. 3. t. 37. 
Corolla greenish-white or yellow, with a purple border, and 
yellow anthers.—Perhaps the same as the preceding.

11 Erica follicularis; leaves spreading; flowers solitary, 
spike-like; corollas conical. ²·G. Native of the Cape of 
Corolla yellow-green or orange-red, 5-7 lines long, with brown 
anthers. Nectarium quadrangular.

12 E. melastoma; leaves 4 in a whorl, stiff, secund; flowers 
terminal, solitary; corolla cone-shaped. ²·G. Native of 
the Cape of Good Hope. Erica melastoma, Andr. heath. 1. icon. 
Erica follicularis ²·G. Sal. in Lin. trans. 6. p. 348. Corolla with 
a greenish-yellow tube, a brown dark mouth, and orange 
anthers.

Black-mouthed Ectasis. Fl. May, July. C1795. Shrub
13 E. rictra; leaves 4 in a whorl; corolla cylindrical, 
incurved. ²·G. Native of the Cape of Good Hope. Erica 
orange-yellow tube, and orange anthers.

14 E. penicilliflora; leaves ciliate, erect; flowers by 
threes; corolla 2 lines long, covered by the calyx, with a 
spherical tube; anthers converging into a pencil-form. ²·G. 
Native of the Cape of Good Hope. Erica penicilliflora, Sal. in 
calyculata, Wendl. eric. 4. p. 5, with a figure. Bracteas and 
calyces white. An elegant species.

15 Erica placentaflora; leaves very obtuse; corolla covered 
by the calyx, with a turnip-formed tube; filaments gradually 
dilated; stigma narrow. ²·G. Native of the Cape of Good 
Hope. Erica placentaflora, Sal. in Lin. trans. 6. p. 348. Herb 
pale, hoary.

Placenta-flowered Ectasis. Shrub
16 E. pudibunda; leaves 3-4 in a whorl, rather viscid; 
flowers terminal, by threes; calyxes ciliate; corolla conical, 
viscid. ²·G. Native of the Cape of Good Hope. Erica 
eric. fasc. 3. p. 5, with a figure. Corolla 2 lines long; anthers 
round, hoary. Fruit turbinate, hoary. Flowers pale red?

17 E. filiformis; leaves 3 in a whorl, remote, narrow, re-
curved, clothed with viscid pubescence; calyx bracteas; corolla 
1 line long, glabrous, with a recurved tube; filaments broad at 
the top; stigma narrow; fruit smooth. ²·G. Native of the 
Cape of Good Hope. Erica filiformis, Sal. in Lin. trans. 
18 E. urceolata; hoary; leaves 4-5 in a whorl, linear, 
spreading, a little incurved, ciliate; flowers almost sessile, 
terminal, capitate; bracteas near the calyx; calyce segments 
linear, ciliate. ²·G. Native of the Cape of Good Hope. Erica 
urceolata, Nois. Lodd. bot. cab. 393. Erica stellatula, Bedfl. eric. 
Corolla urceolate.

Starly Ectasis. Fl. April, June. C1810. Shrub
19 E. demissa; leaves linear, 3 in a whorl; flowers termi-
nal; bracteas imbricate; corolla cone-shaped. ²·G. Native of 
the Cape of Good Hope. Erica demissa, Hort. Bedfl. eric. 

Low Ectasis. Fl. Spring. C1818. Shrub
20 E. ? tubrida; leaves 3 in a whorl; flowers terminal; 
pedicels very short; corolla hairy, 1½ line long, with a bulged 
tube; spurs of anthers cuneate; anthers very short. ²·G. 
Native of the Cape of Good Hope. Erica turgida, Sal. in Lin. 
trans. 6. p. 343. Erica fusco-rubens, Roxb. ms. Flowers 
brownish-red.

Turbid-flowered Ectasis. Shrub

Cult. For culture and propagation see Erica, p. 800.
XXVIII. ERIODE’S MIA (from ἐρώς, erion, wool, and κρώνη, desme, a fascicle; the flowers resemble a fascicle of wool). D. Don, in edinb. phil. journ. 17. p. 156. Erica capitata, Lin. & c.

XXIX. OCTOPERA (from οκτώ, octo, eight, and παπο, petra, a sack; in reference to the 8-celled capsule). D. Don, in edinb. phil. journ. 17. p. 156.—Erica Bergiana, Lin.

Cult. For culture and propagation see Erica, p. 800.

XX. EREMIA (from ἐρώς, eresos, solitary; from the seeds being solitary in the cells). D. Don, in edinb. phil. journ. 17. p. 156.—Erica Totta, Thunb.

Cult. For culture and propagation see Erica, p. 800.

XXI. SALAXIS (from salax, uncouth; but the application is not evident). Sal. Mss. spec. 2.

Cult. For culture and propagation see Erica, p. 800.

Leaves from 3 to 6 in a whorl, with revolute margins. Flowers somewhat racemose at the tops of the branches.

1 S. ARBORESCENS (Willd. ex. Spreng, syst. 2. p. 20.) leaves 3 in a whorl, adpressed; pedicels downy. \( \times \). G. Native of the Mauritius.

Arborescent Salaxis. Shrub.

2 S. MONTANA (Willd. l. c.) leaves 3 in a whorl, glabrous; flowers racemose; corollas glabrous; branches tomentose. \( \times \). G. Native of the Mauritius.

Mountain Salaxis. Shrub.

3 S. AXILLARIS (Salisb.) leaves generally 3 in a whorl, linear, spreading. \( \times \). G. Native of the Mauritius.

Erica axillaris, Th. diss. no. 10.

Axillary flowery Salaxis. Shrub.

Cult. Turfy peat mixed with rough sand is the best soil for the species of Salaxis; and young cuttings of them strike root readily in sand, under a bell-glass, in a little heat.

Cult. For culture and propagation see Erica, p. 800.

Cult. The varieties of Calluna vulgaris are very ornamental when planted in a border or clump, along with the dwarf hardy species of Erica and their varieties, as Erica ciliaris, E. tetrax, E. cineraria, and Gypsophila multiformis, G. vagans, &c. The border in which they are grown requires to be composed of peat soil. All are increased by layers, or young cuttings under a bell-glass.

SUBRIBE II.

ANDROMEDA. (This Subvirtae contains plants agreeing with Andromeda in the Corolla being dead.) D. Don, in Edinb. phil. journ. 17. p. 157. Corolla deciduous.

XXIII. ANDROMEDA (named from the daughter of Cepheus, rescued from the sea-monster by Perseus). D. Don, in
phil. journ. 17, p. 157. Andromeda, species of Authors. Polyfolia, Buschbaum, cent. 5. p. 5. t. 55. f. 1.

Linc. syst. Decandria, Monogynia. Calyx 5-leaved; segments acute, simple at the base. Corolla globose, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments bearded; cells of anthers short, tumid, furnished with one awn each. (f. 136 g.)

* Leaves flat.

1 C. hypnoides (D. Don, l. c.) leaves loose, acerose. H. Native of Lapland, Denmark, and Siberia, on the mountains, where it covers tracts of land; and on the north-west coast of America. Andromeda hypnoides, Linn. spec. 659. fl. lapp. 165. t. 1. f. 3. Ord. fl. dan. t. 10. Pall. fl. ross. p. 55. t. 73. f. 2. Hook. bot. mag. t. 2936.—A small creeping shrub, resembling a moss. Flowers small, with a red calyx, and white corolla.

Club-moss-like Cassiope. Shrub creeping.

** * Leaves imbricated in 4 rows, adpressed, with revolute margins, tumid, somewhat bilocular.

3 C. tetragona (D. Don, l. c.) leaves obtuse, muticately ciliated; peduncles glabrous. H. Native of Lapland and Siberia; of North America, in Canada, Labrador, and the north-west coast; Island of St. Lawrence, Kotzebue Sound. Andromeda tetragona, Linn. spec. 565. fl. lapp. 166. t. 1. f. 4. Pall. fl. ross. p. 50. t. 73. f. 4. Hook. bot. mag. t. 3181. Flowers white.

Mertens' Cassandra. Shrub ½ foot.

5 C. ericoides (D. Don, l. c.) leaves awnned, setose-ciliated; peduncles glabrous. H. Native of Dahuria and Kamtschatka. Andromeda ericoides, Pall. fl. ross. p. 56. t. 73. f. 3. Flower.?

Heath-like Cassiope. Shrub ½ foot.

Fastigate Cassiope. Shrub procumbent.

7 C. Redowskii; leaves scale-formed, shining, smooth, fringed, imbricating in 4 rows, making the branches appear exactly tetragonal; pedicels axillary, glabrous. H. Native of the cast of Siberia. Andromeda Redowskii, Cham. et
ERICACEÆ. XXV. CASSANDRA.

Schlecht. in Linnaea. 1. p. 517. Shrub procumbent, much branched. Flowers drooping. Calyx deeply 4-parted. Corolla campanulate, quadi- riform, with very blunt segments. Stamens 8, very short; anthers 3-celled, biariastate, the cells opening by a pore at the apex. Capsule 4-valved; valves septiciduous in the middle.

Redowski’s Cassiope. Shrub procumbent.

Cult. All the species are delicate little shrubs: they grow well in a peat border, or in pots well drained with shreds in the same kind of soil; and may be increased by layers.

XXV. CASSANDRA (a mythological name of the daughter of Priamus and Hecuba). D. Don, in edinb. phil. journ, July, 1834. Andromeda species, Lin. and others.

Lin. syst. Decandria, Monogynia. Calyx 5-leaved, bifractate at the base; leaves imbricated at the base. Corolla ob-long, with a contracted 5-toothed mouth. Stamens 10, inclosed; filaments glabrous, simple at the base; cells of anthers elongated, and tubular at the apex, nutia. Stigma annular, with a 5-tubercled disk. Capsule with a loculicidal dehiscence. Placenta 5-lobed: lobes simple.—An evergreen shrub, common in North America, north of Europe, and the north of Asia. Branchlets recurved, pubescent. Leaves on short pedioles, elliptic-oblong, dentate-ciliate, coriaceous, veinless, lepadotid on both surfaces by peltate scales, when young silvery beneath. Flowers axillary, on short pedioles, drooping, snow white, disposed in the manner of racemes at the tops of the branches.

1 C. calyculata (D. Don, l. c.) leaves elliptic-oblong, bluish, obsolescent serruluted, rusty beneath; racemes recurved, leafy; bracts of calyx broad, ovate, acuminated; corollas oblong-cylindrical. H. Native of North America, from Canada to Virginia, in bogs and swamps, on the mountains. It grows also in Sweden, Prussia, Siberia, &c. Andromeda calyculata, Lin. spec. 565. Pall. fl. foss. 2. p. 53. f. 71. f. 1. Loddi. bot. cab. 1464.

Var. a, ventricosa (Sims, bot. mag. 1286.)
Var. b, latifolia (Lodd. bot. cab. 530.)
Var. c, obtusiloba (Sims, bot. mag. 862. Lodd. bot. cab. 836.)

Calyculata-flowered Cassandra. Fl. April, May. Clt. 1748. Shrub 1 to 3 feet.

2 C. angustifolia; leaves linear-lanceolate, acute, with sub-dulvedulate revolute edges, rusty beneath; racemes recurved, leafy; bracts of calyx minute; corollas oblong-ovate. H. Native of Carolina and Georgia, in open swamps. Andromeda angustifolia, Ait. hort. kew. 2. p. 70. Andromeda angustifolia, Pursh. fl. am. sept. 1. p. 291. Andromeda crispa, Desf. and Link.

Narrow-leaved Cassandra. Fl. April, May. Clt. 1748. Shrub 1 to 2 feet.

Cult. For culture and propagation, see Lyonia, p. 813.

Lin. syst. Decandria, Monogynia. Calyx 5-lobed. Corolla campanulate; limb revolute, 5-lobed. Stamens 10; filaments glabrous, dilated at the base; cells of anthers elongated, tubular, biariastate at the apex. Stigma truncate. Capsule with a loculicidal dehiscence. Placenta 5-lobed: lobes cuneate, thick, a little arched. Seeds angular, with a lateral oblong hylum.—Evergreen shrubs, natives of North America. Leaves scattered, dilated, with the margins usually toothed. Flowers racemose; pedioles solitary or aggregate.

Var. a, nitida (Pursh. fl. amer. sept. 1. p. 294. under Andromeda); leaves oblong—ovate, serrated, green on both surfaces. H. Andromeda cassinefolia, Vent. malm. 79. Flowers white.

Cult. See Lyonia, p. 831. For culture and propagation.

XXVIII. LYONIA (in memory of John Lyon, an indefatigable collector of North American plants, who fell a victim to a dangerous epidemic amidst those savage and romantic mountains, which had so often been the theatre of his labours). Nutt. gen. am. 1. p. 268. D. Don, in edinb. phil. journ. 17. p. 158.

Lin. syst. Decandria, Monogynia. Calyx 5-parted. Corolla ovate or tubular, with a 5-toothed contracted mouth. Stamens inclosed; filaments flattened, dilated, very short, downy; cells of anthers membranous, dehiscing lengthwise, altogether matric. Style robust, pentagonal, fusiform, thickened at bottom; stigma simple, truncate. Capsule pentagonal, 5-celled, with a loculicidal dehiscence; margins of valves closed by 5 other external narrow valves. Seeds acicular, imbricated.—Shrubs, natives of North America. Leaves usually membranous and downy. Flowers for the most part terminal, disposed in racemose panicles.

* Leaves evergreen.

1 L. ferruginea (Nutt. gen. am. p. 266.) shrubby; leaves on long pedioles, coriaceous, ovate, usually obtuse, quite entire, with hardly revolute edges, covered with brown umbilicate furfuraceous scales, as well as every other part of the plant; pedioles axillary, collected into threes or fives; corollas small, ovate-globose. H. Native of Georgia, Florida, and Mexico, in pine woods. Andromeda ferruginea, Wltl. fl. car. 138. Vent. malm. t. 80. Andromeda ferruginea, β, fruticosa, Michx. fl. amer. bor. 1. p. 252. Corollas white inside, and rusty outside.

2 L. nigida (Nutt. gen. am. p. 266.) arborescent; leaves coriaceous, stiff, crowded, on short pedioles, cuneate-lanceolate, acute, quite entire, convex, with revolute edges, clothed with brown, umbilicate furfuraceous scales, as well as every other part of the plant; pedioles aggregate, axillary; corollas globose. H. Native of Carolina and Florida, in barren sandy woods. Andromeda ferruginea, Wildl. spec. 2. p. 609. Ait. hort. kew. 2. p. 67. Andromeda ferruginea, a, arboreccens, Michx. 1. p. 252. Andromeda rigida, Pursh. fl. Amer. sept. 1. p. 292. Loddi. bot. cab. 430. Corollas white inside. This species is very nearly allied to the preceding; but their habits, and particularly their flowering time, differ so materially, that they are actually distinct.

3 L. marginata (D. Don, in edinb. phil. journ. 17. p. 159.) quite glabrous; branchlets somewhat 3-sided; leaves coriaceous, oval, acuminate, quite entire, smooth, having the midrib running through the deflexed margin; pedioles axillary, aggregate; corollas cylindrical; calyces segments elongated, linear, coloured. H. Native of Carolina and Florida, in sandy forests. An-

* * Leaves deciduous.

4 L. MARIA'NA (D. Don, in edinb. phil. journ. 17, p. 159.) leaves oval, acutish at both ends, quite entire, glabrous, rather coriaceous, paler beneath; floriferous branches almost leafless; pedicles aggregate; corolla ovate-cylindrical; calyx foliaceus; capsule conoid. & H. Native from New England to Florida, in woods and dry swamps, particularly in sandy soil. Andrómeda Mariána, Lin. spec 564. Sims, bot. mag. 1057.—Phk. mant. 448. A dwarf shrub. Flowers large, white, sometimes tinged with red. This plant has a number of very striking varieties.

5 L. RACEMÓSA (D. Don, l. c.) leaves oval-lanceolate, acute, serrated, membranous, glabrous; spikes terminal, second, elongated, simple, or branched; bracteas linear, acute; corollas cylindrical; calyces acute, bifracteate at the base. & H. Native from Canada to Carolina, in bogs and swamps. Andrómeda racemósa, Lin. spec. 564. Lher. stirp. 2. t. 13. Andr. paniculátal. Wart. carol. 138.—Grn. virg. 67. Flowers white. A middle-sized shrub, which may be reckoned one of the finest in North America, not only for the graceful appearance of its flowers, but also for the fine odour they have. The cells of the anthers are said to be bistratate at the apex; it is, therefore, probably, a species of *Zenobia*. There are several varieties of the plant.

6 L. ARBÓREA (D. Don, l. c.) branches terete; leaves oblong, acuminate, mucronately serrated, glabratus; panicles terminal, or many spikes; corollas ovoid-cylindrical, downy. & H. Native from Pennsylvania to Florida, in the valleys of the Alleghany Mountains. Andrómeda arbórea, Lin. spec. 565. Sims, bot. mag. 905.—Catesb. car. 1. t. 71. A beautiful tree, from 40 to 60 feet high. Flowers white. The leaves have a very pleasant acid taste, from which it has been called sorrel-tree. They are frequently made use of by hunters in those mountains, to alleviate thirst.

7 L. PANCíLÁTAL (Nutt. gen. amer. 1. p. 266.) downy; leaves obovate-lanceolate, subacuminate at both ends, and almost entire; floriferous branches terminal, panicled, nearly naked; clusters of flowers pendunculate; corollas nearly globose, downy. & H. Native from Canada to Carolina, common in all swamps and woods. Andrómeda paniculátal. Lin. spec. 564. Lher. stirp. nov. 2. t. 12. Wats. dendr. brit. 37. Flowers small, white. There are a number of varieties of this species, differing in size, pubescence, shape of leaves, &c. Upper surfaces of the older leaves nearly smooth.

8 L. FRONDÓSA (Nutt. gen. amer. 1. p. 267.) every part of the plant is densely clothed with powdery villi; leaves oblong, or oblong-ovate, blunt, or acutish, clothed with furfuraceous villi, often rusty, prominently veined: with revolute, entire, scarious margins; panicle terminal, frondose or leafy; corollas globose, hispid or downy. & H. Native of the lower counties of Virginia and Carolina. Andrómeda frondósal., Pursh. fl. amer. sept. 1. p. 295. Flowers white. Pursh says the anthers are awned; but Nuttall thinks this must be a mistake, or that his plant must be different from that of Pursh.

9 L. MULTÍFLÓRA (Wats. dendr. brit. t. 128.) leaves narrow-lanceolate, serrated, sprinkled with hair-like atoms; panicle terminal, composed of numerous fascicled racemes. & H. Native of North America. Flowers numerous, small, white. Perhaps only a variety of *L. paniculátal*.

10 L. JAMAICÁNSIS (D. Don, in edinb. phil. journ. 17, p. 159.) branches smooth; leaves broad—lanceolate, quite entire, cinereous beneath from dot-like scales, but shining above; pedicles aggregate, on long leafless branches, scaly as well as the calyces; corollas ovate. & S. Native of Jamaica, on the tops of the mountains. Andrómeda Jamaicánésis, Swartz. fl. ind. occ. 2. p. 838. Flowers white.

Jamaica Lyonia. Shrub 6 feet.

11 L. FASCICULÁTAL *; leaves ovate-lanceolate, bluish, a little crenated, coriaceous; racemes shorter than the pedioles; pedicels aggregate, reflexed. & S. Native of the south of Jamaica, on the mountains. Andrómeda fasciculátal, Swartz, fl. ind. occ. 2. p. 836. Flowers white.

Fascicled-flowered Lyonia. Tree.

12 L. CAPELÉÁPOLIS (Wats. dendr. brit. 127.) leaves coriaceous, elliptic, short-acuminated, serrated, sprinkled with short fleshy hairs; corollas rather silky, globular, coarctate; racemes and coryumbs mixed, lateral, leafy. & H. Native of North America. Flowers white. Perhaps only a variety of *L. paniculátal*.

13 L. RUBÉGÍNÓSA *; leaves ovate, coriaceous, quite entire, obtuse, downy beneath, rusty when young; racemes lateral, erect; corollas cylindrical. & S. Native of the West Indies, in the Island of St. Thomas. Andrómeda rubégína, Perss. ench. 1. p. 481. Andr. pubécens, Poir. Leaves shining above, resembling those of *Salix capreá*. Racemes very short, in fascicles.

Rusty Lyonia. Shrub.

14 L. RHONBÍDÓIDALIS *; shrubby; floriferous branches triquetrous; leaves somewhat rhomboid-oblong, cartilaginous, glabrous, rusty beneath, quite entire, callous at the apex; peduncles axillary, aggregate, elongated, filiform. & H. Native of Florida and Carolina. Andrómeda rhombídóidális, Duham. ed. nov. abr. 192.

Rhombid-leavedd Lyonia. Shrub.

Cult. The species thrive best in peat soil, or a sandy loam. Being very ornamental, they are desirable shrubs in every garden. They may either be increased by layers or by seeds. The seeds should be sown in pots or pans in sandy peat soil; they should be covered slightly with earth, as they are extremely small.

XXVIII. LEUCOTHOE (e a mythological name). D. Don, in edinb. phil. journ. 17, p. 159. *Andrómeda* species of authors.

Lin. syst. Deciduas, Monogyná. Calyx 5-leafed; leaves imbricated at the base. Corolla turbular, 5-toothed. Stamens inclosed; filaments dilated, flattened, downy; cells of anthers short, truncate, mutic. Stigma ample, capitate. Capsule with a loculicial dehiscence.—Evergreen shrubs, natives of North
ERICACEÆ. XXVIII. LEUCOTHEA.

America. Leaves coriaceous, dentately spinulose. Flowers white, racemose, axillary, or terminal.

1. L. axilla'ris (D. Don, l. c.) leaves oblong or oval, acuminate, upper part cartilagiously and mucronately serratulate, covered by scattered glandular hairs on the under surface; young branches clothed with powdery down; racemes axillary, spicate, sessile, beset with scaly bracteas; corollas ovate-cylindrical; filaments ciliated, very short. \( \text{fl.} \) H. Native from Virginia to Georgia, on the mountains. Andromeda axillaris, Solander in Hort. kew. 2. p. 392. Pursh. fl. amer. sept. 1. p. 292. Leaves glabrous. Flowers in short spikes, white. Capsule depressed, globose.

3. L. acumin'a'ta; quite glabrous; leaves ovate-lanceolate, gradually narrowed to the top, acuminate, quite entire or unequally serrate, glabrous, shining, reticulately veined, coriaceous; racemes sub-pedicellate, axillary, or terminal, ciliate, the young, with scaly bracteas; corollas short, ovate-cylindrical. \( \text{fl.} \) H. Native of Georgia and Florida, in sandy swamps. Andromeda acuminatæ, Ait. hort. kew. 2. p. 79. Pursh. fl. amer. sept. 1. p. 293. Smith, exot. bot. 89. And. fl. Carolina, Michx. fl. Amer. bot. 1. p. 253. Flowers white, in great abundance, which gives the shrub a fine appearance. The stems are hollow, and are used by the natives for making their pipe stems, from whence the name [Pipes]stem-wood.

5. L. spic'a'ta; glabrous; leaves elliptic-lanceolate, acute, ovate or attenuated at the base, serrate; racemes long, lateral and terminal, secund; branches beset with short white hairs. \( \text{fl.} \) H. Native from Canada to Florida. Andromeda spicata, Wats. undr. brit. 36. Flowers white.

Cult. For culture and propagation see Lyonia, p. 831. Elegant shrubs, worth cultivating in every shrubbery for the sake of the beauty of their blossoms.

XXIX. PIERIS. XXX. PHYLLODOCE.

XXIX. PIERIS (one of the Muses) D. Don, in edinb. phil. journ. 17, p. 159. Andromeda species, Wall.

1. P. form'o'sa (D. Don, l. c.) leaves lanceolate, acuminate, crenulate, glabrous, acute at the base; racemes erectly spreading, disposed in a terminal thyside; pedicels recurved, drooping, and are, as well as the calyxes, prunose; calyce segments ovate-oblong, margined, shining; corollas ovate. \( \text{fl.} \) F. Native of Nipal, where it is called Sheabogee and Chemata.—An evergreen tree, with the habit of Arbutus or Chithera. Pedicels unilateral. Flowers rose-coloured, each furnished with a small bractea at the base. Andromeda formosa, Wall. in asiat. res. 13. p. 395. D. Don, prod. fl. nep. 119. Beautiful Pieris. Tree.

Lanceolate-leaved Pieris. Tree small.

Japan Pieris. Shrub.

Cult. Sandy peat and a little loam is the best soil for the species of Pieris; and they may be increased by cuttings not too young, planted in sand, with a bell-glass over them.

1 P. taxifolia (Salisb. par. t. 36.) leaves with denticulated margins; peduncle aggregate, glandular; calyce segments lanceolate, acuminate; anthers 3 times shorter than the filaments. *H.* Native of Europe; and the north of Asia, at the fountain of Uda. In Scotland, in dry heathy moors, rare; near Aviemore, in Strathpey, ex Mr. H. Brown, of Perth; in the Western Isles of Shiant, G. Don. In North America, on the White Hills of New Hampshire; and on the north-west coast, and of Labrador. Menziesia corneula, Swartz, in Lind. trans. 10. p. 377. t. 30. f. a. Smith, engl. bot. 2469. Lodg. bot. cab. 164. Andrómeda corneula, Lind. spec. p. 563. fr. lapp. 165. t. 1. f. 5. Edfl. d. ian. 57. Andr. taxifolia, Pall. fl. ross. p. 54. t. 72. f. 2. fl. lapp. ed. 2. p. 133. t. 1. f. 5. fl. lapp. t. 57. Erica corneula, Willd. spec. 2. p. 388.—Gmel. sb. 4. p. 131. t. 57. f. 2. Flowers blue or purple, but Pursh says they are red in the American plant.

Pallas's Phyllodoce. Shrubs 1/2 foot.

Cult. Phyllodoce is a genus of elegant, small, heath-like shrubs; they will only thrive in peat soil, and are increased by layers.

1 B. Gmelini (D. Don, in edinb. phil. journ. 17. p. 160.) branchlets pruinose; leaves with denticulated margins; pedun-

Gmelini's BRYANTUS. Pl. trailing.

2 B. STELLÆE'rt (D. Don, l. c.) branchlets glabrous; leaves with ovate-crescented oblong; flowers solitary, nearly sessile; anthers biaristate behind; style conical. *H.* Native of the west coast of North America; on the Rocky Mountains, and near the mouth of the Columbia river; and of the Island of Sitchea. Andrómeda Stelleriana, Pall. fl. ross. p. 58. t. 74. f. 2. Menziesia empetrifórmis, Pursh, fl. amer. sept. 1. p. 265. but not of others. Flowers pale red.

Steller's BRYANTUS. Shrub trailing.

Cult. For culture and propagation see Phyllodoce, p. 583.

XXXII. DABECIA (Called St. Dabec'oe's Heath, in Ireland). D. Don, in edinb. phil. journ. 17. p. 100.—Andrómeda species, Lind.—Menziesia species, Juss.—Erica species, Lind.

Lin. syst. Octândria, Monogynia. Calyx 4-parted. Corolla oval, ventricose; limb 4-toothed. Stamens 8, inclosed; filaments dilated, glabrous; anthers linear, sagittate at the base; cells of anthers parallel, loosened at the apex, dehiscing lengthwise. Stigma simple, truncate. Capsule 4-celled, with a septical dehiscence.—A dwarf, bushy, evergreen shrub, native of Ireland and the Pyrenees. Leaves elliptic, flat, clothed with white tomentum beneath. Flowers terminal, racemose, purple.

Polium-leaved St. Dabecoe's Heath. Fl. June, Sept. Ireland. Shrubs 1 to 2 feet. Cult. This shrub is well fitted for decorating the front of shrubberies, or to be grown on rock-work or banks. It has much the habit of a species of Heath, and is very pretty when in blossom. As the shrub grows in large dense tufs, it may be increased by division; it is also easily increased by layers or cuttings.

XXXIII. ENKIAN'THUS (from ἐνκιάνθος, enkianthos, pregnant, and ἀνθός, anthos, a flower; flowers swollen). Lour. cochin. 276. Melodora. Sal. in hort. trans. 2. p. 156.

Lin. syst. Decândria, Monogynia. Calyx 5 cleft, furnished with coloured bracteas. Corolla campanulate; with a 5-cleft limb, and with 5 pits at the base of the tube. Stamens 10, inserted in the base of the corolla; filaments toothed, pilose at base; cells of anthers awned, opening by a pore at the apex. Style filiform. Berry 5-celled, many-seeded.—Elegant shrubs. Leaves broad, opposite, oblong-elliptic-acuminate, glabrous, green and shining on the upper surface, pale beneath, and frequently red. Bud scales red. Flowers large, terminal, drooping, showy. The species are held in high veneration by the Chinese.
FIG. 138.

2 E. biflorus (Lour. coeh. p. 276.) stem shrubby; flowers twin, terminal. G. Native of the south of China. Flowers red.

Two-flowered Eukianthus. Shrub.

Cult. Elegant green-house plants while in blossom, but rather difficult of culture. The best soil for them is said to be an equal mixture of sandy loam and peat, but care must be taken not to over-water them when not growing freely. Cuttings taken from ripened wood are found to strike root freely, if planted in sand, with a band-glass placed over them. When they grow to a considerable size, they are the greatest ornaments for a green-house or conservatory.

Lin. syst. Decandria, Monogynia. Calyx 5-parted. Corolla globose, or ovately campanulate: limb 5-ellipt, reflexed. Stamens 10, inclosed; anthers compressed on the sides, dehiscing by 2 pores at the apex, fixed by the back beneath the apex, where they are furnished with 2 reflexed awns. Ovarium seated on a hypogynous disk, or half immersed in it, 5-celled; cells many-seeded. Style 1; stigma obtuse. Berry nearly globose, granular.—Trees and shrubs, with alternate laurel-like leaves. Racemes terminal, panicked. Flowers pedicellate, bracteate. Corollas white or flesh-coloured.

1 A. unedo (Lin. spec. 366.) arborescent; branchlets clothed with glandular hairs; leaves oblong-lanceolate, glabrous, serrated; peduncles smooth, nodding. H. Native of the south of Europe, as of Spain, Italy, Greece; Palestine, and many other parts of Asia. It is also found in the west of Ireland, in the County of Kerry, near the Lake of Killarney, on barren limestone rocks, where the country people eat the fruit. Mill. fig. t. 48. Cam. epiti. 1681. Barrel. icon. t. 674. Smith, engl. bot. 2977. The common Arbutus, or Strawberry-tree, rises to the height of 20 or 50 feet, but rarely with an upright stem. It is one of the greatest ornaments in the month of October and November, that being the season when it is in flower; and the fruit of the former year is ripe. When there is plenty both of fruit and flowers upon the trees, they make a handsome appearance at a season when most others are past their beauty. The fruit is said to have constituted part of the food of mankind in early ages. That it was not in any esteem among the ancients, we may suppose from the name Unedo, if Pliny's reason for that name be the true one,—" cui nomen ex argumento fit unum tantum edendi." Virgil recommends the twigs as good for goats in winter:—"Jubeo frondentia capris Arbuta succulere;" and for baskets, "Arbuticl crates et mystica vannis laecli." Horace celebrates the shade of it:—"Nunc viridi membra sub Arbuto stratus." The tree is named, in Greek, Kouspoc, and the fruit M. myssouc; in Latin, Arbatus, and the fruit Unedo; in Italian, Arbuto, Albatro, Albatro, Corzzezolo; in French, L'Arbouier commun. The Greek name is almost preserved at Constantinople, in Komaria.

Var. α, alba (Ait. hort. kew. 2. p. 71.) flowers white.

Var. β, rubra (Ait. hort. kew. 2. p. 71.) flowers reddish.

Var. γ, plena (Ait. l. c.) flowers semi-double.

Var. ε, chizoptelea; petals cut.

Var. t, integrifolia; leaves entire. Sims, bot. mag. 2319.

Var. η, crispa; leaves curled and cut.

Var. θ, salicifolia; leaves narrow.

2 A. Canarensis (Lam. delt. vol. 1.) leaves oblong-lanceolate, serrated, glaucous beneath; panicles erect, clothed with hispid hairs. G. Native of the Canary Islands. Sims, bot. mag. 1577. Flowers greenish white.

3 A. hybrida (Ker. bot. reg. 619.) leaves oblong, acute, serrated, glabrous; branchlets pilose; panicle terminal, pendulous, downy; calyx glabrous. H. Native country unknown. A. andrachnoides, Link. enum. 1. p. 395. Flowers white.

4 A. serratifolia (Nois. ex Lodd. bot. cab. t. 580.) leaves serrated, narrower than those of A. Andraeae; flowers disposed in terminal clusters. H. Native country unknown. Flowers yellowish. Perhaps only a variety of the following.

5 A. Andraeae (Lin. spec. 366.) leaves oblong, bluntish, quite entire, and a little serrated, glabrous; panicles terminal, erect, clothed with viscid down. H. Native of Greece, Asia Minor, Tauria. Belon says it is common in Crete, and between Aleppo and Antioch. Wheeler observed it near Athens, and saw the fruit in the market of Smyrna. About Magnesia it is so plentiful, that it is used as the principal fuel by the inhabitants. Ehret, act. angl. vol. 57. p. 114. t. 6. Ker. bot. reg. 113. Sims, bot. mag. t. 2024. A. integrifolia, Lam. Andraéchne Theophrasti, Chis. hist. 1. p. 48. Andraeae, Park. theatr. 1490. f. 2. Flowers greenish-white. Fruit like that of the common sort. This is the Λεύκαρη of Theophrastus, and is called Λεβρδολα in modern Greek. It is a fine ornamental tree; the largest of the kind in Britain is growing in the botanic garden at Edinburgh. Tournefort enumerates three varieties of it which he observed in the Levant; one with serrated leaves; a second with a large oblong fruit; and a third with large compressed fruit.

Andraeae Strawberry-tree. Fl. March, April. Ch. 1734. Tree 10 to 14 feet.

6 A. laurifolia (Lin. syst. 407. suppl. 238.) leaves oblong, acuminate at both ends, acutely serrated, glabrous; racemes axillary, second, sessile, solitary. H. Native of North America, but what part is unknown, as nothing can be found respecting it in the Linnaean herbarium.

Laurifolia Strawberry-tree. Tree.

7 A. Menziesii! (Pursh. fl. amer. sept. 1. p. 282.) arborescent; leaves broad-oval, quite entire, glabrous, on long petioles; racemes axillary and terminal, panicked, dense-flowered. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. et Arn. in Beech. voy. pt. bot. p. 143.
Menzie's Strawberry-tree. Tree.

8 A. tomenss (Pursh. fl. amer. sept. 1. p. 282.) shrubby; branches hispid; leaves oval, acute, subcordate at the base, clothed with white tomentum beneath, on short petioles; peduncles axillary, shorter than the leaves, somewhat capitately racemose; flowers campanulately unrevolute, bracteate. \( G. \) Native of the north-west coast of America, where it was collected by Mr. Menzies. Hook. bot. mag. t. 2320. Hook. fl. am. text. bot. 129. f. 1. Flowers pure white. The whole herb, except the flowers, is downy, while young. Petioles and mid-rib of leaves hispid.

Var. \( \beta \), \( \mu \) \( \text{du} \) (Hook. et Arn. in Beech. voy. pt. bot. 144. Hook. fl. amer. bot. 129 fl.) shrub quite destitute of long stiff hairs.

9 A. xalapensis (H. B. et Kunth, nov. gen. amer. 3. p. 279.) leaves oblong, acute, quite entire, glabrous above, but clothed with fuscous tomentum beneath; panicle terminal, composed of many racemes. \( G. \) Native of Mexico, in mountain woods near Xalapa, and at Malpays de Joya. Epidermis separating, brownish purple. Young branches glabrous, but beset with ramenta. Leaves oblong at the base, 2 inches long, petiolate. Corollas ovate, white. Filaments villous, dilated at the base.

Xalapa Strawberry-tree. Tree.

10 A. mollis (H. B. et Kunth, nov. gen. amer. 3. p. 280.) leaves oblong, acute, sharply toothed, coriaceous, clothed with soft pubescence above, and canescent tomentum beneath; panicle terminal, crowded, composed of racemes. \( G. \) Native of Mexico, near Guanaxauto. Branchlets purplish brown, angular, downy. Leaves petiolate. Flowers drooping? like those of the preceding.

Soft Strawberry-tree. Tree.

11 A. densiflora (H. B. et Kunth, nov. gen. amer. 3. p. 280. t. 260.) leaves on long petioles, oblong, acute, sharply toothed, coriaceous, glabrous above and shining, but clothed with fuscous down beneath, and the middle nerve with rusty villi; panicle terminal, composed of approximate racemes; flowers crowded. \( G. \) Native of Mexico, on the eastern declivities of the mountains between La Pileta and Xalapa. Branches angular, pilose. Petioles pilose. Leaves 4-5 inches long. Pedicels furnished with 3 bracteas at the base. Corollas oval, white. Filaments dilated and pilose at the base.

Dense-flowered Strawberry-tree. Clt. 1826. Tree 20 feet? 12 A. petiolaris (H. B. et Kunth, l. c. p. 281.) arboreous; leaves on long petioles, oblong, acutish, mucronate, with dentilicate margins, membranous, glabrous above, but clothed with canescent tomentose pubescence beneath; racemes short, crowded, forming a terminal panicle. \( G. \) Native of Mexico, on the western declivities of mountains between Cuichuaca and Guichilaque. Epidermis separating. Branchlets hairy. Leaves rounded at the base, or \( \frac{1}{2} \) inches long. Petioles hairy, red. Ramata numerous at the base of the branches. Pedicels villos, canescent. Corollas ovate-globose, white. Filaments villos, dilated at the base.

Petiolate-leaved Strawberry-tree. Tree tall.

13 A. ferruginea (Linn. syst. 408. suppl. 238.) arboreous; leaves oblong, obtuse, smooth, quite entire; racemes terminal. \( G. \) Native of New Granada. Branches angular, smooth. Leaves petiolate. Racemes axillary, and terminating the branches, solitary. Pedicels bracteate. Flowers remote, nodding, longer than the corollas in the other sorts, almost like those of \( A. \) \( \text{andrina} \).

Rusty Strawberry-tree. Tree.

14 A. phyllotricha (Pers. ench. 1. p. 483.) stem much branched; leaves lanceolate, acuminate, acutely serrate; flowers axillary. \( G. \) Native of Peru. Leaves small. Perhaps a species of \( \text{Pernettya} \).

Phyllotrich-leaved Strawberry-tree. Shrub.

15 A. furcens (Hook. et Arn. in Beech. voy. pt. bot. p. 33.) stem nearly simple, downy; leaves oval, on short petioles, dentilicate, coriaceous, with revolute edges, shining above, and glandular on both surfaces, the glands terminating in hairs; racemes axillary; rachis and pedicels downy and scaly; calyx glabrous; corolla glabrous outside, and hairy inside. \( G. \) Native of Chili, about Conception. Qued-Qued, Fl. 3. p. 56. t. 43. A low-growing shrub. The fruit is described by Feuille to be a reddish brown berry, which is dangerous when eaten, causing delirium; whence the Indian name, which signifies madness.

Raging Strawberry-tree. Shrub low.

16 A. punctata (Hook. et Arn. in Beech. voy. pt. bot. p. 33.) much branched; branchlets downy; leaves nearly sessile, ovate-lanceolate, dentilicate, coriaceous, with revolute margins, besprinkled with plicate glands; racemes axillary, downy, scaly; calyx glabrous; corolla glabrous outside, but pilose inside. \( G. \) Native of Chili, about Conception. Apparently a large shrub, and probably the A. phyllotricha, Pers.

Dotted-leaved Strawberry-tree. Shrub.

Cult. The hardy species of this genus being all ornamental trees or shrubs, are proper for conspicuous places in shrubberies, or to stand singly on lawns. \( A. \) \( \text{andraeae} \) must be protected by a mat in severe weather in winter. They are to be increased by seeds, or by budding or inarching on the comminer kinds. The green-house kinds require the treatment of common green-house plants.

XXXV. ARCTOSTAPHYLUS (from \( \text{aptos} \), \( \text{arctos} \), a bear, \( \sigma \) \( \text{phyllos} \), \( \text{stephyle} \), a grape). Gal. Alans. fam. H. B. et Kunth, nov. gen. amer. 3. p. 277. Spreng. syst. 5. p. 297.—Uva-\( \text{ursi} \), D. Tourn.—Arbutus species, Linn.

Linn. syst. Deciduous, Mauvegynia. Calyx 5-parted (f. 139. a.) Corollia globose (f. 139. b.) or ovate-campanulate; limb 5-cleft, reflexed. Stamens 10, inclosed; filaments dilated at the base, and pilose; anthers compressed at the sides, dehiscing by 2 pores at the apex (f. 139. b.), fixed by the back beneath the middle, where they are furnished with 2 reflexed awns. Ovarium seated on the hypogynous disk, or half immersed in it, usually 5-celled (f. 139. g.), rarely 6-9-celled; cells 1-seeded. Style 1; stigma obtuse. Drupe nearly globose.—Shrubs or subshrubs. Leaves alternate. Racemes terminal. Flowers pedicellate, bracteate. Corollas white or flesh-coloured. Drupes red or black.

1 A. \( \text{uva-ursi} \) (Spreng. syst. 2. p. 287.) stems procumbent; leaves permanent, obovate, quite entire, coriaceous, shining; flowers fasicelate; drupe 5-celled. \( G. \) Native of North America, in the pine barrens of New Jersey, and in mountainous and rocky situations of Canada and New England; and the Island of Unalasc. It is abundant on the continent of Europe, as in Sweden, Denmark, and most parts of the north; also in Switzerland, Germany, Carniola, Dauphinay, Savoy, Sibera, &c. With us it is common upon dry, heathy, mountainous and rocky places throughout the Highlands and Western Isles of Scotland; also in the north of England and Wales. \( \text{Arbutus} \) \( \text{iva-ursi} \), Linn. spec. 506. fl. lapp. no. 162. t. 6. f. 3. Woodv. med. bot. 194. t. 70. Fl. dan. t. 33. Blackew. t. 352. Smith, engl. bot. 714. Arbutus buxifolia, Stokes, bot. 509. \( \text{Uva-ursi} \) buxifolia Sal in Gray arr. 2. p. 400.—Schmidt. arb. t. 138. Planch. icon. 340. It is called in English \( \text{Bear berries} \) and \( \text{Bear-whortle berries} \), from the German, \( \text{Baren-} \) 

traube or \( \text{Barekbeere} \); in Dutch, \( \text{Beerenbruin} \); in French, \( \text{La} \) 

Busserole; in Italian, \( \text{Uva d'orzo} \); in Spanish, \( \text{Uba de oso} \); in
Portuguese, *Uva de urso*; and by most old botanists, *Uva-ursi*. Leaves like those of box. Flowers pale red, or white with a red mouth, growing in small clusters at the extremities of the branches. The leaves have been much celebrated in calculous and nephritic complaints, and other disorders of the urinary passages; the dose is half a drachm of the powder of the leaves every morning, or 2 or 3 times a day. The trials, however, made in this country by no means answered expectation. Perhaps, upon the whole, it will be found no better than other vegetable astringents; some of which have long been used by the country people in gravelly complaints, and with very great advantage. On the plains of the Mississippi, the Indians smoked the leaves under the name of *Sacacommis*, and consider them of great medicinal virtue. But whatever may be its medicinal qualities, the whole plant is certainly very serviceable in dying an ash-colour, but particularly in tinning leather. In this view, it may deserve attention in those countries where whole mountains are covered with it. The berries are red when ripe, filled with an austere mealy pulp; they serve as food for grous and other game.

**Bear-berries.** Fl. May, June, Britain. Shrub trailing.

2 *A. alpina* (Spreng. syst. 2. p. 287.) stems procumbent; leaves obovate, acute, wrinkled, serrated, deciduous; racemes terminal. ½. H. Native of Denmark, Switzerland, Dauphiny, Savoy, Siberia, &c. In many places of the Highlands of Scotland, in dry barren moors. Nothing is more common, says Linnaeus, in all the Lapland Alps, in Dalecarlia, from their tops to their bases, round the White Sea, especially in very sandy places. It is also found in Canada, and the northern parts of America, Aleutian Islands, &c. *A. arbutus alpina*. Lin. spec. 566. Oed. fl. dan. 73. Smith, engl. bot. 2050. Lightf. fl. scot. 215. t. 11. f. a. b. Pedicles rather hairy. The flowers grow in reflexed racemes, and are pure white. The berries are black when ripe, and of the size of a sloe, with a taste somewhat resembling that of black currants, but more mawkish, inomuch that Linnaeus says the Laplanders will scarcely eat them. Haller, on the contrary, thinks the flavour not unpleasant. Mr. Miller describes them as of a pleasant taste, so as frequently to be eaten by the inhabitants of those countries where the plant grows wild.

**Alpine Bear-berry.** Fl. April, June, Scotland. Shb. trailing.

3 *A. polifolia* (H. B. et Kunth, nov. gen. et spec. 277. t. 25.) erect; leaves linear-lanceolate, acute, with quite entire and revolute margins, coriaceous, glabrous above, but downy and glaucous beneath. ½. F. Native of the temperate parts of Mexico, near Villalpan- do. Andromeda ledifolia, Humb. profl. p. 41. A much branched shrub. Racemes terminal, erect, an inch long, downy. Flowers nodding. Corolla scarlet (f. 139.)

**Foliolus-leaved Bear-berry.** Shrub 4 to 6 feet.

4 *A. glaucescens* (H. B. et Kunth, l. c. p. 278.) erect; leaves lanceolate-oblong, obtuse, submacronate, quite entire, coriaceous, glabrous and shining above, but downy and glaucous beneath; racemes terminal, solitary, erect; flowers scarlet. ½. F. Native of Mexico, between Guanaxauto and Valenciana. Racemes 3 inches long, beset with glandular villi. Corollas scarlet?

*Glaucuscent Bear-berry. Shrub.*

5 *A. pu'gens* (H. B. et Kunth, l. c. p. 278. t. 259.) leaves ovate-oblong, acute, mucronate, rather pungent, quite entire, coriaceous, clothed with fine down on both surfaces; racemes short, at most terminal, but at length lateral. ½. F. Native of Mexico, in high places near Moran and Villalpando. A dwarf, much branched shrub. Branchlets angular, downy. Pedicels approximate, fastigate. Corollas white.

**Pungent-leaved Bear-berry. Shrub 1 foot.**

6 *A. hookeri*; branches prostrate, rather downy; leaves petiolate, permanent, oval or obovate, coriaceous, shining, minutely reticulated, mucronately pungent, smoothish, finely margined, almost quite entire; racemes terminal, short; flowers bracteate. ½. F. Native of Chili. *A. arbutus pingens*, Hook. et Arn. in Beech. voy. pt. bot. 144. Habit of *A. uva ursi*, and with the leaves of the same size. Flowers small, urceolate; young leaves white from down beneath, more or less serrated.

*Hooker's Bear-berry. Shrub prostrate.*

**Cult.** The hardy species of this genus grow well in a mixture of sand, loam, and peat, or in a peat border. They are increased by layers, put down in the spring. The green-leaved kinds require the treatment of other hardy green-house shrubs.

XXXVI. PERNETTYA (named after M. Pernetty, author of a history of his voyage to the Falkland Island). Gaud. in Freyc. voy. p. 454. t. 67.

Lin. syst. Decandria, Monogynia. Calyx inferior, 5-parted. Corolla glbose: limb 5-parted, revolute. Stamens 10, almost hypogynous, inclosed; filaments thickened at the base; cells of anthers bifid, and dehiscing at the apex. Ovarium free, depressed, glbose, 5-celled; cells many-seeded. Hypogynous scales or glands 10, 3-lobed, forming a ring round the ovary, and alternating with the stamens. Style terminal, short. Stigma convex, obsoletely 5-lobed. Berry propped by the rather fleshy calyx. Seeds minute, oblong-obvate.—Small, much branched shrubs, with small alternate approximate leaves; axillary, solitary, pedunculate, dropping white flowers, and bracteate peduncles. This genus agrees with Epaacideae in the presence of hypogynous scales.

**Crowberry-leaved Pernettya.** Shrub 2 to 3 feet. 2 *P. mxrona'ta* (Gaud. in ann. sc. 5. p. 102.) leaves ovate, cuspidate, denticulately serrulate, stiff, shining on both surfaces; pedicels axillary, bracteate, about equal in length to the leaves. ½. H. Native of Terra del Fuego, Cape Horn, and Straits of Magellan. Lindl. bot. reg. 1675. *A. arbutus mucronata*. Lin. fil. suppl. p. 239. Forst. in comm. geot. 9. p. 31. Graham in bot. mag. t. 3093. Lam. ill. t. 306. f. a. Lodh. bot. cab. 1858. Flowers white, drooping.

**Mucronate-leaved Pernettya.** Fl. May. Clt. 828. Shrub 2 to 3 feet.

**Small-leaved Pernettya.** Shrub 2 to 3 feet.

4 *P. myrsinites*; leaves ovate-lanceolate, serrated, sat-
tered; pedicels solitary, axillary, very short. $H$. Native of the Straits of Magellan, in woods on the mountains. Andrómeda myrsinitis, Lam. ill. gen. t. 363. $f$. 2. Leaves small.

Myrtle-like Pernettya. Shrub 2 to 3 feet.

5 P. Cavanillesiana; leaves ovate, acute, glabrous, obtusely serrated; pedicels axillary, solitary, furnished with two scales at the base; stems trailing. $F$. Native of South America. Andrómeda prostrata, Cav. cv. gen. 6, p. 483. $f$. 2. Leaves green above, and rusty and veiny beneath, on very short peduncles. Cavanilles's Pernettya. Shrub prostrate.

6 P. filosa; stem pilose, procumbent; leaves ovate-elliptic, ciliately-serrulated, ciliately-serrulatus, coriaceous, mutic at the apex and callous; pedicels axillary, 1-flowered, elongated, nutate; corolla ovate, with blunt revolute teeth. $H$. Native of Mexico. Arbustus pilosa, Graham, in bot. mag. 3177. Corolla white.

7 P. Purpurea (D. Don, ms. in herb. Lamb.) branchlets setose; leaves lanceolate, acute, dentate, glabrous, veiny beneath; pedicels scabrous, glandular; corollas ovate. $F$. Native of Peru. Flowers purple. Purple-flowered Pernettya. Shrub.

8 P. ciliata (D. Don, i. e.) branchlets setose; leaves ovate-lanceolate, acute, having the margins denticulated, and ciliated with bristles; peduncles glandular. $F$. Native of Mexico.

Ciliated Pernettya. Shrub.

Cult. For culture and propagation see Phyllodoce, p. 833.

XXXVII. AGAR'ISTA (a mythological name, the beautiful daughter of Clithenes; in reference to the beauty of the flowers). D. Don, ms.—Andrómeda species of Comm. and other authors.

Lin. syst. Decandra Monogynia. Calyx fleshy, 5-lobed; lobes imbricate on the base. Corolla ovate, with a contracted, 5-toothed, conical mouth. Stamens 10, inclosed; filaments flattened, dilated at the base, and villous; anthers biparite; with short membranous cells, which are mutic at the base and diverging at the apex, opening by a terminal hole. Style robust, terete; stigma capitate. Capsule globose, pentagonal, 6-celled, with a loculicidal dehiscence. Placenta thick, oblong. Seeds angular, curved.—Evergreen shrubs. Natives of the Mauri-
tius and South America. Leaves coriaceous, reticulately veined, quite entire. Flowers racemose, terminal, very beautiful. In-
termediate between Gaultheria and Andrómeda.

2 A. salicifolia; leaves lanceolate, attenuated at both ends, white beneath; racemes simple, secund, glabrous. $H$. S. Native of the Mauritius. Andrómeda salicifolia, Comm. ms. Lam. cv. l. 1. p. 159. Smith, com. ined. 1. 58. Hook. exot. fl. 3. t. 192. bot. mag. 3266. Leaves 2-4 inches long. Ra-
cemes simple. Corolla oblong, ovate, beautiful purple.

Willow-leaved Agarista. Shrub 2 to 3 feet.

3 A. Subrotunda; leaves roundish-elliptic, cordate at the base, mucronate at the apex, glabrous above, but clothed with ferruginous tomentum beneath; racemes terminal, solitary, or fasci-cled, secund, downy. $H$. G. Native of Brazil, in the prov-
ince of Minas Geraes, on rocks about Villa St. Joo d'el Rey.

Andrómeda subrotunda, Pohl. pl. bras. 2. p. 32. t. 121. Branches tomentose. Leaves on very short peduncles, approxi-
mate, setosely denticulated on the nerves and margins, and termi-
inating in a spine mucronate. Corolla ovate, ventricose, pur-
red or scarlet, with almost erect segments. Ovaries villous.

Roundish-leaved Agarista. Shrub 3 feet.

4 A. Multiflora; leaves lanceolate, rounded at the base, glabrous; racemes axillary, suprabryanose; ovariun glabrous. $H$. G. Native of Brazil, in the province of Minas Geraes, in mountainous places; in Serra Matsuqueira. Andrómeda multiflora, Pohl. pl. bras. 2. p. 33. t. 122. Shrub much branched. Leaves petiolate, remote, 2½ inches long and 8 lines broad. Racemes many-flowered, secund. Bracteas oblong, acute, ciliated. Corolla elliptic, ventricose, white, with erect seg-
ments.

Many-flowered Agarista. Shrub 6 to 10 feet.

5 A. Polhill; leaves ovate, acute at the apex, emarginate at the base, glabrous, painted beneath on the sides of the nerve with dots; racemes axillary. $H$. G. Native of Brazil, in the prov-
ince of Minas Geraes, in dry mountainous places of Itambe. Andrómeda crassifolia, Pohl. pl. bras. 2. p. 54. Leaves on short peduncles, orbicular, 1½ inch long and 8 lines broad. Ra-
cemes many-flowered, secund; bracteas linear, glabrous. Co-
rollas unknown.

Pohl's Agarista. Tree.

6 A. Brachamorosia; leaves ovate-oblong, obtuse, obso-
letely mucronate, with revolute margins, coriaceous, glabrous, shining above; racemes axillary and terminal, approximate at the tops of the branches. $H$. G. Native of New Grandua, in the province of Bracamoros, near St. Felipe, and Paramo de Ynamo. Andrómeda Brachamorosia, H. B. et Kunth, nov. gen. aner. 3. p. 288. t. 263. Andrómeda myrtilloides, Willd. her. Branch-
lets angular. Leaves 6-7 lines long. Bracteas minute at the base of the pedicels. Corollas scarlet, with ovate, revolute teeth. Stigma ciliated, hardly thicker than the style.

Bracamoros Agarista. Tree 10 to 15 feet.

7 A. Sprengelii; leaves ovate-oblong, obtuse, mucronate, coriaceous, with revolute margins, glabrous on both surfaces; racemes axillary, drooping. $H$. S. Native of Brazil, within the tropic. Andrómeda revoluta, Spreng. neunt. entd. 2. p. 131. syst. 2. p. 291. Young leaves and young branches rather downy.

Sprengel's Agarista. Shrub.

8 A. Eucalyptoides; glabrous; leaves on long petioles, oblong, acuminate, obliquely rounded at the base, with revolu-
tes margins; racemes lateral, approximate towards the tops of the branches. $H$. S. Native of Brazil, at Rio Grande do Sul. Andrómeda eucalyptoides, Cham. et Schlecht, in Linnea. 1. p. 519. An elegant shrub. Young branches angular. Leaves ½ inch long. Corolla arcuata, 3 lines long, with ob-

Eucalyptoides-like Agarista. Shrub or small tree.

9 A. Pumila; glabrous; leaves petiolate, ovate, mucronate, coriaceous, with revolute margins; racemes secund, axillary and terminal, glabrous, approximate at the tops of the branches; ovariun glabrous. $H$. S. Native of Brazil, within the tropic. Andrómeda pumila, Cham. et Schlecht. in Linnea. 1. p. 521. Branches angular. Leaves more than an inch long, larger than those of A. nummularia. Style length of corolla. Corolla urce-
late, with short obtuse spreading teeth, scarlet.

Fair Agarista. Shrub 1 to 2 feet.

10 A. Nummularia; leaves on short petioles, coriaceo, broad-
ate, rather retuse, mucronate, coriaceous; racemes axillary and terminal, and are, as well as the young branches, hispid;

ovarium downy. $H$. G. Native of the south of Brazil, in the province of Rio Grande do Sul. Andrómeda nummularia,
Cham. et Schlecht. in Linn. I. p. 520. Leaves shining above, ciliated with long stiff hairs on the nerves beneath, and margins while young. Larger leaves 8 lines long. Racemes approximate at the tops of the branches. Calyx hairy. Style exserted. Corolla urceolate, with short, obtuse, reflexed teeth, scarlet.?

Cham. et Schlecht. in Linn. I. p. 504.—Flowers scarlet, with white filaments and yellow anthers. There are varieties of it having the inflorescence either hairy or glabrous.

Cham. et Schlecht. in Linn. I. p. 506. Corollas scarlet, with obtuse spreading teeth.

Cham. et Schlecht. in Linn. I. p. 508. Leaves 15 lines long. Corollas ovoid, coriaceous, scarlet, much larger than those of A. pulchra. Style woolly at the base.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 504.—Flowers scarlet, with white filaments and yellow anthers. There are varieties of it having the inflorescence either hairy or glabrous.

Cham. et Schlecht. in Linn. I. p. 506. Corollas scarlet, with obtuse spreading teeth.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.

Cham. et Schlecht. in Linn. I. p. 508. A box-like shrub, with the habit of A. Bracanomastia and A. revoluta. Corollas white, green at the apex, glabrous.
**ERICACEÆ. XXXIX. GAULTHERIA.**

3 D. heterophylla (Blum. l. c. p. 585.) leaves oblong or lanceolate, acuminate at both ends, nearly veinless, glabrous, dotted beneath; pedicels flescled. \(\text{G. }\) Native of Java, on the higher mountains, on the west side of the island.

Var. \(\beta\): leaves cuneate-oblong, acutish or obtuse.

Variable-leaved Diplocosia. Fl. Year. Shrub par.

 Cult. For culture and propagation, see *Agarista*, p. 838.

Lin. syst. Decandria, Monogynia. Calyx 5-5-3. corolla ovate, with a short 5-3-3 limb (f. 140. h.). Stamens 10, inclosed; anthers bifid at the apex; lobes biauriculate (f. 140. c.). Style 1; stigma obtuse. Hypogynous scales 10, obsolete or connate at the base. Capsule depressed globose, 5-celled, 5-furrowed, covered by the calyx, which is sometimes baccate; valves septiferous in the middle. Placentas adnate to the base of the column. Seeds numerous, covered by a reticulated testa.—Small trees or shrubs. Leaves alternate. Flowers axillary and terminal, racemose, rarely solitary; pedicels bracteolate. Corollas white, rose-coloured, or scarlet. Filaments usually hairy.

*Flowers axillary, solitary.* Peduncles or pedicels browsed with some imbricated bracteas at the base.

1 G. prolemus (Lin. spec. 565.) stem procumbent; branches erect, naked at bottom, but with crowded leaves at top; leaves obovate, acute at the base, finely and ciliately toothed; flowers few, terminal, nutant. \(\text{G. }\) Native of North America, in dry woods, on mountains, and in sandy plains from Canada to Virginia. Andr. bot. rep. 116. Kalm. amen. 3. p. 14. t. 1. f. 6. Duhum. arb. 1. p. 286. t. 113. Lodd. bot. cab. t. 82. Sims. bot. mag. 1866.—A little shrubby plant, resembling seedling plants of *Kalmia latifolia*. Flowers white. Berries red, entire, and known by the name of partidge berries. The leaves, if properly cured, make a most excellent tea, for which reason it is likewise known by the name of Mountain Tea.

*Prolemus* Gaultheria. Fl. July, Sept. CIt. 1762. Shrub \(\frac{1}{2}\) foot, procumbent.

2 G. repens (Blum. bidr. p. 857.) stem creeping, rather pilose; leaves minute, rather pilose beneath, ovate, acute, coriaceous; peduncles axillary, 1-flowered. \(\text{G. }\) Native of Java, on the top of Mount Gede.

Creeping Gaultheria. Fl. Year. Shrub.

3 G. nummularóides (D. Don, prod. fl. nep. p. 150.) branches filiform, procumbent, very bristly; leaves coriaceous, mucronulate, nearly sessile, naked above, but hirsut from hairs beneath and on the margins; pedicels axillary, very short, coriaceous. \(\text{G. }\) Native of Nipaul, on the Alps. Shrub much branched. Flowers drooping. Pedicels and calyces glabrous. Calyces segments broad-ovate, mucronulate, with connivent margins. Corolla ovate, longer than the calyx.

*Moneywort-like* Gaultheria. Shrub procumbent.

4 G. buxifólia (Willd. in nov. act. berol. vol. 4.) stem erect; branches hairy; leaves roundish-ovate, obtuse, toothed, coriaceous, scabrous from dots beneath; pedicels filiform. \(\text{G. }\) Native of Caraccas. Branches hairy, erect.

*Box-leaved* Gaultheria. Shrub.

Pedicels pilose, furnished with 5-7 imbricated bracteas at the base. Corollas ovate, glabrous, white.

*Anastomosis* Gaultheria. Shrub.

6 G. perpuraéscens (H. B. et Kunth, nov. gen. amer. 3. p. 282.) procumbent! branchlets and leaves clothed with bristly hairs; leaves elliptic-oblong, acute at both ends, serrulated, 1-nerved, purplish beneath; flowers axillary, solitary. \(\text{G. }\) Native of New Granada. Hairs or bristles dark purple. Leaves green above. Peduncles or pedicels bracteate at the base. Fruit drooping.

*Purpurl-leaved Gaultheria. Shrub procumbent.*

7 G. myrsínóides (H. B. et Kunth, l. c. p. 283.) branches and leaves glabrous; leaves oblong, acute, obtuse at the base, crenated at top, shining above; flowers axillary, solitary. \(\text{G. }\) Native of New Granada, near the town of Almuguer. Branchlets angular. Peduncles downy, furnished with imbricated bracteas at the base. Corollas ovate-globose, glabrous, white.

*Myrtille-like* Gaultheria. Shrub.

8 G. myrtílides (Cam. et Schlecht, in Linneæa, vol. 1. p. 523.) branches beset with bristles, as well as the under sides of the leaves and calyces; leaves broad-lanceolate, with the margins ciliately serrulated and somewhat reflexed; flowers axillary, solitary, on short pedicels near the tops of the branches. \(\text{G. }\) Native of Brazil, within the tropic. Scales at base of pedicels ciliated. Corolla urceolate, pilose inside, glabrous outside, with reflexed teeth. Filaments dilated at base.

*Myrtile-like* Gaultheria. Shrub \(\frac{1}{2}\) to 1 foot.

9 G. ciliata (Cam. et Schlecht, in Linneæa. 5. p. 125.) shrubby, glabrous; flowers axillary, solitary; peduncles downy, bracteolate at the base; leaves coriaceous, nearly sessile, lanceolate, acute, sharply serrulated; teeth setigerous in the young state. \(\text{G. }\) Native of Mexico, on Mount Orizaba, along with *Solanum tuberosum*; and at Chiconquiqua and Malpaus de Joya. Leaves \(\frac{1}{8}\) inch long. Flowers white. Berries black.

*Ciliated-leaved* Gaultheria. Shrub.

** Racemes axillary and terminal at the tops of the branches. Pedicels bracteate.**

10 G. Shallón (Pursh. fl. amer. sept. 1. p. 283. with a figure); procumbent, hairy; leaves ovate, subcordate, serrated, glabrous on both surfaces; racemes second, bracteate, clothed with rusty down. Fl. H. Native of North America, on the falls of the Columbia, and near the Western Ocean.

Hook. bot. mag. t. 2843. Lindl. bot. reg. 1411. Lodd. bot. cab. 1373. Branches warty, clothed with rusty down while young. Leaves broad, abruptly acuminate. Pedicels scaly. Corolla white, tinged with red, downy, urceolate, with a closed limb. Berries globose, acute, fleshy, purple. This plant grows in the shade of cloverine forests, where hardly any thing else will grow, which makes it a very desirable shrub for plantations. The berries of the Shallon are much esteemed by the natives, on account of their agreeable flavour.

---

**FIG. 140.**
**ERICACEÆ. XXXIX. GAUTHHERIA.**

**Very fragrant Gauthheria.** Ch. 1824. Shrub.

13 G. punctata (Blum. bl. drj. p. 856.) leaves lanceolate, terminated by a gland, serrated, dotted beneath, glabrous as well as the branches; racemes panicled, terminal; calyces ciliated. F. G. Native of Java, very common on the top of Mount Gede, where it is called by the natives Tjutagie-wangie.

**Dotted-leaved Gauthheria.** Shrub.

15 G. leucocarpa (Blum. bl. drj. p. 856.) branches and leaves glabrous; leaves ovate-oblong, long-acuminated, bluntly serrated; racemes axillary and terminal, drooping; calyces a little ciliated. F. G. Native of Java, in woods on the higher mountains, where it is called Zangtig badas by the natives.

**White-fruited Gauthheria.** Fl. Year. Shrub.

14 G. Sprengeli; leaves oblong, rounded at both ends, callous at the apex, quite entire, with revolute edges, lispid on both surfaces; branches hairy; racemes terminal, straight, second, clothed with ciliate hairs. F. S. Native of Brazil, where it was collected by Sello. G. hispida, Sprengel, syst. 2. p. 288. but not of R. Br.

**Sprengel's Gauthheria.**

16 G.? bracteata; branches beset with rusty hairs; leaves ovate-acute, obscurely denticulated, shining above and rusty beneath; racemes terminal, simple; corollas and calyces hairy. F. G. Native of Quito, near the Crater of Tunguragua, and on Mount Chimborazo. Andromeda bracteata, Cav. icon. 6. p. 42. t. 562. f. 1. Hairs on the under side of the leaves, hulbous at the base. Leaves ⅓ inch long, and 1 inch broad. Bracteas at the base of the pedicels concave, ovate-acute, and the pedicels are bibracteolate. Stamens 10; villous; anthers beariata at the base. Corollas tubular, pale red, with erect ovate-acute teeth.

**Bracteate Gauthheria.** Shrub ½ foot.

18 G. elliptica (Cham. in Linnaea. 8. p. 502.) racemes, corollas, and capsules, downy; bracteas and calyces ciliated, the rest of the plant glabrous; leaves elliptic, acute at both ends, mucronate, marginated, rather coriaceous, finely and equally serrulate, smooth and shining above, and beset with black dots beneath, reticulately veined; racemes terminal and axillary, forming a panicle; bracteas ovate-orbicular, obtuse, concave, at first imbricated, and therefore the racemes appear strobiliforme. F. S. Native of the south of Brazil, where it was collected by Sello. Very like G. acuminata, Cham. in Linnaea. 5. p. 126. and G. vernalis, Popp. pl. chir. exsic. 3. no. 119. Prostrate and rooting. Corollas ovate-urceolate, inflected, downy outside and villous inside.

**Elliptic-leaved Gauthheria.** Shrub creeping.

17 G. acuminata (Schlecht. et Cham. 5. p. 126 and 7. p. 524.) shrubby, glabrous; flowers racemose, axillary; leaves on short petioles, ovate, acuminated, acute, finely serrulate, coriaceous, reticulately veined, discoloured, full of black dots beneath, but scabrous on both surfaces from elevated dots; sertacmes mucronate. F. G. Native of Mexico, on Serra Colorado; and at St. Salvador and Malpays de Joya. Flowers white. Fruit black. Leaves ⅓ inches long.

**Acuminated-leaved Gauthheria.** Shrub.

18 G. reticulata (H. B. et Kunth, nov. gen. 3. p. 284.) branches and leaves glabrous; leaves oblong, acutish at both ends, serrately crenulately, shining above; racemes crowded at the tops of the branches, axillary and terminal; corollas glabrous. F. G. Native of the Andes of Quito, between Ona and Loxa, in Paramo de Saragurum. Andromeda reticulata, Humb. pro.l. p. 30. Leaves terminated by a sessile gland, shining above. Racemes involucrated by some bracteas at the base, downy. Corolla ovate, tubular, white, glabrous. Fruit capsular.

**Reticulated-leaved Gauthheria.** Shrub.

19 G. cocinea (H. B. et Kunth, 1. c. p. 284.) branches rather pilose; leaves roundish-ovate, acutish, rounded at the base, denticulated, glabrous, shining above and dotted beneath; racemes terminal and axillary at the tops of the branches; corollas clothed with glandular hairs. F. S. Native of Caracas, on Mount Avila. Andromeda cocinea, Humb. pro.l. p. 39. Leaves with black dot-like glands beneath. Racemes involucrated by imbricate bracteas at the base. Flowers secund, on long pedicels; pedicels clothed with glandular hairs. Bracteas at the base of the pedicels concave, coloured, glandularly ciliated. Corollas ovate, scarlet, clothed with glandular hairs. Fruit capsular.?

**Scarlet-flowered Gauthheria.** Shrub.

20 G. odorata (Humb. trav. l. p. 397. and 599. nov. gen. 3. p. 285. Pers. ench. 1. p. 482.) branches beset with glandular viscid hairs; leaves ovate-oblong, acuminately ciliate, coriaceous, to the base, sharply denticulate, glabrous and shining above, a little ciliate from the base beneath; corollas axillary and terminal at the tops of the branches; corollas pilose. F. S. Native of New Andalusia, on Mount Tunmiriquí; and on the southern declivity of Mount Silla de Caracas, where it is called Pejo by the natives; and of Mexico, at Cuesta Grande de Chiconcuaca. G. scabra, Wild. herb. Shrub much branched. Leaves aromatic, ⅔ inches long, glandularly ciliated while young. Racemes involucrated by some bracteas at the base. Flowers secund, nutant. Pedicels beset with glandular hairs as well as the rachis. Bracteas red, lanceolate, length of pedicels. Coollas ovate, pale red. Fruit capsular.

**Sweet-scented Gauthheria.** Shrub 4 to 5 feet.

21 G. cordifolia (H. B. et Kunth, nov. gen. am. 3. p. 285. t. 526.) branchlets ciliate; leaves ovate, acute, ovate, ciliate, denticulated, rugose, glabrous and shining above, but hairy beneath; racemes axillary and terminal at the tops of the branches; corollas clothed with ciliate hairs. F. G. Native of New Granada, on the Andes near Almaguer and Pansitara, in rather frigid places. Branches twining, ex Bompl. Leaves ⅔ inches long; Pedicels and flowers beset with glandular hairs and ciliate. Bracteas oblong, acute, concave, ciliate with glandular hairs, and clothed with adpressed hairs outside, longer than the pedicels. Calyx ciliate, clothed with glandular hairs. Corollas ovate, scarlet or purple.

**Heart-leaved Gauthheria.** Shrub.

22 G. rigidia (H. B. et Kunth, l. c. p. 286.) branches puberulous; leaves ovate-oblong, acute, ciliate at the base, sharply denticulate, glabrous, but a little ciliate; racemes axillary and terminal at the tops of the branches; corollas glabrous. F. S. Native of the province of Cumana, on Mount Cocollar. Andromeda rigidia, Humb. trav. p. 397. Leaves terminated by a sessile gland. Racemes involucrated by many imbricated bracteas. Bracteas oblong, concave, ciliated, glabrous, coloured, longer than the pedicels. Pedicels and rachis downy. Corollas ovate, scarlet.

**Stiff Gauthheria.** Tree small.

23 G. tomentosa (H. B. et Kunth, l. c. p. 287. t. 262.)
branches and under sides of leaves clothed with rusty tomentum; leaves glabrous and shining above, lanceolate-oblong, acute, obuse at the base, with quite entire revolute margins; racemes axillary and terminal at the tops of the branches; corollas tomentose. S. Native of the Andes, about Quito, in Paramo de Saraguro. Leaves tomentose on both surfaces while young. Pedicels and calyces clothed with rusty down. Bracteas tomentose, ovate-oblong, much shorter than the pedicels. Corolla ovate.

**Tomentose Gaultheria.** Tree 10 to 15 feet.

24 G. ferruginea (Cham. et Schlecht. in Linnaea, 1. p. 524.) leaves ovate, acute, shining above, with serrately scabrous margins, clothed with rusty tomentum beneath, as well as the racemes and flowers. G. Native of Brazil, within the tropic. Leaves often coriaceous at the base. Racemes bracteate, erect, rising from the axils at the tops of the branches, the whole forming a panicle. Corolla 3 lines long, with erect teeth.

**Rusty Gaultheria.** Shrub.

25 G. scabra (Willd. in nov. act. soc. berol. 4.) leaves ovate-cordate, acute, toothed, scabrous, reticulately veined beneath; racemes axillary, simple; calyx and bracteas clothed with glandular hairs. G. Native of Caraccas. Calyx baccate, black.

**Scabrous Gaultheria.** Shrub.

26 G. erecta (Vent. hort. eels, p. 5. t. 5.) leaves oval, mucronate, acute, shining above; branches and racemes clothed with glandular clamydial hairs. G. Native of Peru. Leaves with revolute denticulated margins.

**Erect Gaultheria.** Shrub.

27 G. hysteda (R. Br. prod. p. 553.) leaves long-lanceolate, serrulately, pilose beneath as well as on the petioles; branchlets hispid; racemes axillary and terminal, shorter than the leaves; rachis and pedicels downy; calyces baccate; fruit and ovaries glabrous; stem erect. F. Native of Van Diemen's Land. Corollas white.?

**Hispid Gaultheria.** Shrub. erect.

28 G. rupestris; racemes simple, bracteate; corollas campanulate; leaves oblong, serrulately. G. Native of New Zealand. Androdéma rupestris, Forst. prod. no. 195. Nearly allied to the preceding.

**Rocky Gaultheria.** Shrub erect.

29 G. antipoda (Forst. prod. no. 186.) leaves roundish-ovate, serrate-toothed, glabrous, reticulately veined; branches downy; stem diffuse; racemes panicled, rather hairy; corollas glabrous. G. Native of New Zealand. Flowers white.?

**Antipodal Gaultheria.** Shrub.

**Cult.** The species are ornamental: they thrive best in a peat soil, and are readily increased by dividing or by layers. The greenhouse species should be treated as other hardy greenhouse shrubs.

1 E. repens (Lin. spec. 565.) branches, petioles, and nerves of leaves very hairy; leaves cordate-ovate, quite entire; corollas cylindrical. G. Native from Canada to Carolina, on shady rocks and in stony woods, sides of hills and roots of pines. Andr. bot. rep. 102. Lam. ill. t. 367. f. 1. Lodd. bot. cab. 160.—Pluk. alm. t. 107. f. 1. Flowers white, tinged with red, very fragrant.

**Creeping Epigaea.** Fl. May, July. Ch. 1736. Shrub creeping.

2 E. cordifolia (Swartz, prod. 73. fl. ind. occ. 2. p. 842.) stem erectish, strigose; leaves cordate, roundish, stiff, hispid, serrated, convex; corollas ovate. G. Native of Guadalupe and Cayenne. Lam. ill. t. 367. f. 1. Flowers white.?

**Heart-leaved Epigaea.** Shrub erect.

**Cult.** E. repens is a beautiful procumbent shrub: it will thrive only in peat soil and shady situations, and, being rather tender, should have a hand-glass or frame placed over it in frosty weather; indeed, it grows best under a hand-glass or frame the whole year: it is increased by layers or separating the rooted shoots; or by cuttings, which root readily in sand with a hand-glass over them. For the culture of E. cordifolia see Agarista, p. 833.

**LIN. SYST.** Octándria Monogyniæ. Calyx 4-cleft, bifracate at the base. Corolla short, campanulate, 4-cleft. Stamens 8; filaments hairy. Hypogynous disk 8-toothed. Anthers seminiforous.—A small creeping plant with hispid branches, small, roundish-oval, acute leaves; and axillary, solitary, nearly sessile, white flowers. Habit of Wild Thyme.

1 P. serpyllifolia; G. Native from Canada to Pennsylvania. Mr. Nuttall has observed this plant north-westward of Lake Michigan; and, as Mr. Pursh very justly remarks, abounding where evergreens are predominant, keeping pretty constant pace with the northern forests of pines, larches, and firs, growing always amidst sphagnum. Vaccinium ripens, Lin. spec. 500. Michx. fl. 6. bor. amer. 1. p. 228. t. 23. Gaultheria serpyllifolia, Pursh. fl. amer. sept. 1. p. 283. t. 13. Arbatus filiformis, Lam. dict. 1. p. 228. Berries white, produced in inconsiderable quantities. They are aromatic, not very acid, and rather insipid than agreeable. The shrub has the same aromatic taste and smell as Gaultheria procumbens.

**Wild Thyme-leaved Snowberry.** Fl. April, May. Ch. 1815. Shrub creeping.

**Cult.** See Oxyccocus, p. 858, for culture and propagation.

**LIN. SYST.** Decándria, Monogyniæ. Calyx 5-parted. Corolla so deeply 5-parted as to appear pentapetalous. Stamens 10, inclosed, or nearly so; anthers behind, at length indifferently pendulous and obverse, cordate, mucronate at the apex, obtuse. Ovarium free. Style straight. Stigma trifid. Capsule girdled by the calyx, 5-celled, with a loculicular dehiscence; cells many-seeded. Shrub or trees. Leaves alternate. Racemes terminal, solitary or panicled. Flowers bracteate, white.

1 C. allintifolia (Lin. spec. 566.) leaves cuneate-obovate, acute, coarsely serrated above, glabrous on both surfaces, and of the same colour; racemes spicate, simple, bracteate, clothed with hoary tomentum. G. Native from New England to Virginia, in swamps, frequent. Schmidt, arb. 47. Lam. ill. 369. Duh. arb. 1. p. 176. t. 71. Mill. fig. 28. Catesba. ear. 1. t. 66. C. allintifolia, var. a, denudata, Ait. hort. rew. 2. p. 73.

**Alder-leaved Clethra.** Fl. July, Sept. Ch. 1731. Shrub 3 to 4 feet.

5 P
ERICACEÆ. XLI. Clethra.

2 C. tomentosa (Lam. dict. 2. p. 46.) leaves cuneate-obovate, acute, finely serrated at top, clothed with white tomentum beneath; racemes spicate, simple, bracteate, villously tomentose. \( \text{H} \). Native of Virginia and Carolina, in swamps. W. abd. Brit. N. 29. C. alnifolia, \( \beta \), pubescent, Ait. hort. kew. 2. p. 73. C. incana, Pers. enh. 1. p. 482. This is a very distinct species, although it has been considered by some as a mere variety of the preceding.

3 C. scabra (Pers. ench. 1. p. 482.) leaves broad, cuneate-ovate, acute, scabrous on both surfaces, coarsely serrated; serrations hooked; racemes spicate, subpanicled, bracteated, finely tomentose. \( \text{H} \). Native of the western parts of Georgia, where it was collected by Mr. Lyon.

C. paniculata (Ait. hort. kew. 2. p. 73.) leaves narrow, cuneate-lanceolate, acute, acuminate, glabrous on both surfaces; racemes terminal, elongated, composed of racemes, and clothed with white tomentum. \( \text{H} \). Native of Carolina.

5 C. aemina (Michx. fl. amer. bor. 1. p. 250.) leaves oval, acuminate, bluntish at the base, serrated, glabrous on both surfaces, rather glaucous beneath; racemes spicate, almost solitary, bracteate, clothed with white tomentum. \( \text{H} \). Native of Carolina, on the high mountains. Lodd. bot. cab. 1427. C. montana, Betr. cat. Grows to the size of a tree.

Flowers resembling those of C. alnifolia.

6 C. brasiliana (Cham. in Linnaea. 8. p. 510.) leaves obovate, obtuse, rather retuse, acutish at the base, cuneate, glabrous above and tomentose beneath, almost quite entire, or serrulately-toothed at the apex; teeth and apex mucronate; racemes forming panicles at the tops of the branches, tomentose; segments of corolla fringed; genitals inclosed. \( \text{s} \). Native of tropical Brazil. The leaves vary much in form and size. Tomentum of a rusty-colour.

Brazilian Clethra. Shrub or tree.

7 C. tajofolia (H. B. et Kunth, nov. gen. amer. 3. p. 289.) arboreous; leaves obovate, sharply and remotely toothed, coriaceous, glabrous; racemes clustered at the tops of the branches. \( \text{S} \). Native of South America, in woods near Bonavista, between Caracas and La Victoria. Young branches angular, and densely clothed with rusty down. Leaves 3-4 inches long, paler beneath. Racemes clothed with rusty tomentum. Corollas white, about the size of those of the lily of the valley.

Beach-leaved Clethra. Tree.

8 C. nicolai (H. B. et Kunth, l. c. p. 289.) arboreus; leaves oblong, coarsely and undulately crenated, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches. \( \text{S} \). Native of South America, near Santa Fe de Bogota. Cuellaria floribunda, Wildl. herb. Branchlets angular, clothed with rusty down, intermixed with stiff hairs, as well as the racemes. Leaves 3-4 inches long, having the teeth intermixed with glandular denticulations, while young having a few dot-formed stellate hairs above. Corollas white.

Two-coloured-leaved Clethra. Tree.

9 C. tinnberræata (H. B. et Kunth, l. c. p. 290. t. 264.) arboreous; leaves elliptic-oblong, quite entire, coriaceous, glabrous above, but clothed with white tomentum beneath; racemes in fascicles at the tops of the branches; stamens hardly inclosed, \( \text{s} \). Native along with the preceding. Cuellaria rugosa, Wildl. herb. Branches glabrous, brown. Flowers sub-second, nutant, about the size of those of C. alnifolia. Pedicels, calyces, and rachis clothed with rusty tomentum. Corolla white, having the segments emarginately 2-lobed, and lacinately fringed at the apex.

Fringed-flowered Clethra. Tree.

11 C. obovata (Ruiz et Pav. fl. per. 4. t. 381.) leaves obovate, wrinkled, denticulated. \( \text{G} \). Native of Peru, in forests about Cuchero. Cuellaria obovata, Ruiz et Pav. syst. p. 193. Racemes long, fascicled at the tops of the branches. Branches and leaves downy. Flowers small.—A tall tree. The wood is very hard, and is made into utensils by the natives.

Obovate-leaved Clethra. Tree tall.

12 C. revoluta (Ruiz et Pav. fl. per. 4. t. 380. f. a.) leaves oblong, denticulated, revolute and excavated at the base. \( \text{G} \). Native of Peru, in forests towards Pillao. Cuellaria revoluta, Ruiz et Pav. syst. p. 193. Branches, leaves, and racemes downy. Racemes simple, fascicled at the tops of the branches.

Revolute-leaved Clethra. Tree 30 feet.

13 C. canescens (Herb. Reinw. et ex Blum. bjudr. p. 863.) leaves cuneate-oblong, acute, serrated at the apex; panicle terminal, clothed with canescent scar; calyces segments ovate, acute. \( \text{G} \). Native of the Celebes, in woods, on the mountains. Canescens paneled Clethra. Fl. Sept. Shrub.

14 C. tinnifolia (Swartz, fl. ind. occ. 2. t. 845.) arboreous; leaves oblong-lanceolate, quite entire, hoary beneath; racemes spike-formed, panicled at the tops of the branches, tomentose. \( \text{G} \). Native of the south of Jamaica; also of Mexico, near Chiconquiaco. Tinus occidentalis, Lin. spec. 530. Volkâmeria, P. Browne, jam. 214. t. 21. f. 1. Sloan, jam. 2. p. 86. t. 198. f. 2. Flowers white. Sloane calls this tree Bastard Locust tree.

Laurestine-leaved Clethra. Clt. 1825. Tree 12 to 14 feet.

15 C. foliacea (Ait. hort. kew. 2. p. 73.) leaves oblong, attenuated, lanceolate, glabrous on both surfaces, serrated; racemes spike-formed, panicled at the tops of the branches; calyces segments obtuse. \( \text{G} \). Native of Madeira. Sims, bot. mag. 1057. Flowers white. There are several varieties of this species; a smaller variety, and a variegated-leaved one.

Cult. All the species of this genus are very ornamental. The hardy kinds thrive best in peat earth, or a very light sandy loam: they are dwarf shrubs, and are therefore well fitted for the front of shrubberies, where the soil will suit. By layers is the usual mode of increasing them, but they also strike root readily from cuttings in sand under a hand-glass. The greenhouse kinds are well adapted for large conservatories, and they thrive in the same kind of soil recommended for the hardy species. Cuttings taken from wood not too ripe will strike root readily in sand under a hand-glass. All may be raised from seeds, which in most of the species ripen in plenty.

Trize 11.

**XLI. RHODODENDRON** (from po'kow, rhodon, a rose, and éx'kpyor, dedron, a tree; in reference to the terminal bunches of flowers, which are usually red). Lin. gen. no. 548. Schreb. gen. no. 746. Gaertn. fruit. 1. p. 304. t. 63. Juss. gen. 158. D. Don, in edinb. phil. journ. prod. fl. nep. p. 152.—Azalea species of authors.—Rhodora, Lin.—Chamerohododendron, Torn. inst. t. 373.

**Linn. syst. Penta-Dccándria, Monogénia.** Calyx 5-parted. Corolla somewhat funnel-shaped, or campanulate; rarely rotate or 5-parted; limb 5-cleft, somewhat bilabiate; upper lip the broadest, and usually spotted. Stamens 5-10, usually exserted, declinate; anthers opening by 2 terminal pores. Capsule 5-celled, 5-valved, rarely 10-celled and 10-valved, as in *R. arboreum*, with a septical dehiscence at the apex. Placentas simple, angle. Seeds compressed, sphaeriform, winged.—Shrubs or trees, usually evergreen. Leaves alternate, quite entire, terminated by a spacieal apex, or yellow gland. Flowers terminal, corymbose, showy.

1 R. *Po'nticum* (Lin. spec. 562.) leaves oblong-lanceolate, glabrous on both surfaces, attenuated towards the thick petals, with a streak on the upper surface, of a wide lanceolate form; racemes short, corymbose.  h. H. Native of Asia Minor, at Pontus; and of Gibraltar, Iberia, and Caucasus, in wet places in beech and alder copices. Pall. fl. Росс. 1. p. 43. t. 29. Jacq. icon. rar. 1. t. 78. Lam. ill. 504. Curt. bot. mag. 650. Leaves sometimes becoming ferrugineous beneath. Corolla purple, large, with ovate, acute, or lanceolate segments. Calyx minute, 5-toothed, somewhat cartilagineous. This is a very common plant, and there are a great many varieties. The most remarkable are those with white, red, or bluish flowers, and striped leaves. Tournefort has related that the flowers of this species were reputed to impart a noxious quality to honey; this Guldentadt contradicts, and imputes it to *Azalea Pontica*.

Var.  *ê. obtùsum* (Wats. dendr. brit. t. 162.) leaves subcoritate, coriaceous, obtuse; calyx very short, unequally and undulately crenated.  h. H. Native of Pontus. Shrub 3-4 feet high. Flowers purple.

Var.  *ê. myr'git'folium* (Lodd. bot. cab. 909.) leaves small; flowers purple.  h. H. Native of Gibraltar.

Var.  *ê. Smíthii* (Sweet, fl. gard. n. s. t. 50.) leaves lanceolate, clothed with white tomentum beneath; corymbas many-flowered; ovarium tomentose, 10-celled; flowers of a rose purple, approaching to crimson, elegantly spotted with black.  h. H. A hybrid, raised by Mr. Smith, of Coombe Wood, from the seed of *R. Ponticum*, impregnated by the pollen of *R. arboreum*.

**Pontic** Rhododendron or Rose-bay. Fl. May, June. Clt. 1763. Shrub 6 to 12 feet.

2 R. *Máxi'mum* (Lin. spec. p. 563.) arboreous; leaves elliptic-oblong, acute, convex, bluish at the base, whitish or rusty beneath, glabrous; calyce segments oval-obtuse; segments of corolla roundish.  h. H. Native from Canada to Carolina, on the mountains near rivulets and lakes. Sims, bot. mag. 951. Lam. ill. 361. Schmidt, abr. t. 121.—Mill. fig. 229. —Catesus, caric. 3. t. 17. f. 2. Flowers pale red, in umbellate corymbs, studded with green, yellow, or purple protuberances.

3 R. *fur'pereum*; arboreous; leaves large, oblong-elliptic, flatish, acute, bluish at the base, green and glabrous on both surfaces; segments of corolla oblong, obtuse.  h. H. Native of Virginia and Carolina, on the highest mountains, near lakes. R. *Máxi'mum*  cà. purpur'ereum, Pursh, fl. amer. sept. 1. p. 297. Flowers large, purple. Calyce segments obtuse. This shrub approaches near to *R. Ponticum*, but it differs in its foliaceous calys, and otherwise. It grows to an immense size; its stem is often found 18 inches and more in diameter, and its foliage triple the size of any other species.

5 R. *Macrophy'llum* (D. Don, miss. in herb. Lamb.) leaves lanceolate, acute, glabrous on both surfaces, as well as the peduncles, rounded at the base; ovarium bristly.  h. H. Native of the north-west coast of America, where it was collected by Menzies. Petioles an inch long. Leaves 7-8 inches long. Flowers copious, smaller than those of *R. maximum*, white. Calyce lobes short, rounded. Filaments glabrous.

**Long-leaved** Rhododendron. Shrub.

6 R. *Catawbi'ense* (Michx. fl. bor. amer. 1. p. 258.) leaves short-oval, rounded, and obtuse at both ends, glabrous, of a different colour beneath; calyce segments elongated, oblong.  h. H. Native on the high mountains of Virginia and Carolina, particularly on the head waters of the Catawba River. Sims, bot. mag. 1671. Lodd. bot. cab. 1176. Flowers purple, disposed in umbellate coryms.

Var.  *ê. Russel'li'annum* (Sweet fl. gard. n. s. t. 91.) leaves oblong, finely tomentose beneath; corymbas many-flowered; flowers of a bright rose red, approaching to crimson.  h. H. A hybrid, raised from the seed of *R. Catawbi'ense*, impregnated by the pollen of *R. arboreum*, by Mr. Russell, of Battersse.

7 R. *Brachycar'rum* (D. Don, miss. in herb. Lamb.) leaves elliptic-oblong, obtuse, clothed with rusty tomentum beneath, rounded at the base; ovaries 5-celled, and are as well as the peduncles hairy.  h. H. Native of Japan. Petioles half an inch long. Leaves 3 inches long. Calyce lobes very short, roundish, revolute, callous. Style elongated. Stigma clavate.

**Short-fruited** Rhododendron. Shrub.

8 R. *Chrysanth'um* (Linn. syst. 405. suppl. 237.) leaves acutish, attenuated at the base, oblong, glabrous, reticulately veined, and of a rusty colour beneath; flowers and buds clothed with rusty tomentum; pedicels hairy; calyce hardly any; segments of the corolla rounded; ovarium tomentose.  h. H. Native of Siberia, on the highest mountains, and of Caucasus. Pall. itin. append. p. 729. no. 87. t. n. f. 1-2. fl.Ross. 1. p. 44. t. 30. Woodv. med. bot. 433. t. 149. Plenk, 5 p 2.
par. Lond. t. 80.—Gmel. sib. 4. t. 54. R. officinale, Salisb. p. 191. t. 54. Branches decumbent, beset with rusty stipular-lobed segments. Flowers handsome, large, drooping, revolute, rather irregular, yellow. Stigma 5-lobed. The plant and its effects were first described by Gmelin and Steller, who mention it as used in Siberia for the cure of rheumatism; with us it is used in decoction as a substitute for Colchicum. (F. 141.)

ERICACEE. XLIII. Rhododendron.

20 R. formosum (Wall. pl. rar. asiat. 3. p. 3. t. 207.) leaves lanceolate, acute, attenuated at the base, beset with rusty dots beneath; segments reflexed; ovary 10-celled. ♀. F. Native of Nipaul. Leaves an inch and a half long. Flowers about the size of those of R. Ponticum, white, suffused with red. Limb of calyx short.

Showing Rhododendron. Shrub.

Sect. III. _Pogonanthum_ (from πογον, pegon, a beard; and ἀνθος, anthos, a flower; throat of corolla woolly inside). Limb of calyx short, 5-lobed. Corolla salver-shaped, with a cylindrical tube, and a spreading limb. Stamens 8, included. Ovary 5-celled.—Leaves evergreen, coriaceous.

Bearded, flowered Rhododendron. Fl. April, May. Clt. 1820. Shrub 1 to 1½ feet.

Sect. IV. _Leptophorum_ (from λεπτός, lepis, a scale; and θερός, pheho, to bear; leaves covered with small scales). Limb of calyx dilated, 5-lobed. Corolla campanulate or rotate. Stamens 10. Ovary 5-celled.—Leaves membranous, sometimes deciduous.

22 R. _Lepidoptera_ (Wall. cat. 733.) every part of the plant is beset with ferruginous scale-like dots; leaves spatulate or lanceolate, attenuated at the base, beset with round scale-like dots, as well as the branchlets, ferruginous beneath; calycine segments rounded; corollas short, campanulate, lepidotomous, with roundish entire lobes; capsules also lepidotomous; filaments woolly at the base. ♀. F. Native of Nipaul. A widely-branched shrub, with the habit of _R. Dnatricum_. Leaves of a thinner texture, about an inch long. Flowers as well as the capsule covered with round rust-coloured scales. Flowers deep pink, solitary or 2-5 together, terminal, on short filiform pedicels.

Scaly-dotted Rhododendron. Shrub 2 to 3 feet.

Flowers crimson, disposed in umbellate corymbs, 5-6 together, surrounded by large dotted scales or bracteae. Calyx covered with yellow scales, ciliate. Segments of corolla unequal, undulate. Stamens 5-8, equal in length to the corolla. Stigma capitate, 5-lobed. Filaments hairy at the base.

24 R. _Dauricum_ (Lin. spec. 562.) deciduous; leaves oblong, attenuated at both ends, glabrous, lepidotomous from rusty scales, particularly beneath; limb of calyx 5-toothed; corollas rotate. ♀. H. Native of Siberia, peculiar to the alpine tracts of Eastern Asia; it appears first at the mouth of the river Yenesei, and beyond that, especially from the river Ula, in the pine woods, it begins to be common; but about the Baikal it is most abundant, and extends through the deserts of the Mongols to China and Thibet; at the Lena it becomes more rare, and beyond that it is much dwarfer, with more slender flowers and narrower leaves. Pall. fl. rosse. 1. p. 47. t. 32. Andr. bot. rep. t. 4. Curt. bot. mag. t. 636. Lodd. bot. cab. 605.—Amn. ruth. 151. t. 21. Roots knotted, bound by fibres. Stems twisted and knotted in the wild state. Petioles downy. Leaves dotted on both surfaces, but ferruginous beneath; before the fall in autumn they become of a dusky red colour. The flowers rise before the leaves from the tops of the branches, from buds which are composed of concave downy scales. Corollas purple.

Var. _β._ atrorubens (Ker. bot. reg. t. 134.) evergreen; leaves deep green and shining above. ♀. H. Native of Siberia. Sims. bot. mag. 1888.

Sect. V. _Chameleitrus_ (from χαμαι, chamai, on the ground; and cistus, the rock-rose: plants with the habit of _Helianthemum_. Limb of calyx foliaceous, 5-celled. Corolla rotate. Stamens 10. Ovary 5-celled.—Leaves small, membranous, evergreen.

26 R. _Chameleitrus_ (Lin. spec. 562.) leaves oblong-lanceolate, attenuated at both ends, stiifo, glanularily ciliated; peduncles usually twin, and are as well as the calyces beset with glandular hairs. ♀. H. Native of the Alps of Europe; as of Austria, Carniola, Mount Baldo, and near Salzburg; and in Eastern Siberia. Jacq. fl. austr. 3. t. 217. Curt. bot. mag. t. 488. Lodd. bot. cab. 1491.—Mich. gen. 225. t. 106.—Plak. phyt. t. 23. f. 4. Corollas rotate, pale purple. A dwarf tufted shrub, with small leaves, about the size of those of a species of _Helianthemum_.

27 R. _Indicum_ (Sweet. fl. gar. n. s. 128.) branches strigose; leaves cuneate-lanceolate, finely crenulated, strigose, attenuated at both ends; calyceate teeth long-lanceolate, obtuse, ciliated, spreading; flowers terminal, solitary or twin, decandrous. ♀. H. Native of China. Much cultivated in Japan for the sake of its elegant flowers. Azaela Indica, Lin. spec. 214. Thunb. jap. 84. Sims. bot. mag. 1480. Lodd. bot. cab. 275.—Hern. lutea. 152. t. 128. Tsutsuji, kwempf. amoen. 714. t. 146. Flowers showy, scarlet or red.

Var. _β._ plicatum (Sweet. fl. gar. n. s. 117.) calyx very hairy, with subulate segments; leaves elliptic, acute; flowers decandrous, terminal, 2-3 together. ♀. G. A hybrid between _R. edulis_ and _R. indicum_. R. Indicum, var. _γ._ Smithii, Sweet, horit. brit. 2. p. 343. Corollas large, of a deep rosy purple, spotted with deep red inside.

Var. _γ._ ignescens (Sweet. fl. gar. n. s. 128.) The four lower segments of the corolla flame-coloured, and the superior one lilac, and absolutely dotted. ♀. S. Native of China.
**Ericaceae. XLI. Rhododendron.**

Var. ē, aurantiacum; flowers of orange-red colour. ½. G. Native of China.

Var. ē, luteum (Sweet. I. c.) flowers double, yellow.

Var. ē, variegatum (Blum. bijdr. 851.) leaves oblongate, covered with white silky bristles; flowers rose-coloured, variegated with white. ½. G. Native of China and Japan.

Var. ē, spatulatum (Blum. bijdr. 852.) leaves spatulate, mucronate, beset with rusty stigae; flowers rose-coloured. ½. G. Native of China and Japan.

Var. ē, grandiflorum (Blum. bijdr. 853.) leaves oblongate, mucronate, beset with white bristles or stigae; flowers large, solitary, deep rose-coloured. ½. G. Native of China and Japan.

Var. ē, augustifolium (Blum. I. c.) leaves narrow-lanceolate.

Var. κ, floribundum (Blum. I. c.) leaves narrow, cuneate-lanceolate, beset with rusty stigae; stem much branched. ½. G. Native of China and Japan.

**Indian Rhododendron.** Fl. March, May. Clt. 1808. Shrub 3 to 6 feet.

28 R. scabrum; leaves ovate, mucronulate, acute at the base, ribboned beneath, beset with adpressed bristles, as well as the branchlets and peduncles; flowers deciduous; filaments papillose; anthers corniculate at the base; stigma dilated. ½. G. Native of Japan, in woods on mountains. R. maximum, Thunb. fl. jap. p. 181. Flowers deep rose-coloured, campanulate, usually twin. Lobes of corolla oblong, obtuse, twice longer than the tube. Stamens exerted. Calyces segments oval, obtuse, ciliated. Leaves 1 ½ to 3 inches long, coriaceous. Corolla 3 inches in diameter.

Scabrous Rhododendron. Shrub.

29 R. macranthum; leaves opposite or 3 in a whorl, obovate or lanceolate, mucronulate, shining, clothed with adpressed bristles; flowers pentandrous; calyces segments lanceolate, acute, deeply toothed, bristly; filaments glabrous. ½. G. Native of Japan. Azalea macranthum, Bunge, in mem. acad. peteb. 2. p. 115. R. nitens, D. Don, mss. Stems several, rising from the root-stocks, 2-4 feet long, procumbent, naked. Branches fascicled, leafy at the tips, beset with adpressed silky bristles, which change to brown, as well as the calyces. Flowers solitary or in pairs, nearly sessile, involucrated by bracteae. Corollas large, of a brilliant salmon-colour, glabrous outside; the limb spreading with oblong blunt lobes; the upper lobes marked with deeper coloured spots. There is a variety of this species, having the flowers pale pink and striped.

Descr. 1833. Shrub procumbent, 2 to 3 feet.

30 R. reticulatum (D. Don, mss.) leaves broadly ovate, acute, rather coriaceous, sparingly hairy, glaucous and reticulately veined beneath. ½. G. Native of Japan, on the mountains, and has been lately introduced by Mr. Knight, of King’s Road, Chelsea. Stems erect, a foot or 2 feet high, stiff. Leaves stiff, 1 ½ inch long, rounded at the base, bright green and shining above, beset with a few adpressed bristles as well as the young shoots. Flowers not seen.

31 R. Farrer(e) (Tate, in Sweet. fl. gard. n. s. t. 95.) branches stiff, villous while young, but glabrous in the adult state; leaves stiff, coriaceous, ovate, obtuse, ending in a short ciliarginous mucrone, attenuated at the base, nerved and reticulately veined, hairy on both surfaces, with somewhat recurved ciliated edges; petioles ciliated at the base; flowers terminal, solitary. ½. G. Native of China, from whence it was brought by Capt. Farrer. Calyx pilose, 5-lobed. Corolla spreading, with undulate segments, lilac or pale purple-red. A dwarf deciduous shrub. Flowers deciduous.

32 R. phœnicium; hairy, leaves oblong-obovate, tapering into the petioles at the base; flowers collected at the tops of the branches, large, deciduous; stamens short; calyx erect, glan-

Var. β, flore pleno (Hook. bot. mag. 2509.) flowers double, purple. Lodd. bot. cab. 1461.

**Purple Rhododendron.** Fl. May. Clt. 1824. Shrub 3 to 10 feet.

34 R. mucrona-tum; much branched; branches pilose; leaves cuneate-oblong, mucronate, clothed with cream hairs; flowers in fascicles; calyces segments long-acuminate, pilose; flowers octandrous and deciduous. ½. G. Native of China. Flowers white. Azalea mucronata, Blum. bijdr. p. 853.—Perhaps the same as R. ledifolium.

Mucronate-leaved Rhododendron. Shrub.

35 R. Burman’s; leaves linear-lanceolate, long-acuminate, with recurved margins, clothed with silky villi on both surfaces. ½. G. Native of Japan. Azalea rosamarniformis, Burm. ex Blum. bijdr. p. 853. but not of Roth. Flowers pentandrous.

**Burman’s Rhododendron.** Shrub.

36 R. mollis; branchlets pilose; leaves oblong-lanceolate, acute, narrowed at the base, ciliated, very soft beneath; flowers in fascicles; calyx very short; tube clothed with silky tomentum; flowers pentandrous. ½. G. Native of China. Azalea mollis, Blum. bijdr. p. 853.

Soft Rhododendron. Shrub.

37 R. Lowereîîâna; leaves lanceolate, quite entire, rugose about the edges, smooth; corolla white, dotted with red, as also the calyx, anthers, and gynaeae. ½. G. Native of Cochin-China. Azalea punctata, Lour. coeb. p. 113. Flowers disposed in terminal heads.

**Lowereîî’s Rhododendron.** Shrub 4 to 5 feet.

38 R. decumens (D. Don, mss.) stems decumbent; leaves ovate, acute; flowers pentandrous; segments of the calyx ovate, acute, ciliated. ½. G. Native of China, from whence it has been lately introduced by Knight and Tate. Flowers crimson.

39 R. Simone (Sweet. fl. gard. 290.) leaves slowly deci-
duous, elliptic, acutish, pilose, pubescent, feather-nerved, with ciliated margins, crenate beneath; corollas downy; stamens equal in length to the limb of the corolla. ½. G. Native of China. Azalea Sinensis, Lodd. bot. cab. 885. Flowers flame-coloured, pentandrous.

Var. β, flavescens (Sweet. fl. gard. 290.) flowers yellow.

**Chinese Rhododendron.** Fl. May, June. Clt. 1823. Shrub 3 to 4 feet.

**Sect. VII. Pentanthera** (from πεντε, pente, five; and ανθηρα, anthera, an anther; flowers pentandrous). Limb of calyx short, 5-lobed. Corolla funnel-shaped. Stamens 5. Ovarium 5-celled. Leaves deciduous.
40 R. flava; flowers leafy, clamy; leaves ovate, oblong, pilose, ciliated; corolla funnel-shaped; stamina very long. H. Native of the Levant, at Pontus; Caucasus, Turkey, &c. Azalea Pönica, Lin. spec. 1669. Curt. bot. mag. t. 433. Azalea arborea, Lin. spec. ed. 1. p. 150.—Buxb. cont. 5. p. 36. t. 69. Flowers fine yellow. Leaves shining. There are a great variety of species of this species in the gardens, differing principally in the colour of the flowers, and the hue of the leaves. The flowers are of all shades, from yellow to copper or orange-coloured. They are sometimes white, (see Sims, bot. mag. 2383.), and are sometimes striped with yellow and red.

Yellow-flowered Rhododendron. Fl. May, June. Ch. 1793. Shrub 4 to 6 feet.

41 R. nudiflorum (Torr. fl. un. st. 1. p. 140.) leaves lanceolate-oblong, nearly smooth and green on both surfaces, ciliate on the margins, having the mid-rib bristly beneath, and woolly above; flowers rather naked, not clammy; tube of corolla longer than the divisions; teeth of calyx short, rather rounded; stamina much exerted. H. Native from Canada to Georgia, on the sides of hills. Azalea nudiflora, Lin. spec. 214. Azalea periclymenoides, Michx. fl. bor. amer. 1. p. 151. This beautiful shrub has a great many varieties, besides those mentioned below, for which see Loud. hort. brit. p. 66. and supplement, among which is one with double flowers. Flowers scarlet, pink, white, striped, variegated, red, purple, &c., disposed in terminal clustered racemes, appearing before the leaves. The variety η proves clearly that Azalea and Rhododendron are not generically distinct.

Var. a, coccineum (Sims, bot. mag. 180.) flowers scarlet; leaves lanceolate. H. Native of Georgia, near Savannah.

Var. γ, carneum (Pursh, l. c.) corollas pale red, having the tube red at the base; calyx foliaceous. H. Ait. l. c. Ker. bot. reg. 120.

Var. ε, album (Pursh, l. c.) flowers white; calyx middle-sized. H. Ait. l. c.

Var. µ, papilionaceum (Pursh, l. c.) flowers reddish, with the lower segment white; calyx foliaceous. H. Ait. l. c.

Var. ζ, partitum (Pursh, l. c.) flowers pale red, 5-parted even to the base. H. Ait. l. c.

Var. η, polyandrum (Pursh, l. c.) flowers rose-coloured, short; stamina 10-20. H. Native near Philadelphia.

Var. θ, Gallohero (Pursh, l. c.) branches tomentose-dowly; leaves evergreen are deciduous, oblong, acute, downy white, glabrous, in the adult state, and recurved at the apex; tube of corolla a little longer than the segments. H. A hybrid, raised from the seed of R. nudiflorum, impregnated by the pollen of a hybrid raised between R. Pönicum and R. Catawbineum. Flowers delicate light purple, disposed in terminal racemose corymbs. R. Govenián, Sweet, fl. gard. 3. t. 283.

Var. ι, rufum (Lodd. bot. cab. t. 51.) flowers red. H. Naked-flowered Rhododendron. Fl. April, June. Ch. 1734. Shrub 3 to 4 feet.

42 R. viscósum (Torr. l. c.) leaves oblong-ovobate, acute, smooth and green on both surfaces, ciliated on the margins, having the mid-rib bristly; flowers clammy, leafy, hairy; tube of corolla as long as the segments; teeth of the calyx short, rounded; stamina hardly longer than the corolla. H. Native from Canada to Georgia, in swamps and shuddy woods. Azalea viscosa, Lin. spec. 214.—Pluck. alm. 106. t. 161. f. 4. Catesb. car. l. t. 57. Flowers white, sweet-scented, in terminal clusters, downy. There are a great number of varieties of this species, (see Loud. hort. brit. p. 66.), varying in the colour of the flowers, and otherwise. The flowers are white and red, and variegated with these colours. There is a downy variety with red flowers figured in Lodd. bot. cab. t. 441.

Var. β, ornánatum (Sweet, fl. gard. n. s. 137.) A hybrid raised from the seed of R. viscosum β rubéscens, fertilized by the pollen of R. Pönicum.

Var. β, Mortérí (Sweet, fl. gard. n. s. t. 10.) A hybrid between R. caeruleuca and one of the red varieties of R. nudíflora. There are also two kinds of this; one with a flesh-coloured corolla, having the upper segment orange-coloured, edged with flesh-colour, called R. Mortérí cárnea; and another called Mortérí, var. práestans, with pale copper-coloured flowers, tinged with blush.

Marygold Rhododendron. Fl. May, June. Ch. 1806. Shrub 2 to 6 feet.

44 R. arbórescens (Torr. l. c.) leaves obovate, rather obtuse, smooth on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib almost smooth; flowers not clammy, leafy; tube of corolla longer than the segments; calyx leafy, with the segments oblong and acute; filaments exerted. H. Native of Pennsylvania, on the sides of rivulets near the Blue Mountains. Azalea arbórescens, Pursh, fl. amer. sept. 1. p. 153. Flowers large, reddish; leaves of flower-buds large, yellowish brown, surrounded with a fringed white border.

Arborescens Rhododendron. Fl. May, July. Ch. 1818. Tree 10 to 20 feet.

45 R. sérínæ (Torr. l. c.) branches smoothish; leaves obovulate, rather mucronate, coriaceous, smooth on both surfaces, shining above, having the nerve bristly beneath, with revolute ciliated margins; flowers clammy, leafy; tube of corolla a little longer than the segments; calyx very short; filaments exerted. H. Native from New York to Virginia, in deep mossy swamps on the mountains. Azalea nitidã, Pursh, fl. amer. sept. 1. p. 153. Ker. bot. reg. 414. Flowers white, tinged with red. Leaves dark green, shining, smaller than any other species of the present section.

46 R. hispidum (Torr. l. c.) branches straight, very hispid; leaves long-lanceolate, hispid above, and smooth beneath, glaucous on both surfaces, ciliated on the margins, having the nerve bristly beneath; flowers very clammy; leafy; tube of corolla wide, scarcely longer than the segments; teeth of calyx oblong, rounded; filaments exerted. H. Native of New York and Pennsylvania, on the borders of lakes on the highest part of the Blue Mountains. Azalea hispidã, Pursh, fl. amer. sept. 1. p. 154. Watts. dendr. brit. 6. Azalea viscosa, var. glátea, Ait. hort. kew. 1. p. 219. Flowers white, with a red border, and a tinge of red on the tube, which makes them appear to be of a rose-colour before expansion. Stamens sometimes 10. This species may be distinguished from the rest of the present section by its bluish appearance.

47 R. nicolor; leaves oblong, clothed on both surfaces with fine hoary pubescence, not bristly on the nerve; flowers small,
not clanny, naked; tube of corolla hardly longer than the segments; calyx very short: having one of the segments linear, and 4 times longer than the rest; filaments exserted; branchlets hispid.  ♂. H. Native of Carolina and Georgia, on barren sandy hills. Azalea bicolor, Pursh, fl. amer. sept. 1. p. 153. Azalea nudiflora, var. bicolor, Ait. hort. kew. 1. p. 319.—Trew. chrest. t. 48. Flowers slender and smaller than the rest, of a pale rose-colour, or nearly white, with a deep red-coloured tube.

48 R. glaucus; branchlets hispid; leaves oblongate, acute, glabrous on both surfaces, glaucous beneath, ciliated on the margins, having the mid-rib bristly; flowers very clanny, leafy; tube of corolla twice longer than the segments; calyx very short; filaments about equal in length to the segments of the corolla. ♂. H. Native from New England to Virginia, in swamps of a clayey soil. Azalea glauca, Pursh, fl. amer. sept. 1. p. 154. Lam. ill. p. 493. Wats. dendr. brit. 5. Azalea viscosa, var. florifluida, Ait. hort. kew. 1. p. 319. Flowers white, very fragrant. The shrub is dwarfer than other species of the present section, and flowers in great abundance. Nuttall considers this as only a variety of A. viscosa, differing in nothing but in the under sides of the leaves being glaucous.

49 R. canescens; leaves ovate-oblong, downy above, and tomentose beneath, not bristly at the middle nerve; flowers not clanny; nearly naked; tube of corolla hardly shorter than the segments; teeth of calyx very short, rounded, obtuse; stamens hardly exserted. ♂. H. Native of Lower Carolina, on the banks of rivers; and of Virginia, on the mountains of the Cacapon Springs, near Winchester. Azalea canescens, Michx. fl. bor. amer. 1. p. 150. Wats. dendr. brit. 116. Flowers rose-coloured.

50 R. spectosum; branches hairy; leaves lanceolate, ciliated, acute at both ends; calyx pubescent; corolla silky, with obtuse, ciliated, lanceolate, undulated segments; stamens exserted. ♂. H. Native of North America. Azalea speciosa, Willd. enum. p. 66. Lodd. bot. cab. 1244. Wats. dendr. brit. 116. A cocinea, Lodd. Flowers scarlet and orange-coloured. There are several varieties of this species, varying in the shape of the leaves and the colour of the flowers; see Loud. hort. brit. p. 66. Lodd. bot. cab. 1255.

Sect. VIII. Rhodora (from ρόδος, rhodon, a rose; colour of flowers). Leaf of calyx 5-toothed. Corolla bilabiate; upper lip broadest, and 2-3-eleft; lower one bidentate. Stamens 10. Capsule 5-celled, 5-valved.—Leaves deciduous. Habit of last section.

Cult. Of all the genera in existence, Rhododendron comprises the most handsome, elegant, and showy shrubs, well fitted for adorning shrubberies, or to be grown singly on lawns. All the species grow best in peat soil, or very sandy loam, or vegetable mould: they are either increased by layers or by seeds. When raised in the latter way, the seeds must be sown early in the spring, in flat pans or pots, filled with peat earth, and covered very slightly; the pots or pans should then be set in a close frame, or at the front of a hot-house, till the plants come up, watering them very slightly when dry; and as soon as the seedlings have grown high enough to be laid hold of, they should be planted out into other pans or pots, filled with the same kind of mould; after which they may stand in a close frame for a few days, until they have struck fresh roots, and afterwards hardened to the air by degrees. The smaller kinds of Rhododendron may be propagated freely by cuttings, taken off from young wood, and planted in sand, placing a bell-glass over them. There are now in the gardens a great many hybrid kinds of Rhododendron, and are still increasing in number; some of which outvie the species in splendour. The species natives of Nipaul, China, and Japan, in mild winters, would probably succeed in the open air, but they will not survive a severe winter without protection; they are therefore best kept in pots, and placed among other greenhouse or frame plants. R. arboreaum and R. album are among the most showy of the species, and are well adapted for conservatories, or to be placed in large tubs in the greenhouse. Young cuttings of the tender kinds, if torn off close to the stem, and planted in a pot of sand, will strike root readily; the pot should be plunged in heat under a hand-glass.

XLIV. VIREYA (named by Blume after M. Virey, a French physician). Blum. bijdr. p. 854.

Lin. Syst. Decauaria, Monogynia. Calyx small, absolutely 5-toothed. Corolla subcampanulate, or funnel-shaped, regular, 5-lobed, adnate to the disk of the calyx. Stamens 10, inserted in the calyceine disk; alternate filaments the shortest; anthers oblong, bursting inwardly, naked, delisising by two pores at the apex. Style filiform; stigma capitate, 5-furrowed. Capsule silique-formed, 5-angled, 5-celled. Placentae 5-lobed. Seeds numerous, expanded into a bristle-formed awn at both ends.—This genus differs from Rhododendron in the calyx being small, and in the stamens not being attached to the corolla in any way.—Mostly parasitical shrubs. Leaves scattered and verticillate, quite entire, coriaceous, covered with scaly dots beneath. Flowers disposed in terminal fascicles.

* Corollas subcampanulate.

1 V. Javaica (Blum. bijdr. 854.) leaves oblong-lanceolate, clothed with fine rusty dots beneath; flowers showy, deep orange. ♂. G. Native of Java, at the foot of Mount Salak, where it is called by the natives Gaja Mirka. Var. 3; flowers citron-coloured, smaller.

Java Vireya. Fl. Year. Shrub.

2 V. solea (Blum. bijdr. 855) leaves lanceolate, densely clothed with rusty scales beneath; flowers white, middle-sized. ♂. G. Native of Java, on Mount Salak, parasitical upon trees. Rhododendron album, Blum. cat. hort. butinz. p. 72.

White-flowered Vireya. Fl. Year. Shrub.

* * Corollas funnel-shaped.

3 V. tubiflora (Blum. bijdr. 855.) leaves lanceolate, densely clothed with rusty dot-like scales beneath; flowers scarlet. ♂. G. Native of Java, on the higher mountains.

Tub-flowered Vireya. Fl. Year. Shrub.

4 V. Celebica (Blum. i. c.) leaves broad, lanceolate, clothed with rusty dot-like scales beneath; flowers scarlet. ♂. G. Native of the Celebes, in mountain woods.

Celebes Vireya. Fl. Year. Shrub.

5 V. retusa (Blum. bijdr. 856.) leaves spatulate, retuse, with recurved margins, beset with rusty dots beneath; branches
ERICACEÆ. XLV. BEJARIA. XLVI. HYMENANTHES.

rough; flowers scarlet. ½. G. Native of the west of Java, on high mountains.

_Recuse-leaved_ Vireya. Fl. Year. Shrub.

_Cult._ For culture and propagation, see _Agarista_, p. 838.

_Lin. syst._ Dodecándria, Monogónia. Calyx deeply 7-cleft. Corolla so deeply 7-cleft as to appear of 7 petals, spreading. Stamens 14, hypogynous; anthers oblong or pendulous, awnless. Ovarium free, 7-furrowed. Style elongated; stigma depressedly capitate, 7-furrowed. Capsule depressedly globose, girded by the permanent calyx, and terminated by the style, 7-celled, 7-valved, with a sepicalid dehiscence; cells many-seeded.

—_Elegant alpine shrubs_; with scattered, crowded, quite entire, coriaceous leaves; racemose or corymbose, bracteate flowers. Corollas usually purple.

1 B. _resinosă_ (Mutis, Amer. 1. t. 8. Lin. syst. 443. suppl. 246.) branches downy; leaves ovate, smooth; corymb terminal, simple; pedicels downy; corollas resinous and viscid; filaments downy near the base. ½. G. Native of New Granada. Branches prolificous. Leaves an inch long. Corollas purple.

_Resinosus-leaved_ Bejaría. Shrub 3 to 5 feet.

3 B. _glauca_ (Humb. et Bonpl. pl. aquin. 2. p. 118. t. 177.) glabrous; leaves oblong, obtuse, glaucous beneath; racemes terminal and auxiliary; pedicels somewhat fastigate. ½. G. Native of South America, in the alpine region of the province of Venezuela, near the top of Silla de Caracas. Shrub much branched; branchlets angular. Corolla flesh-coloured, glabrous; filaments glabrous.

4 B. _coarctata_ (Humb. et Bonpl. pl. aquin. 2. p. 125. t. 121.) branches clothed with pubescent tomentum; leaves oblong, glabrous, glaucous beneath; corymbs terminal, simple; peduncles, pedicels, raci, and calyxes clothed with rusty tomentum. ½. G. Native of Peru, in cold places near the city of Caxamarca. Shrub much branched. Flowers purple. Filaments glabrous, but dilated and pubescent at the base.

_Coarctata-corymbose_ Bejaría. Shrub 4 to 5 feet.

5 B. _graniflora_ (Humb. et Bonpl. pl. aquin. 2. p. 120. t. 119.) leaves ovate, glabrous above, but clothed with rusty tomentum beneath, as well as the pedicels, pedicels, raci, calyxes, and branchlets; corymb terminal, branched a little, many-flowered. ½. G. Native of the province of Quito, in cold places between Loxa and Oxa, in Paramo de Saraguro; and near Alto de Pulla, and Vinacuac. Shrub much branched; branches subverticillate. Corollas purple, about the size of those of _Dictamnus albus_. Filaments glabrous, but dilated and ciliated at the base.

_Great-flowered_ Bejaría. Shrub 3 to 4 feet.

6 B. _x'estusANS_ (Mutis, in _Lin. fl._ suppl. 247. mant. 242. Humb. et Bonpl. pl. aquin. 2. p. 120. t. 118.) leaves elliptic, rather glabrous above, but downy and glaucous beneath, while young clothed with rusty tomentum, and ciliated with glands; coryms terminal, simple; peduncles, pedicels, raci, calyxes, and branchlets clothed with clammy glandular hairs. ½. G. Native of New Granada, near Gonzauama. Much branched; branchlets subverticillate. Flowers smaller than those of the preceding, purple. Filaments villous at the base.

_Heating_ Bejaría. Shrub 10 to 15 feet.

7 B. _ledifolia_ (Humb. et Bonpl. pl. aquin. 2. p. 124. t. 120.) leaves oblong, somewhat mucronate, with revolute edges, glaucous beneath, beset with glandular hairs on both surfaces along the middle nerve; racemes terminal; peduncles, pedicels, raci, branchlets, and calyxes clothed with clammy glandular hairs. ½. G. Native of South America, on the top of Silla de Caracas. Shrub much branched; branches purplish. Flowers about the size of those of _B. glauca_, purple.

_Ledum-leaved_ Bejaría. Shrub 3 to 4 feet.

8 B. _Caxamarcaësis_ (H. B. et Kunth, nov. gen. amer. 3. p. 294.) branches pilose; leaves oblong, glabrous above, pubescently hairy and glaucous beneath; corymb terminal, simple; peduncles, pedicels, and rachi, clothed with rusty pilose tomentum; calyxes hairy. ½. G. Native of Peru, on the Andes, about Caxamarca. A much-branched shrub. Flowers size of those of the preceding, purple; petals narrow.

_Caxamarca_ Bejaría. Shrub 5 to 4 feet.

9 B. _lançolata_ (Ruiz et Pav. fl. per. 4. t. 1513. f. 3.) branches and racemes hairy; leaves ovate-lanceolate; corymbs simple, racemose; pedicels short. ½. G. Native of Peru, on the high hills of Rodos Pilloa and Huassa-Huassì, where it is called _Rosa-Rosa, or Rosa Huagetta_. Acúmn lanceolata, Ruiz et Pav. syst. p. 124. Flowers purple or rose-coloured.

10 B. _oblonga_ (Ruiz et Pav. fl. per. 4. t. 1513. f. a.) leaves oblong, with revolute margins; flowers corymbose; pedicels long. ½. G. Native of Peru, in the province of Tarum, at Churupallana; and of Pantañaha, at Acónaya and Macora, where it is called _Rosa-Rosa, from the copious rose-coloured flowers_. Acúmn oblonga, Ñuñahu, Ruiz et Pav. syst. p. 123. Flowers purple or rose-coloured. Branches, petioles, and corymbs downy. Corymbs compound.

_Oblong-leaved_ Bejaría. Shrub 4 to 5 feet.

_Cult._ For culture and propagation see _Agarista_, p. 838. Extremely elegant plants, with the habit of some species of _Rhododendron_, and are therefore well worth the cultivator's care.

XLVI. HYMENANTHES (from ἱμενα, hymen, a membrane; and ἄνθος, anthos, a flower; in reference to the thin corollas). Blum. bijdr. 862.

_Lin. syst._ Dodecándria, Monogónia. Calyx small, obsolescently denticulated. Corolla campanulate, with a short compressed tube, and a 7-parted limb; segments of the limb imbricated. Stamens 14, hypogynous; alternate ones shortest. Anthers fixed by the back, mutic, opening by 2 pores at the apex. Ovarium free, girded by a nectariferous tumb margin at the base. Style long; stigma obtuse, 7-crenated. Capsule oblong, 7-celled, 7-valved, many-seeded.—Nearly allied to _Bejaría_, but differs from it in the small calyx and monopetalous corolla.

1 H. _Jarógiaca_ (Blum. l. c.) shrub a little branched; leaves subverticillate, 3 to 4 in a whorl, petiolate, oblong, acuminate, narrower at the base, quite entire, coriaceous, glabrous, reticulated above, veinless and yellowish beneath; flowers disposed in dense, terminal, bracteate spikes. ½. G. Native of Japan, from whence it was received by Blume under the name of _Rhododendron máximum._

_Japan_ Hymenantes. Shrub.

_Cult._ For culture and propagation see _Agarista_, p. 838.
ERICACEÆ. XLVII. KALMIA. XLVIII. MENZIESIA. XLIX. AZALEA.

LIN. SYST. DECIDUIRA, Monogynia. Calyx 5-parted. Corolla salver-shaped; under side of limb producing 10 corneous tuber- tendrums, and as many cavities on the upper side, in which the anthers lie, or are concealed. Capsule 5-celled, many-seeded; dissections marginal.—Evergreen shrubs, with alternate or ternately verticillate leaves. Flowers disposed in terminal, raceme, compound corymb; but in one species the flowers are solitary and axillary. Pedicels long, 1-flowered, trichobraciate at the base; external bractea originating from the rachis. Buds naked. Anthers opening by two oblique truncate pores.—This genus is considered poisonous, and is often fatal to cattle.

1 K. LATIFOLIA (Lin. spec. 560.) leaves on long petioles, scattered, or in a whorl, oval, coriaceous, smooth and green on both surfaces; corymb terminal, downy, and viscid. H. Native from Canada to Carolina, on the sides of stony hills. Curt. bot. mag. 175. Bigel. med. bot. p. 133. Wangh. amer. t. 25. f. 50.—Catesb. ear. 2. t. 98.—Trew. chhr. t. 38. f. l.—Pluk. mant. t. 379. f. 6. A very elegant shrub when in flower: in America it is called Laurel, and on the mountains Calico-bush. Flowers red. It is not improbable that the delatereous honey in Philadelphia might have been collected from the bees from the flowers of the Calico-bush, which in some places pervades, in rocky woods and depressed summits of mountains, almost in a similar manner with Calluna vulgaris of Europe.

2 K. ANGUSTIFOLIA (Lin. spec. 561.) leaves petiolate, scattered, or 3 in a whorl, oblong, obtuse, rather rustly beneath; coryambre lateral; bracteas linear; peduncles and calyces clothed with glandular pubescence. H. Native from Canada to Carolina, in bogs, swamps, and sometimes in dry mountain lands. Curt. bot. mag. 331. Loddd. bot. cab. 502.—Catesb. ear. 3. t. 17. f. 1.—Trew. chhr. t. 38. f. 2. Flowers dark red. The shrub is known by the name of Sheep Laurel in North America, being considered very poisonous when fed upon by sheep. There are several varieties of this species besides the one mentioned, differing in the size of parts, and in the deeper and lighter shade of the corolla. See Loud. hort. brit. p. 171.

Var. 3, ovata (Pursh, fl. amer. spec. 1. p. 296.) leaves broader; stems taller. H. Native of New Jersey, on the mountains.

3 K. GLAUCA (Ait. hort. kew. ed. 2. p. 64.) branchlets 2-edged or triquetrous; leaves opposite, on short petioles, oblong, smooth, glaucous beneath, with revolute edges; coryambre terminal, compound, bracteate; pedicels and calyces glabrous. H. Native of bogs in Canada; and on the borders of mountain lakes of New York and Pennsylvania; and of the Island of Sitcha. Curt. bot. mag. 177. Lam. ill. t. 303. Lich. stirp. nov. 2. t. 9. Loddd. bot. cab. 1503. K. polifolia, Wangh. act. soc. herol. 8. p. 129. t. 5. A very handsome upright small shrub, with pale red flowers. According to Nuttall, the flowers are disposed in terminal compound corymb, each corymb composed of 3 racemose coryambules; and the pedicels and calyces are said by him to be clothed with powdery viscid pubescence.

Var. β, rosmarinifolia (Pursh, fl. amer. spec. 1. p. 296.) leaves linear, more revolute on the margins, and having the under surface green. H. Mr. Pursh discovered this variety in a bog near Albany, and is inclined to think it a distinct species.

4 K. CUNEATA (Michx. fl. bor. amer. 1. p. 257.) leaves scattered, sessile, cuneate-oblong, glabrously pubescent beneath, minutly awned at the apex; coryambre lateral, few-flowered. H. Native of Carolina, on the mountains. Branches twigg. Leaves deciduous. Flowers white, red at the bottom, disposed in sessile, lateral, fastigiate clusters.

Cult. Handsome shrubs when in blossom. They grow best in peat soil, and are increased either by layers or by seeds. When raised by seeds, they are reared and otherwise treated in the manner recommended for Rhododendron, which see, p. 848.

LIN. SYST. OCTODRURA, Monogynia. Calyx 4-lobed. Corolla tubular or globose: limb very short, 4-lobed, revolute. Staments 5, inclosed; filaments subulate, glabrous; cells of anthers parallel, connate, mutic at the base, and opening each by an oblique foramen at the apex. Stigma obtuse. Capsule ligneous, 4-celled, with a septical dehiscence. Placenta 4-lobed. Seeds scrobiform.—Deciduous shrubs, natives of North America. Leaves membranous, glaucous beneath. Pedicels numerous, terminal, 1-flowered, fascicled.

1 M. FERRUICNEA (Smith, icon. indec. 1. p. 56. t. 56.) corolla urceolate, with rounded lobes; leaves and branches hairy. H. Native of the north-west coast of America, particularly on the Columbia River; and of the Island of Sitka. Lam. ill. t. 285. M. urceolaris, Salisb. par. Lond. no. 44. Leaves ovate-lanceolate. Flowers of a rust-colour.

Three-flowered Menziesia. Shrub tall.

Cult. For culture and propagation see Azalea, p. 851.

XLIX. AZALEA (from αζαλεος, azaleos, dry, arid; habita-

LIN. SYST. Pentandria, Monogynia. Calyx 5-parted. Corolla short, campanulate, 5-cleft. Stamens 5, equal, shorter than the corolla; cells of anthers opening by a terminal pore. Style straight, inclosed. Capsule 5-celled: with 5 cloven-pointed valves, whose inflexed edges form the double partitions.—A small, evergreen, glabrous, procumbent shrub, with the habit of Thyme. Leaves opposite, small, elliptic, glabrous, with revolute margins. Flowers pedicellate, rising in fascicles from the axils of the upper leaves, small, red.

Cult. This small shrub grows well in a peat border, or in pots in sandy peat earth; it is easily increased by layers or by seeds.

LIN. SYST. Decandria, Monogyna. Calyx deeply 5-parted. Corolla 5-petalled. Stamens 10, exserted; anthers opening by 2 terminal pores. Capsule 5-celled, 5-angled, dehiscing at the apex.—A small, erect, bushy shrub. Leaves small, convex, oval, glabrous, shining. Flowers white, disposed in terminal corymbs; the delicacy of the leaves, and the abundance of its white flowers, are highly ornamental.

Cult. For culture and propagation see Ledum below.

LI. LEDUM (λάδος, ledon, was a name applied by the ancients to a plant producing the substance called Ladanum, and now known by the name of Cistus Ladanum; in foliage, the Ledum of modern botanists agrees with the plant of the ancients). Lin. gen. no. 846. Gaertn. fruct. 2. p. 145. t. 112. Juss. gen. 159. Nutt. gen. amer. 1. p. 975.  

LIN. SYST. Decandria, Monogyna. Calyx minute, 4-toothed. Corolla 5-petalled, spreading. Stamens 5-10, exserted; anthers opening by 2 terminal pores. capsule subovate, 5-celled, 5-valved, opening at the base, pedicellate. Seeds numerous, flat, linear, scarious, furnished with a membranous wing at each extremity. —Dwarf evergreen shrubs. Leaves coriaceous, with revolute margins, and tomentose on the under surface. Flowers white, disposed in terminal corymbs; pedicels bracteate at the base. Shrubs exhalng a peculiar scent when bruised.

2 L. latifolium (Ait. hort. kew. 2. p. 65.) leaves linear-oblong, with replicate margins, clothed with rusty tomentum beneath; stamens 5, about the length of the corolla. H. H. Native of Canada, in sphenogous swamps; Greenland, Labrador, Newfoundland, Hudson's Bay. This or the preceding species has lately been found in Ireland. Jacq. icon. 3. t. 464. Schmidt, arb. t. 164. Lam. ill. t. 363. f. 1. Lodl. bot. cab. 534. L. Grenlandicum, Retz, obs. 4. p. 26. Fl. dan. t. 567. L. païistre, Michx. fl. bor. amer. 1. p. 239. Flowers white. A larger and broader leaved shrub than the last; commonly called Labrador Tea; and the leaves are said to be a good substitute for it. Bees are very fond of the flowers.

3 L. Canadensis (Lodl. bot. cab. 1049.) leaves ovate petiolate, white beneath; flowers disposed in terminal umbellate corymbs, large. H. H. Native of Canada, in swamps. Flowers white.

Canadian Wild-Rosmary. Fl. April, May. Ct.? Shrub ½ to 1 foot.  

Cult. A peat soil, or very sandy loam answers best for the species of this genus; and they are readily increased by layers and seeds. The seeds should be sown, and the seedlings afterwards managed in the manner recommended for Rhododendron, p. 848.

Tribe III.  

LIN. SYST. Octo-Decandria, Monogyna. Calyx 4-5-toothed (f. 142. a.) Corolla urceolate or campanulate (f. 142. b.), more or less deeply 4-5-cleft; limb reflexed. Stamens 8-10, hypogynous. Anthers 2-horned (f. 142. d.), dehiscing at the summit, and sometimes furnished at the back with 2 spreading spurs or bristles. Style longer than the stamens; stigma obtuse. Berry globose (f. 142. e.), depressed at top, 4-5-celled (f. 142. f.), many-seeded.

—The species of Vaccinium are mostly confined to Europe and North America, but are peculiarly abundant in the latter country. They are suffruticos, shrubby, gemmaceous plants. Bud-scales often permanent, on the base of the small branches. Leaves alternate, membrosum, often beset with resinous dots, either permanent or deciduous. Flowers pedicellate, either solitary, simply racemose, or tufted, drooping, inodorous, generally very elegant, tinted with various shades of red or pink, never blue, scarcely yellowish.

3 a 2
Berries black, purple, bluish, or red, generally eaten, though not always pleasant, nor wholesome in a crude state. The species of this genus were all understood by Linnaeus, who therefore has led all following authors astray. In reviewing the whole, we find something to add, though we have many specimens that are dubious. We are obliged to follow the distribution of Linnaeus, into the evergreen and deciduous species, though some uncertainty must always attend that character respecting species known from dried specimens only.

§ 1. Leaves deciduous.

* Pedicels 1-flowered, usually solitary, rarely twin or fasciculated.

1 V. myrtillus (Linn. spec. 498.) pedicels solitary, 1-flowered; leaves serrated, ovate, smooth; stem acutely angular, smooth; calyx hardly divided. H. Native on heaths, stony moors, and mountain woods throughout most parts of Europe, especially the more northern; plentiful in Britain. Dr. Sibthorp gathered it on the Bithynian Olympus. It is common on the hills in the Island of Unalascha. Smith, engl. bot. 456. Fl. jap. 1794.—Gemmellinae 115. Math. valva. 1. p. 210. "The juice of them has been employed to stain paper or linen purple. In autumn the wood game chiefly live upon the product of this shrub. Mr. Menzies brought from the west coast of North America what can scarcely be considered more than a gigantic variety, 7 or 8 feet high, larger in every part, with less distinctly serrated leaves.

Myrtle-like or Common Bilberry, or Bleaberry. Fl. May. Britain. Shrub ½ to 2 feet.

Chamissonis’s Whortle-berry. Shrub 1 foot.

3 V. ovatifolium (Smith, in Rees’ cycl. no. 2.) pedicels solitary, 1-flowered; leaves elliptic, obtuse, pointless, entire, smooth, strongly veined beneath; stem angular; calyx hardly divided. H. Native of the north-west coast of America, where it was collected by Mr. Menzies; and in the Island of Sitcha by Bongard. Branches smooth, as acutely angled as in V. myrtillus. The leaves agree most in shape with V. ovatifolium, but are not a quarter the size, even when full grown. The berries are red, and make excellent tarts. They appear to be smaller than the last, and crowned with a similar calyx.

Small-leaved Bilberry. Shrub 8 to 10 feet.

5 V. geminifolium (H. B. K. Thunb. nov. gen. amer. 3. p. 287.) flowers axillary, twin, drooping, decandrous; leaves oblong, bluntish, crenulated, reticulately veined, rather membranous, glabrous; anthers furnished with 2 awns on the back. H. Native of Mexico, between Omitlan and Moran. Habit and stature of V. myrtillus. Branchlets angular, downy. Leaves 8-10 lines long, paler beneath. Corolla campanulate, ventricose at the base, with short ovate bluntish segments. Filaments membranous, glabrous.

Twin-flowered Whortle-berry. Shrub 1 foot.

6 V. hirtum (Thunb. jsp. 155.) pedicels solitary, 1-flowered; leaves ovate, serrated, hairy all over, as well as the young branches. H. Native of Japan, on the hills between Maaco and Jedo. Branches terete. Flowers on very short stalks.

Hairy Bilberry. Fl. April. Shrub 8 to 3 feet.

7 V. uliginosum (Linn. spec. 499.) pedicels somewhat aggregiate, 1-flowered; leaves obovate, entire, smooth; branches terete. H. Native of Sweden, Germany, Siberia, Switzerland, Savoy, Scotland, and the north of England; as well as in the more northern parts of America, and on its west coast; and in the Island of Sitcha, on marshy mountain heaths and alpine bogs. Smith, engl. bot. t. 581. Fl. dan. 231. Myrtillus grandid, Bauh. hist. 1. p. 518. Taller than the Common Bilberry, and of a more glaucous hue. Leaves glaucous beneath. Flowers flesh-coloured, with 8 long-horned stamens. Berries large, juicy, black, covered with a mealy bloom; they are eatable, but not either very grateful or wholesome. A variety with slightly pointed leaves was published by an apothecary at Berne, in 1757, as V. nuerronatum, an imaginary species.

Bog or Great Bilberry. Fl. April, May. Britain. Shrub 2 feet.

8 V. calycina (Smith, in Rees’ cycl. no. 7.) pedicels solitary, 1-flowered; leaves obovate, serrated, smooth, with downy ribs; branches angular; calyce segments deep, ovate. H. Native of the Sandwich Islands, in woods upon lofty mountains. Leaves 1½ inch long, and near an inch wide. Corolla oblong, with 5 angles.

Large-calycised Bilberry. Shrub 2 to 3 feet.

9 V. angustifolium (Ait. hist. kew. ed. 2. vol. 2. p. 356.) pedicels scattered, mostly solitary, 1-flowered, naked; leaves lanceolate, nearly entire, down at the ribs and margins. H. Native of Canada, about Hudson’s Bay and Labrador. Berries large, bluish black, known by the name of Blusets. V. myrtilloides. Michx. fl. bor. amer. 1. p. 234. Michaux says this species has the habit of V. myrtillus; its leaves being membranous, of a narrow lanceolate form.

10 V. salicifolium (Cham. et Schlecht. in Linnaea. 1. p. 525.) flowers axillary, solitary, on short pedicels; leaves cuneate-lanceolate, cuspidate, quite entire, rather coriaceous, reticulately veined; corolla cylindrically urceolate, with a 4-cleft revolute limb. H. Native of Unalascha, on mossy hills. Shrub trailing, glabrous, habit of Salix alpigena, creeping under the moss. Branches angular, cinnamon-coloured. Flowers drooping; calyptra leaves 4-5, short, ovate, acute. Stamens 8, included. Anthers biaristate on the base.

Willowy Whortle-ber. Shrub creeping.

11 V. cespitosa (Michx. fl. bor. amer. 1. p. 234.) flowers
leaves ovate, acute, with slight glandular serratures, polished above, and rather downy beneath; corollas bell-shaped, acute; stamens the length of the tube.  

**Flowers in sessile tufts.**

12 V. gale'zans (Michx. fl. bor. amer. 1. p. 292.) flowers on very short stalks, in sessile tufts; leaves sessile, lanceolate-wedge-shaped, slightly serrated, downy; calyx pointed; corollas ovate, much contracted at the mouth; style prominent.  

13 V. tenu'lem (Ait. hort. kew. ed. 2. vol. 2. p. 358.) flowers in dense sessile tufts; leaves nearly sessile, ovate-lanceolate, acuminate, finely serrated, smooth, except the rib and margins; branches angular, with a downy line on each side; calyx of 5, deep, acute segments.  

**Shrub.**  

Native of Virginia and Carolina, in shady woods and swamps.  

14 V. liq'u'strum (Michx. fl. bor. amer. 1. p. 283.) flowers nearly sessile, in tufts; leaves nearly sessile, erect, lanceolate, mucronate, finely serrated, veiny, downy; corolla longish, ovate; branches angular.  

15 V. pal'idium (Ait. hort. kew. ed. 2. vol. 2. p. 355.) racemes bracteate; corolla cylindrically bell-shaped; leaves ovate, acute, finely serrated.  

**Tree.**  

May, June.  

16 V. arbor'eum (Marsh. in Michx. fl. bor. amer. 1. p. 230.) pedicels axillary and solitary, or terminal and racemose, naked;}

lateral, solitary, nearly sessile; leaves somewhat wedge-shaped, rounded, obtuse, serrated, membranous, very smooth.  

**Trunk.**  

Native of America, in the more northern regions, particularly about Hudson’s Bay; also in the Island of Sitcha. A little shrub, with many crowded stems, from 2 to 4 inches high, very smooth in every part.  

Corolla of a short urceolate form.  

**B.**  

Native from North Carolina to Florida, in dry woods on the rocky banks of rivers.  

17 V. sta'mi'num (Lin. spec. 498.) racemes downy, with oval bracteas as long as the flowers; anthers biaristate on the back, twice as long as the spreading bell-shaped corolla; leaves elliptic, acute, entire, and glaucous rather downy beneath.  

**H.**  

Native from New England to Florida.  

18 V. dum'osum (Ait. hort. kew. ed. 2. vol. 2. p. 356.) racemes downy, with oval bracteas; and the pedicels with 2 lanceolate bracteoles; leaves ovate, mucronate, entire, dry and viscid; ovary hairy; corolla bell-shaped, obtuse, longer than the stamens.  

**B.**  

Native from New England to Florida, in dry sandy woods, particularly in pine-forests.  

**Bushy Whortle-berry.**  

Fl. June, July.  

19 V. cor'ybos'mum (Lin. spec. 499.) flowering branches almost leafless; racemes corymbose, drooping, with membranous bracteas, which are shorter than the downy flower-stalks; leaves elliptic, acute, minutely serrated, smooth, with downy ribs.  

**H.**  

Native from Canada to Carolina and Georgia, in swamps and wet woods.  

**Tree.**  

1765.  

18 feet to 20 feet.  

**Tree.**  

May, June.  

This species joins the solitary flowered species with the racemose flowered species; the axillary flowers being solitary and pedicellate, and the terminal ones racemose.  

Shrub.

Fonte de 1772.
ERICACEÆ.

LIII. VACCINIUM.

feet high, with numerous roughish terete branches, which are somewhat angular and downy while young. Leaves 1½ to 2 inches long, tipped with a glandular point. Racemes rising from the branches of the preceding year, seldom accompanied by leaves. Bracteas reddish, membranous, fringed. Calycine segments broad and shallow. Corollas white or reddish, cylindrically urceolate, rather angular, contracted at the mouth. Stamens 10, downy; anthers inclosed, having a double pouch at the base, but no spurs. Berries black, insipid. This species has a variety of sizes, shape, and colour.

Var. \( \beta \), virgatum (Ait. hort. kew. ed. 2. vol. 2. p. 358.) flowers white, tinged with crimson or pale red, very elegant, smaller than the species. \( \gamma \). H. Native of Virginia and Carolina; in swamp. Andr. bot. rep. 181. Wats. dendr. brit. t. 32. In Andrews' plate of \( V. \) virgatum, the racemes are accompanied by leaves, of which we have seen no example in \( V. \) corymbosum. Shrub 2½ feet high. Racemes short, lateral and terminal.

Var. \( \gamma \), fuscum (Ait. hort. kew. l. c.) flowers striped with red and white; calyx downy. \( \eta \). H. Native of Lower Carolina and Georgia, in swamps. F. ornlosus; Andr. bot. rep. t. 97.

Var. \( \varepsilon \), angustifolium; leaves narrow-lanceolate, acuminate at both ends, sessile, bespangled with brown minute pedicellate glands beneath, and hairy on the mid-rib above. \( V. \) virgatum, var. angustifolium, Wats. dendr. brit. t. 34. Flowers almost white.

20 V. MARIA'NEM (Wats. dendr. brit. t. 124.) racemes terminal, 3-4 flowered; corollas cylindrical, contracted at the mouth; leaves elliptic, coriaceous, glabrous, distinctly and minutely denticulated. \( \eta \). H. Native of North America. Flowers deciduous, white.

21 V. GRANDIFLORUM (Wats. dendr. brit. 125. f. a.) racemes terminal, 3-4 flowered; corollas cylindrical, contracted at the mouth; leaves lanceolate, finely serrated, attenuated at both ends, glabrous. \( \eta \). H. Native of North America. Flowers white, deciduous.

22 V. ELONGATUM (Wats. dendr. brit. t. 125. n.) corymbs few-flowered, bracteal; pedicels downy; leaves elliptic-lanceolate, serrated, tipped by a glandular hair each, and with a few hairs on the nerves; branchlets downy. \( \eta \). H. Native of North America. Corollas white, with reflexed teeth.

24 V. GLABRUM (Wats. dendr. brit. t. 125. n.) spikes lateral; corollas campanulate cylindrical; leaves elliptic, entire, glabrous. \( \eta \). H. Native of North America. Flowers white.

25 V. BRACATEUM (Thumbl. fl. jap. 156.) racemes axillary, longer than the glabrous, acute, serrated leaves; bracteas lanceolate, serrated; pedicels furnished with 2 awl-shaped bracteoles. \( \eta \). F. Native of Japan, in the Island of Niphon. Branches smooth, angular while young. Racemes 2-3 inches long; pedicels secund, drooping. Corollas cylindrical, white. The leaves may be evergreen.

Bracteate-flowered Whortle-berry. Shrub.

26 V. CILIA'TUM (Thumbl. fl. jap. 156.) racemes axillary, longer than the ovate, bristly, nearly entire leaves; bracteas lanceolate, smooth. \( \eta \). F. Native of Japan, &c. where it is called Susa-jub. The stem is smooth, and the branches villous. Leaves 1½ inches long, unequal. Flowers red, unilateral.

Ciliate-leaved Whortle-berry. Shrub.

27 V. FRONDOSUM (Lin. spec. 499.) racemes loose; bracteas obvate, not half so long as the slender pedicels, which bear 2 small linear bracteoles in the middle; leaves ovate-oblong, obtuse, entire, smooth. \( \eta \). H. Native from New Jersey to Carolina, in open woods. Andr. bot. rep. 140. V. glaucum, Michx. flor. Amer. 1. p. 231. Flowers small, almost globular, white. Berries large, blue, globular, edible, called by the country people Blue Tangles. Branchlets terete, smooth, and slender. Leaves 2½ inches long, glaucous beneath, and sprinkled with minute resinous dots. Racemes lateral from the former year's wood. Flowers drooping, greenish-white, shaped like those of the Lily of the valley, but smaller; anthers inclosed.

Var. \( \beta \), venustum (Ait. hort. kew. ed. 2. vol. 2. p. 357.) leaves lanceolate, acute at both ends. \( \eta \). H. V. frondosum, var. \( \beta \), lanceolatum, Pursh, flor. Amer. 1. p. 786.

Var. \( \beta \), rubescens (Pursh. flor. Amer. sept. 1. p. 286.) corollas redish. \( \eta \). H. Curt. bot. mag. 1288.

Var. \( \gamma \), lutescens (Pursh. l. c.) leaves lanceolate; flowers redish-yellow. \( \eta \). V. parviflorum, Andr. bot. rep. 125.

29 V. ARCTOSTAPHYLOS (Lin. spec. 500.) racemes lateral; bracteas all at the base of the pedicels; leaves elliptic, acute, minutely serrated, hairy beneath; stamens as long as the corolla, which is bell-shaped, with very hairy filaments; calyx slightly 5-lobed. \( \eta \). H. Native on the coast of the Black Sea, where it was gathered by Tournefort, who describes it as a shrub about the height of a man, with a trunk as thick as a man's arm. Young branches downy on two opposite sides. Leaves 2½ inches long. Racemes from the wood of the preceding year, below the fresh leafy shoots, drooping, rather hairy, each composed of 8-10 pendulous flowers, of a dirty white colour, tinged with purple. Anthers spurred at the base. Corollas bell-shaped, hairy. Tournefort judges this to be, with great probability, the elephantopus, or Bear's Grape, of Galen. What the var. \( \beta \) of Linnaeus may be, we know not, as nothing answerable to it is to be found in Tournefort's Corollarium.

30 V. PADI FOLIUM (Smith, in Rees' cyclo. no. 22.) racemes lateral; bracteas all at the base of the pedicels; leaves ovate-
lanceolate, acute, serrulaped, smooth on both surfaces, except the mid-rib; stamens nearly as long as the bell-shaped corolla, with smooth slightly fringed filaments; calyx 5-lobed. \( \gamma \). F. Native of Madeira, on the loftiest part of the island, where it forms impenetrable thickets. V. arctostaphylos, Andr. bot. rep. t. 30. Curt. bot. mag. 974. V. Madèreuse, Link. enum. 1. p. 675. Corollas larger than those of the preceding, pale green, with a purple tinge; sometimes it appears to be all over purple externally. The Caucasian plant, discovered by Pallas, is said not to differ from that of Madeira. Pallas says the berries are black, juicy, catabile, and gratefully acid; and he sometimes found the flowers 4-cleft.

Shrub 6 to 10 feet.

31 V. *cylindræcum* (Smith, in Rees' cyc. no. 23.) racemes lateral; bracteas serrated, all at the base of the pedicels; leaves elliptic-lanceolate, acute, serrulaped, quite smooth, except the base of the mid-rib; stamens half the length of the cylindrical corolla, with hairy filaments; calyx slightly 5-toothed. \( \gamma \). H. Native of the Azores, on the mountains, where it is called *Uva de Serra*, or Mountain-berry. Apparently arborescent. Branches downy on the opposite sides. Racemes numerous, rising from the wood of the preceding year. Flowers drooping, nearly an inch long, apparently red or purple.

*Cylindrical* flowered Bear's Grape. Shrub or tree.

32 V. *ledifolium* (Pohl, pl. bras. 2. p. 36. t. 123.) racemes axillary and terminal, loose, downy; flowers uniserial; leaves sessile, linear, attenuated at the base, ciliated, glabrous above, but yellowish-brown beneath, with the nerves downy. \( \gamma \). G. Native of Brazil, in the province of Minas Geraes, on the higher mountains, in dry places. Stem dark, hoary. Leaves deciduous. Bracteas of two forms, acute, ciliated. Corolla white, glabrous, having the teeth reflexed.

*Ledum-leaved* Whortle-berry. Shrub 1 foot.

§ 2. Leaves evergreen.

*Flowers racemose.*

33 V. *meridionaee* (Swartz, fl. ind. occ. p. 676.) racemes erect, downy; bracteas coloured, solitary, ovate, at the base of the pedicels; leaves ovate, crenate, smooth; stem arborescent. \( \gamma \). G. Native of Jamaica, on the Blue Mountains. Tree with a very straight trunk and hard wood. Branches downy when young. Leaves 1 inch long. Flowers drooping, reddish-white. Corollas ovate, quadrangular before expansion, contracted at the mouth, with 4 acute, recurved segments. Stamens 8, as long as the corolla: their filaments hairy in the middle. Berries roundish, juicy, pleasantly flavoured, pale red, resembling those of *V. vitis-idaea*. The flowers are rarely 5-cleft, and decandrous. Racemes rising from the top of the wood of the preceding year.

34 V. *coniferum* (H. B. et Kunth, nov. gen. amer. 3. p. 265. t. 250.) racemes axillary, solitary, short, sessile, drooping, about equal in length to the leaves; leaves ovate elliptic, bluish, crenulate, coriaceous, glabrous; flowers decandrous; anthers mutic. \( \gamma \). H. Native of Mexico, on high mountains near Moran and Cerro de Oyamel. Branchlets angular, glabrous. Leaves 5-6 lines long, beset with scattered, brown, minute dots beneath. Pedicels bracteate at the base. Corolla campanulate, white, with ovate, acute, recurved segments.

*Crowded-leaved* Whortle-berry. Shrub 1 foot.

35 V. *floribundum* (H. B. et Kunth, nov. gen. amer. 3. p. 266. t. 251.) racemes terminal and axillary, drooping, much longer than the leaves; leaves oblong, acute, coriaceous, glabrous, crenulate; flowers octandrous and decandrous; anthers mutic. \( \gamma \). G. Native of Peru, on the mountains near Caxamarca. Branchlets angular, downy. Leaves 6-7 lines long, besprinkled with a few black dots beneath. Corolla campanulate, white, having a quadridril or quinquedril limb, with oval bluntish segments. Flowers about the size of those of *V. vitis-idaea*. Filaments membranous, ciliated. Racemes approximate at the tops of the branches, bracteate (f. 142.)

*Bottle-flowered* Whortle-berry. Shrub.

36 V. *leucants* (Cham. in Linnaea, 7. p. 554.) arboreous; branches angular, sometimes downy; leaves coriaceous, on short petioles, oval-lanceolate, acute, glandularly serrated, having the petioles and mid-rib downy above, the rest glabrous; racemes second, rising from the branches of the preceding year, leafless; flowers drooping; corollas unequally campanulate; anthers biastrate. \( \gamma \). F. Native of Mexico, below St. Salvador. Flowers white. Fruit black and edible. Nearly allied to *V. Meridionaee*.

37 V. *Caraccasaeeum* (H. B. et Kunth, nov. gen. amer. 3. p. 266.) racemes axillary, twice longer than the leaves; flowers second, octandrous or decandrous; leaves elliptic, acute, crenulate, coriaceous, glabrous, shining above; anthers biastrate on the back. \( \gamma \). H. Native on the southern declivity of Mount Silla de Caraccas. Branchlets angular, glabrous. Leaves shining above, 9-10 lines long. Racemes crowded at the tops of the branches. Corolla campanulate, glabrous, reddish-white, with a 4-5-parted limb; segments ovate, acutish. Filaments membranous, ciliated.

38 V. *vitis-idaee* (Lin. spec. 500.) racemes terminal, drooping, with ovate concave bracteas, which are longer than the pedicels; leaves obovate, revolute, minutely toothed, dotted beneath; corolla bell-shaped. \( \gamma \). H. Native of dry, barren, stony woods and heaths in the north of Europe; plentiful in Scotland, Westmoreland, Derbyshire, and Wales. Mr. Parry says it occurs on rocks near the sea-coast, from Canada to New England; but the American plant is more robust than the European, with considerably larger leaves. Lodg. bot. cab. 416. It has also been found in the islands of Kamtschatka, Unalaska, and St. Lawrence. Smith, engl. bot. 598. Fl. dan. t. 40. Lodg. bot. cab. 1023. — Vitis-idae'æ râbra, Cam. epit. 136. Root creeping, woody. Stems ascending a span high; young branches triteae, downy. Leaves like those of box, but darker. Flowers pale pink, 4-cleft, octandrous. Anthers without spurs. Berries blood-red, acid, auster, and bitter, less palatable in tarts than either the Cranberry or Bilberry, but excellent in a rob or jelly, for colts and sore throats, as well as to eat with roast meat; to which latter purpose this jelly is universally applied by the Swedes, and forms a sauce to venison which is thought superior to currant jelly. In Wales it is used with roast mutton. It may be cultivated in a moist shady border of bog-earth, like the *Bleaberry*. 

---

**FIG. 142.**
**Ericaceae**

**Cow-berry** or Red Whortle-bery. Fl. June. Britain. Shrub \( \frac{3}{4} \) foot.

39 V. MYRTIFOLIUM (Michx. fl. bor. amer. 1. p. 229.) creeping, quite smooth; leaves petiolate, oval, shining, revolute, sparingly and minutely toothed; racemes axillary, nearly sessile, of few flowers; corolla bell-shaped, somewhat inflated, minutely 2-toothed; bracteas without dorsal horns. \( \frac{1}{2} \) H. Native of Carolina. Michaux describes the berries as small, globose, crowned by the calyx, black, on short stalks. *Myrtle-leaved Whortle-bery.* Fl. May. July. Cl. 1812.

Shrub creeping.

40 V. CRASSIFOLIUM (Andr. bot. rep. t. 105.) racemes lateral and terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic, crenated, smooth, paler and veiny beneath; corolla bell-shaped; stem diffuse. \( \frac{1}{2} \) H. Native of Carolina. Curt. bot. mag. 1152. A hairy shrub, requiring some shelter from our variable winters and springs. Leaves not an inch long, with a little minute pubescence on the mid-rib and petals. Flowers 5-cleft, decandrous, prettily variegated with pink and white, drooping, on red corymbose stalks. Stems hairy. *Thick-leaved Whortle-bery.* Fl. May. June. Cl. 1787.

Shrub trailing.

41 V. VILLIUM (Smith, in Rees's cycl. no. 29.) racemes longer than the leaves; pedicels, calyx, corolla, and lanceolate bracteas densely hairy; leaves elliptic, entire, revolute, coriaceous, with a blunt point, hairy on the upper side. \( \frac{1}{2} \) F. Native of Mexico, from whence specimens were sent by Mnis to Linnæus. Branches densely hairy when young. Leaves crowded, an inch long, on thick downy petals, scarcely hairy beneath, except on the mid-rib. Racemes towards the ends of the younger branches, axillary, drooping, very hairy. Pedicels bracteate. Corolla purplish, with 5 hairy angles, and as many recurved teeth. Perhaps a species of *Gaylussacia.*

**Villosus** Whortle-bery. Shrub.

42 V. MYRTUM (Andr. bot. rep. t. 480.) racemes terminal, corymbose; bracteas shorter than the pedicels; leaves elliptic-obovate, acute, crenated, smooth and shining; corollas cylindrical. \( \frac{1}{2} \) H. Native of Carolina. Curt. bot. mag. 1550. Stems either erect or diffuse. Leaves \( \frac{3}{4} \) to 1 inch long, paler and veiny beneath. Pedicels, bracteas, and calyx very smooth, of a shining red or purple colour. Calyx of 5 broad, or rather shallow segments. Corollas ovate, oblong, white or pink, with 5 slight spreading teeth, decandrous. The branches are downy on two opposite sides. *Shining-leaved Whortle-bery.* Fl. May. June. Cl. 1794.

Shrub 1 foot, or decumbent.

43 V. Schlechtendalii; racemes elongated, erect, and are as well as the pedicels, peduncles, and ribs of leaves on the under surface, downy; leaves rather coriaceous, permanent, with the nerves and veins prominent on both surfaces, lanceolate or obovate-lanceolate, acute, adpresstly serrated, callously mucronate at the apex as well as the serratures, and running into the short pedicels, at the base; fruticose branches nearly leafless. \( \frac{1}{2} \) F. Native of Mexico, near Jalapainga, in woods. Vaccinium, nov. spec. Cham. et Schlecht. in Linnæa, 6. p. 395. An erect, much-branched, evergreen, smoothish shrub. Leaves 2 inches long, and 9 lines broad. Bracteas linear, acute, caducous; calyx bibracteate at the base. Berries drooping, umbonate, crowned by the minute calycine teeth. *Schlechtendal's Whortle-bery.* Shrub.

44 V. BREVIFOLIUM (Salish. par. t. 4.) racemes axillary, of few flowers; leaves petiolate, obovate, toothed or crenated, smooth on both surfaces; stems tufted; corollas roundish-ovate; filaments glandular; stigma capitate. \( \frac{1}{2} \) H. Native of the western parts of Virginia, near Winchester and the Sweet Springs. Curt. bot. mag. 928. Lodde. bot. cab. 648. V. bra-chyceurum, Michx. fl. bor. amer. 1. p. 234. A handsome little shrub, in stature and general aspect, resembling *V. vitis-ideæ.* The leaves are, however, smooth, even, and not dotted on the under side. Corollas globular, contracted at the mouth, not bell-shaped. Stamens 10. Anthers sparse at the base, discharging their pollen by lateral, not terminal aperitures. Flowers white, delicately striped with red. *Box-leaved Whortle-bery.* Fl. June. Clt. 1794. Shrub \( \frac{3}{4} \) foot.

45 V. OVA TUM (Pursh, fl. amer. sept. 1. p. 290.) racemes axillary and terminal, bracteate, short; leaves on short pedicels, oblong, ovate, acute, revolute, serrated, smooth, coriaceous; corolla cylindrical, campanulate; calyxes acute. \( \frac{1}{2} \) H. Found by Governor Lewis on the banks of the Columbia River, and by Mr. Menzies on the north-west coast of America. Hook. et Arn. in Beech. voy. pt. bot. p. 144. Shrub much branched; branches hairy, as well as the pedicles. The foliage is like that of *Pernettya mucronata.* *Ovate-leaved Whortle-bery.* Fl. May. Cl. 1826. Shrub.

46 V. CANADENSE (Richards. in Franklin. 1st journ. append.) leaves lanceolate, quite entire, downy; racemes terminal; flowers fasciculate; style inclosed. \( \frac{1}{2} \) H. Native of Arctic America. *Canadian Whortle-bery.* Shrub.

47 V. SCABREUM (Pohl. pl. bras. 2. p. 37. t. 124.) racemes terminal and axillary, longer than the leaves, beset with glandular hairs; leaves on short pedicels, oblong, mucronate, with revolute ciliate edges, scabrous, having the nerves hispid beneath. \( \frac{1}{2} \) G. Native of Brazil, in turfy bogs at Registo Velho and Villa de Barbacena. Stems many from the same root, leafy at the tops. Leaves scabrous above, and glabrous beneath, permanent. Pedicels pilose, bracteate at the base. Bracteas of two forms, deciduous. Corolla glabrous, campanulate, white. *Scabrous Whortle-bery.* Shrub 1 foot.

48 V. MONTANUM (Pohl. pl. bras. 2. p. 38. t. 125.) racemes axillary, bracteate, pilose; leaves on short pedicels, oblong-elliptic, mucronate, hardly narrowed at the base, glabrous, but having the nerves on the under side rather pilose. \( \frac{1}{2} \) G. Native of Brazil, in the province of Minas Geraes, in dry places on Serra de Pinheiro. Leaves permanent, dark green above, and yellowish-green beneath, 8 lines long and 4 broad. Flowers unilateral. Corolla campanulate, glabrous, white. *Mountain Whortle-bery.* Shrub diffus.
flowered, furnished with 2 lanceolate bracteas about the middle; leaves roundish-ovate, serrated; calyx of 5 broad ovate pointed segments. \( \varphi \). F. Native of Otago and Owalu. Andrómeda créa, Lin. fil. suppl. 288. Branches terete, slightly downy when young. Leaves mucronate, about an inch long. Corolla ovate-oblong, with 5 angles, and 5 cleft small segments. Stamen 10. Anthers with 2 dorsal horns, according to Linnæus. Perhaps a species of *Pernettya*.

**Wirzy Whortle-berry.** Shrub small, \( \frac{1}{2} \) foot.

52. *V. reticulatum* (Smith, in Rees' cyc. no. 30.) pedicels axillary, solitary, 1-flowered, downy; leaves obovate, more or less serrated, coriaceous, with a blunt point, strongly reticulated on both sides, and nearly smooth. \( \varphi \). F. Native of the Sandwich Islands, on the high mountains, in woods, where it was collected by Mr. Menzies. Branches when young angular and downy. Leaves an inch long, with revolute margins. Pedicels bracteate, swelling upwards. Calyx in 4 or 5 deep-coloured segments, at length involute. Corolla cylindrical, twice as long as the calyx, purple, slightly hairy, with 4 or 5 cleft blunt teeth. Style hairy. Berries globular, depressed, nearly smooth.

**Reticulated-leaved Whortle-berry.** Shrub.

**Trailing Whortle-berry.** Fl. May, June. Ch. 1827. Shrub creeping.

55. *V. penduliflorum* (Gaud. in Freyc. voy. pt. bot. p. 454.) pedicels axillary, solitary, 1-flowered, elongated, pendulous in the fruit-bearing state; flowers deciduous; calyce segments lanceolate, one-half shorter than the corolla, which is campanulate and 5-angled; anthers awned; branches angular, leafy; leaves oblong, sharply serrated, rather coriaceous. \( \varphi \). F. Native of the Sandwich Islands, at the altitude of 500 hexapods. An erect glabrous shrub.

**Pendulous-flowered Whortle-berry.** Shrub.

54. *V. microphyllum* (Hrb. Reinwdt. ex Blum. bijdr. p. 851.) stem shrubby; branchlets puberulous; leaves ovate-obtuse, quite entire, with recurved margins, veiny, coriaceous, glabrous; pedicels almost solitary, axillary, 1-flowered; corollas urceolate; anthers mutic; calyx bractless. \( \varphi \). G. Native of the Celebes, on the mountains.

**Small-leaved Whortle-berry.** Shrub.

55. *V. dentatum* (Smith, in Rees' cyc. no. 31.) pedicels axillary, solitary, 1-flowered, smooth; leaves obovate, with sharp tooth-like serratures, coriaceous, veiny, very smooth; calyx longer than the smooth ovarium. \( \varphi \). F. Native of the Sandwich Islands, on the lofty mountains, where it was found by Mr. Menzies. The branches are angular, and always smooth, like every other part. Leaves rather longer than the *V. reticulatum*, with less prominent veins. Calyce segments keeled.

**Tooth-leaved Vaccinium.** Shrub.

56. *V. obtusum* (Pursh, fl. amer. sept. 1. p. 290.) pedicels axillary, solitary, 1-flowered; leaves small, oval, rounded, and blunted at each end, mucronate, entire, coriaceous, smooth; stem creeping. \( \varphi \). H. Native of the north-west coast of America, where it was gathered by Mr. Menzies.

**Blunt-leaved Whortle-berry.** Shrub.

57. *V. empetrifolium* (H. B. et Kunth, nov. gen. amer. 3. p. 263. t. 268.) creeping, quite glabrous; leaves approximate, subimbricated, obtuse, quite entire, coriaceous, glabrous; pedicels solitary, axillary, 1-flowered; flowers octandrous; corollas tubularly campanulate; anthers mutic; calyx bicracteate at the base. \( \varphi \). G. Native of the western declivity of the burning Mount Antisana, between Pintac and Pinantura. Leaves 2½ lines long. Corolla scarlet, glabrous; with ovate, acute, spreading segments. Anthers dehiscing lengthwise. Filaments ciliated.

**Emetrum-leaved Whortle-berry.** Shrub creeping.

58. *V. penéœides* (H. B. et Kunth, nov. gen. amer. 3. p. 264.) creeping, glabrous; leaves approximate, subimbricated, oblong, acute, obsolescently crenulated, still, glabrous, a little ciliated; pedicels short, axillary, solitary, 1-flowered; flowers octandrous; calyx bicracteate; anthers mutic. \( \varphi \). G. Native of the province of Quito, at Mount Tunguragua, near Cuchilla de Guambispa. Leaves 3 lines long. Branchlets downy. Flowers solitary, on the tops of the branches. Corolla tubularly campanulate, scabrous, with ovate acutish segments. Filaments pilose.

**Penea-like Whortle-berry.** Shrub creeping.

59. *V. acuminatum* (H. B. et Kunth, nov. gen. amer. 3. p. 264.) arboreus; leaves approximately subimbricated, ovate, acuminated, quite entire, coriaceous, glabrous; flowers axillary, solitary, on a stem or branch, about as long as the ovary; leaves oblong, sharply serrated, rather coriaceous. \( \varphi \). F. Native of the Sandwich Islands, on the altitude of 500 hexapods. An erect glabrous shrub.

**Acmone-leaved Whortle-berry.** Shrub 10 to 15 feet.

**Acmone-leaved Whortle-berry.** Shrub 10 to 15 feet.

**Atemon-leaved Whortle-berry.** Shrub or small tree.
Nutt. gen. amer. 1. p. 250.—Vaccinium species of Lin. and others.

Linn. syst. Octandria, Monogyonia. Calyx 4-toothed. Corolla 4-parted, with nearly linear revolute segments. Stamens 8, with connivent filaments; anthers tubular, 2-parted. Berries many-seeded.—Small, prostrate, creeping, evergreen shrubs, with small leaves, growing in sphagnose morasses. Branches filiform, proliferous. Flowers produced at the base of the spring branches, in short gemmaeous racemes; pedicels filiform, conspicuously bibracteate. Berries red, rarely white, acid.

1 O. palustris (Pers. ench. 1. p. 419.) stems filiform, creeping; leaves small, ovate, entire, acute, smooth, with revolute margins; pedicels terminal, 1-flowered; segments of corolla oval. \( \varphi \). H. Native of turfy mossy bogs in the mountainous parts of Europe; common in Switzerland, Russia, Scotland, Ireland, and the north of England, as well as in Lincolnshire and the neighbouring part of Norfolk. Mr. Pursh speaks of it as common on the boggy mountains of North America, from Canada to Pennsylvania, Island of Ungaskeba. O. vulgaris, Pursh. fl. amer. sept. 1. p. 263. O. Europeus, Nutt. gen. amer. 1. p. 251. Vaccinium Oxyccæus, Lin. spec. 500. Smith, engl. bot. t. 319. Oed. fl. dan. t. 80. Vaccinium Oxyccæus, var. \( \varphi \), ovalifolium, Michx. fl. bor. amer. 1. p. 228. Vaccinia palustris, Ger. emac. 1419. Lob. icon. 2. t. 109. Oxycoccum, Cord. hist. 140. 2 f. 1. Leaves convex, and dark shining green above, and glaucous beneath. Stems reddish. Pedicels few together, about the tops of the branches, red, slightly hoary. Corolla pink, with reflexed oblong segments. Stamens with purple downy filaments and yellow anthers. Berries pear-shaped, globular, often spotted, crimson, of a peculiar flavour, with a strong acid, grateful to most people in the form of tarts, for which purpose they are largely imported from Russia. Not long since, cranberries from Lincolnshire and the north-west corner of Norfolk were sold in the streets of Norwich by cart-loads; but the extensive inclosures have in many parts destroyed and drained their native bogs. Lightfoot records, that at Longtown, on the borders of Cumberland, not less than 200. or 300. worth were sold each market day, for 5 or six weeks together, and dispersed over different parts of the kingdom. In Sweden, these berries serve only to boil silver plate to its due degree of whiteness, their sharp acid corroding the superficial particles of the copper alloy.

2 O. macrocarpus (Pursh, fl. amer. sept. 1. p. 263.) stems prostrate, filiform, creeping; leaves elliptic-oblong, nearly flat and obtuse, distantly sub serrated on the margins, glaucous beneath, downy at the points when young: segments of the corolla linear-lanceolate; flower-bearing branches erect, proliferous; pedicels lateral. \( \varphi \). H. Native from Canada to Virginia, in bogs, principally on a sandy soil, and on high mountains. Wats. dendr. brit. t. 122. Vaccinium macracarpum, Ait. hort. kew. ed. 1. vol. 2. 13. t. 7. Hook. bot. mag. 2506. Lam. ill. t. 286. f. 4. Vaccinium hispidulum, Wangh. amer. t. 50. f. 67. Vaccinium oxyccæus \( \beta \), oblongifolium, Michx. fl. amer. bor. 1. p. 229. Points of young leaves, peduncles, and thise larvae and receptacles hairy. Berries spherical, red, often remaining throughout the winter. This is a larger and more robust plant than the preceding. Several flowers come forth at the ends of the last year’s branches, surmounted by the shoots of the present year. The bracteas are situated in the upper part of the pedicels in this, while in the preceding they are situated at the lower part. The berries are larger, and of a brighter red than the last, and are collected in great abundance for making tarts in America, and exported from thence to Europe; but they always prove here far inferior in quality to the Russian cranberries, however excellent in America. The best way of having American cranberries in Europe is by cultivation in an artificial bog, with great plenty of water, as first contrived by Sir Joseph Banks. A very few square yards of ground thus employed will yield as many cranberries as any family can use. If allowed to hang until they are full ripe, as late as October, they are even better than the common cranberry, and may be kept dry in bottles throughout the year. Our wild cranberries have generally been gathered too early; as may also be the case with those brought from America. "Wherever there is a pond," Mr. Neill observes, "the margin may, at a trilling expense, be fitted up for the culture of this plant, and it will continue productive for many years. All that is necessary is to drive in a few stakes 2 or 3 feet within the margin of the pond, and to place some old boards within these, so as to prevent the soil of the cranberry-bed from falling into the water; and lay a parcel of small stones or rubbish in the bottom, and over it peat or bog earth, to the depth of about 3 inches above and 7 inches below the surface of the water. In such a situation the plants grow readily; and if a few be put in they entirely cover the bed in the course of a year or two, by means of their long runners, which take root at different points. From a very small space a large quantity of cranberries may be gathered; and they prove a remarkable regular crop, scarcely affected by the state of the weather, and not subject to the attack of insects.

Large-fruited or American Cranberry. Fl. May, July. Ct. 1760. Shrub creeping.

Erect Cranberry. Fl. May, June. Ct. 1806. Shrub 2 feet. Cult. When any of the species are grown for the sake of their berries, they should be planted in an artificial bog, as mentioned under O. macrocarpus. But when grown only for having a specimen of the plants, they will grow well in pots filled with peat and sand, having sphagnum set round their roots: the pots should be well drained with sherd, and set in deep pans of water.

Linn. syst. Pentandria, Monogyonia. Liam of calyx 5-cleft. Corolla tubular, ventricose at the base; limb 5-toothed. Stamens 10, inserted in the limb of the calyx, inclosed; anthers mucous, drawn out from the top into 2 little tubes. Style erect; stigma depressedly capitate. Drupes nearly globose, clothed by the calyx, 10-seeded; cells 1-seeded. Seeds lenticular, smooth. —Evergreen or deciduous shrubs. Leaves scattered, coriaceous, each terminated by a mucron or gland. Racemes axillary, approximate. Flowers scarlet, bracteate. Very nearly allied to Thibadia, but very distinct.

* Corollas treculata, or cylindrical.

1 G. runifolli (H. B. et Kunth, nov. gen. amer. 3. p. 276.
Rhododendron Gaylussacia. Shrub. 9 G. pseudo-vaccinum (Cham. et Schlecht. in Linnaea. 1 p. 530.) glabrous or downy; leaves elliptic-lanceolate; racemes terminal, aggregate; corollas cylindrical; ovarium glabrous. 

Native of Brazil, within the tropic, in open sandy places; near Caravellos Freireis. Vaccinium Brasilíenis, Spreng. nov. prov. p. 42. syst. 2 p. 212. Leaves obsolescent serrated towards the top, with a few cilia at the base of the younger leaves. Racemes axillary, erect, summed, racemose, of a fine crimson colour, as well as the corolla, which are cylindrically urceolate; calycine teeth roundish, acuminate. There are glabrous and downy varieties of this species.

False-vaccinium Gaylussacia. Shrub 1 to 2 feet. 10 G. myrtifolia (Cham. et Schlecht. in Linnaea. 8 p. 494.) leaves obovate-lanceolate, acute, terminated by an obuse callous point, with serrated reflexed margins, an inch long; racemes crimson, usually solitary, nearly terminal, erect, exceeding in leaves; calycine segments short, ovate, acuminate. 

Native of Brazil, within the tropic. Corolla tubular, petricose. Young branches pilose. Young leaves ciliolate. Leaves yellow beneath, pilose on the petiole and midrib.

Myrtle-leaved Gaylussacia. Shrub. 11 G. salicifolia (Cham. et Schlecht. in Linnaea. 1 p. 532.) quite glabrous and pruinose; leaves oblong-lanceolate, acute, terminated by a callous point, with serrated reflexed margins, a half inch long, and tr Cirrus-nerved, and entire. Native of Java, on trees on the mountains. Anthers biaristate on the back, beneath the apex. Stigma truncate, simple. Capsule 10-celled; cells 1-seeded. Lanceolate-leaved Gaylussacia. Shrub. 12 G. lanceolata (Blum. biijdr. p. 861.) stem parasitical; leaves oblong-lanceolate, acuminate, coriaceous, glabrous, reticularly veined, and triple-nerved beneath; racemes axillary, simple, and are, as well as the calyces, tomentose; pedicels tribracteate at the base. Native of Brazil, within the tropic. Branchlets, petioles, and rachis canescent from down, with the nerves and margin densely ciliolate, as well as the bracteae and calyces. Corolla glabrous, rarely pilose on the nerves.

Far. 

Myrtle-like Gaylussacia. Shrub. 15 G. palidula (Cham. in Linnaea. vol. 8 p. 499.) branches marked by cicatrises occasioned by the falling of the leaves; leaves nearly sessile, quite entire, usually acute, terminating in 5 n 2.
ERICACEÆ. LIV. GAYLUSSACIA. L.V. THIBAUDIA.

each in an inflamed white mucrone; flowers pale, clothed with glandular down; bracteas foliaceous, green, length of flowers; bracteoles somewhat foliaceous, lanceolate, situated under the calyxes; calycine segments lanceolate, about a third the length of the corolla; filaments villous, about a fourth the length of the anthers. \( h \). S. Native of Brazil, within the tropic.

\* Pulexifloria Gaylussacia. Shrub.

16 G. anxustifolia (Cham. in Linnaea. 8. p. 499.) branches, petioles, inflorescence, and calyxes downy; leaves coriaceous, linear-lanceolate, narrowed into the short petioles at the base, ending each in a callous acute point, with reflexed inconspicuously serrated edges, shining above and rufescent beneath; racemes axillary, nearly terminal, erect, exceeding the leaves; lower bracteas foliaceous; superior ones coloured; calycine segments ovate, acuminated, or acutely triangular, and are, as well as the bracteas, ciliate; corollas cylindrical, downy on the nerves; filaments villous, shorter than the anthers. S. Native of equinoctial Brazil. Ineffoscent coloured.

\* Narrow-leaved Gaylussacia. Shrub.

17 G. porphyria (Cham. et Schlecht. in Linnaea. 1. p. 536. and L. p. 560.) quite glabrous and pruinose; leaves linear, acute at both ends, crenated; peduncles axillary, 1-3-flowered, furnished with small glandularly serrated bracteas; corolla urceolate, with short erect teeth. S. Native of equinoctial Brazil. The young leaves at the tops of the branches and flowers are crimson. Calycine teeth ovate, acuminated, cuspidate, with glandularly ciliated edges.

\* Pine-leaved Gaylussacia. Shrub \( \frac{1}{2} \) to 1 foot.

\* * \* Corollas campanulate.

18 G. proo-do-gaultheria (Cham. et Schlecht. in Linnaea. 1. p. 535.) branches straight, hispid; leaves narrow-elliptic, subcordate, sebrons on both surfaces, obsolescently serrated towards the top; racemes axillary and terminal at the tops of the branches, approximate, second, erect, hispid, bracteate. S. Native of Brazil, within the tropic. Leaves rising from the root, biennial or triennial, about a foot high, branched. Flowers white, hardly crimson. Corollas campamulate, with hairy angles. Calycine teeth narrow, lanceolate. Ovarium hairy, glabrous.

\* False Gautheria Gaylussacia. Shrub 1 foot.

19 G. decipiens (Cham. in Linnaea. 8. p. 500.) branches hairy; leaves coriaceous, elliptic, obtuse, attenuated at the base, obsolescently crenated towards the apex; racemes from the axis of the ultimate leaves, second, erect; calycine teeth triangular, acuminated; corolla campamulate, pilose on the angles, with erect triangular teeth. S. Native of Brazil, within the tropic. G. buxifolia, Cham. et Schlecht. in Linnaea. 1. p. 328, but not of H. B. et Kunth. Leaves glabrous above, but pubescent on the nerves beneath. Corollas white, campamulate, not scarlet. This species has been referred to G. imbricata by Pohl, but it differs in its flowers being campamulate and white, not scarlet.

\* Deceiving Gaylussacia. Shrub 1 to 1 \( \frac{1}{2} \) foot.

20 G. ameana (Cham. in Linnaea. 8. p. 501.) branches, petioles, and inflorescence downy; calyxes glabrous, but are, as well as the bracteas, ciliated with glandular hairs; leaves on very short petioles, ending each in a callous mucrone, serrated in front, with reflexed margins covered with resinous dots beneath, having thick veins and nerves prominent beneath; racemes nearly 1 inch long, erect, elongated; calycine segments ovate, acuminated; corolla campamulate, glabrous, filaments ciliated, half the length of the anthers; bracteas foliaceous. S. Native of Brazil, within the tropic. Flowers white.

Var. a; leaves obovate-cuneated, rounded.

Var. b; leaves narrower, blunt at the base, acuter at the apex, obovate or lanceolate.

\* Pleasant Gaylussacia. Shrub 4 to 6 feet.

21 G. incana (Cham. in Linnaea. 1. p. 535.) clothed with hoary tomentum; leaves oblong, with revolute margins, quite entire; racemes axillary and terminal, approximate at the tops of the branches, second, erect; corollas campamulate, downy. S. G. Native of Brazil, within the tropic. Leaves ciliiform above and white beneath. Calycine teeth lanceolate. Corolla downy, as well as the filaments.

\* Hoary Gaylussacia. Shrub 1 foot.

\* Cult. For culture and propagation see Agarista, p. 838. All the species are extremely elegant when in blossom, and are therefore very desirable plants in every collection.

1 T. bracteata (Ruiz et Pav. f. fl. per. 4. t. 388. ined.) leaves ovate-lanceolate, acuminated, 5-nerved; bracteas large, permanent, coriaceous, 2-lobed; anthers spurred at the base. S. Native of Peru. Branches angular, glabrous. Leaves rounded at the base, 2-3 inches long, petiolate. Flowers disposed in terminal thyridoid corymbs at the tops of the branches. Corollas scarlet, nearly an inch long. Bracteas imbricate. Filaments bearded at the apex.

\* Bracteate Thibaudia. Shrub.

2 T. melifera (Ruiz et Pav. f. c. t. 387. f. b.) branches terete, downy; leaves oblong, obtuse, feather-nerved, acute at the base; flowers axillary, coriaceous, bracteate; limb of calyx nearly entire; corollas short. S. Native of Peru. Leaves 2-3 inches long, on short petioles, glabrous. Bracteas small. Peduncles downy. Limb of calyx obliquely 5-lobed. Filaments glabrous.

\* Honey-bearing Thibaudia. Shrub.

3 T. punctatifolia (Ruiz et Pav. f. c. t. 387. f. a.) leaves oblong-lanceolate, acuminated, 5-nerved, rounded at the base, dotted beneath; calyx bluntly 5-lobed; racemes elongated, nodding; bracteas large, oblong, mucronate, adpressed; corollas ventricose; filaments glabrous. S. Native of Peru. Leaves a hand long, glabrous. Petioles short, robust. Branchlets angular. Racemes a span long, many-flowered. Flowers drooping. Corolla ventricose, an inch long.

\* Dotted-leaved Thibaudia. Shrub.

4 T. coractata (Ruiz et Pav. t. c. t. 385.) branches angular, glabrous; leaves lanceolate, acuminated, 5-nerved, rounded at the base; flowers aggregate; bracteas 2-lobed, roundish, coriaceous; calycine teeth acute; filaments glabrous. S. Native of Peru. Bicolor, Dunal. in herb, Lamb. Leaves 3-4 inches long, marked with white veins above. Flowers peduncu-
late, subcoriaceous, 5-10 together, drooping. Berries large. Corolla 1½ inch long.

**Coarctate-flowered Thibaudia.** Shrub.

5 T. Cauila (Ruiz et Pav. l. c. t. 380.) branches angular; leaves nearly sessile, coriaceous-oblong, obtuse, denticulated; racemes few-flowered; bracteas lanceolate, acuminate; calyce teeth short, acute; filaments glabrous. \( \beta \). S. Native of Peru. Leaves 4 inches long, feather-nerved. Bracteas permanent, lanceolate, coriaceous. Corolla an inch long.

**Wing-stemmed Thibaudia.** Shrub.

6 T. Elliotica (Ruiz et Pav. l. c. t. 384. f. b.) branches angular; leaves elliptic-oblong, with revolute margins; flowers aggregate; calyces teeth acutish, very short. \( \beta \). S. Native of Peru. Leaves 3 inches long, attenuated at the base, on short petioles, feather-nerved. Peduncles half an inch long.

**Elliptic-leafed Thibaudia.** Shrub.

7 T. Emarginata (Ruiz et Pav. l. c. t. 384. f. a.) branches terete, glabrous; leaves obovate, emarginate, bristly beneath; flowers solitary; calyx obsolescent, 5-toothed; corollas conical; filaments glabrous. \( \beta \). S. Native of Peru. Leaves 1½ inch long, 3-nerved, acute at the base. Corolla ventricose, 3 lines long. Flowers pendulous. Peduncles glabrous.

**Emarginate-leaved Thibaudia.** Shrub.

8 T. Floribunda (H. B. et Kunth, nov. gen. amer. 3. p. 269. t. 254.) branches terete, glabrous; leaves lanceolate, acuminate, reticulately veined, glabrous, as well as the inflorescence; racemes axillary, solitary; bracteas imbricated; filaments glabrous. \( \beta \). S. Native of New Granada, near Santa Fe de Bogota. Leaves 5 inches long. Calyce teeth ovate, acute. Corolla ventricose, scarlet.

**Bundle-flowered Thibaudia.** Shrub.

9 T. Longifolia (H. B. et Kunth, l. c.) branches pentagonal, glabrous; leaves long-lanceolate, acuminate, obtuse at the base, reticulately triple and quintuple-nerved, and are, as well as the calyces and corollas, glabrous. \( \beta \). G. Native of the Andes, about Quindiu, near La Seja. Leaves 6-7 inches long. Racemes axillary, shorter than the leaves. Flowers size and structure of those of the preceding species.

**Long-leaved Thibaudia.** Shrub.

10 T. Falcata (H. B. et Kunth, l. c.) branches terete, glabrous, fuscous; leaves lanceolate, acuminate, falcate at the apex, acute at the base, reticulately quintuple-nerved, and are, as well as the calyx and corollas, glabrous. \( \beta \). S. Native of the Andes, about Popayan, near Pondaman and Palace. Leaves on short petioles, 8-9 inches long. Racemes axillary, solitary, nearly sessile, 3 or 4 times shorter than the leaves. Corollas large, tubular, white, but red and ventricose below. Calyce teeth short, acute.

**Falcate-leaved Thibaudia.** Shrub.

11 T. Macrophylla (H. B. et Kunth, l. c. p. 270.) branches terete, glabrous; leaves ovate-lanceolate, acuminate, rounded at the base, reticulately quintuple-nerved, and are, as well as the calyx and corolla, glabrous. \( \beta \). S. Native of the Andes, about Popayan, near Pondaman and Palace. Leaves on short petioles, 8-9 inches long. Racemes axillary, solitary, nearly sessile, 3 or 4 times shorter than the leaves. Corollas large, tubular, white, but red and ventricose below. Calyce teeth short, acute,

**Long-leaved Thibaudia.** Shrub 10 feet.

12 T. Supraestus (H. B. et Kunth, l. c. p. 270.) branches downy, striated a little; leaves lanceolate, bluish, acute at the base, reticulately veined, glabrous above and downy beneath, especially on the nerves; calyxes glabrous. \( \beta \). S. Native of New Granada, in Paramo de Saragura, near Loja and Alto de Pulla. Leaves 3 inches long. Racemes axillary. Fruit nearly globose, about the size of those of *Prunus spinosa*.

**Rock Thibaudia.** Shrub.

13 T. Nitida (H. B. et Kunth, l. c. p. 271.) branches trigo-
nated, acute at the base, reticulately quintuple-nerved; branches, calyxes, and corollas glabrous. H. S. Native of South America, in the province of Choco, in one place near the town of Cali, towards Cerro de San Antonio, where it is called Quercem de Cali. Leaves 3 or 3½ inches long. Pedicels trichractate at the base, red. Corollas tubular, ventricose at the base, red. Calyces teeth ovate, acute, short. The flowers, bracteas, and wood, are very sweet scented when dried, and which scent is easily communicated to water, spirits, or wine. Spirits of wine saturated with this aroma smells like cloves, and is useful in mitigating tooth-ache.

Quercem Thibaudi. Shrub 5 to 6 feet.

20 T. ardisioides (H. B. et Kunth, l. c. p. 274.) branches terete, glabrous; leaves opposite, sessile, oblong, obtuse, subcordate, reticulately nerved, and are, as well as the branches, calyxes, and corollas, glabrous. H. S. Native of New Grenada, near Fusagarriga, in woody places. Leaves 3½ inches long, with diaphanous edges. Racemes axillaries, sessile, solitary, pendulous, girded by small imbricated bracteas at the base. Corollas cylinically tubular, scarlet, with a white limb. Calyces teeth ovate, acute, ciliate.

Ardisia-leaved Thibaudi. Tree 16 to 20 feet.

Cult. For culture and propagation see Agarista, p. 538. Extremely elegant shrubs when in blossom.

LVI. AGAPETES (from agapetos, agapetes, beloved; in reference to the plants being showy). D. Don, ms. in herb. Lamb. Thibaudia species, Wall and Blume. Ceratosemen species, Roxb.

1 A. setolera (D. Don, in herb. Lin. soc.) leaves scattered, lanceolate, petiolate, acuminate, obtuse at the base; flowers disposed in racemose corymb; peduncles and calyces hispid; filaments bearded; anthers bifid; segments of corolla ovate-oblong. H. G. Native of the East Indies, on the Pundua mountains. Thibaudia setigera, Wall. cat. no. 752. Leaves about 4½ inches long, on very short robust petioles, obliquely denticulated. Flowers numerous, in lateral and terminal corymbose racemes, furnished with bristly hairs. Corolla about 1 inch long. Bristle-bearing Agapetes. Shrub.

2 A. verticillata (D. Don, l. c.) leaves verticillate, lanceolate, acuminate, finely denticulate, acute at the base; flowers corymbose; peduncles and calyces hispid; corolla glabrous, with short blunt lobes; filaments nearly smooth; anthers bifid. H. G. Native of the East Indies, on the Pundua mountains. Thibaudia verticillata, Wall. cat. no. 753. Leaves on very short petioles, disposed in interrupted verticillate fascicles. Corolla scarcely an inch long. Stigma almost simple. Whorled-leaved Agapetes. Shrub.

3 A. loranthifolia (D. Don, l. c.) leaves sessile, lanceolate, bluntly acuminate, quite entire; flowers generally solitary; segments of the corolla elongated; anthers emarginate at the apex; filaments and corollas smoothish. H. G. Native of the East Indies. Thibaudia loranthifolia, Wall. cat. no. 754. Leaves 3 inches long, cuneate-lanceolate. Calyx with ovate acute teeth, and is, as well as the peduncles, rather bristly. Segments of corolla ovate at the base. Loranthus-flowered Agapetes. Shrub.

§ 2. Corollas short, ovate.

6 A. sprengeri; leaves petiolate, ovate-lanceolate, acuminate, denticulated, attenuated at the base, woolly; flowers racemose, glabrous, peduncles glabrous; calyce segments ovate, denticulate; filaments downy; anthers bifid. H. G. Native of the East Indies. Thibaudia sprengeri; Wall. cat. no. 6298. Leaves 3 inches long. Flowers drooping, from 5 to 7 in a cluster. Corolla ovate-oblong, about 1½ inches long. Sprengel's Agapetes. Shrub.

7 A. serrata; leaves verticillate, petiolate, lanceolate, acuminate, serrate, attenuated at the base; flowers racemose, pendulous, and are, as well as the filaments, glabrous; branchlets chaffy. H. G. Native of the East Indies. Thibaudia serrata, Wall. cat. no. 6299. Leaves 2 inches long, on very short foot stalks. Calyces teeth very short, mucronate. Corolla ovate-oblong, 2 inches long. Serrate-leaved Agapetes. Shrub.

8 A. symphyocladia (D. Don, l. c.) branchlets downy; leaves ovate, mucronate, serrulate; flowers and calyces downy; calyce segments rounded, mucronulate; filaments bearded. H. G. Native of the East Indies. Andromeda symphyocladia, Wall. cat. no. 1522. Corolla a line long. Symphoeclade-leaved Agapetes. Shrub.

9 A. elliptica; stem parasitical; leaves elliptic-oblong, acutish at both ends, biglandular at the base, coriaceous, veiny, glabrous; racemes second, finely tomentose. H. G. Native of Java, on Mount Salak, upon trees. Thibaudia elliptica, Blum. bijdr. p. 859. Elliptic-leaved Agapetes. Fl. Year. Shrub parasitical.

10 A. floribunda; leaves elliptic-oblong, acuminate at both ends, coriaceous, glabrous, veiny; calyces ciliate. H. G. Native of Java, on the tops of the mountains, where it is called Prun by the natives. Thibaudia floribunda, Blum. bijdr. l. c. Bundic-flowered Agapetes. Shrub.

11 A. laurifolia; stem parasitical; leaves cuneate-oblong, bluntish, coriaceous, glabrous, almost veinless; racemes glabrous. H. G. Native of Java, on the top of Mount Burangrang, upon trees. Thibaudia laurifolia, Blum. l. c. Laurel-leaved Agapetes. Shrub parasitical.

12 A. varioleatolia; leaves oblong-lanceolate, acutish coriaceous, glabrous, nearly veinless; racemes leafy, and are, as
well as the calyces, downy. \( \ddagger \). G. Native of Java, on Mount Gede, where it is called by the natives *Jatigie-belot*. Thibaudia xaringiefolia, Blum. bijdr. p. 860.

13 A. *Lucretta*; stem sometimes parasitical; leaves small, obovate, rather retuse, with recurved margins, coriaceous, glabrous, a little veined; racemes, calyces, and corollas downy. \( \ddagger \). G. Native of Java, in the higher woods. Thibaudia lucida, Blum. l. c.

Shining Agapetes. Fl. Year. Shrub parasitical.

14 A. *coriacea*; stem parasitical; leaves elliptic or oblong-lanceolate, much acuminated, coriaceous, somewhat 3-nerved, and are, as well as the racemes, calyces, and corollas, glabrous. \( \ddagger \). G. Native of Java, on the mountains, upon trees, where it is called *Kilagiday* by the natives. Thibaudia coriacea, Blum. l. c.

Coriaceous-leaved Agapetes. Shrub parasitical.

15 A. *cuneifolia*; leaves cuneiform, obtuse, sometimes retuse, with recurved margins, coriaceous, nearly veinless, and are, as well as the racemes and calyces, glabrous. \( \ddagger \). G. Native of Java, on the higher mountains, in woods. Thibaudia cunei-

folia, Blum. bijdr. p. 861.

Wedge-leaved Agapetes. Fl. Year. Shrub.

16 A. *Myrtoida*; branches downy; leaves ovate-elliptic, bluish, with recurved margins, coriaceous, nearly veinless, downy on both surfaces at the midrib; racemes glabrous. \( \ddagger \). S. Native of the Moluccas, on the tops of the burning mountains. Thibaudia myrtoides, Blum. bijdr. 861.

Myrtle-like Agapetes. Shrub.

Cult. For culture and propagation see *Agarista*, p. 838.

LVII. CERATOSTEMA (from κέρας, keros, a horn, and στῆμα, stema, a stem; in reference to the anthers being bluntly spurred at the base). Juss. gen. p. 163. Ruiz et Pav. fl. per et Chil. vol. 4. ined.

LIN. SYST. *Decandria Monogyna*. Limb of calyx large, 5-parted, foliaceous. Corolla tubular, coarctate at the apex, 5-lobed. Stamens 12; filaments very short. Anthers bluntly spurred at the base; cells elongated at the apex, filiform, almost wholly free, dehiscing by a terminal pore each. Stigma simple, obtuse. Berry 5-celled, many-seeded. Seeds small, angular.—Evergreen shrubs, natives of Peru. Leaves oblong, on short petioles, almost veinless, coriaceous, rounded and subcordate at the base. Flow-

ers almost sessile, lateral and terminal, pedunculate. Corollas large, scarlet.

1 C. *grandiflora* (Ruiz et Pav. fl. per. 4. t. 383. f. b.) branches and peduncles downy; leaves lanceolate or ovate, usually mucronate; calyce segments acuminated; corollas longer than the peduncles. \( \ddagger \). G. Native of Peru. Leaves an inch or an inch and a half long, obtuse.

*Great-flowered* Ceratostema. Shrub.

2 C. *hiroshita* (Ruiz et Pav. fl. per. 4. t. 383. f. a. ined.) branches and peduncles downy; leaves oval-oblong, obtus-

ate; calyce segments ovate, mucronate, reticulated; corollas about equal in length to the peduncles. \( \ddagger \). G. Native of Peru. C. cordifolia, Dunal, in herb. Lamb. Leaves 1½ inch long.

Hairy Ceratostema. Shrub.

Cult. See *Agarista*, p. 838, for culture and propagation.—Elegant shrubs, worth cultivating in every collection.

Trib. IV.

PYROLEÆ (this tribe only contains the genus *Pyrola*). D.

Don, in edinb. phil. journ. 17. p. 152. Anthers 2-celled. Ova-

rium free. Hypogynous disk naked. Seeds peltate, samaroid. Embryo dicotyledonous. Plants leafy, terrestri-

al.

LIN. SYST. *Descandra Monogyna*. Calyx 5-parted. Petals 5.

Stamens 10. Anthers dehiscing at the base by 2 holes. Stigma 5-lobed. Capsule 5-celled; valves connected by fine intricate tomentum. Placenta lunate, with simple lobes. Cells many-seeded. Seeds narrow, seboiform, winged at both ends. Embryo transverse. Umbel evergreen herbs with wide creeping roots. Leaves petiolate, alternate, smooth, and usually shining, coriaceous, crenulated, toothed or serrated. Scapes erect, furnished with a few scales, usually triquetrous or quad-

rangular, convolute. Flowers pedicellate, bracteate, pendulous, globose or campanulate, white or red, disposed in terminal racemes. All the *Pyrole* are possessed of strong astringent qualities, and were formerly much esteemed for supposed healing properties; they are now wholly disused.

1 P. *rotundifolia* (Lin. spec. 567.) leaves roundish, quite entire or crenulated, shorter than the dilated petioles; scape triquetro-

us; calyce segments lanceolate, acute; stigma clavate, bluntly 5-toothed. \( \ddagger \). H. Native of Asia, Europe, and North America, in old woods, in stony or sandy soil. In Britain, in dry heathy woods, but rare; in the north of England and High-

lands of Scotland. Smith, engl. bot. 213. exclusive of the syn. of fl. dan. Lam. ill. t. 397. f. 1. P. grandiflora, Radd. diss. p. 27. t. 3. f. 2.—Riv. mon. t. 137. and 136. f. 2.—Mor. ox. sect. 12. t. 10. f. 1. Leaves numerous. Scapes furnished with 2-3 lanceolate-acute scales. Racemes 10-16-flowered. Pedic-

les secedum, rather remote, scattered. Flowers rather large, milk-white.

2 P. *asarifolia* (Michx. fl. bor. amer. 1. p. 251.) leaves re-

iform, coriaceous, repandely crenated, twice shorter than the dilated petioles; scapes acutely triquetro-

us; racemes many-flowered; calyce segments ovate, acuminated, adpressed; stigma clavate, with an elongated 5-lobed disk. \( \ddagger \). H. Na-

tive of Canada, in pine woods; and on the mountains of Pennsyl-

vania, in beech woods. Leaves numerous. Scapes furnished with a few scarios convolute scales. Racemes elon-

gated. Pedicels remote, scattered. Flowers greenish-white or yellowish-green, about the size of those of the preceding.

3 P. *chlorantha* (Swartz, in Stockh. trans. 1810. t. 5. Nutt. gen. amer. 1. p. 375.) leaves orbicular, retuse, obso-

letely narrowed to the narrow petiole; racemes few-flowered; calyce segments very short, obtuse; petals oblong; openings of anthers tubular; stigma clavate, with an elongated 5-lobed disk. \( \ddagger \). H. Native of Sweden and Upper Canada. Lodd. bot. exp. 1542. P. convolvula, Bart. prod. fl. phil. p. 50. P. asarifolia, Rad. diss. p. 23. t. 4. f. 1. exclusive of the synonyme of Michaux. P. rotundifolia, \( \beta \), nunmularia, Muhl. cat. P. minor, Pursh. miss. and perhaps of fl. amer. sept. 1. p. 299. Scapes tetragonal, furnished only with one minute scale in the middle. Pedicels curved, scattered. Flowers cam-

-
pandulate, about the size of those of *P. elliptica*, greenish-white, pendulous.

4 P. **occidentalis** (R. Br. mss. in herb. Banks, ex D. Don, in wern. mem. 5. p. 232.) leaves roundish, membranous, obsolescent denticulated, twice longer than the simple petals; racemes few-flowered; calycine segments oblong, obtuse; disk of stigma 5-lobed. 2. H. Native of Sedge Island, on the north-west coast of America, where it was collected by D. Nelson. Leaves numerous, one-half smaller than those of *P. rotundifolia*.

**Western Winter-green.** Pl. ½ foot.

5 *P. elliptica* (Nutt. gen. amer. 1. p. 273.) leaves elliptic or ovate, membranous, serrulatate, longer than the dilated petals; racemes few-flowered; bracteas lanceolate, subulate, recurved at top; calycine segments very short, ending each in a recurved mucrone; petals oval; stigma clavate, with an erect 5-lobed disk. 2. H. Native of both Canadas, in woods; and around Philadelphia; and in the woods of New Jersey. Rad. diss. p. 81. t. 5. f. 1. P. ovalifolia, Pursh, mss. in herb. Lamb. Scapes acutely triquetrous, furnished with a solitary scarious scale near the base. Pedicels scattered, distant. Flowers campanulate, white, with a grateful smell, smaller than those of *P. rotundifolia*.

6 *P. dentata* (Smith in Rees’ cyc. D. Don in wern. mem. 5. p. 235.) leaves cuneate-oblong, coriaceous, acute at the base, twice as much longer than the narrow petals, having the margin remotely toothed or quite entire; racemes elongated, few-flowered, rather secund; petals oval; disk of stigma elongated, 5-lobed. 2. H. Native of the Island of Nootka, on the north-west coast of America, where it was collected by Mr. Menzies. Leaves crowded. Scapes angular, naked. Racemes drooping at the apex, secund. Flowers campanulate, drooping, milk-white.

**Toothed-leaved Winter-green.** Pl. 1 foot.

7 *P. vicosa* (Smith in Rees’ cyc. D. Don in wern. mem. 5. p. 235.) leaves ovate, mucronulate, coriaceous, somewhat serrated, equal to the narrow petals in length, red beneath, but dark green, and marked along the veins with whitish bands above; racemes many-flowered; petals roundish; stigma clavate, with a 5-lobed disk. 2. H. Native of the Island of Nootka, on the north-west coast of America; and of Japan, near the town of Nagasaki. Scapes acutely triquetrous, reddish, never convolute, furnished with scarious scales. Pedicels scattered. Flowers globose campanulate, pendulous, white.

**Painted-leaved Winter-green.** Pl. ¼ foot.

8 *P. aphyllea* (Smith in Rees’ cyc. D. Don in wern. mem. 5. p. 237.) leafless; scape angular, furnished with numerous scales at the base; racemes many-flowered, rather secund; calycine segments ovate, acute, crenulatate; petals roundish; disk of stigma elongated, 5-crenated. 2. H. Native of Nootka Island, on the north-west coast of America, where it was collected by Mr. Menzies. Scapes numerous. Flowers globose, pendulous, milk-white. This remarkable species, although wholly destitute of leaves, is not, strictly speaking, leafless; their place is supplied by a kind of foliaceous scales, of a greenish colour. In some of the fine specimens preserved in the Banksian herbarium, an approach to leaves may be distinctly observed.

---

**Leafless Winter-green.** Pl. ¼ foot.

§ 2. Stamens erect, bent towards the pistilum. Style decurrent, longer than the petal. Stigmas without a ring. Scapes erect. Flowers racemose, globose, pendulous, scattered, never secund.

§ 3. Stamens erect. Style straight; stigma exanastomized, or without a ring. Scapes erect. Flowers pendulous, racemose.

10 *P. minor* (Lin, spec. 567.) leaves roundish or oval, coriaceous, repandly crenulated, longer than the petal, which are dilated; racemes spicate; bracteas lanceolate, somewhat much longer than the pedicels; calycine segments very short; style inclosed; stigma flattish, 5-lobed. 2. H. Native of the colder parts of Europe, and the north of Asia, on heaths, in bushy places, and in woods; in Britain, in mossy woods and thickets, in mountainous situations; in Yorkshire, and common in many parts of Durham; woods near Brodie House, and at the Falls of Clyde, and many other places of Scotland. Fl. dan. t. 55. Smith, engl. bot. 158. Rad. diss. p. 15. t. 1. P. rosea, Smith, engl. bot. 2543. Rad. diss. p. 18. t. 2. P. rotundifolia, Pall. ind. taur.—Gmel. sib. 4. p. 128. no. 16. t. 56. f. 1.—Riv. mon. t. 136. f. 1. Leaves numerous, mucronulate at the apex. Scapes quadrangular, furnished with a lanceolate membranous scale in the middle. Racemes spicate, dense. Flowers globose, with a contracted mouth, white tinged with red. A variety of this species has been gathered in the Island of Unalaska.

**Smaller Winter-green.** Fl. June, July. Britain. Pl. ¼ to ½ foot.

11 *P. secundiflora* (Lin. spec. 567.) leaves ovate, acute, membranous, sharply serrated, longer than the narrow petals; raceme secund or unilateral; calycine segments rounded; petals oblanceolate; style exserted; stigma flattish, 5-lobed. 2. H. Native of Europe, Asia; and North America, from Canada to New Jersey; among bushes and in alpine woods, particularly in dry, mossy, pine woods; in Britain, in mossy alpine woods; in Yorkshire; in many fir or birch woods in Scotland; on the hill of Dunnain; in Darway forest, near Brodie House. Fl. dan. t. 402. Smith, engl. bot. t. 517.—Gmel. sib. 4. p. 129. t. 56. f. 2. Riv. mon. t. 128. f. 2.—Mor. hist. 1. sect. 12. t. 10. f. 4. Stems rather woolly. Leaves mucronulate. Peduncles bluntly angular. Racemes elongated, many-flowered. Flowers campanulate, white, tinged with pale green.

**Second-flowered Winter-green.** Fl. June, July. Britain. Pl. ½ to ¼ foot.
ERICACEE. LIX. CHIMAPHLA. LX. MONESES. LXI. CLADOATHANUS.

865

Cult. All the species of Winter-green are very pretty when in blossom, but are extremely difficult to cultivate in gardens. They grow best in a sandy or gravelly soil, in a shady situation. They should be mulched with moss, and a hand-glass placed over them. They may be increased by division.

LIX. CHIMAPHLA (from χήμα, chéma, winter, and φέλος, phéló, to love; the plants are green in winter). Pursh, fl. amer. sept. 1. p. 300. Nutt. gen. amer. 1. p. 374.
—Chimáza, R. Br. in herb. Banks—Pyrola species, Lin. and others.

Umellata-flowered Winter-green. Fl. June. Cht 1752. Pl. 143 to 144 foot. 2 C. maculata (Pursh, fl. amer. sept. 1. p. 300. Nutt. gen. amer. 1. p. 275.) leaves lanceolate, acute, with white bands on the upper surface along the nerve and veins, opposite, or 4 in a whorl; peduncles downy, bearing a 2-3-flowered corymb at the apex; bracteoles linear; appendages of filaments woolly; style very short. 5. H. Native of North America, from Canada to Carolina, in sandy or gravelly woods; on the north-west coast. Pyrola maculata, Lin. spec. 568. Sims, bot. mag. 897. Chimáza maculata, R. Br. in herb. Banks.—Pluk. mant. 157. t. 349. f. 4. Plant subfrutescent, evergreen. Root creeping. Stem procumbent at base and ascending at apex. Lower surface of leaves red. Pedicels and calyces red, clothed with clamyd down. Flowers pendulous, white. Anthers yellow. This plant is in high esteem for its medicinal qualities among the Indians; they call it sipo-si-acne. Mr. Pursh tells us, that he has witnessed the beneficial effects of a decoction of this plant in a very severe case of hysterics; and he says it is a plant eminently deserving the attention of physicians. We are also informed that its decoction has proved very serviceable in scrophulous diseases.

3 C. Menziesii (Sprung, syst. 2. p. 317.) leaves alternate, or 3 in a whorl, lanceolate, acuminate, serrated, discolorous; peduncles 2-flowered, glabrous; bracteae broad-roundish; calyx segments elliptic, acule; style distinct. 5. H. Native of the north-west coast of America, where it was collected by Mr. Menzies. Pyrola Menziesii, R. Br. in herb. Banks ex Don, in memor. mém. 5. p. 245. Plant subfrutescent, evergreen. Root creeping. Stems ascending, red. Pedicels glabrous. Flowers pendulous, white. Leaves deep green above and red beneath. This species has a striking resemblance to P. maculata.

Menzies' Winter-green. Plant ascending, 2 to 3 inches long.

Cult. See Pyrola, for culture and propagation, above.

LX. MONESES (from μοιρος, moiros, alone; flowers solitary on the tops of the scapes). Sal. mss. in Gray, brit. arrang. 2. p. 403. Pyrola uniflora, of authors.

1 M. grandiflora (Sal. mss. in Gray, brit. arrang. 2. p. 403.) flowers solitary, at the top of the scape; cells of anthers elongated and tubular; stigma acutely 5-toothed; leaves orbicular, serrated. 5. H. Native of Europe, Asia, and North America, in alpine mossy woods; in Britain, in alpine woods and by the sides of trickling rills; in the western islands of Harris and Skye. In a firt wood near Brodie House, by Forres. Pyrola uniflora, Lin. spec. 568. Fl. dan. t. 8. Smith, engl. bot. t. 146.—Moris. hist. 3. p. 505. sect. 12. t. 10. f. 2.—Riv. mon. t. 189. f. 1. Leaves 3, rarely 4 in a whorl, longer than the dilated petioles. Scape furnished with an ovate scale above the middle. Flowers large, solitary, drooping, white, very sweet-scented. Stamens recurring.

Cult. For culture and propagation, see Pyrola, above.

LXI. CLADOATHANUS (from κλάδος, klados, a branch, and δαύμος, thamos, a shrub). Bongard, in mem. acad. petersb. 2. p. 155. t. 1.—Pyrola fruticosa, Eschholz. mss.

Margins of the valves septifertous. Placenta 5-lobed; lobes roundish. Seeds numerous, small, involved in membranous aril.—A much branched shrub. Leaves sessile, entire, elliptic or oblong, glabrous, but when young finely ciliated, glaucous beneath, 1½ inch long and 5 lines broad. Flowers axillary, solitary.

1 C. pyroliflorus (Bougard, l.c.). B. H. Native of the north-west coast of America, and of the Island of Sitcha. Pyrola-flowered Cladothamnus. Shrub 4 to 6 feet.

Cult. For culture and propagation see Azalea, p. 531.

Tribe V.

—Leafless parasitical herb.

LXII. HYPO PitY S (from ὑπό, under; and πυτίς, a pine-tree; the species are parasitical on the roots of pine-trees). Dill. gen. 7. Nutt. gen. amer. 1. p. 270.—Monotropa species, Lin. and others. Orobanchoideae, Tourn. mem. acad. 170.

Lin. syst. Decândria, Monogynîa. Calyx 3 to 5-parted. Corolla permanent, so deeply 4-5-cleft as to appear of 4-5 petals; each segment with a cucullate nectareiferous base. Stamens 8-10. Anthers small, horizontal, with 2 obtuse horns at their base, at length opening flat. Stigma orbicular, naked. Capsule 5-celled, 5-valved. Seeds numerous, minute, surrounded by a wing.— Parasitical plants, mostly upon the roots of trees, destitute of proper leaves and verdure. Root roundish, composed of an agglomeration of intricate succulent fibres, producing many 1-flowered scaly scapes or stems. Flowers at first nuttant. Plants white and smooth, destitute of the musky odour of Hypopitys, but having a nauseous liqueaceous scent when bruised. Habit of Orobanche.

1 M. Morisoniana (Michx. fl. bor. amer. 1. p. 266.) scapes elongated, very straight, 1-flowered, furnished with distant scales; flower erect. 2. H. Native of Virginia and Carolina, in shady woods, parasitical on the roots of trees.—Mor. hist. 3. sect. 12. t. 16. f. 5. Flowers larger than in the following species, frequently with 12 stamens.

2 M. uniflora (Lin. spec. 553.) scape short, thick, 1-flowered, furnished with approximate scales; flowers drooping.

Cult. The species are not cultivable.

LXIII. MONOTROPA (from μονή, monos, one; and τρόπος, tropo, to turn; flowers turned one way). Nutt. gen. amer. 271.—Monotropa species, Lin. gen. no. 596. Juss. gen. 450.

Lin. syst. Decândria Monogynîa. Calyx none. Corolla permanent, so deeply 5-parted as to appear 5-petalled; each segment with a cucullate nectareiferous base. Stamens 10; anthers reinfra, horizontal, with 2 obtuse horns at their base, emitting the pollen near the middle by 2 transverse chinks. Stigma orbicular, naked. Capsule 5-celled, 5-valved. Seeds numerous, minute, surrounded by a wing.— Parasitical plants, mostly upon the roots of trees, destitute of proper leaves and verdure. Root roundish, composed of an agglomeration of intricate succulent fibres, producing many 1-flowered scaly scapes or stems. Flowers at first nuttant. Plants white and smooth, destitute of the musky odour of Hypopitys, but having a nauseous liqueaceous scent when bruised. Habit of Orobanche.

1 M. Morisoniana (Michx. fl. bor. amer. 1. p. 266.) scapes elongated, very straight, 1-flowered, furnished with distant scales; flower erect.

2. H. Native of Virginia and Carolina, in shady woods, parasitical on the roots of trees.—Mor. hist. 3. sect. 12. t. 16. f. 5. Flowers larger than in the following species, frequently with 12 stamens.

2 M. uniflora (Lin. spec. 553.) scape short, thick, 1-flowered, furnished with approximate scales; flowers drooping.

Cult. The species are not cultivable.

LXIV. PTEROSPORA (from πτερός, pteron, a wing; and σπόρος, spora, a seed; the seeds are surrounded by a membranous margin or wing). Nutt. gen. amer. 1. p. 209. Lindl. coll. with a figure.

Lin. syst. Decândria, Monogynîa. Calyx 5-parted. Corolla ovate, with a 5-toothed reflexed border. Stamens 10. Anthers excentrically pettate, 2-celled, adnate to the filaments by the margin, bifidose at the base. Capsule 5-celled, imperfectly 5-valved; dissepiments and valves united towards the base, and joined with the central axis. Placenta 5-lobed. Seeds very numerous and minute, each furnished with a terminal wing.—An evanescent annual plant, destitute of verdure, with the habit of Monotropa, to which it is nearly allied. Leaves none. Stem simple, racemose. Flowers numerous, scattered, reddish, resembling those of some species of Andromeda. Peduncles rather long, 1-flowered, drooping.

1 P. andromeda (Nutt. gen. amer. 1. p. 27.) O. H. Native of Upper Canada, near the Falls of Niagara, in clay soils; banks of Seneca lake; and near Albany, in the state of New
York. Plant covered with brownish viscid hairs. Stems brownish red or purple, furnished with lanceolate scales at the base. Peduncles filiform, mutant. Corollas white, with a red border.

Andromeda-flowered Pterospora. Fl. July. Pl. 1 to 2 feet.

Cult. The plant is not cultivatable.

1 S. Caroliniana (Ell. fl. car. vol. 2.) ©. H. Native of North Carolina, in rich shady woods. Flowers sweet-scented, reddish-white.

Cult. The plant is not cultivatable.
